Response to Comment KK1

Section 5.15.3 *Population and Housing Environmental Impacts* (5.13-12) states:

“Since the Orange County Subregion is anticipated to become increasingly jobs-rich over the next 20 years, the project-related employment would exacerbate the subregional jobs/housing imbalance. As a result, the proposed project will not improve and would only exacerbate the Orange County’s overall jobs/housing imbalance and the impact is considered significant and unavoidable.”

No mitigation is available to rectify conflicts with the numerical objectives of regional planning documents including the jobs/housing ratio. A portion of the project’s housing growth will be absorbed in residential projects currently being developed or planned in the surrounding area. Substantial new areas of residential development will be opened for development with the completion of several planned transportation improvement in the County. Housing projects developed under the Base Plan or Overlay Plan will be consistent with the City of Irvine’s Housing Element Affordable Housing Goal.

The Base Plan and the Overlay Plan were developed to reflect the will of the voters per Measure W. A higher development intensity alternative was analyzed (Alternative 6.5) in the EIR which evaluated 4,635 housing units. Alternative 6.5 concludes that a greater impact would occur on the following environmental elements: traffic/circulation; air quality; noise; geology and seismicity; hydrology and water quality; aesthetics; public services and facilities and utilities. Refer to the Alternatives (Section 6.0) in the EIR for further discussion.

Response to Comment KK2

While the number of multi-use residential units has been reduced from 2,313 to 1,500, the overall level of multi-use residential development has been increased from 3,261 to 3,625. The EIR examines two formulated plans: the Base Plan and the Overlay Plan. The EIR analyzes the environmental impacts from these plans and proposes mitigation measures to reduce impacts to levels less than significant. The current General Plan allows a maximum 3,261 dwelling units in Planning Areas 30 and 51 combined. Under the proposed Base Plan 225 multi-family housing units would be developed; implementation of the Overlay Plan would result in the construction of 3,625 housing units. Implementation of either plan would be consistent with the affordable housing goals stated in the City of Irvine’s General Plan Housing Element. As a result, the project provides for a mix of housing densities in the residentially zoned areas.

Section 5.13.3 *Population and Housing Environmental Impact* states:

“...housing project developed on the site under either the Base Plan or Overlay Plan will be required to be consistent with the City’s Housing Element Affordable Housing Goal, which states that:

- 5 percent of units should be affordable to households earning less than 50 percent of the County Median Family Income through rental housing.
- 5 percent of the actual number of units built should be affordable as either rental or ownership housing for households earning between 51 and 80 percent of the County Median Family Income.
- 5 percent of the units should be affordable to household earning between 81 and 121 percent of the County Median Family Income, satisfied through the development of ownership housing.”

1.0 Introduction

This Program Environmental Impact Report is prepared in accordance with the California Environmental Quality Act (CEQA) of 1970 (Public Resources Code Section 21000 et seq.); the Guidelines for the Implementation of the California Environmental Quality Act (CEQA Guidelines) published by the Resources Agency of the State of California (California Administrative Code Sections 15000 et seq.); and the environmental review guidelines of the City of Irvine.

Overview of the Project

Assuring the reuse of the site of the former Marine Air Corps Station El Toro (MCAS El Toro) in accord with the Orange County Great Park Plan is of primary importance to the City of Irvine and the residents of Orange County. The City of Irvine has actively supported the development of a major park and related non-aviation uses on the site for a number of years. This Final Program EIR and the related project are part of the continuing process required to realize this objective.

Project

The project land area involves approximately 4,806 acres. At present, 414 acres are within the City of Irvine and the balance are unincorporated area as shown in Table 1-1. Of this acreage, 4,693 represent the former MCAS El Toro property.

**Table 1-1
Project Area Acreages**

Acres	Unincorporated Areas¹	City of Irvine²	Total
Former MCAS El Toro:			
Planning Area 51	4,279	16	4,295
Planning Area 30	0	398	398
Subtotal	4,279	414	4,693
Musick Jail & IRWD Parcel:			
Planning Area 35	113	0	113
Subtotal	113	0	113
Project Area Total	4,392	414	4,806

¹ Project area proposed for annexation. See Figure 3-1 in Project Description.

² Project area proposed for zone change. See Figure 3-1 in Project Description.

The project consists of the following actions: 1) Annexation, General Plan Amendment, Pre-Zoning (prior to annexation), and Zoning of the unincorporated portion of Planning Area 51; 2) Annexation of the unincorporated portion of Planning Area 35 (James A. Musick Branch Jail and the Irvine Ranch Water District Parcel); and 3) General Plan Amendment and Zone Change for Planning Area 30 which is presently in the City of Irvine; and 4) Approval of the form of a Development Agreement vesting approval of higher intensity overlay uses in consideration for dedication of land for public purposes and for developing and funding certain infrastructure improvements and maintenance of the public uses by the

purchaser/developer and subsequent landowners and funding for specific park, roadways, and other circulation facilities and infrastructure. Together, these actions establish the policy and legislative structure to guide the development of the former MCAS El Toro property and the implementation of the “Orange County Great Park.”

These actions are described in greater detail in Section 3.0 - Project Description. The reader should refer to Section 3.0 for a discussion of all actions included in the project.

Purpose

The purpose of the project is to assure that reuse of the former MCAS El Toro is consistent with the intent of Measure W approved by the voters in March, 2002 while responding to the decision of the federal government to sell the land. The City also wishes to assure the orderly development of public infrastructure and public open space amenities. Securing local control over land use decisions and the coordination of all infrastructure improvements is essential to meet the City’s objectives. Annexation of portions of the property not currently within the City limits and an amendment of the City’s General Plan and Zoning Ordinance are actions required to transfer complete land use control from the County of Orange to the City of Irvine.

Background

The decision to close MCAS El Toro was made by the Department of Navy (DON) under the Base Realignment and Closure Act in July, 1993. Since that time several plans for the reuse of the site have been prepared by various entities including the County of Orange, El Toro Reuse Planning Authority (ETRPA), and the City of Irvine. The current plan, called the Orange County Great Park Plan, is consistent with the concept for reuse of El Toro approved by the voters of Orange County in the March, 2002 initiative (Measure W). The Measure W initiative amended the County General Plan north of the Southern California Regional Rail Authority (SCRRA) Metrolink rail line to designate the unincorporated land for park, open space and other uses, removing the designation of the site as a commercial airport from the County General Plan. While the amendment to the County General Plan created by Measure W does not govern land use regulations in the City, the intent of providing significant public open space land use designations has been incorporated into the City’s Great Park Plan.

Orange County Board of Supervisors Actions

Following the passage of Measure W in March 2002, the City of Irvine immediately embarked on the refinement of the Orange County Great Park Plan. On April 16, 2002, the Orange County Board of Supervisors formally voted to cease further planning for the former MCAS El Toro and to support the annexation and land use planning of the property by the City of Irvine. The Board of Supervisors also decided not to pursue receipt of title to the former MCAS El Toro property and to negotiate with the DON to terminate the El Toro Master Lease existing between the County and the DON. The El Toro Master Lease between the County and DON was terminated in July 2002.

Decision by Navy to Sell El Toro Lands

On April 23, 2002, shortly after the passage of Measure W, the DON issued a Record of Decision (ROD) for the former MCAS El Toro property. The DON announced that the transfer of the property would be in accordance with the will of the people and the intent of Measure W. Subsequently the DON announced its intention to sell the property by public auction in accordance with federal surplus property disposal procedures.

Following the DON decision to sell the land at public auction, the City of Irvine concept plan was modified to assure that the orderly development of the “great park” could be realized through the private sector. The modification recognized that the land would not be transferred to the City or other public agency through a Public Benefit Conveyance or a no-cost Economic Development Conveyance. The Orange County Great Park Plan recognizes that sale of the land will require a reasonable economic return to the private sector buyer. At the same time the City and other local interests want to assure park, open space and other public areas are dedicated to the City or other non-profit or governmental entity in perpetuity and improved without cost to the local taxpayer.

The City prepared a revised land plan that would allow for increased development intensities in exchange for the private sector participation in a development agreement that required the full dedication and improvement of public infrastructure and open space amenities. The City’s strategy is to allow for intensified private development under a Development Agreement arrangement in return for dedication of lands to be used for park, open space and public and institutional purposes. By also allowing for a less intense development plan as the base/underlying zoning designation, the future private sector owner’s decision as to whether to pursue the more development intense overlay zoning through a development agreement is voluntary.

Project Location

The project is located in the center of Orange County and includes land within the City of Irvine and unincorporated area. The project area is northeast of the intersection of Interstate 5 and the Eastern Transportation Corridor Toll Road. Figure 1-1 (Project Location) depicts the location of the project area in a regional and local context, respectively. The total project area encompasses approximately 4,806 acres or 7.5 square miles. The total area proposed for annexation is 4,392 acres.

The project area is generally bounded by the cities of Irvine and Lake Forest on the south and east, and unincorporated area in the County of Orange on the north. Other nearby local jurisdictions include the cities of Laguna Hills, Laguna Niguel, Laguna Woods, Mission Viejo, Aliso Viejo and Tustin.

Major roadways bordering the project area include I-5 to the southwest, Sand Canyon Avenue to the northwest, Portola Parkway and Irvine Boulevard to the north, and Bake Parkway to the northeast. John Wayne Airport is located seven miles to the west of the project area. The Irvine Transportation Center, a major multi-modal transit center linking Orange County Transportation Authority (OCTA) bus, Metrolink commuter rail, and Amtrak rail services, is adjacent to the SCRRA tracks which traverse the site and separate Planning Areas 51 and 30.

Source: Cotton/Bridges/Associates, 2002.

Figure 1-1
Project Location

The James A. Musick Jail Facility is located on a 105-acre parcel northwest of existing Bake Parkway and east of the future extension of Alton Parkway. The northern boundary of the Musick Jail site abuts the former MCAS El Toro. Existing buildings of the Irvine Spectrum abut the Musick Jail site to the west/southwest. An eight-acre (IRWD) parcel west of the Musick Jail contains the IRWD East Irvine Zone IV Pumping Station, Zone III 5.0 million gallon potable water reservoir, and a 7.0 million gallon potable water reservoir.

The Orange County Great Park Plan

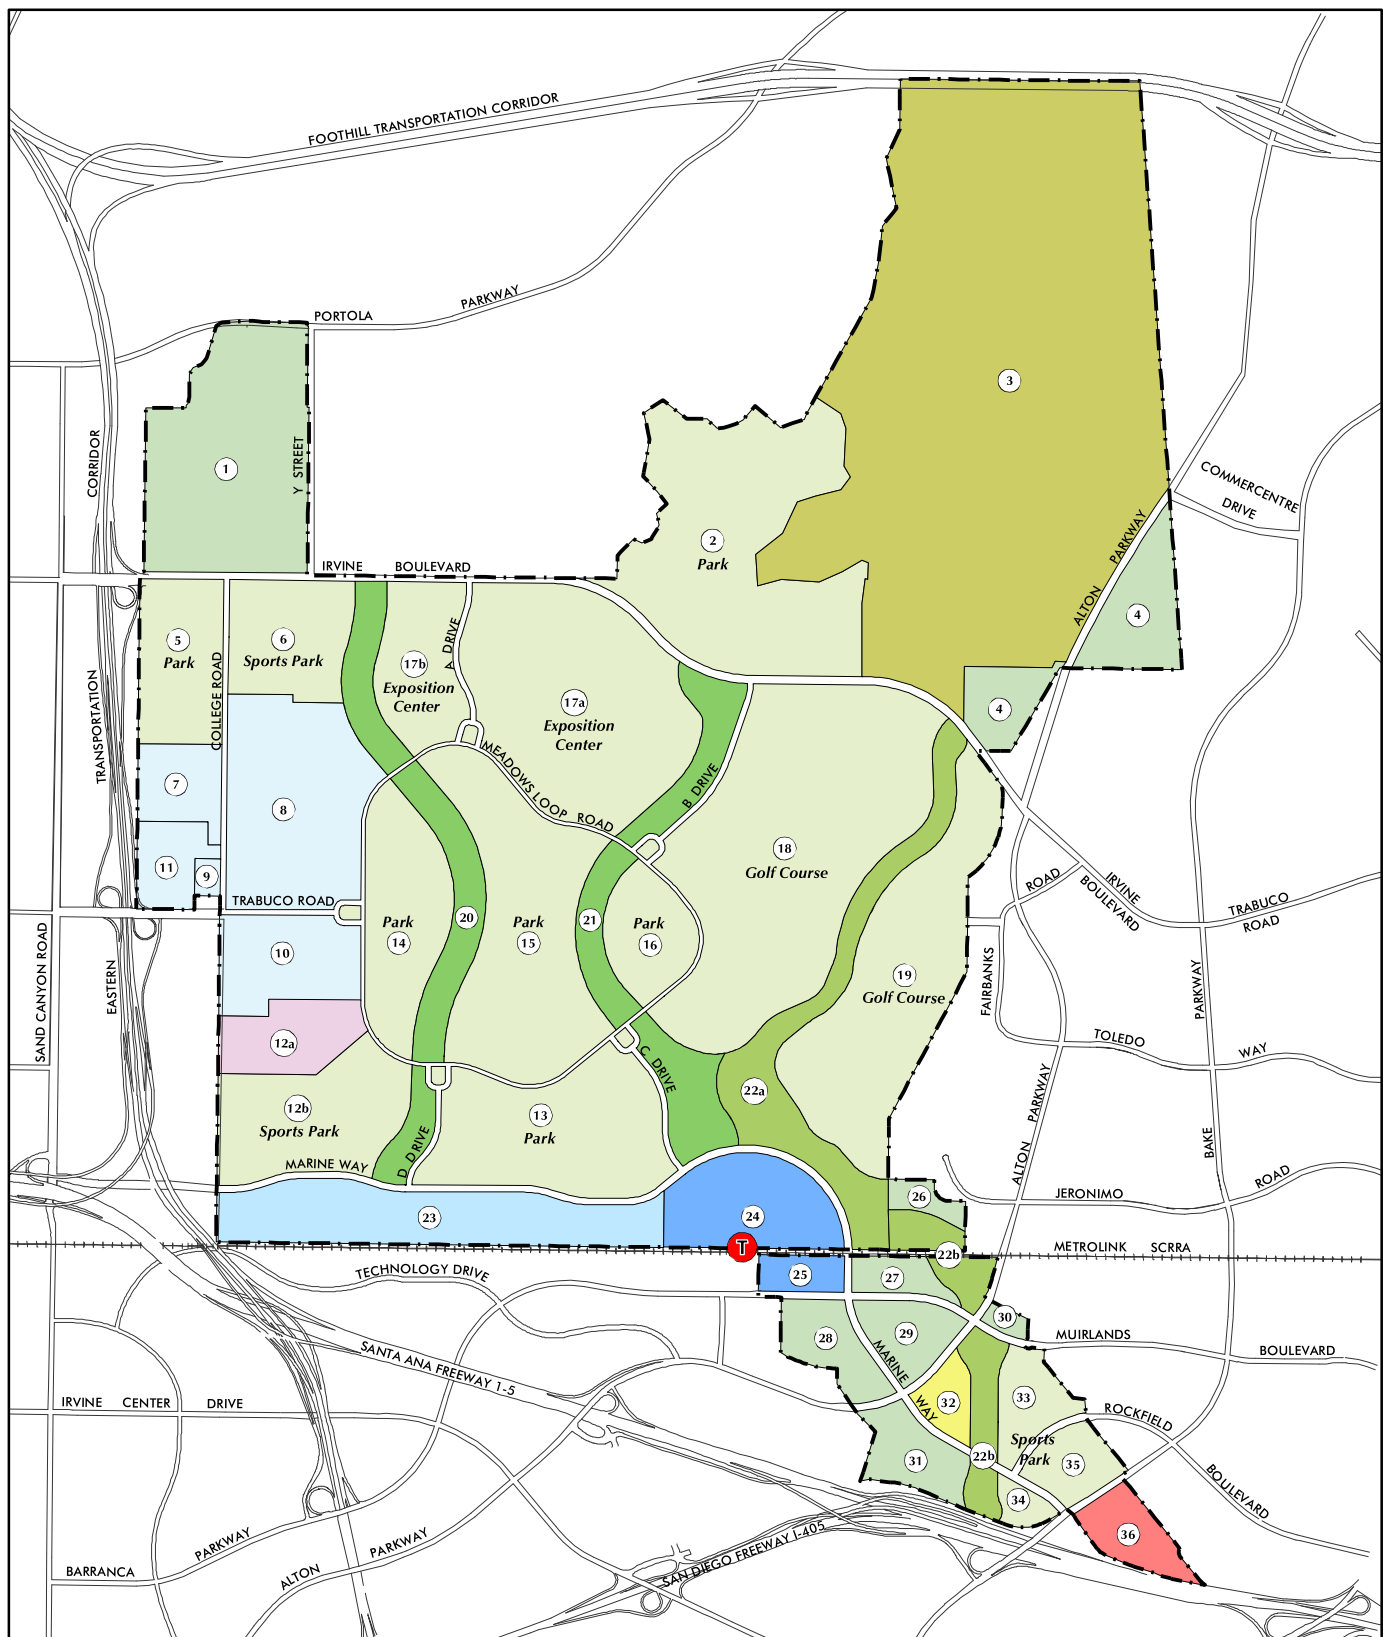

In 2001, the City of Irvine devoted substantial time and resources to prepare a plan for the reuse of the former MCAS El Toro property. The plan included large areas of park, recreational uses and open space. Other uses in the plan were institutional uses, research and development uses, agriculture, educational uses and various others. This concept plan was based on the assumption that the federal government would transfer the land to public entities at low or no cost via public benefit conveyances and/or economic development conveyances similar to other base reuse efforts.

With the prospect that the land would be sold to the private sector, a strategy was incorporated in the Plan to assure the realization of the park, open space and other public uses to dedicate to the City and other non-profit or governmental entities through a Development Agreement. To accomplish the goal of substantial public use of the site while providing economic return to potential buyers, the Great Park Plan is formulated as an overlay plan, i.e., a base plan with an overlay. Zoning for the project area has a zoning overlay. This is a tool traditionally used to permit more creative use of the land and possible increased intensity of use, just as it is proposed in this case by the City of Irvine.

The Base plan is illustrated in Figure 1-2 and represents the minimum level of development anticipated for the site. The Overlay Plan defines additional development rights which may be granted if the property owner enters into a Development Agreement with the City. The Development Agreement will include a requirement for the dedication of land for public uses and for funding of certain infrastructure and public open space amenity improvements and their long term maintenance by the purchaser/developer as well as any future owners of the property. Actual development of the El Toro site will occur at an intensity no greater than that shown in the Overlay Plan illustrated in Figure 1-3. Development intensities for the Base and Overlay plans are listed in Table 1-2.

Project Area Setting

The general locale and surrounding uses are shown in a recent aerial of the site (Figure 1-4). Surrounding land uses include the Irvine Spectrum business park, Wild Rivers Water Park and the Verizon Wireless Amphitheater to the southwest, industrial/business parks to the southeast, residential neighborhoods to the west within the City of Irvine, residential neighborhoods to the southeast within the City of Lake Forest, and agriculture and open space to the northeast.

Former MCAS El Toro (PAs 51 and 30)

In 1993, in accordance with the Base Realignment and Closure Act (BRAC), the Department of Defense (DOD) listed MCAS El Toro for base realignment and operational closure by 1999, and subsequent transfer of the base to civilian control. Closure officially occurred in July, 1999.

Many existing buildings, structures, ancillary facilities, runways, etc. have been left on-site by the Navy. Portions of the site are currently utilized for agricultural operations. The Department of the Navy (DON) provides caretaker responsibilities for the former MCAS El Toro. The Navy is leasing some of the existing facilities for various interim activities, such as the golf course and equestrian facilities and the Cal State University, Fullerton Extension Campus, agricultural operations and recreational vehicle storage.

James A. Musick Jail Facility (portion of PA 35)

The James A. Musick Jail Facility is currently a minimum-security detention and corrections facility, housing approximately 1,250 inmates. This property is owned and operated by the County of Orange. Inmate housing and detention facilities are located in the northeast corner of the site. The remainder of the site is used for agriculture uses associated with inmate detention.

An expansion of the Musick Jail Facility was approved by the County. The proposed expansion was evaluated in County EIR 564. Depending on future need the expansion could potentially house 7,584 inmates in a minimum/medium/maximum security facility. This expansion would occur in three phases and include a Sheriff's Southeast Station, ancillary jail facilities (warehouse, central plant, food service, laundry, staff and visitor parking, etc.), and a relocated Interim Care Facility. The phasing of expansion would depend mostly on the availability; however, the County would like to complete the expansion project by 2006. Construction has not yet commenced.

IRWD Parcel (portion of PA 35)

An eight-acre parcel owned by the Irvine Ranch Water District contains the IRWD East Irvine Zone IV Pumping Station, Zone III 5.0 million-gallon potable water reservoir, and 7.0 million-gallon potable water reservoir. This parcel is west of the Musick facility abutting both the Musick site and the El Toro site.

Federal Disposal Process

Once a federal property has been selected for closure, disposal of the land or facility must follow federal guidelines. Generally, if a federal agency no longer has a need for real property it declares the property excess to its needs and reports the availability of the property to the General Services Administration for transfer or disposal. The excess property is then screened with other federal agencies to ascertain if other federal requirements exist. The excess property can be assigned to any federal agency that has demonstrated a need. Pursuant to this screening process, 905 acres were transferred to the FAA on December 3, 2001. The Navy also anticipates that 70 acres will be transferred to

the Department of Justice. At this point in time, the former MCAS El Toro property determined to be not surplus and therefore available for sale are illustrated on Figure 1-5. Subsequent decisions by the Navy regarding additional FAA sites, a California Air National Guard site, and other potential transfer opportunities may further reduce this surplus area.

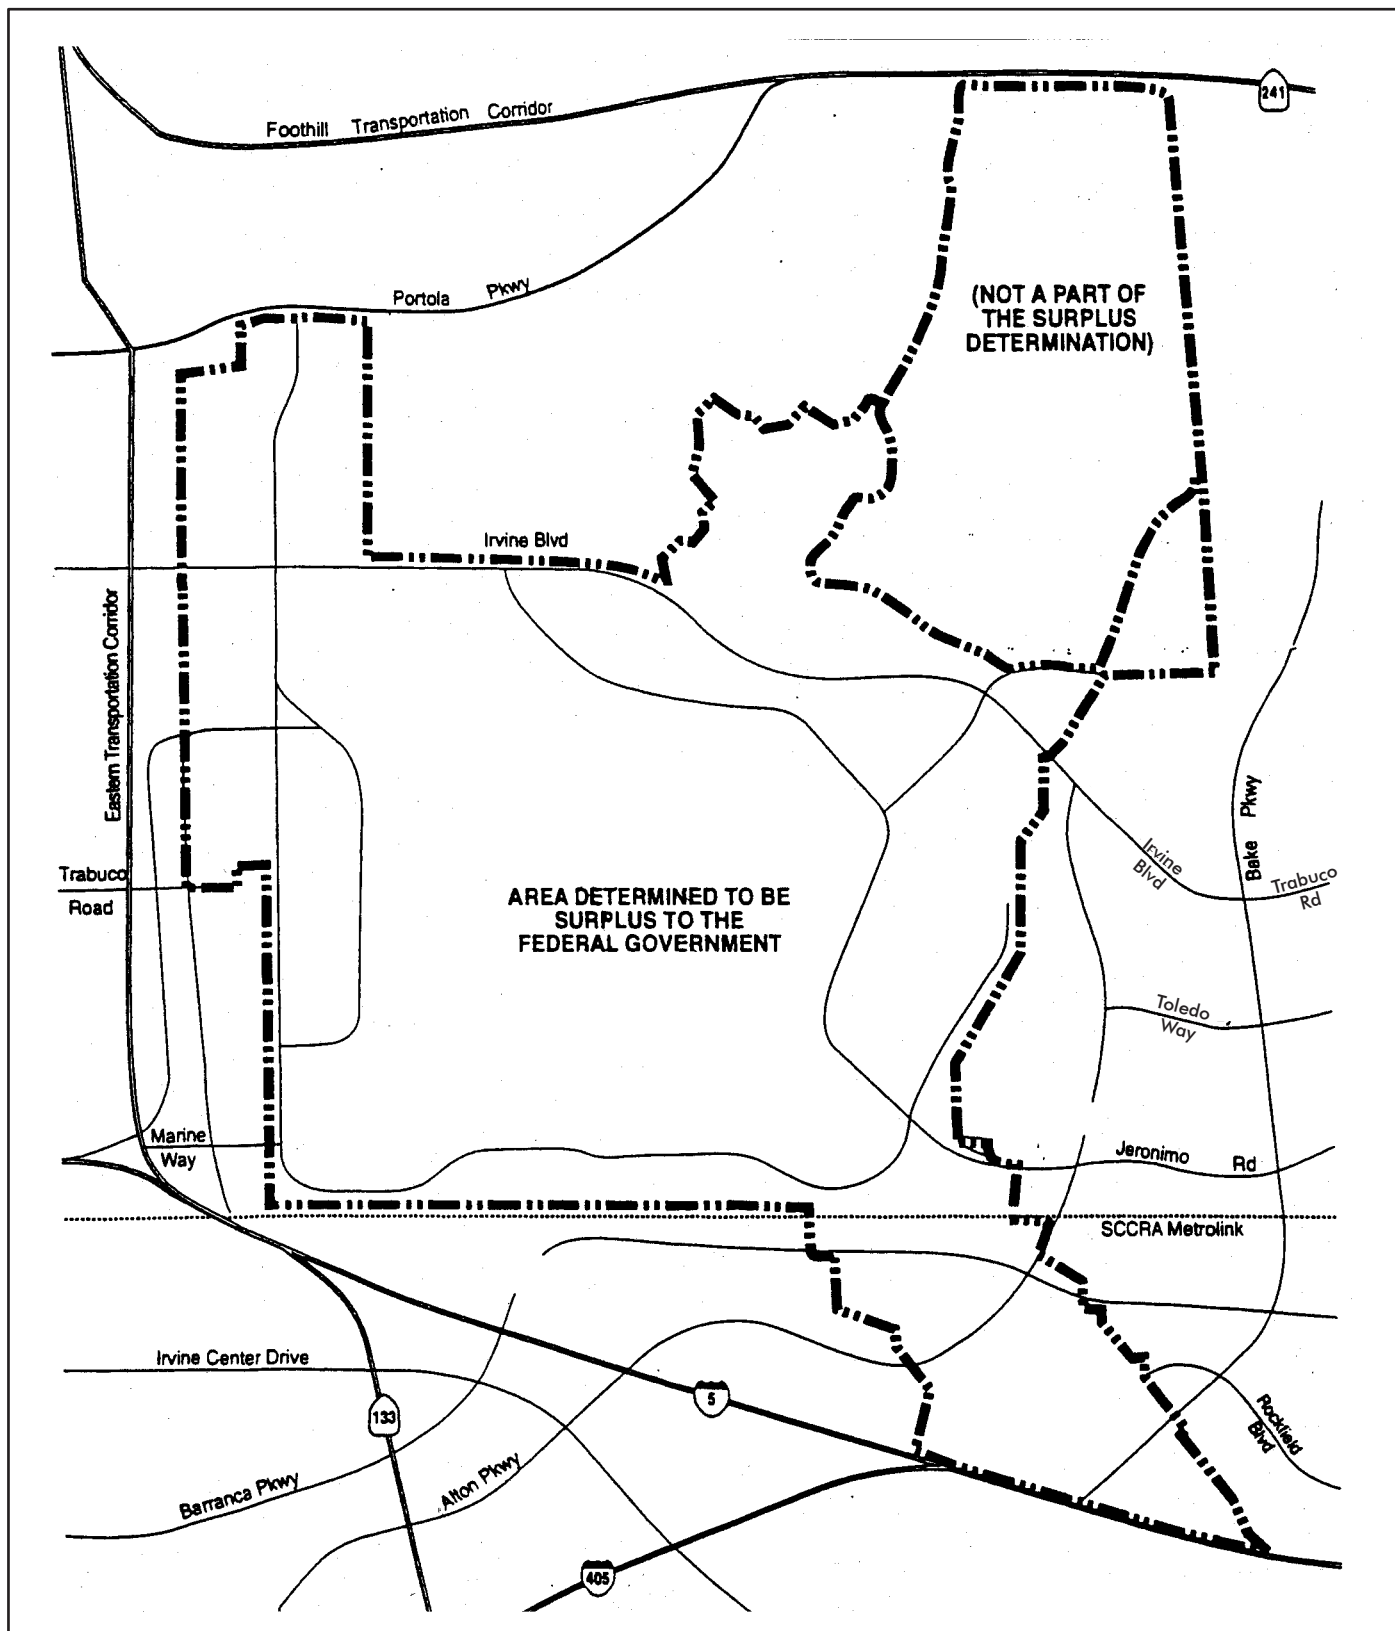

The federal screening process for possible conveyances began in 1995. Federally-recognized Native American tribes, providers of housing for the homeless, and public or private non-profit entities may request conveyances. The Community Reuse Plan (CRP) approved by the County of Orange County acting as the Local Redevelopment Authority [LRA] made recommendations to the DON for conveyances of MCAS El Toro property or buildings that were identified during the federal, state, local, and homeless screening processes. Nine conveyances are recommended under this process at this time. A list of these possible conveyances is contained in Appendix F. The DON is reviewing these conveyances and the manner in which these conveyances will be made is being determined. For purposes of this document the land uses represented in the conveyances are assumed to be a part of the project.

EIR As An Information Document

This EIR is intended to provide information to public agencies, the general public, and decision makers, regarding the environmental impacts from the construction and operation of the proposed project. Under the provisions of CEQA, “The purpose of the Environmental Impact Report is to identify the significant effects of a project on the environment, to identify alternatives to the proposed project, and to indicate the manner in which significant environmental effects can be mitigated or avoided.” (Public Resources Code 21002.1(a)).

According to the CEQA Guidelines (Section 15168), a Program EIR may be prepared on a series of actions that can be characterized as one large project, are related geographically, and as logical parts in a chain of contemplated actions in connection with issuance of rules, regulations or plans. The Program EIR allows for a more exhaustive consideration of effects and alternatives than would be practical in an EIR on separate individual actions, and ensures consideration of cumulative impacts that might not otherwise be addressed on a case-by-case basis. The proposed project involves several land use actions covering approximately 4,806 acres of land.

Full development of the project area in accordance with the Orange County Great Park Plan is estimated to take over 20 years. As such, the Program EIR provides a first-tier analysis of the proposed project by analyzing the broad environmental effects. Subsequent activities in the project area must be examined in light of the Program EIR to determine whether an additional environmental document must be prepared. If a subsequent project or later activity would have effects that were not examined in this Program EIR, or not examined at

an appropriate level of detail to be used for the later activity, an initial study would need to be prepared, leading to a negative declaration or an EIR. If the City finds that pursuant to Section 15152 of the CEQA Guidelines, no new effects could occur or new mitigation measures would be required for a subsequent project, the City can approve the activity as being within the scope of the project covered by this Program EIR, and no new environmental documentation would be required.

Numerous acronyms are used throughout the Final Program EIR. These acronyms and meanings are included in Appendix A of this EIR.

Notice of Preparation

The Notice of Preparation (NOP) of an EIR was distributed on October 2, 2002. The NOP, the NOP distribution list, and NOP comments are included in Appendix B and C. The comment letters to the NOP are on file at the City of Irvine, Community Development Department, One Civic Center Plaza, Irvine, California 92623-9575, contact Glen Worthington (949) 724-6370.

Scoping Session

On October 29, 2002, the City of Irvine held a scoping session at the Irvine City Hall to answer questions and permit discussion on the project. The University Village alternative land use plan was developed in response to public comments made at the meeting and subsequently provided as written responses to the NOP.

Public Review Period

Comments of all agencies and individuals on the Draft Program EIR were accepted during the 45-day public review period which opened on February 18, 2003 and closed on April 4, 2003. A Response to Comments document was published by the City of Irvine on May 15, 2003. In response to comments received, minor revisions were made to the EIR. These clarifications/modifications do not constitute significant additional information that changes the conclusions of the environmental analysis or requires re-circulation of the document (CEQA Guidelines Section 15088.5). All changes made were noted in the Response to Comments document and incorporated in to the Final Program EIR certified by the City Council.

2.0 Executive Summary

Project Description

The project consists of the following actions: 1) Annexation, General Plan Amendment, Pre-Zoning (prior to annexation), and Zoning of the unincorporated portion of Planning Area 51; 2) Annexation of the unincorporated portion of Planning Area 35 (James A. Musick Branch Jail and the Irvine Ranch Water District Parcel); and 3) General Plan Amendment and Zone Change for Planning Area 30 which is presently in the City of Irvine; and 4) Approval of the form of a Development Agreement vesting approval of higher intensity overlay uses in consideration for dedication of land for public purposes and for developing and funding certain infrastructure improvements and maintenance of the public uses by the purchaser/developer and subsequent landowners and funds for specified park, roadways, and other circulation facilities and infrastructure. Together, these actions establish the policy and legislative structure to guide the development of the former MCAS El Toro property and the implementation of the "Orange County Great Park."

These actions are described in greater detail in Section 3.0 - Project Description. The reader should refer to Section 3.0 for a discussion of all actions included in the project.

The purpose of the project is to assure that reuse of the former MCAS El Toro is consistent with the intent of Measure W approved by the voters in March, 2002 while responding to the decision of the federal government to sell the land at a public auction. The City also wishes to assure a financially viable development consistent with the intent of Measure W with the orderly development of public infrastructure and public open space amenities at no cost to the local taxpayer. Securing local control over land use decisions and the coordination of all infrastructure improvements is essential to meet the City's objectives. Annexation of the portions of the property not currently within the City limits and an amendment of the City's General Plan and Zoning Ordinance are actions required to transfer complete land use control from the County of Orange to the City of Irvine.

Project Location

The project is located in the center of Orange County and includes land within the City of Irvine and unincorporated area. The project area is northeast of the intersection of Interstate 5 and the Eastern Transportation Corridor Toll Road. Figure 1-1 (Project Location) depicts the location of the project area in a regional and local context, respectively. The former MCAS El Toro portion of the project area encompasses approximately 4,693 acres or 7.3 square miles. Approximately 4,279 acres of the former MCAS El Toro portion of the project area (PA 51) are located on unincorporated County land, but within the City of Irvine Sphere of Influence. Approximately 398 acres (PA 30) and 16 acres (PA 51) are within the city limits of Irvine. The James A. Musick Jail facility and the Irvine Ranch Water District (IRWD) parcel comprise approximately 113 acres, and are located on unincorporated County land. The total land area being annexed is 4,287 acres.

The project area is generally bounded by the cities of Irvine and Lake Forest on the south and east, and unincorporated area in the County of Orange on the north. Other nearby

local jurisdictions include the cities of Laguna Hills, Laguna Niguel, Laguna Woods, Mission Viejo, Aliso Viejo and Tustin.

Major roadways bordering the project area include I-5 to the southwest, Sand Canyon Avenue to the northwest, Portola Parkway and Irvine Boulevard to the north, and Bake Parkway to the northeast. John Wayne Airport is located seven miles to the west of the project area. The Irvine Transportation Center, a major multi-modal transit center linking Orange County Transportation Authority (OCTA) bus, Metrolink commuter rail, and Amtrak rail services, is adjacent to the SCRRRA tracks which traverse the site and separate Planning Areas 51 and 30.

The James A. Musick Jail Facility is located on a 105-acre parcel northwest of existing Bake Parkway and east of the future extension of Alton Parkway. The northern boundary of the Musick Jail site abuts the former MCAS El Toro. Existing buildings of the Irvine Spectrum abut the Musick Jail site to the west/southwest. An eight-acre (IRWD) parcel west of the Musick Jail contains the IRWD East Irvine Zone IV Pumping Station, Zone III 5.0 million gallon potable water reservoir, and a 7.0 million gallon potable water reservoir.

Environmental Impacts

The City of Irvine has determined that an EIR is required pursuant to the CEQA Guidelines. The environmental issue areas identified for study in the Final Program EIR are land use, traffic/circulation, air quality, noise, public health and safety, geology and seismicity, hydrology and water quality, agricultural resources, biological resources, paleontological resources, cultural resources, aesthetics, population/housing, public services and facilities, utilities, cumulative impacts, growth-inducing impacts, and significant irreversible environmental changes. Table 2-1 presents a summary of the environmental impacts of the proposed project, mitigation measures to reduce potential significant impacts for the proposed project, and the level of significance of each impact after mitigation. Significant unavoidable project-level impacts have been identified for air quality, agricultural resources and population/housing. Cumulative unavoidable impacts have been identified for traffic/circulation, air quality, population/housing, and agricultural resources.

Potential Areas of Controversy

The primary area of controversy surrounding the proposed project is whether the former air station should be reused as a non-aviation use versus an aviation use. Until the recent passage of Measure W on March 5, 2002, the County of Orange was proceeding with plans for a commercial airport at the former MCAS El Toro site. While the Orange County voters approved Measure W, limited opposition remains to the non-aviation use of the property. Other issues related to the proposed project are addressed in Sections 5.1 through 5.15 of this Final Program EIR.

Alternatives to the Proposed Project

The alternatives evaluation during the analysis of the proposed project include:

1. No Project/Measure W/PA51/Millennium Plan II PA30

2. Existing City of Irvine General Plan (Millennium Plan II Land Uses)
3. Measure W PA 51/Millennium Plan II PA 30 - Modified
4. Alternative Land Use Plan – University Village
5. Increased Residential Alternative

Table 2-1
Environmental Impacts and Mitigation Measures

Potential Impacts	Mitigation Measures	Level of Significance After Mitigation
5.1 Land Use		
Base Plan and Overlay Plan No significant land use impact has been identified.	Base Plan and Overlay Plan No mitigation measure is proposed, as no significant land use impact has been identified.	Base Plan and Overlay Plan Not applicable.
5.2 Traffic/Circulation		
Base Plan Tran B1. Implementation of the Base Plan will cause an increase in traffic which is substantial in relation to the existing traffic load and capacity of the street system (i.e., result in a substantial increase in either the number of vehicle trips, the volume to capacity ratio on road, or congestion at intersections) in the 2007, 2025, and Post 2025 scenarios as follows: ROADWAY/FREEWAY/TOLLWAY/RAMP SEGMENTS Year 2007 I-5 Freeway Southbound off ramp at Alton Parkway Year 2025	Base Plan Locations experiencing peak hour deficiencies and significantly impacted by the project have been evaluated to determine what improvements are necessary to provide acceptable levels of service in accordance with City of Irvine and adjacent jurisdiction standards. Project mitigation in the form of (1) constructing new on-site arterial highways, (2) constructing new off-site roadway improvements, and (3) participating on a fair share basis to needed off-site freeway/tollway ramp improvements, have all been determined as part of the traffic analysis. The traffic impact study has presented a multi-phase analysis of the potential traffic related impacts that would be anticipated to occur under the Orange County Great Park proposed network and land use concepts. The following identifies the measures needed to mitigate the impacts that have been identified. As the planning process for the project proceeds, and the land use plan becomes more defined and refined, additional analyses will be required to determine the cost, assign responsibility and refine the phasing of mitigation measures.	Base Plan Less than significant.

Table 2-1
Environmental Impacts and Mitigation Measures

Potential Impacts	Mitigation Measures	Level of Significance After Mitigation
<p>I-5 Freeway at Jeffrey Road – southbound on ramp (AM/PM) I-5 Freeway at Sand Canyon Avenue – northbound on ramp (PM) I-5 Freeway at Sand Canyon Avenue – southbound off ramp (AM) I-5 Freeway at Bake Parkway – southbound off ramp (AM) I-405 Freeway at Jeffrey Road – northbound off ramp (PM) I-405 Freeway at Sand Canyon Avenue – northbound direct on ramp (PM) I-405 Freeway at Sand Canyon Avenue – southbound off ramp (AM)</p> <p>Post 2025</p> <p>I-5 Freeway from Jeffrey Road to Sand Canyon Avenue- southbound (AM) I-405 Freeway from Jeffrey Road Sand Canyon Avenue- southbound (AM)</p> <p>I-5 Freeway at Jeffrey Road – southbound on ramp (AM/PM) I-5 Freeway at Sand Canyon Avenue – northbound on ramp (PM) I-5 Freeway at Sand Canyon Avenue – southbound off ramp (AM) I-5 Freeway at Bake Parkway – southbound off ramp (AM) I-405 Freeway at Sand Canyon Avenue – northbound direct on ramp (PM) I-405 Freeway at Sand Canyon Avenue –</p>	<p>Tran 1. Prior to the approval of any final map (other than a financing and conveyance map) within the Great Park project, and prior to issuances of any building permits for permanent improvements within the Great Park property, the landowner or subsequent project applicant shall apply for annexation of any areas within the final map to the Irvine Spectrum Transportation Management Association (TMA) (“Spectrumotion”) in accordance with Article X of the recorded Declaration of Covenants, Conditions and Restrictions (CC&Rs) for the Irvine Spectrum TMA, including any supplementary or amended CC&Rs. The primary purpose of this mitigation measure is to reduce traffic, air quality and noise impacts. Should annexation into Spectrumotion not be approved, the landowner or subsequent project applicant shall develop and implement a similar transportation management plan containing the elements and meeting the criteria described below:</p> <p>Transportation Management Plan (TMP)</p> <p>The development and implementation of a Transportation Management Plan is an identified mitigation measure to manage transportation access for the Great Park Project. This document summarizes the key elements of the TMP.</p> <p>1.0 Introduction</p> <p>The purpose of this document is to provide an outline for a comprehensive TMP for the Great</p>	

Table 2-1
Environmental Impacts and Mitigation Measures

Potential Impacts	Mitigation Measures	Level of Significance After Mitigation
<p>southbound off ramp (AM)</p> <p>INTERSECTIONS</p> <p>Year 2007</p> <p>Please refer to Table 5.2-6.</p> <p>Year 2025</p> <p>Please refer to Table 5.2-7.</p> <p>Post 2025</p> <p>Please refer to Table 5.2-8.</p> <p>Tran B2. Implementation of the Base Plan will result in inconsistencies with the adopted Orange County Master Plan of Arterial Highways (MPAH). These inconsistencies are associated with Marine Way and Rockfield Boulevard.</p> <p>Tran B3. Implementation of the Base Plan will exceed, either individually or cumulatively, a level of service standard established by the county congestion management agency for designated roads or highways in the 2025 scenario. The Base Plan will impact the following:</p>	<p>Park. This report is not intended to provide the specific details of the plan, but rather to highlight the key components and provide direction for subsequent detailed planning and implementation activities. When preparation of the TMP is undertaken, all of the agency and stakeholders will be invited to provide input.</p> <p>It is the intent to annex Planning Area 51 and a portion of Planning Area 35 into the Irvine Spectrum Transportation Management Association (Spectrumotion). Spectrumotion is a private, non-profit Transportation Management Association (TMA) formed to reduce traffic congestion in Irvine Spectrum. Spectrumotion promotes, markets, and subsidizes alternatives to solo-commuting and assists the business community in complying with trip reduction related requirements. Membership is mandatory to property owners with deed restrictions requiring participation in the TMA. Membership dues provide the funding for the Association and its programs, which offer a variety of employer and commuter services focused on reducing vehicular trip generation.</p> <p>In the event that annexation of PAs 51 and 35 into Spectrumotion is not approved, a TMP similar to that provided by Spectrumotion will be implemented. This document sets forth the components of the TMP should it be necessary.</p>

<p>INTERSECTION</p> <p>Year 2025</p> <p>El Toro Road/Avenida de la Carlota</p>	<p>2.0 Transportation Management Plan Framework</p> <p>The key elements of the Great Park TMP are set forth below:</p> <p>New Hire Orientation: Inform newly hired employees of commuting services available to them.</p> <p>Public Transportation Pass Sales: Provide a central location for purchase of passes to available transit services ((i.e., OCTA buses, Metrolink, Amtrak, etc.).</p> <p>Vanpool and Carpool Formation Assistance: Perform all of the administrative work necessary to establish van pools and car pools.</p> <p>On-site Promotions: Hold rideshare promotions at work sites and assist in employer assistance promotions.</p> <p>Telecommuting/Alternative Work Schedule Consulting: Assist employers in developing and implementing a telecommuting or alternative work schedule program.</p> <p>Personalized Commute Consulting: Provide a personalized commute profile to any commuter, which includes carpool match list containing the names of other commuters in the North Irvine Sphere that live and work near</p>	

Table 2-1
Environmental Impacts and Mitigation Measures

Potential Impacts	Mitigation Measures	Level of Significance After Mitigation
	<p>each other.</p> <p>Website: Maintain a website with all of their program information available.</p> <p>Rideshare Promotions: Conduct high visibility rideshare promotions as a means to advertise its services.</p> <p>Subsidies: To the extent financially feasible, offer subsidies to assist in the formation of vanpools, the formation of carpools, and to encourage the trying of transit services.</p> <p>Public Agency Coordination: Work closely with various public and quasi-public agencies to improve bus and commuter rail service to the Spectrum and North Irvine Sphere areas.</p> <p>3.0 Transportation Management Plan Implementation</p> <p>As part of the TMP, a process will be established to monitor its effectiveness in reducing peak hour trip generation in the Great Park. Provision shall be made for the Plan to be modified as appropriate to enhance its effectiveness.</p> <p>Tran 2. Prior to the issuance of the first building permit, City shall establish, and the landowner or subsequent project applicant shall commit to participate in, a transportation system/infrastructure</p>	

Table 2-1
Environmental Impacts and Mitigation Measures

Potential Impacts	Mitigation Measures	Level of Significance After Mitigation
	<p>fee program to fund improvements identified as mitigation measures listed in Tables 5.2-16 and 5.2-17 of this EIR.</p> <p>Tran 3. Prior to issuance of any building permits for permanent improvements within the Great Park property, the landowner or subsequent project applicant shall implement or contribute its percentage funding responsibility for traffic improvements as identified in the project traffic study (Urban Crossroads, December 2002) to maintain satisfactory levels of service as defined by the City's General Plan, based on thresholds of significance, performance standards, and methodologies used in this EIR, Orange County Congestion Management Program, and established in the transportation system/infrastructure fee program described in Mitigation Measure Tran 2 above.</p> <p>Tran 4. Prior to approval of each Master Tentative Map or equivalent, the landowner or subsequent project applicant shall prepare, subject to City review and approval, an updated traffic study consistent with the City of Irvine Traffic Study Guidelines inclusive of a phasing plan for traffic improvements associated with the subject Master Tentative Map. The phasing plan will specify the timing, funding, construction, and responsibilities for all traffic improvements identified in the updated traffic study. The updated traffic study will determine whether any additional or alternative traffic improvements are necessary based on updated</p>	

Table 2-1
Environmental Impacts and Mitigation Measures

Potential Impacts	Mitigation Measures	Level of Significance After Mitigation
	<p>traffic forecasts. The updated traffic study will evaluate the cumulative impact of the subject map and all previously approved or concurrently submitted maps. The methodology for the study area, applicable land use and circulation modifications, and standards for assessing and mitigating impacts employed in the updated traffic study shall be consistent with a City approved traffic study scope of work. The landowner or subsequent project applicant shall construct, bond for, or enter into a funding agreement for necessary improvements identified in the updated traffic study and/or participate in the City fee program (Tran 2 above) to the extent that the improvements identified in the updated traffic study are listed in Tables 5.2-16 and 5.2-17 of this EIR.</p> <p>Traffic signals that are on-site or directly related to the Great Park development will be installed as warranted through the mitigation implementation plan process.</p> <p>Tran 5. In conjunction with the preparation of any updated traffic study as required in Mitigation Measure Tran 4 for each master tentative map or equivalent, and assuming that a regional transportation agency has not already programmed and funded the warranted improvements to the impacted freeway mainline or freeway/tollway ramp locations in conjunctions with fulfilling its regional role, the landowner or subsequent project applicant and the City will take the following actions:</p>	

Table 2-1
Environmental Impacts and Mitigation Measures

Potential Impacts	Mitigation Measures	Level of Significance After Mitigation
	<ol style="list-style-type: none"> 1. The City shall ensure that the updated traffic study identifies the project's proportionate impact on the specific freeway mainline and/or freeway-tollway ramp locations and its percentage responsibility for mitigating these impacts (assuming tolled conditions on the Transportation Corridors) based on thresholds of significance, performance standards and methodologies used in this EIR and established in the Orange County Congestion Management Program and City of Irvine Traffic Study Guidelines. 2. The City shall estimate the cost of the project's percentage responsibility in cooperation with Caltrans and the Transportation Corridor Agency. 3. The landowner or subsequent project applicant shall enter into an agreement with the City prior to recordation of the first final map for each Master Tentative Map or equivalent to establish the method and timing of payment of the identified percentage responsibility. 4. The City shall allocate landowner or subsequent project applicant's percentage contribution to traffic improvements that result in improved traffic flow on the impacted mainline and ramp locations, including but not limited to construction of physical or operational improvements, contributions to mandated trip reduction or transit programs, or 	

Table 2-1
Environmental Impacts and Mitigation Measures

Potential Impacts	Mitigation Measures	Level of Significance After Mitigation
	<p>funding participation in a regional transportation improvement fee program, if adopted.</p> <p>Tran 6. The project shall mitigate to insignificant levels all project impacts at significantly impacted study area intersections. Tables 5.2-16 and 5.2-17 show the mitigation program for each phase. With regard to impacts that require improvements in other jurisdictions, the City of Irvine shall cooperate with the affected jurisdiction to ensure that the improvements are constructed in a timely manner.</p> <p>Tran 7. Assuming that a regional transportation agency has not already programmed and funded the improvements, the City of Irvine shall coordinate with Caltrans and the Transportation Corridor Agencies, and submit for their approval, proposed plans for modifications to the state highway system and the transportation corridors, as required to provide ramp connections to Trabuco Road. If needed, the City shall prepare a Project Study Report, a New Connection Request, and a Detailed Traffic Revenue Study for review by Caltrans and the Transportation Corridor Agency for the proposed connection of Trabuco Road to the Eastern Transportation Corridor. The City shall perform toll and revenue impact studies for any mitigation measure (improvement) that may be impacted by the non-compete clause or any similar agreement restricting a public agency's authority to construct improvement.</p>	

Table 2-1
Environmental Impacts and Mitigation Measures

Potential Impacts	Mitigation Measures	Level of Significance After Mitigation
	Tran 8. Following adoption of a land use plan and circulation plan for the Great Park property and before the issuance of building permits with the base property, the City of Irvine shall enter into a cooperative study with OCTA and other affected jurisdictions to amend the Orange County Master Plan of Arterial Highways (MPAH). Marine Way, Trabuco Road from SR-133 tollway to College Road, and Y Street shall be included on the MPAH.	
Overlay Plan Tran O1. Implementation of the Overlay Plan will cause an increase in traffic which is substantial in relation to the existing traffic load and capacity of the street system (i.e., result in a substantial increase in either the number of vehicle trips, the volume to capacity ratio on road, or congestion at intersections) in the 2007, 2025, and Post 2025 scenarios as follows: ROADWAY/FREEWAY/TOLLWAY/RAMP SEGMENTS Year 2007 I-5 at Alton Parkway – southbound offramp (AM) I-405 at Irvine Center Drive – southbound offramp (AM)	Overlay Plan Same as Base Plan mitigation.	Overlay Plan Less than significant.

<p>FREEWAY/TOLLWAY LOCATIONS</p> <p>Year 2025</p> <p>I-5 from Sand Canyon Avenue to Jeffrey Road – northbound (PM) I-5 from Jeffrey Road to Sand Canyon Avenue– southbound (AM) I-405 from Jeffrey Road to Sand Canyon Avenue- southbound (AM)</p> <p>INTERSECTIONS</p> <p>Year 2007</p> <p>El Toro Road/Avenida de la Carlota</p> <p>Year 2025</p> <p>El Toro Road/Avenida de la Carlota</p>		
5.3 Air Quality		
<p>Base Plan and Overlay Plan</p> <p>AQ1. Implementation of the proposed project will result in a significant air quality impact associated with the fugitive dust emissions resulting from the demolition of existing structures, and land preparation and excavation for the construction of proposed structures. Additionally, the operation of the project will result in a significant impact</p>	<p>Base Plan and Overlay Plan</p> <p>The following section provides a summary of the possible mitigation measures that could be implemented for the development of the former MCAS El Toro according to the proposed project. The limited availability of specific data to quantify air quality impacts for emission sources within the proposed project make it impossible to accurately quantify the effectiveness of each of the mitigation measures. However, these measures are identified as possibilities for the project,</p>	<p>BasePlan/Overlay Plan</p> <p>Due to the size of the project, certain impacts that result from development will be "unavoidable" as these impacts cannot be completely mitigated and most of these changes are irreversible. This is</p>

Table 2-1
Environmental Impacts and Mitigation Measures

Potential Impacts	Mitigation Measures	Level of Significance After Mitigation
<p>associated with motor vehicle emissions.</p>	<p>while some are recommended by the SCAQMD for all development projects within the SCAB. As expected, the implementation of some or all of the mitigation measures will result in an overall reduction in potential air emissions from the proposed project. However, the implementation of any of these emission mitigation measures cannot be guaranteed at this stage of the proposed project, because they may not be technically or economically feasible once actual development gets underway. Therefore, the emission mitigation measures discussed in the following sections are defined as alternate control measures that could be implemented for the proposed project.</p> <p>Construction Emissions Mitigation</p> <p>The major source of construction emissions are fugitive dust emissions resulting from the demolition of existing structures, and land preparation and excavation for the construction of proposed structures. Actual erection of structures is considered a minimal source of construction related dust emissions. The following mitigation measures are intended to effectively reduce pollutant emissions from construction activities. Some or all of the mentioned mitigation measures can be implemented as necessary, but quantification and application of these measures cannot be specified at this time.</p> <p>AQ1. Prior to the start of demolition and construction within the project area, adjacent sensitive receptors shall be informed of the planned demolition and construction activities. Measures to avoid significantly impacting these receptors shall be developed and implemented by the project proponent in coordination with these uses. Other applicable mitigation measures such as</p>	<p>considered a significant unavoidable impact, although the overall effect on air quality within the Basin for the life of the proposed project is estimated at less than one half of one percent. Construction-related emissions are expected to result in unavoidable short-term impacts in terms of ROG and NO_x, although implementation of mitigation measures during construction will minimize these impacts to the extent feasible. Short-term impacts on sensitive receptors are expected to be mitigated during construction and no long-term CO hotspots will be created that may affect sensitive receptors. Operational emissions from future development under the proposed project will consist of area source and motor vehicle emissions, which will exceed SCAQMD thresholds. These air quality emissions from future development</p>

Table 2-1
Environmental Impacts and Mitigation Measures

Potential Impacts	Mitigation Measures	Level of Significance After Mitigation
	<p>erection of fences around construction areas; staggered use of equipment near sensitive receptors; diversion of truck trips away from receptors; etc.; shall be employed as necessary. Compliance with this measure shall be verified by the Director of Community Development.</p> <p>AQ2. Prior to the commencement of construction activities required to demolish and/or remove existing DON infrastructure, including runways, the Director of Community Development shall receive and approve a construction emissions mitigation plan from the chose demolition contractor. Prior to the issuance of grading permits, the applicant of any future development project shall submit, and the Director of Community Development shall approve a construction emissions mitigation plan. The plan shall identify implementation procedures for each of the following emissions reduction measures and all feasible mitigation measures shall be implemented. If certain measures are determined infeasible, an explanation thereof shall be provided.</p> <ul style="list-style-type: none"> C Evaluate the availability and use, if available, of low-emission (i.e., methanol- or natural gas-powered) construction equipment instead of diesel for each construction phase. C Water exposed soils at least twice daily and maintain equipment and vehicle engines in good condition and in proper tune. C Wash off trucks leaving the site. C Replace ground cover on construction sites when it is determined that the site will be undisturbed for 	<p>under the proposed project will remain significant, even after mitigation.</p> <p>Area Source (Post-Construction) Emission Mitigation</p> <p>Emissions resulting from the post-construction and routine operation of various sources within a development contribute to long term impacts on air quality throughout its life. Some of the mitigation measures that could reduce energy consumption within the proposed project and thus, reduce associated emissions should be considered for implementation and are listed below.</p> <ul style="list-style-type: none"> C Central residential space heating and cooling for multi-dwelling units. C Orient buildings north/south for reducing energy-related combustion

Table 2-1
Environmental Impacts and Mitigation Measures

Potential Impacts	Mitigation Measures	Level of Significance After Mitigation
	<p>lengthy periods.</p> <ul style="list-style-type: none"> C Reduce speeds on unpaved roads to less than 15 miles per hour. C Halt all grading and excavation operations when wind speeds exceed 25 miles per hour. C Suspend all emission generating activities during smog alerts. C Use propane- or butane-powered on-site mobile equipment instead of diesel/gasoline, whenever feasible. C Properly maintain diesel-powered on-site mobile equipment. C Sweep streets at the end of the day if substantial visible soil material is carried over to the adjacent streets. C Use electricity from power poles rather than temporary on-site diesel- or gasoline-powered generators, whenever feasible. C Use of low-VOC asphalt. C Cover all trucks hauling dirt, sand, soil or other loose material to and from the site. C Provide temporary traffic controls (e.g., flag persons) during all phases of construction to ensure minimum disruption of traffic. C Schedule construction activities that affect traffic flow on adjoining streets to off-peak hours to the extent possible. C Reroute construction trucks away from congested streets, whenever feasible. C Provide dedicated turn lanes for movement of construction trucks and equipment on- and off-site, whenever feasible. 	<p>emissions.</p> <ul style="list-style-type: none"> C Central commercial space heating. <p>These measures could be accounted for in the planning process such that the overall impact of the proposed project on prevalent air quality in the SCAB is minimized.</p> <p><i>Motor Vehicle (Operational) Emission Mitigation</i></p> <p>Motor vehicle emissions form a large portion of the total operational emissions from the proposed project. These emissions can be mitigated by the use of fuel-efficient vehicles and a well designed transportation system. However, most of the measures will be ineffective unless the occupants of various commercial and residential establishments within the project contribute their share in the mitigation effort. The implementation</p>

Table 2-1
Environmental Impacts and Mitigation Measures

Potential Impacts	Mitigation Measures	Level of Significance After Mitigation
	<p>AQ3. Prior to the issuance of building permits for any future development, the applicant shall submit, and the Director of Community Development shall have approved, an operation-emissions mitigation plan. The plan shall identify implementation procedures for each of the following emissions reduction measures and all feasible mitigation measures shall be implemented. If certain measures are determined infeasible, an explanation thereof shall be provided.</p> <ul style="list-style-type: none"> C Utilize built-in energy-efficient appliances to reduce energy consumption and emissions. C Utilize energy-efficient and automated controls for air conditioners and lighting to reduce electricity consumption and associated emissions. C Install special sunlight-filtering window coatings or double-paned windows to reduce thermal loss, whenever feasible. C Utilize light-colored roofing materials as opposed to dark roofing materials to conserve electrical energy for air-conditioning. C Provide shade trees in residential subdivisions as well as public areas, including parks, to reduce building heating and cooling needs, whenever feasible. C Ensure that whenever feasible, commercial truck traffic is diverted from local roadways to off-peak periods. C Centralize space heating and cooling for multiple-family dwelling units and commercial space. C Orient buildings north/south for reducing energy-related combustion emissions. C Use solar energy, when feasible. 	<p>of some of the measures cannot be stated with certainty, as they are owner and employer specific and related specific land use types within the proposed project. Development of the proposed project will identify motor vehicle mitigation measures that would result in reductions in emissions and thereby contribute to the overall improvement in air quality within the SCAB. The inclusion of the OCTA facility within the proposed project is aimed at encouraging the use of alternative transportation thereby reducing motor vehicle congestion and related air quality emissions and impacts. The implementation of an emission reduction program under SCAQMD Rule 2202 is also expected to result in reducing motor vehicle air quality emissions and impacts.</p>

Table 2-1
Environmental Impacts and Mitigation Measures

Potential Impacts	Mitigation Measures	Level of Significance After Mitigation
	<p>C Use high rating insulation in walls and ceilings.</p> <p>AQ4. Information on available housing and employment opportunities within the project area shall be provided to employees and residents of the project area, so as to encourage employees to live within the residential developments planned on-site and future residents to find employment nearby.</p> <p>AQ5. Future employment generating non-residential development shall include measures to reduce vehicle trips including: the promotion of carpool incentives and alternative work schedules, easy access to public transit systems, trail linkages between uses, low-emissions vehicle fleets, and the provision of on-site facilities such as banking and food courts, and bicycle parking facilities, and other transportation demand management measures, as deemed appropriate.</p>	
5.4 Noise		
<p>Base Plan and Overlay Plan</p> <p>No significant noise impact has been identified.</p>	<p>Base Plan and Overlay Plan</p> <p>No mitigation measure is proposed, as no significant noise impact has been identified.</p>	<p>Base Plan and Overlay Plan</p> <p>Not applicable.</p>

Table 2-1
Environmental Impacts and Mitigation Measures

Potential Impacts	Mitigation Measures	Level of Significance After Mitigation
5.5 Public Health and Safety		
<p>Base Plan and Overlay Plan</p> <p>HH 1. Construction activities involving demolition and possible substantial remodeling of existing structures in the project area as the project area develops could result in the disturbance of structures and soils containing ACMs or LBPs. This is considered a significant impact.</p> <p>The presence of ACMs and LBP in structures and soils of properties conveyed by the DON may pose a future hazard to the public if the materials degrade or are otherwise disturbed. This is considered a significant impact.</p> <p>HH 2. IRP Site 24 is located in zoning districts categorized as 6.1 Institutional and 1.5 Recreation. The site may be conveyed with temporary restrictions on use that are not appropriate for transportation facility use. This is considered a significant impact.</p> <p>Future uses of IRP Site 3 may be potentially constrained by the implementation of institutional controls. This is considered a significant impact.</p>	<p>Base Plan and Overlay Plan</p> <p>HH 1.</p> <ul style="list-style-type: none"> a. Prior to the conveyance of the property and issuance of subsequent grading permits, where the presence of ACMs is identified, the DON or its transferee shall ensure that all available information concerning ACMs has been provided to the City of Irvine, and the purchasers of the property, including: <ul style="list-style-type: none"> C The type, location and condition of ACMs C The results of any asbestos testing C Description of asbestos control measures taken, if any C The costs or time necessary to remove existing ACMs C The results of any site-specific asbestos inventory updates b. For any structures known to contain ACMs that will be renovated and/or demolished prior to transfer, the DON shall ensure that all asbestos is removed and disposed of in accordance with applicable federal, state and local regulatory requirements. c. Prior to transfer of any structure constructed before October 1988, scheduled for renovation and/or demolition, and in which the presence of ACMs is unknown, an asbestos survey shall be conducted by the DON. This requirement can be waived if an 	<p>Base Plan/Overlay Plan</p> <p>Less than significant.</p>

Table 2-1
Environmental Impacts and Mitigation Measures

Potential Impacts	Mitigation Measures	Level of Significance After Mitigation
<p>HH 3. IRP Site 16 (Crash Crew Pit No. 2) is located in zoning district designation 1.5 Recreation. The site may be conveyed with temporary restrictions on use that are not appropriate for recreational land uses. This issue is considered a significant impact.</p> <p>The Habitat Preserve, Wildlife Corridor, and Recreational areas in the northeastern portion of PA 51 will be exposed to the highest level of fire risk from wildfires because these areas and adjacent areas area currently defined as having high risk for wildland fires. The proposed project will result in an increase in both population and structures adjacent to this high fire risk area and the impact is considered significant. Additionally, existing structures may not meet City fire safety requirements.</p>	<p>architect or project engineer responsible for the construction of the structure or an accredited asbestos inspector signs a statement that no ACM was specified as a building material, and to the best of their knowledge, no ACMs were used as a building material.</p> <p>d. Any existing structures in which ACMs have been identified and which will remain in use shall be addressed in an Operation and Maintenance Plan and must be managed in accordance with applicable laws.</p> <p>e. Any renovation and/or LBP abatement activities on residential units at former MCAS El Toro shall be conducted in accordance with all applicable federal, state and local regulatory requirements.</p> <p>HH 2.</p> <p>a. Prior to transfer, the City of Irvine shall receive from the DON, with the concurrence of the appropriate regulatory agencies, a statement that the "Action Required" IRP Site 3 is to be conveyed for restricted use and that all institutional controls have been identified and implemented. The City of Irvine will adopt appropriate rules, policies, and regulations necessary to avoid actions that compromise the integrity of the remediated sites and that uphold the institutional controls. The actions of the City of Irvine shall be in accordance with the General Development Standards for the zone, which requires the Planning Commission to approve a master plan for the entire Planning Area indicating location, acreage, and types of land use within the Planning Area. As stated under Sec. 9-51-5 General Development Standards, boundaries</p>	

Table 2-1
Environmental Impacts and Mitigation Measures

Potential Impacts	Mitigation Measures	Level of Significance After Mitigation
	<p>and acreages are approximate and shall be established by master plan approval.</p> <p>b. Prior to transfer, if the DON chooses to impose temporary restrictions on the use of Sites 16 and 24 pending adequate remediation of groundwater, the City of Irvine shall receive from the DON a statement of temporary restrictions on the use of the sites and the release of the sites for unrestricted use following implementation of adequate remediation of groundwater. The City of Irvine shall adopt appropriate rules, policies, and regulations necessary to avoid actions that compromise the integrity of the remediated sites and that uphold the institutional controls. The actions of the City of Irvine shall be in accordance with the General Development Standards for the zone, which requires the Planning Commission to approve a master plan for the entire Planning Area indicating location, acreage, and types of land use within the Planning Area. As stated under Sec. 9-51-5 General Development Standards, boundaries and acreages are approximate and shall be established by master plan approval.</p> <p>HH 3. The Community Development Department, in coordination with the Orange County Fire Authority (OCFA), will be responsible for review of all development plans, which would include evaluation of very high fire severity zones, special fire protection plans, and any requirements for fuel modification zones. Projects potentially impacted by wildland fire hazards will be subject to OCFA Guidelines for "Development Within and Exclusion from Very High</p>	

Table 2-1
Environmental Impacts and Mitigation Measures

Potential Impacts	Mitigation Measures	Level of Significance After Mitigation
	<p>Fire Severity Zones” and “Fuel Modification Plans and Maintenance.” Additionally, all demolition, renovation, and construction activities in the project area will be subject to review by OCFA to ensure adequate fire protection, water flow, emergency access, design features, etc., according to the standards of the Uniform Fire Code and the California Fire Code. Due to the implementation of these standard fire protection procedures, the proposed project is not anticipated to result in significant short- or long-term adverse impacts related to fire hazards.</p> <p>HH 4. Prior to issuance of occupancy permits of any existing structure at the former MCAS El Toro, a fire life-safety evaluation of the structure including recommendations for improvements required for compliance with current Building Codes for use of existing structures adopted by the City of Irvine and plans for any required improvements shall be submitted to the Chief Building Official for review and approval.</p> <p>HH 5. Prior to the issuance of a grading permit, the applicant shall prepare and the Director of Community Development shall approve a protocol plan (including but not limited to worker training, health and safety precautions, additional testing requirements, and emergency notification procedures) in the event of unknown hazardous materials are discovered during grading, construction, and/or related development activities. The applicant and/or property owner that discovers contamination due to past military operations not previously identified by the DON shall be responsible for notifying the DON, appropriate</p>	

Table 2-1
Environmental Impacts and Mitigation Measures

Potential Impacts	Mitigation Measures	Level of Significance After Mitigation
	<p>regulatory agencies, and the Director of Community Development of the City of Irvine in a timely manner. Additionally, said protocol plan shall be revised should the discovery of previously unknown hazardous materials be made during any of the above mentioned development activities.</p> <p>HH 6. The City of Irvine shall develop and maintain the location and status, as well as other pertinent information, of all monitoring wells located on the former MCAS El Toro in a geographic information system (GIS). The City shall review all permit applications on the former air station for well locations that may be affected by a permit, and require applicants to maintain appropriate access. Access to wells shall be limited to authorized personnel.</p>	
5.6 Geology and Seismicity		
<p>Base Plan and Overlay Plan</p> <p>GS 1. Future development of the project area has the potential to result in the exposure of people or structures to strong seismic ground shaking in the event a major earthquake occurs along any one of the active faults in the region. This is considered a significant impact.</p> <p>GS 2. The level of seismic activity expected in the project area is similar to the County as a whole, and other areas of Southern California. As such, the risk of loss, injury or</p>	<p>Base Plan and Overlay Plan</p> <p>GS 1. Prior to issuance of a building permit, the City of Irvine shall require that all development be designed in accordance with the seismic design provisions outlined in future proposed development geotechnical reports and specified in the latest Building Codes adopted by the City of Irvine. Compliance with this measure shall be verified by the Community Development Department.</p> <p>GS 2. Prior to issuance of a building permit, as per existing City policies, geotechnical studies shall be prepared at the time specific development projects are proposed to</p>	<p>Base Plan and Overlay Plan</p> <p>Less than significant.</p>

Table 2-1
Environmental Impacts and Mitigation Measures

Potential Impacts	Mitigation Measures	Level of Significance After Mitigation
<p>death involving strong seismic ground shaking is similar to the risk associated with other regions within Southern California.</p> <p>GS 3. Some expansive soils may be present in localized areas within the project area. The presence of expansive soils could create risks to life or property through the post 2025 development levels. This impact is considered significant.</p> <p>GS 4. Many of the existing buildings on the former MCAS El Toro site may not have been constructed in a manner that is acceptable for its intended use. Temporary or permanent reuse of these facilities could expose people to a greater seismic risk than buildings that are constructed to applicable seismic codes. This is considered a significant impact.</p> <p>GS 5. Future development of the project area has the potential for impacts resulting from soil erosion or the loss of topsoil. This impact is considered significant through the post 2025 development levels.</p> <p>GS 6. Some expansive soils may be present in localized areas within the project area. The presence of expansive soils could create risks to life or property. This is considered a significant impact.</p>	<p>address site specific geotechnical considerations. The scope of each geotechnical study is based on the underlying geotechnical conditions of the individual site. These reports will provide measures to prevent settlement.</p> <p>1. Prior to design and construction of any future developments within the project area, a comprehensive geotechnical evaluation, including development-specific subsurface exploration and laboratory testing, shall be conducted. The purpose of the subsurface evaluation is to:</p> <ul style="list-style-type: none"> a. Further evaluate the subsurface conditions in the area of the proposed structures. b. Provide specific data on potential geologic and geotechnical hazards. c. Provide information pertaining to the engineering characteristics of earth materials in the project area. <p>From this data, recommendations for grading/earthwork, surface, and subsurface drainage, temporary and/or permanent dewatering, foundations, pavement structural sections, and other pertinent geotechnical design considerations may be formulated and shall be included in the grading and building plans for individual developments. General recommendations are as follows:</p> <p>C Seismic Ground Shaking - Measures to prevent risk of loss, injury or death involving</p>	

Table 2-1
Environmental Impacts and Mitigation Measures

Potential Impacts	Mitigation Measures	Level of Significance After Mitigation
	<p>seismic ground shaking include constructing new development to the latest adopted building codes. In addition, new development should not be located near active earthquake faults.</p> <p>C Erosion or Loss of Topsoil – Erosion and sediment control measures shall be implemented as required by the City's Grading and Water Quality ordinances.</p> <p>C Where Expansive Soils Exist – Measures for the design of foundations, slabs, flatwork and other improvements subject to drainage from expansive soils.</p> <p>Compliance with this measure shall be verified by the Community Development Department.</p> <p>GS 3. Prior to issuance of building permits for the occupancy of any existing structure at the former MCAS El Toro, or occupancy of any existing structure if a building permit is not issued, a seismic evaluation of the structure including recommendations for seismic improvements required for compliance with current Building Codes for use of existing structures adopted by the City of Irvine and plans for any required seismic improvements shall be submitted to the Chief Building Official for review and approval.</p> <p>GS 4. Prior to issuance of a grading permit, detailed geotechnical and hydrology reports shall be prepared prior to any development approval or grading</p>	

Table 2-1
Environmental Impacts and Mitigation Measures

Potential Impacts	Mitigation Measures	Level of Significance After Mitigation
	activities. These reports shall specifically address erosion control and surface runoff for both construction and long-term operations on the site. Recommendations contained in these reports to prevent soil erosion, siltation, and debris influx into the drainage system shall be implemented. Compliance with this measure shall be verified by the Community Development Department.	
5.7 Hydrology/Water Quality		
<p>Base Plan and Overlay Plan</p> <p>H/WQ 1. Grading and excavation activities required for future development could result in the exposure of bare soils which could result in both wind and water-related erosion, and a significant water quality impact if not properly treated. Through buildout of the proposed project, wind and water related erosion has the potential to violate water quality standards or waste discharge requirements. This is considered a significant impact. Implementation of Mitigation Measures HW1 and HW2 will reduce the impact associated with the potential to violate water quality standards and waste discharge requirements to a level less than significant.</p> <p>Additionally, a Storm Water Pollution Prevention Plan (SWPPP), Water Quality Management Plan (WQMP) will be</p>	<p>Base Plan and Overlay Plan</p> <p>H/WQ 1. Prior to issuance of a grading permit, the applicant shall provide evidence that the development of the project area shall comply with City of Irvine adopted Grading and Water Quality Ordinances to ensure that the potential for soil erosion is minimized on a project-by-project basis. Specifically, the NPDES discharge permitting requirements to which the City is obligated will ensure that construction activities reduce, to the maximum extent feasible, the water quality impacts of construction activities. The NPDES permit guidance states that "industrial/commercial construction operations that result in a disturbance of one acre or more of total land area . . . and residential construction sites that result in the disturbance of five acres or more . . . shall be required to develop and implement BMPs . . . to control erosion and siltation and contaminated runoff from the construction sites." Note: In March 2003 this provision will apply to residential construction sites that result in the disturbance of</p>	<p>Base Plan and Overlay Plan</p> <p>Less than significant.</p>

Table 2-1
Environmental Impacts and Mitigation Measures

Potential Impacts	Mitigation Measures	Level of Significance After Mitigation
<p>prepared. A Notice of Intent (NOIs) for coverage of projects under the General Construction Activity Storm Water Runoff Permit will be submitted to the State Water Resources Control Board prior to issuance of grading permits in the project area. This requirement will be met to the satisfaction of the City Engineer for: a) any disturbance of one acre or more of soil in the project area; b) General Dewatering NPDES Permit of the Santa Ana RWQCB; and c) provisions of the Countywide Permit.</p> <p>These measures will be implemented in accordance with local and State regulatory requirements. As future projects are planned, designed, and constructed in the project area, specific BMPs and other water quality control methods will be utilized to reduce water quality degradation in the Newport Bay watershed. Future projects in the proposed project area will acknowledge and implement those additional requirements that may be imposed by RWQCB in the future.</p> <p>H/WQ 2. Improvements to the flood control system shall be evenly scheduled during the various phases of development. However, a substantial increase in the rate or amount of surface runoff due to new development may occur, resulting in flooding on- or off-site depending on the future proposed</p>	<p>one acre or more.</p> <p>The City's standard conditions of approval indicate that a Storm Water Pollution Prevention Plan (SWPPP) shall be prepared prior to the approval of grading permits for any project site in order to reduce sedimentation and erosion. The SWPPP shall include the adoption of erosion and sediment control practices such as desilting basins and construction site chemical control management measures.</p> <p>Additionally, prior to the issuance of a grading permit, project applicants must submit, and the Director of Community Development or designee must have approved, a Water Quality Management Plan (WQMP). The WQMP must identify the Best Management Practices (BMPs) that will be used on the site to control predictable pollutant runoff after the site is occupied. Ongoing operations after construction would be subject to the Countywide Municipal NPDES Stormwater Permit, for which the City is a Co-Permittee. This WQMP shall identify, at a minimum, the routine, structural, and non-structural measures specified in the Countywide NPDES DAMP Appendix which details implementation of BMPs whenever they are applicable to a project, the assignment of long-term maintenance responsibilities (specifying the developer, parcel owner, maintenance association, leasee, etc.), and shall reference the location(s) of structural BMPs.</p> <p>Also in accordance with standard City project</p>	

Table 2-1
Environmental Impacts and Mitigation Measures

Potential Impacts	Mitigation Measures	Level of Significance After Mitigation
<p>development. The potential for flooding to occur on-or off-site as a result of future development of the project area is considered a significant impact. Implementation of Mitigation Measure HW3 will reduce this impact to a level less than significant.</p> <p>H/WQ 3. With recent improvements to upstream flood control facilities, the floodplain area has likely decreased and fewer areas of the project area are subject to inundation. The phasing of the flood control system improvements in PAs 51 and 30 will be coordinated with the street-phasing schedule so that the storm drains are installed prior to or in concert with road construction. Improvements to the flood control system shall be evenly scheduled during the various phases of development. However, a substantial increase in the rate or amount of surface runoff due to new development may occur, resulting in flooding on- or off-site depending on the future proposed development. This is considered a significant impact. Implementation of Mitigation Measure HW3 will reduce on- or off-site flooding due to surface runoff to a level less than significant.</p> <p>H/WQ 4. As per the requirements of the Regional Water Quality Control Board, proposed</p>	<p>permitting and approval procedures, Notices of Intent (NOIs) for coverage of projects under the General Construction Activity Storm Water Runoff Permit will be submitted to the State Water Resources Control Board prior to issuance of grading permits in the project area. This requirement will be met to the satisfaction of the Director of Community Development for any disturbance of one acre or more of soil in the project area. Also in force during the period of construction would be the General Dewatering NPDES Permit of the Santa Ana RWQCB, as well as the provisions of the Countywide Permit.</p> <p>The Mitigation Measures will be implemented in accordance with local and State regulatory requirements. As future projects are planned and designed in the project area, specific BMPs and other water quality control methods will be utilized to reduce water quality degradation in the Newport Bay watershed. Future projects in the proposed project area will acknowledge and implement those additional requirements that may be imposed by RWQCB in the future. Compliance with these measures shall be verified by the Community Development Department.</p> <p>H/WQ 2. Prior to issuance of a grading permit, evidence (e.g., in the form of a construction management plan) shall be provided that demonstrates that all stormwater runoff and dewatering discharges from the project area shall be managed to the maximum extent practicable or treated as appropriate to comply with</p>	

Table 2-1
Environmental Impacts and Mitigation Measures

Potential Impacts	Mitigation Measures	Level of Significance After Mitigation
<p>projects occurring upstream of or discharging into impaired waterbodies listed on the Clean Water Act Section 303(D) list may be subject to additional controls (specifically Total Maximum Daily Loads or TMDLs) pursuant to that regulation. Depending on the specific type of project proposed, these controls could include discharge prohibitions, revisions to discharge permits or management plans to address water quality impacts. This is especially important in the Newport Bay watershed. At this program level of planning, the potential to degrade surface water quality is considered a significant impact. Implementation of Mitigation Measure HW1 will reduce the impact of future development on surface water quality to a level less than significant.</p> <p>Additionally, a Storm Water Pollution Prevention Plan (SWPPP), Water Quality Management Plan (WQMP), Notice of Intent (NOIs) for coverage of projects under the General Construction Activity Storm Water Runoff Permit will be submitted to the State Water Resources Control Board prior to issuance of grading permits in the project area. This requirement will be met to the satisfaction of the City Engineer for: a) any disturbance of one acre or more of soil in the project area; b) General Dewatering NPDES Permit</p>	<p>water quality requirements identified in the Santa Ana Regional Water Quality Control Board Basin Plan, including Total Maximum Daily Load (TDML) Implementation Plan adopted for this watershed.</p> <p>H/WQ 3. Prior to approval of the first tentative tract or parcel map in the project area, detailed hydrology and hydraulic analysis shall be conducted. Studies and analysis shall be prepared in accordance with OCFCD methodologies and standards and the Flood Control Master Plan for San Diego Creek, as well as any additional guidelines in effect at the time of project design. Recommendations contained in the hydrology studies and/or hydraulic analysis to address drainage/flooding issues related to proposed development shall be implemented. Compliance with this measure shall be verified by the Community Development Department.</p> <p>H/WQ 4. Prior to issuance of a building permit, developers with property located in the newly delineated 100-year floodplain shall be required to construct such improvements as necessary to remove the property from the 100-year floodplain. Additionally, the developer shall prepare a Letter of Map Revision (LOMR) request to have the FIRMs revised to remove the development areas from the 100-year floodplain upon completion of the approved flood control facilities. The LOMR request shall be filed upon completion of design of the flood control improvements to contain or redirect the 100-year flood flows away from the property.</p>	

Table 2-1
Environmental Impacts and Mitigation Measures

Potential Impacts	Mitigation Measures	Level of Significance After Mitigation
<p>of the Santa Ana RWQCB; and c) provisions of the Countywide Permit.</p> <p>The Mitigation Measures will be implemented in accordance with local and State regulatory requirements. As future projects are planned and designed in the project area, specific BMPs and other water quality control methods will be utilized to reduce water quality degradation in the Newport Bay watershed. Grading or building permit applicants will be required to submit and obtain approval of a Water Quality Management Plan (WQMP) from the City of Irvine prior to issuance of the permits. The WQMP will specifically identify BMPs that will be used on-site to control predictable pollutant runoff. This WQMP shall identify, at a minimum, the routine, structural, and non-structural measures specified in the Countywide NPDES DAMP Appendix which details implementation of BMPs whenever they are applicable to a project, the assignment of long-term maintenance responsibilities (specifying the developer, parcel owner, maintenance association, leasee, etc.), and shall reference the location(s) of structural BMPs.</p> <p>Future projects in the proposed project area will acknowledge and implement those additional requirements that may be</p>	<p>After the improvements are constructed, Record Drawings and a maintenance agreement with, or letter from, a public agency shall be submitted to FEMA to complete the LOMR process.</p>	

Table 2-1
Environmental Impacts and Mitigation Measures

Potential Impacts	Mitigation Measures	Level of Significance After Mitigation
<p>imposed by RWQCB in the future. Compliance with these measures shall be verified by the Community Development Department.</p> <p>H/WQ 5. Project development is proposed in areas of PAs 51 and 30. Existing and proposed development within these areas could be subject to potential flooding associated with a 100-year frequency storm. Mitigation Measure HW4 will reduce the impact of exposure of future residential development in the project area to a level less than significant.</p>		
5.8 Agricultural Resources		
<p>Base Plan and Overlay Plan</p> <p>Ag 1. The project Base Plan will convert 574 acres of Prime Farmland, 63 acres of Unique Farmland, and 46 acres of Farmland of Statewide Importance to non-agricultural use. The Overlay Plan will convert 651 acres of Prime Farmland, 63 acres of Unique Farmland and 88 acres of Farmland of Statewide Importance to non-agricultural uses.</p> <p>Ag 2. The project will involve changes in the existing environment, which, due to their location or nature, could result in conversion of existing farmland to non-agricultural use.</p>	<p>Base Plan and Overlay Plan</p> <p>Ag 1. In order to encourage agriculture as an interim land use pending development on the project site by warning future residents that they are buying or renting a house adjacent to existing agricultural operations, City Of Irvine Standard Discretionary Case Condition B.4 and City Of Irvine Standard Subdivision Condition 3.4 regarding disclosure statements shall be amended to include the following for subdivisions proposed adjacent to existing agricultural operations:</p> <p>Prior to issuance of building permits, the applicant shall submit, and the Director of Community Development shall have approved, a completed occupancy disclosure form for the project. The</p>	<p>Base Plan and Overlay Plan</p> <p>Significant and unavoidable.</p>

Table 2-1
Environmental Impacts and Mitigation Measures

Potential Impacts	Mitigation Measures	Level of Significance After Mitigation
	<p>approved disclosure form, along with its attachments, shall be included as part of the rental/lease agreement and as part of the sales literature for the project. The disclosure statement shall include the following information:</p> <p>Continuation of agricultural operations adjacent to the site and their potential effects (spraying of pesticides, noise, dust, odor, etc.) on future residents or tenants.</p> <p>Ag 2. Heritage and community service/educational farming operations shall be encouraged within utility easements and other lands. Heritage farming is defined as small-scale specialty farming operations that can be accommodated in an urban environment. An example would be the Edible Landscape project located adjacent to Harvard Avenue within the Edison right-of-way.</p> <p>Ag 3. Future landowners and the City shall work cooperatively with farmers to minimize conflicts between agricultural operation and adjacent urban uses.</p>	
5.9 Biological Resources		
<p>Base Plan and Overlay Plan</p> <p>Bio 1. The southern tarplant, a federal species of concern, may be affected by development of the site. This is considered a significant impact.</p>	<p>Base Plan and Overlay Plan</p> <p>Bio 1. Prior to approval of a subdivision map for each project area, a focused survey for the southern tarplant, mountain plover, and burrowing owl shall be conducted. Prior to approval of a subdivision map for</p>	<p>Base Plan and Overlay Plan</p> <p>Less than significant.</p>

Table 2-1
Environmental Impacts and Mitigation Measures

Potential Impacts	Mitigation Measures	Level of Significance After Mitigation
<p>Bio 2. There is a limited amount of highly disturbed wetland habitat on the project site. The project may result in an impact to this habitat.</p> <p>Bio 3. PAs 51 and 30 contain a large number of trees, many of them mature, representing a wide range of species. Implementation of the proposed project may result in damage and destruction to the trees. A significant impact related to conflicts with the City of Irvine's Urban Forestry Ordinance may occur.</p>	<p>development within, or in proximity to Serrano Creek, a focused survey shall be conducted for the least Bell's vireo and southwestern willow flycatcher. Should the focused survey identify a significant population of southern tarplant or mountain plover, or the presence of burrowing owl, least Bell's vireo, or southwestern willow flycatcher in an area proposed for development, impacts shall be avoided through incorporation of the species into an open space easement, or if impacts cannot be avoided, then mitigation shall be negotiated through consultation with the United States Fish and Wildlife Service (USFWS) and the California Department of Fish and Game (CDFG).</p> <p>Bio 2. Prior to approval of a subdivision map for each project area, a wetland delineation shall be performed for all areas within the master plan subarea that contain the potential for wetland habitat and/or jurisdictional waters. The loss of impacted wetlands shall be mitigated through the implementation of a wetland mitigation plan prepared and accepted by the appropriate agency (i.e., U.S. Army Corps of Engineers, U.S. Fish and Wildlife Service, California Department of Fish and Game). Wetlands impacted on-site shall be mitigated through on-site or off-site replacement, re-creation (i.e. within the proposed wildlife corridor), and/or revegetation as deemed acceptable by the appropriate jurisdictional agencies.</p> <p>Bio 3. The City shall continue to work with State and federal agencies during the implementation of the proposed project to implement the revegetation/restoration plan for the wildlife corridor. Measures such as sight and</p>	

Table 2-1
Environmental Impacts and Mitigation Measures

Potential Impacts	Mitigation Measures	Level of Significance After Mitigation
	<p>sound barriers, including artificial sound walls and natural diversions (e.g. hedges and tree lines) shall be incorporated into corridor design to ensure the viability of the corridor. The City shall implement the corridor consistent with the design criteria and viability analysis established in the EIR.</p> <p>Bio 4. Prior to issuance of a grading permit for each project area, a complete inventory of all trees of trunk diameter at breast height (DBH) greater than six inches and any significant (as determined by a certified arborist selected by the City) plants on the project site, excluding those within the habitat preserve shall be prepared. This inventory shall be prepared by an arborist certified by the International Society of Arboriculture and shall include (but not be limited to) data for each tree such as species, variety, DBH, condition (excellent, good, fair, poor, dead), and any recommendations. All trees in this inventory shall be considered "Significant Trees" under the City of Irvine's Urban Forestry Ordinance (UFO) (Section 5-7-401 et al) and the UFO shall apply to all trees included in this inventory.</p>	
5.10 Paleontological Resources		
<p>Base Plan and Overlay Plan</p> <p>P1. Earthmoving operations such as grading and trenching has the potential to impact buried paleontological resources in the moderately to highly sensitive areas in the coastal plain and washes, northeast, northwest and southern</p>	<p>Base Plan and Overlay Plan</p> <p>P1. Prior to issuance of a grading permit for any portion of the project area, a qualified paleontologist shall be retained by the City or designee to carry out an appropriate paleontology investigation of the area proposed for grading. (A qualified paleontologist is</p>	<p>Base Plan and Overlay Plan</p> <p>Less than significant.</p>

Table 2-1
Environmental Impacts and Mitigation Measures

Potential Impacts	Mitigation Measures	Level of Significance After Mitigation
<p>portions of PA 51. This is considered a significant impact.</p> <p>Additionally, pleistocene terrestrial vertebrates have been discovered four miles from PA 30. Similar beds of Pleistocene terrestrial vertebrates may underlie PA 30. This impact is considered significant.</p>	<p>defined as an individual with an M.S. or Ph.D. in paleontology or geology who is familiar with paleontological procedures and techniques.) The City of Irvine has standard conditions applied prior to the issuance of grading permits when a project site includes potentially significant paleontological sites, and paleontological monitoring conditions have not been attached to the previous map approval. These standard conditions include retaining a qualified paleontologist, establishing procedures for cultural and scientific resource surveillance, and protection of any resources discovered during the grading process.</p> <p>When fossils are discovered, the paleontologist (or paleontological monitor) shall recover them. In most cases, this fossil salvage can be completed in a short period of time. However, some fossils specimens (such as a complete large mammal skeleton) may require an extended salvage period. In these instances the paleontologist (or paleontological monitor) shall be allowed to temporarily direct, divert or halt grading to allow recovery of fossil remains in a timely manner. Because of the potential for the recovery of small fossil remains, such as isolated mammal teeth, it may be necessary in certain instances to set up a screen-washing operation on-site.</p> <p>Fossil remains collected during the monitoring and salvage portion of the mitigation program shall be cleaned, repaired, sorted, and cataloged. Compliance with this measure shall be verified by the Community Development Department.</p>	

Table 2-1
Environmental Impacts and Mitigation Measures

Potential Impacts	Mitigation Measures	Level of Significance After Mitigation
5.11 Cultural Resources		
<p>Base Plan and Overlay Plan</p> <p>Cult1. Grading activities associated with future development of the project area may cause a substantial adverse change in the significance of an archaeological resource. Mitigation Measures Cult B1 through Cult B3 will reduce this impact to a level less than significant.</p> <p>Cult2. Grading activities could uncover previously unknown human remains, including those interred outside of formal cemeteries. Mitigation Measure Cult B4 will reduce this impact to a level less than significant.</p>	<p>Base Plan and Overlay Plan</p> <p>The following measures have been developed to provide assurances that significant cultural resource impacts or potentially significant cultural resource impacts associated with the proposed project will be mitigated to a level less than significant. This assurance is obtained by verification, which would occur at subsequent levels of environmental review. Finally, in some instances, it is not possible at this program level of analysis to determine if cultural resource impacts would occur from the implementation of specific actions. For these situations, mitigation measures provide for further review at the time of specific development proposals in the project area. Increased planning detail developed at the development proposal level will clarify the specific impacts and options available for mitigation. As such, these measures are not intended to restrict the development of appropriate mitigation measures, as determined through analysis at a subsequent level of review.</p> <p>Cult1. Prior to subdivision for development, a detailed archaeological report(s) shall be prepared within PAs 51 and 30. This report(s) shall specifically address the potential for encountering archaeological resources at the time specific development is proposed. The report(s) shall provide recommendations to prevent degradation of archaeological resources such as site avoidance and data recovery. Recommendations contained in the report shall be implemented. Compliance with this measure shall be verified by the Community Development Department.</p>	<p>Base Plan and Overlay Plan</p> <p>Less than significant.</p>

Table 2-1
Environmental Impacts and Mitigation Measures

Potential Impacts	Mitigation Measures	Level of Significance After Mitigation
	<p>Cult2. Monitoring of excavation and grading activities associated with future development in PAs 51 and 30 shall be conducted by a certified archaeologist in accordance with the report required in Mitigation Measure Cult1. If resources are encountered in the course of ground disturbance, the archaeological monitor shall be empowered to halt grading and to initiate an archaeological testing program. The testing shall include recordation of artifacts, controlled removal of the materials, and an assessment of their importance under CEQA and the City's local guidelines. Compliance with this measure shall be verified by the Community Development Department.</p> <p>Cult3. Prior to the issuance of grading permits and/or building permits for any future development in PAs 51 and 30, a detailed mitigation program shall be submitted by the applicant to the City of Irvine to address archaeological resources discovered during grading. Provisions of the program shall include an immediate evaluation of the find by a qualified archaeologist. If the find is determined to be a unique archaeological resource, contingency funding and a time allotment sufficient to allow for implementation of avoidance measures or appropriate mitigation shall be available. Work may continue on other parts of the construction site while archaeological resource mitigation takes place. The City of Irvine has standard conditions applied prior to the issuance of grading permits when a project site includes potentially significant archaeological sites. These include retaining a qualified archaeologist, establishing procedures for cultural and scientific</p>	

Table 2-1
Environmental Impacts and Mitigation Measures

Potential Impacts	Mitigation Measures	Level of Significance After Mitigation
	<p>resource surveillance, and protection of any resources discovered during the grading process. Compliance with this measure shall be verified by the Community Development Department.</p> <p>Cult4. Prior to the issuance of any grading and/or building permits, a mitigation program shall be submitted by the developer to the City of Irvine to address the accidental discovery or recognition of any human remains. The program shall include the following:</p> <p>There shall be no further excavation or disturbance of the site or any nearby area reasonably suspected to overlie adjacent human remains until:</p> <p>C <i>The county coroner must be contacted to determine that no investigation of the cause of death is required, and</i></p> <p>If the coroner determines the remains to be Native American:</p> <p>C <i>The coroner shall contact the Native American Heritage Commission within 24 hours.</i></p> <p>C <i>The Native American Heritage Commission shall identify the person or persons it believes to be the most likely descended from the deceased Native American.</i></p> <p>C <i>The most likely descendent may make recommendations to the landowner or the person responsible for the excavation work, for means of treating or disposing of, with appropriated dignity, the human remains and any associated grave goods</i></p>	

Table 2-1
Environmental Impacts and Mitigation Measures

Potential Impacts	Mitigation Measures	Level of Significance After Mitigation
	<p><i>as provided in Public Resources Code Section 5097.98, or</i></p> <p>C <i>Where the following conditions occur, the landowner or his authorized representative shall rebury the Native American human remains and associated grave goods with appropriate dignity on the property in a location not subject to further subsurface disturbance.</i></p> <p>C <i>The Native American Heritage Commission is unable to identify a most likely descendent or the most likely descendent failed to make a recommendation within 24 hours after being notified by the commission.</i></p> <p>C <i>The descendant identified fails to make a recommendation; or</i></p> <p>C <i>The landowner or his authorized representative rejects the recommendation of the descendant, and the mediation by the Native American Heritage Commission fails to provide measures acceptable to the landowner.</i></p> <p>Compliance with this measure shall be verified by the Community Development Department.</p>

Potential Impacts	Mitigation Measures	Level of Significance After Mitigation
project will generate solid waste as result of demolition, operation of proposed land uses, and landscape maintenance.	<p>deconstruction of the aged structures and property, including but not limited to buildings and runways, at El Toro MCAS is contaminated with lead based paints, asbestos, or other materials that may render it unsuitable for recycling or reuse. At the sole cost and expense of the project applicant, in order to evaluate this condition and determine the feasibility of recycling of solid waste material from the El Toro MCAS site by ordinary means, a technical evaluation by a qualified environmental consultant must be conducted. The technical evaluation shall include sufficient sample testing of all types of solid waste materials to be generated by the project to analyze its composition. A copy of the full technical evaluation and its findings must be submitted to the City of Irvine Community Development Department. The City of Irvine must confirm the adequacy of the technical evaluation prior to authorizing the demolition, dismantling, or deconstruction project to proceed.</p> <p>If it is determined by the technical evaluation that the material is contaminated and prohibited from being recycled by ordinary means, a further evaluation must be conducted to identify and evaluate other feasible methods approved by state law to divert the material from landfills. This may include the delivery of the waste material to other appropriate non-disposal or transformation facilities, such as "waste-to-energy" (WTE) plants.</p> <p>SW2. For that solid waste which is determined to be inappropriate for recycling (as that term is defined by California Public Resources Code Section 40180), the</p>	result in a significant impact related to solid waste.

Table 2-1
Environmental Impacts and Mitigation Measures

Potential Impacts	Mitigation Measures	Level of Significance After Mitigation
	<p>project applicant must submit a written plan to the City and implement such plan to ensure that 75% of the material, or the maximum amount feasible as determined by the technical evaluation, is diverted from the landfill through other methods that comply with state statutes and regulations.</p> <p>SW3. For that solid waste which the technical study deems to be suitable for recycling, the project applicant must submit a written plan to the City and implement such plan to ensure that solid waste material generated by the demolition, dismantling, or deconstruction project, land use operations and maintenance is collected by a City authorized solid waste hauler or recycling agent, and that a minimum of 75% of the solid waste from the project is diverted from landfills by recycling, as that term is defined by California Public Resources Code Section 40180. ("Recycling" does not include transformation, as defined in Public Resources Code Section 40201.)</p> <p>SW4. To ensure ongoing compliance with these mitigation measures, the project applicant will be required to submit solid waste tonnage reports to the City of Irvine on City approved forms, accompanied by "weight ticket" receipts from state-certified disposal, nondisposal, or transformation facilities, on a quarterly basis to demonstrate that solid waste diversion has occurred in accordance with these required mitigation measures and in a manner that is consistent with, and not detrimental to, the efforts of the City of Irvine to comply with AB939.</p>	

**Table 2-1
Environmental Impacts and Mitigation Measures**

Potential Impacts	Mitigation Measures	Level of Significance After Mitigation
<p><u>Energy and Communications</u></p> <p>Base Plan and Overlay Plan</p> <p>The specific significant environmental impact of constructing new energy and communication facilities that will be needed to serve the proposed project cannot be determined at this General Plan level of analysis as specific site plans and locations have not been prepared. However, the general significant impacts associated with the construction and operation of public facilities has been addressed within this EIR, which would include the construction and operation of new energy and communication facilities.</p>	<p>To assure compliance with applicable statutes related to the disposal of solid waste, it is necessary for the City to require appropriate and effective mitigation measures to limit the disposal and ensure significant recycling of solid waste on-site.</p> <p>SW5. For green waste, the project applicant must submit a written plan to the City and implement such plan to ensure that the green waste material generated by landscape maintenance operations is collected by a City authorized waste hauler or recycling agent, that the maximum feasible amount of that collected green waste is recycled, and that a minimum of 50% of the green waste from the project is diverted from landfills by recycling, as that term is defined by California Public Resources Code Section 40180.</p> <p><u>Energy and Communications</u></p> <p>Base Plan and Overlay Plan</p> <p>Mitigation Measures identified in other sections of this EIR address the environmental impacts associated with the construction and operation of public utilities. These measures are applicable to the construction and operation of new energy and communication transmission facilities identified in this section to serve new growth expected in the project area.</p>	<p><u>Energy and Communications</u></p> <p>Base Plan and Overlay Plan</p> <p>Less than significant.</p>

Table 2-1
Environmental Impacts and Mitigation Measures

Potential Impacts	Mitigation Measures	Level of Significance After Mitigation
No significant impact is anticipated related to substantial use of fuel and/or energy sources by the project was identified.		

3.0 Project Description

Project Characteristics

The project consists of the following actions: 1) Annexation, General Plan Amendment, Pre-Zoning (prior to annexation), and Zoning of the unincorporated portion of Planning Area 51; 2) Annexation of the unincorporated portion of Planning Area 35 (James A. Musick Branch Jail and the Irvine Ranch Water District Parcel); and 3) General Plan Amendment and Zone Change for Planning Area 30 which is presently in the City of Irvine; and 4) Approval of the form of a Development Agreement vesting approval of higher intensity overlay uses in consideration for dedication of land for public purposes and for developing and funding certain infrastructure improvements and maintenance of the public uses by the purchaser/developer and subsequent landowners and funds for specified park, roadways, and other circulation facilities and infrastructure. The proposed actions, by City of Irvine Planning Area are illustrated in Figure 3-1 and detailed in Table 3-1 entitled Proposed Action by Area.

Figure 3-2 depicts the proposed General Plan designations for the site. Figure 3-3 depicts the allowed uses within the Orange County Great Park (OCGP) designation by Planning Area Zone (PAZ). The base and overlay provisions of the OCGP designation are illustrated for each PAZ for all land being annexed and the portion of the project area currently in the City. The proposed General Plan land use designations and related zoning districts are summarized by PAZ in Table 3-2. Land uses planned in the project area are open space/park, residential, cultural facilities, transit oriented development, golf courses, habitat preserve/wildlife corridor, sports parks, agriculture, auto center use, educational, research and development, institutional, exposition centers, and transportation facilities.

The proposed zoning districts for the Base and Overlay Plans are illustrated in Figure 3-4. Certain zoning districts illustrated are not currently in the City's Zoning Ordinance at present and the creation of these districts constitutes an amendment to the City's Zoning Ordinance.

For purposes of the environmental analysis contained in this document, Tables 3-3 and 3-4 indicate the type and intensity of development permitted under the Base Plan and the Overlay Plan. The base line against which the impacts are analyzed is the existing conditions within the project area, including the present California State University-Fullerton satellite operation, golf course, and equestrian facilities.

Development standards for each PAZ are identified in terms of maximum acreage, maximum number of units, maximum square footage, and other development maximums. The proposed project represents a reduction of intensity of use compared to those uses that are presently designated in the City of Irvine General Plan. The proposed project includes street system modifications and other infrastructure improvements outside the area of the lands being annexed. These improvements are currently conceptual but are considered part of the project and are addressed in the Final Program EIR as related improvements.

In addition, interim activities may be conducted by the City or designee on properties to be conveyed to the City after the purchase of the property by private parties and prior to build-out of the Plan. Interim activities may include agricultural and nursery operation, and open storage. Extensive materials reclamation activities related to the removal of the runways and the recycling and distribution of concrete, asphalt, and other materials resulting from runway removal and recycling and/or removal of other facilities and buildings will also occur.

Other interim activities involving short-term use of the land or on-site buildings may also occur periodically. By the year 2007 a portion of the overall development will occur. The expected reuse of facilities and land and the new development projected is shown in Table 3-5. Some of the activities shown in the table currently exist on the site. Interim activities must be consistent with the interim uses allowed in the City's Zoning Ordinance.

Ownership and management of the land and buildings will ultimately transfer to the party or agency to whom title transfers as a result of the sale of the land. Demolition of buildings will occur if they interfere with the orderly development of the property or become obsolete or uneconomic to repair for reuse.

Certain lands within the former MCAS El Toro property are being retained in federal ownership. At present, these lands lie primarily north of Irvine Boulevard and are indicated as "Lands being retained in federal ownership" on Figure 3-1 Proposed Actions. Subsequent decisions by the Department of Navy may result in additional areas that will remain in federal ownership. Although these lands are within the project area and are considered a part of the project, land use control will remain with the federal government as the pre-empting agency. Any action proposed by a federal agency would require review under NEPA, as applicable.

Annexation Background and Rationale

Annexation is the procedure used by a city to extend its corporate boundaries. The Local Agency Formation Commission Orange County (LAFCO) is empowered to evaluate, consider, and approve proposals for city, county, and special district incorporations, formations and boundary changes. LAFCO acts within a set of state-mandated parameters that encourage planned, well-ordered, efficient urban development patterns, encourage the preservation of agricultural and open space lands, and discourage urban sprawl. A project area must be within a city's Sphere of Influence before annexation can be considered by LAFCO. As defined by State law (Government Code Section 56076), a Sphere of Influence is "a plan for the probable physical boundaries and service area of a local government agency." Once LAFCO approves an annexation, only protest from the affected landowners(s) or registered voters can terminate proceedings.

Spheres of Influence are adopted for each city by LAFCO. The Orange County LAFCO policy on Spheres of Influence states that spheres are a planning tool to guide LAFCO decisions and that the sphere boundaries are meant to facilitate the logical and economical extensions of government facilities and services: "Territory placed within a city's sphere indicates that the city is the most logical provider of urban services for development." (Sphere Policy Guideline #5).

DU = Dwelling Units

Source: Urban Crossroads

The City of Irvine's application for annexation to LAFCO states the City has determined that to ensure the most efficient and economical provision of public services, the City should be designated as the area's legal service provider through annexation. Annexation will provide the City with means to effectively plan for necessary public services. It will ensure coordination between public service agencies and encourage consistency in the development of service delivery and development standards. Annexation will also enable planning for infrastructure financing to ensure that services and facilities will be available at the time of need.

The City of Irvine is considered the logical local government service provider for the subject property because the unincorporated area is within the City's Sphere of Influence and a

portion of the former MCAS El Toro is already in the City. The proposed annexation area's northern perimeter is bounded by the dedicated Natural Communities Conservation Plan (NCCP) habitat preserve, which clearly defines the limits of potential urban growth. Reuse of the former MCAS El Toro will directly impact the City of Irvine by placing demands on existing City infrastructure and requiring extension of new facilities and services. Employees, residents, visitors, etc. will use City streets for access, be assisted by City law enforcement and shop and play in surrounding City areas.

The Orange County Sphere Guidelines include a specific policy on unincorporated county islands. Sphere Policy Guideline #4 states: "City spheres that include unincorporated islands of territory should be encouraged to annex the islands to the city. The Commission acknowledges that unincorporated islands are generally costly for county government to serve and often have service impacts on the surrounding city." Government Code Section 56375(a)(3) also discourages the creation of unincorporated County islands. As stated under Section 56375(a)(3), "As a condition to the annexation of an area that is surrounded, or substantially surrounded, by the city to which the annexation is proposed, the commission may require, where consistent with the purposes of this division, that the annexation include the entire island of surrounded, or substantially surrounded, territory." For this reason the annexation proposal includes the Musick Jail Facility and the IRWD parcel.

General Plan Element Amendments

The impacts of the amendment to the General Plan are those associated with the maximum intensity of development permitted by the Overlay provisions contained within the OCGP designation. A description of proposed amendments to the City of Irvine General Plan is provided below by General Plan element. In all the elements all existing references to Millennium Plan would be removed. Factual and technical information would be modified to reflect the General Plan Amendment.

Existing General Plan Policy is:

A. Land Use - Promote land use patterns which maintain safe residential neighborhoods, bolster economic prosperity, preserve open space, and enhance the overall quality of life in Irvine.

The objectives and implementing policies contained in the Land Use Element of the General Plan are unchanged by this amendment and will be implemented as part of future development of the Orange County Great Park.

The General Plan Amendment will make the following changes in the Land Use Element:

- The General Plan Land Use map (General Plan Figure A-3) will be amended to reflect the land uses contemplated in the Orange County Great Park plan using a designation of "OCGP." This designation is not presently contained within the General Plan.
- Figure A-4, Scenic Highways, will be amended to remove Millennium Parkway.
- Maximum land use intensity and density standards by Planning Area will be revised in Tables A-1 and A-2 as indicated in Tables 3-3 and 3-4 of this Final Program EIR.

B. Circulation - The majority of the objectives and implementing policies contained in the Circulation Element of the General Plan are unchanged by this amendment and will be implemented as part of future development of the Orange County Great Park. The project includes modification of Policy B-1(c) regarding Level of Service, as well as, roadway characteristics for roadways within the project area. These characteristics are enumerated in Table 3-6. Roadway classification and operation characteristics have been determined based on the volume of traffic and traffic characteristics (e.g., local versus through traffic).

The project will make the following changes in the Circulation Element:

- The General Plan Amendment will modify Policy B-1 (c) to add the following sentence:

In conjunction with individual subdivision map level traffic studies for development proposed in Planning Areas 30 and 51, a LOS "E" would be considered acceptable for application to intersections impacted in Planning Areas 13, 30, 31, 32, 34, 35, and 39.

- Figure B-1 "Master Plan of Arterial Highways" and Figure B-2 "Operational Characteristics" will be amended as illustrated in Figure 3-5 and Figure 3-6 to reflect the alignment of roadways within the Orange County Great Park as follows:

Major Highways:

- (a) Marine Way is aligned to join the Bake Parkway north bound exit ramp from I-5 and terminate at Sand Canyon at I-5.
- (b) Trabuco Road terminates at proposed Meadows Loop Road.

Primary Highway:

- (a) Realign Rockfield Boulevard to terminate at Marine Way.

Secondary Highways:

- (a) On-site circulation includes a new commuter highway/collector (Y Street) to serve the development between Irvine Boulevard and Portola Parkway.
- (b) Research Parkway is renamed College Road and modified to extend from Irvine Boulevard to Marine Way.

Figure 3-6
Proposed Irvine General Plan
Operational Characteristics Amendments

- Figure B-3 “Public Transit” will be amended to reflect the alignment of roadways within the Orange County Great Park. The potential for Inter-City and Local Feeder Transit Corridors on Trabuco Road and Marine Way will continue to be shown.
- Figure B-4 “Trails Network” will be amended to reflect the realigned roadways within the Orange County Great Park. Additional on-site Class I trails will link the recreational, educational, and cultural uses within the Orange County Great Park. In addition, the roadway network amendments to Figure B-1 Master Plan of Arterial Highways will result in an expansion of the Class II (On-Street) Bike Trail system through Planning Areas 30 and 51. Figure 3-7 illustrates the proposed Irvine General Plan Trails Network Alignments.

The Riding and Hiking Trail will be realigned parallel Irvine Boulevard until it reaches the Open Space/Habitat Preserve. At this point, the Riding and Hiking Trail will then extend north toward SR 241 and the Agua Chinon Reservoir. The Riding and Hiking Trail along Portola Parkway east of Jeffrey Road will be eliminated.

C. Housing - The objectives and implementing policies contained in the Housing Element of the General Plan are unchanged by this amendment and will be implemented as part of future development of the Orange County Great Park. Up to 3,625 new units may be added to the housing stock in the City with this amendment which will create and improved jobs-housing balance when compared to the existing General Plan.

D. Seismic Element - The objectives and implementing policies contained in the Seismic Element of the General Plan are unchanged by this amendment and will be implemented as part of future development of the Orange County Great Park.

E. Cultural Resources - The objectives and implementing policies contained in the Cultural Resources Element of the General Plan are unchanged by this amendment and will be implemented as part of future development of the Orange County Great Park. Whether the amount of land available for development of cultural facilities will be increased by this amendment is not known at this time—substantial land area is designated for cultural facilities in the present General Plan and substantial land area is designated in the Orange County Great Park Plan.

F. Noise - The objectives and implementing policies contained in the Noise Element of the General Plan are unchanged by this amendment.

G. Public Facilities and Services - The objectives and implementing policies contained in the Public Facilities and Services Element of the General Plan are unchanged by this amendment and will be implemented as part of future development of the Orange County Great Park. Public facilities and service responsibilities will expand due to the land use changes associated with this amendment.

H. Integrated Waste Management - The objectives and implementing policies contained in the Integrated Waste Management Land Use Element of the General Plan are unchanged by this amendment and will be implemented as part of future development of the Orange County Great Park.

- Orange County Great Park Boundary
- Blue line Class I (off-street) Trails - Add
- Black line Class II (on-street) Trails - Add (all new OCGP streets)
- Green line Riding and Hiking Trails - Add

- Orange line Class I (off-street) Trails - Delete
- Red line Riding and Hiking Trails - Delete
- Red 'T' in a circle Irvine Transportation Center

Figure 3-7
Proposed Irvine General Plan
Trails Network Amendments

I. Energy - The objectives and implementing policies contained in the Energy Element of the General Plan are unchanged by this amendment and will be implemented as part of future development of the Orange County Great Park.

J. Safety - The objectives and implementing policies contained in the Safety Element of the General Plan are unchanged by this amendment and will be implemented as part of future development of the Orange County Great Park.

K. Parks and Recreation - The objectives and implementing policies contained in the Parks and Recreation Element of the General Plan are unchanged by this amendment and will be implemented as part of future development of the Orange County Great Park.

The General Plan Amendment will make the following changes in the Parks and Recreation Element:

- Figure K-1 “Recreational Facilities” will be amended to add public golf courses, regional parks, and public and private exposition centers shown within the Orange County Great Park (Figure 3-8).

L. Conservation and Open Space - The objectives and implementing policies contained in the Conservation and Open Space Element of the General Plan are unchanged by this amendment and will be implemented as part of future development of the Orange County Great Park. Objective L-10 Agriculture is specifically implemented by the project. Agriculture uses are part of both the Base Plan and the Overlay Plan (see Section 5.8 Agricultural Resources for more detailed discussion related to this issue).

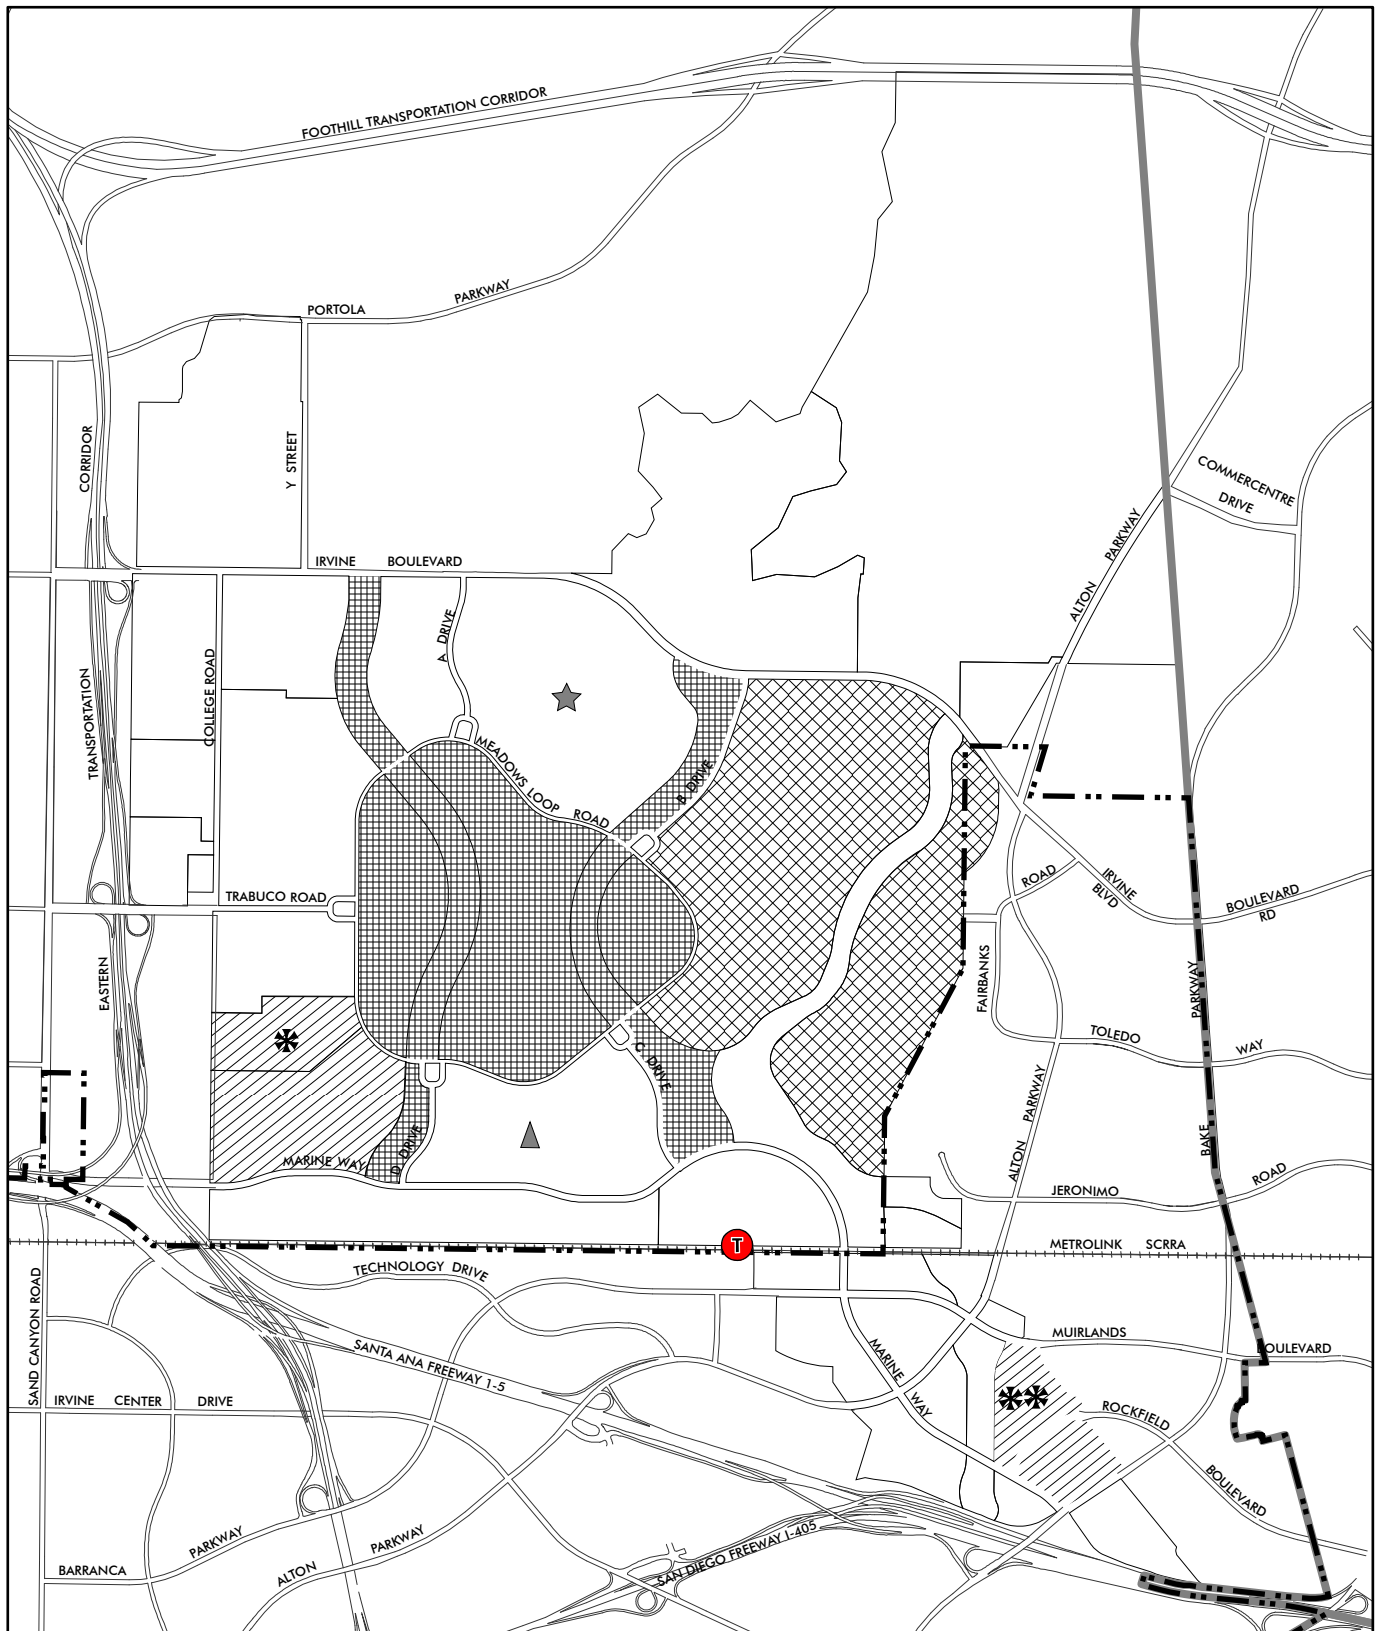

The General Plan Amendment will make the following changes in the Conservation and Open Space Element:

- Figure L-2 “Conservation and Open Space” will be amended to add Preservation, Recreation, and Agriculture areas, consistent with Orange County Great Park uses. (Figure 3-9).

M. Growth Management - The objectives and implementing policies contained in the Growth Management Element of the General Plan are unchanged by this amendment and will be implemented as part of future development of the Orange County Great Park.

The General Plan Amendment will contribute to the following actions in support of the Growth Management Element:

- The General Plan amendment will modify General Plan Figures B-1 “Master Plan of Arterial Highways” and B-2 “Operational Characteristics” in the City of Irvine Circulation Element. The County of Orange Master Plan of Arterial Highways currently reflects a military base at MCAS El Toro. The Circulation Element changes will lead to a cooperative study to be coordinated with the Orange County Transportation Authority (OCTA) and other inter-jurisdictional planning forums following annexation of the property to reconcile the circulation system differences between the County General Plan and the City General Plan.

Proposed Irvine General Plan
Conservation and Open Space Amendment

- Objective M-6 “Balanced Growth” requires the City to consider the impact of any General Plan Amendment on the jobs/housing balance. Adoption of the project will create an improved jobs/housing balance for the project area over the job housing balance in the current general plan.

Implementation

The City of Irvine’s objective is to assure that the project is developed in an orderly fashion. The DON announced that the property will be disposed through a public auction and that the property will be sold in as many as four parcels. In response to the DON’s approach to sell the property, the City will allow the buyer(s) of the property to participate in a City (or its designee) coordinated approach to project wide permitting issues and construction of public infrastructure. This process will allow for a single point of responsibility to coordinate future project wide issues.

Development Agreement

The proposed project includes the approval of a Development Agreement. The Draft Development Agreement is provided in Appendix D of this Final Program EIR. The Development Agreement provides the link between the Base Plan and Overlay Plan. The Development Agreement will not allow any additional intensity than that identified for the proposed Overlay Plan.

The Development Agreement is strictly an agreement between the City and applicable property owner/developer that authorizes and vests development rights in accordance with the Overlay Plan in consideration for the property owners’ conveyance to the City of the Great Park, Sports Park, Drainage Corridor, Wildlife Corridor and other parcels, and pays to the City and participates in financing for the construction and maintenance of infrastructure and public improvements within the conveyed property. The proposed Development Agreement does not grant or approve any land use entitlements that are not otherwise allowed through the proposed General Plan amendment and zone change. Unless otherwise provided in the Development Agreement, the rules, regulations, and official policies governing permitted uses, density, design, improvements, and construction are those in effect when the agreement is executed. The environmental impacts of those proposed entitlement actions are addressed throughout this Final Program EIR.

Special Project Features

Wildlife Corridor

Presently there is no wildlife corridor within the project area. However, a major feature of the proposed project is the inclusion of a wildlife corridor land use which would allow for the creation of a wildlife corridor connecting the Lomas Ridge and the San Joaquin Hills. The proposed wildlife corridor alignment is depicted in Figure 3-3 (General Plan land use “Wildlife Corridor” – Subareas 22a and 22b). The wildlife corridor provides connection to the 995-acre habitat preserve, as well as the Limestone-Whiting Wilderness Park. To the

south, the corridor will connect to the Laguna Coast Wilderness Park through existing and future major open space linkages.

Drainage Corridors

The proposed project includes a land use category for the creation of drainage corridors through the project site (see Figure 3-3). The proposed drainage plan for the project is based on an earthen open channel and landscaped drainage corridor (corridor) method. A typical “corridor” consists of a trapezoidal channel cross-section that is 4 feet to 6 feet deep and up to 500 feet wide with side slopes climbing at a rate of five to ten percent depending on the location. A “strip” approximately 100 feet in width containing the streamline and the lowest portion of the side slopes is proposed to be protected by natural riparian plant types. Adjacent to the riparian strip, the corridor is proposed to be planted to the edges with a conventional landscaping palette. These drainage corridors offer an opportunity to control surface water flow, improve surface water quality, and create wetland/riparian habitats where none currently exist in the project area.

Runway Removal

Existing runways, parking aprons, and associated aviation facilities are located in a substantial portion of the former MCAS El Toro planned for urban use. In order to use the former MCAS El Toro for the purposes proposed by the Orange County Great Park, the runways must be removed. This requires the runways to be broken up into pieces suitable to fit into a crushing machine and crushed to a size for use as aggregate base for roadways and other potential uses both on-site and off-site. The runways can be removed in a sequential manner with stockpiling of material onsite as required to permit maximum economy of scale in the operation. The crushing and recycling operation will occur on the property in areas that later will become park and open space. The City will be responsible for managing the removal of runway materials within the portions of the property to be conveyed to the City. Those portions of the property in private ownership may participate in the City’s crush and recycle program for the runway removal.

Development Schedule

Total development of the project is expected to occur by 2025. Development sequencing will be linked to the availability of infrastructure, the completion of hazardous materials cleanup on MCAS El Toro, and the removal of the runways.

Statement of Objectives

The City has a substantial interest in the conversion of the former MCAS El Toro site from military use to civilian use since 440 acres are within the City’s boundaries and the balance of the site is within the City’s Sphere of Influence. This project is a part of the action by the City to initiate annexation proceedings and General Plan amendments and Zone Changes implementing the non-aviation uses for the former MCAS El Toro.

This statement of objectives serves as a benchmark to ascertain the environmental impacts and other purposes of a proposed project and associated alternatives. These objectives will

be used to evaluate the significance of the environmental impacts of the proposed project with the impacts of other alternatives for the former MCAS El Toro discussed in this document.

The City of Irvine's objectives are as follows:

1. Annex the former MCAS El Toro site and adjacent lands within the City's Sphere of Influence.
2. Convert the former MCAS El Toro to a Great Park with regional open space, cultural and recreational facilities.
3. Amend the Irvine General Plan and Zoning Ordinance to implement proposed Orange County Great Park land use designations.
4. Coordinate location and development of roadways and transportation systems in the project area with the local and regional circulation and transportation systems.
5. Create a wildlife corridor connection through the property which may potentially connect the Cleveland National Forest to the north and the coastal open space preserves to the south.
6. Respond positively and effectively to the DON's decision to sell the property to private interests by allowing private development of some land while ensuring the implementation of park and open space amenities.

Discretionary Actions

City of Irvine

The discretionary actions to be taken by the City of Irvine at (or as part of) the completion of the Final Program EIR may include, but are not limited to the following:

- CEQA related actions and approvals;
- Annexation related approvals;
- General Plan amendments (including amendments made to conform to actions by other agencies related to the project);
- Approval of Development Agreements and Covenants, Conditions and Restrictions (CC&Rs) governing the property;
- Ordinance actions, including zone changes and zoning code amendment;
- Actions to approve interim use activities;
- Approval of master plan for development;
- Actions related to real and personal property acquisition, leases, management and other approvals;
- Regulatory or other actions implementing mitigation measures or actions;
- Approval of master plans and subdivisions for development; and
- Approval of community facilities districts or other assessment districts.

Actions and Approvals of other Agencies

State and local agencies in addition to the City of Irvine may use the EIR in connection with any discretionary actions required to implement or otherwise assure development of the Great Park Plan including, but not limited to actions of the following types. Federal agencies may also use the document as a basis for providing environmental review and clearance in accord with the National Environmental Policy Act.

The agencies which may use this Program EIR and types of actions that these agencies may take in connection with the EIR include, but are not limited to the following:

- Local Agency Formation Commission Orange County (LAFCO) – Approval of annexation
- The United States Department of Defense/Department of the Navy (DOD/DON) and the General Services Administration –Sale and conveyance of property
- Airport Land Use Commission (ALUC) for Orange County – Amendment of the Airport Environs Land Use Plan (AELUP), dated 1995
- County of Orange – Revision of the County's General Plan
- Southern California Association of Governments (SCAG) – Revisions to regional models related to growth, development and airport plans.
- Transportation Corridor Agency (TCA)
- South Coast Air Quality Management District (SCAQMD)
- Regional Water Quality Control Board (RWQCB) – National Pollutant Discharge Elimination System (NPDES) Permit
- Army Corps of Engineers (Corps) – Section 404 (Dredge and Fill) Permit
- California Department of Transportation (Caltrans)
- California Department of Fish and Game – Approvals related to wildlife corridor and habitat areas
- Federal Department of the Interior (DOI) Fish and Wildlife Agency
- Southern California Regional Rail Authority (SCRRA)
- Orange County Transportation Authority (OCTA) – Revisions to the County Master Plan of Arterial Highways (MPAH)
- Irvine Unified School District
- Saddleback Unified School District
- California Public Utilities Commission – Highway Rail Crossings
- California Department of Toxic Substances Control (DTSC) – Approval of acquisition and/or development of property for public schools based on hazardous materials evaluation.

4.0 Environmental Setting

Physical Context

The proposed project area (which consists of City of Irvine Planning Areas (PA) 51, 30, and a portion of 35) is located in the central portion of Orange County, approximately 45 miles southeast of Los Angeles. Figure 4-1 depicts the location of the project area as shown on the El Toro and Tustin USGS quadrangles. Figure 1-4 (see Section 1.0 Introduction) provides an aerial photograph of the project area and surrounding land uses. The project area is generally bounded by the cities of Irvine and Lake Forest on the south and east, and unincorporated area in the County of Orange on the north. Other nearby local jurisdictions include the cities of Laguna Hills, Laguna Niguel, Laguna Woods, Mission Viejo, Aliso Viejo, and Tustin.

The project area is located north of the Santa Ana (I-5) Freeway, east of the Eastern Transportation Corridor (SR-133), and south of the Foothill Transportation Corridor (SR-241). Major roadways bordering the project area include Barranca Parkway to the south, Sand Canyon Avenue to the west, Portola Parkway and Irvine Boulevard to the north, and Alton Parkway to the east.

The Irvine Transportation Center, a major multimodal transit center linking Orange County Transportation Authority (OCTA) bus, Metrolink commuter rail, and Amtrak rail services, is adjacent to the Southern California Regional Rail Authority (SCRRA) tracks, which bisects the project area

Former MCAS El Toro (PA 51)

PA 51 encompasses approximately 4,295 acres. With the exception of 16 acres in the City of Irvine, PA 51 is unincorporated County jurisdiction, but within the City of Irvine's Sphere of Influence. The portion of the former MCAS El Toro north of the railroad is PA 51. A golf course occupies the southeastern portion of the PA 51. The northeastern portion of PA 51 is largely undisturbed and is designated as a habitat preserve. Former military buildings/facilities occupy the northeastern and northwestern portions of PA 51. Agricultural areas abut the east, north, and northwest boundary of PA 51. I-5 and urban areas of the City of Irvine abut the southwest boundary of PA 51. The southwestern boundary abuts the SCRRA, PA 32, and PA 30.

Former MCAS El Toro (PA 30)

PA 30 consists of approximately 398 acres within the City of Irvine. PA 30 is currently being utilized for agricultural production. The Irvine Spectrum is located east of PA 30. I-5 is south and southwest of PA 30. Urban areas of the City of Irvine are north and west of the site and PA 51 is north of PA 30.

Source: USGS 7.5-minute series, El Toro and Tustin quadrangles, photorevised 1982 and 1981.

--- Project Boundary

Figure 4-1
USGS Map of El Toro Area

James A. Musick Branch Jail (Portion of PA 35)

The James A. Musick Jail Facility is located on a 105-acre site within a portion of PA 35. The facility is northwest of existing Bake Parkway and easterly of the future extension of Alton Parkway. The northern boundary of the Musick Jail site abuts PA 51. The existing buildings of Irvine Spectrum abut the Musick Jail site to the west/southwest. Residential uses in the City of Lake Forest are, at the closest point to the Musick Jail site, approximately 700 feet to the southeast of the present jail fence.

IRWD Parcel (Portion of PA 35)

The eight acre IRWD parcel is also located in a portion of PA 35. The parcel contains the IRWD East Irvine Zone IV Pumping Station and Zone III 5.0 million gallon potable water reservoir and 7.0 million gallon potable water reservoir. This parcel is northwest of the Musick Jail facility. The northern portion of this parcel abuts PA 51. Agricultural fields are southwest of the parcel.

Project Area Conditions

Regulation of land use in PA 51 and 30 (the former MCAS El Toro) is currently the responsibility of the Department of Defense (DOD), while the James A. Musick Jail facility is owned and operated by the County of Orange and the IRWD parcel is owned by the Irvine Ranch Water District.

The project area is located within the South Coast Air Basin (SCAB). The SCAB is generally dominated by high-pressure systems over the Pacific Ocean and is arid, with little rainfall and plentiful sunshine. Moderate temperatures and comfortably low humidity are the predominant weather patterns in the region. Precipitation is limited, normally occurring from late November to April.

Noise heard on-site is primarily generated by traffic from surrounding roadways and freeways, including the Santa Ana (I-5) Freeway, the Eastern Transportation Corridor (SR-133), and the Foothill Transportation Corridor (SR-241).

The project area contains hazardous materials contamination associated with operations from former military activities (the majority of which are located in PA 51). These hazardous materials consist of petroleum-based products such as aviation and vehicular fuels, engine and lubricating oils, solvents, cleaners, paints, thinners, pesticides and herbicides; chlorinated/halogenated compounds, including polychlorinated biphenyls (PCB); some radioactive materials; ordinance munitions and propellants. Cleanup and remediation of hazardous materials on-site is currently underway under the Base Realignment and Closure Cleanup Plan (BCP).

The project area extends from the southern margin of the foothills of the Santa Ana Mountains to the southeastern edge of the alluvial Tustin Plain. The Santa Ana foothills are underlain by a tilted sequence of stratified sedimentary bedrock units which make up the hills and ridges. The Tustin Plain is a gently sloping alluvial plain underlain by alluvial fan sediments consisting of sand, silt, and clayey silty sand. There is no known active or potentially active fault crossing or projecting into the project area. Portions of PA 51 lie

within the San Diego Creek drainage basin and the remaining portion of the project area (PA 30 and a portion of PA 35) lie within the Borrego Canyon drainage system and drain into the Borrego Canyon Wash.

Notes and References

None.

5.0 Environmental Impacts and Mitigation Measures

This section of the Final Program EIR addresses the environmental setting for each impact area, the threshold for determining significance of environmental impacts, identification of environmental impacts, mitigation measures for those environmental impacts, which are deemed significant, and the environmental impact remaining after implementation of mitigation measures. Notes and references are also listed.

Each impact is discussed and analyzed in the sections that follow. Each environmental impact issue area is addressed according to the format identified below. For impacts where there is no material difference between those associated with the Base Plan and those associated with the Overlay Plan, a single discussion applicable to both plans is provided. For impacts where there are differences between the two plans, separate discussions are provided. Similarly, the attendant discussion of mitigation measures is either combined for both plans if there is no difference in impacts, or separated if they are particular to each plan.

Environmental Setting: A discussion of the existing conditions, services, and physical environment of the project area.

Threshold for Determining Significance: The amount or type of impact which contributes a substantial or potentially substantial adverse change in the environment, based on the thresholds contained in the Environmental Checklist contained in Appendix G of the CEQA Guidelines. Based on this criterion, project impacts can be classified as: significant and unavoidable; significant, but can be mitigated, avoided, or substantially lessened; or less than significant.

Environmental Impact: A discussion of the impacts of the proposed project according to the land use distribution and intensity as identified for the Base Plan and Overlay Plan, in quantitative and/or qualitative terms, based on the uses of land identified in the project description.

Mitigation Measures: A discussion of the measures required by the City of Irvine to avoid, mitigate or substantially lessen significant impacts associated with implementation of the Base Plan and Overlay Plan.

Impact After Mitigation: A discussion of the level of impact of the project following the implementation of required or recommended mitigation measures.

Notes and References: A list of reference sources indicating the document, person or data source for information contained within the section. A complete listing of references can be found in Section 8.0 – References of this Final Program EIR.

Areas of Potential Environmental Impact

1. Land Use
2. Traffic/Circulation
3. Air Quality
4. Noise
5. Public Health and Safety
6. Geology and Seismicity
7. Hydrology and Water Quality
8. Agricultural Resources
9. Biological Resources
10. Paleontological Resources
11. Cultural Resources
12. Aesthetics
13. Population/Housing
14. Public Services and Facilities
15. Utilities

Detailed discussions of these impacts are found in the following sections. Other long-term environmental issues, including cumulative environmental impacts caused by the project, growth inducing impacts, unavoidable significant environmental impacts, and areas of no significant impact are discussed in Section 7.0 – Analysis of Long-Term Effects of this Final Program EIR.

5.1 Land Use

5.1.1 Environmental Setting

Regional Setting

The project area (which consists of the City of Irvine Planning Areas (PAs) 51, 30, and a portion of 35) is located in the central portion of the County of Orange as shown in Figure 1-1 in the *Introduction* of this EIR. The former MCAS El Toro property (PAs 51 and 30) encompasses approximately 4,693 acres or 7.3 square miles. Approximately 4,279 acres of the former MCAS El Toro property are in unincorporated County territory within the Sphere of Influence of the City of Irvine. The remaining 414 acres are within Irvine city limits. The proposed project includes the annexation of approximately 4,392 acres which includes the James A. Musick Jail facility and the Irvine Ranch Water District parcel.

The project area is generally bounded by the City of Lake Forest on the south and southeast, the City of Irvine on the west and southeast, and the County of Orange on the north. Other nearby local jurisdictions include the cities of Laguna Hills, Laguna Niguel, Laguna Woods, Aliso Viejo, Mission Viejo and Tustin.

The project area is located northeast of the Santa Ana (I-5) Freeway, east of the Eastern Transportation Corridor (SR-133), and south of the Foothill Transportation Corridor (SR-241). Major roadways bordering the project area include Barranca Parkway to the south, Sand Canyon Avenue to the west, Portola Parkway and Irvine Boulevard to the north, and Alton Parkway to the east as shown in Figure 1-1, Vicinity Map (Section 1.0 – Introduction of this Final Program EIR).

The Irvine Transportation Center, a major multi-modal transit center linking Orange County Transportation Authority (OCTA) bus, Metrolink commuter rail, and Amtrak rail services, is adjacent to the Southern California Regional Rail Authority (SCRRA) tracks, which bisect a portion of the project area.

Existing Land Uses

Former MCAS El Toro (PAs 51 and 30)

The former MCAS El Toro base (PAs 51 and 30) was developed in 1942 on land purchased from The Irvine Company. The former base operated continuously as a military air facility from that time until it was closed in July 1999, as part of the federal 1993 Base Realignment and Closure (BRAC) process. The DON provides caretaker responsibilities for the former MCAS El Toro. Since closure, existing buildings, structures, ancillary facilities, runways, etc. have been left on-site by the DON. Portions of the site are also currently used for agricultural operations. The DON is leasing some of the existing facilities for various interim activities, such as the golf course and equestrian facilities and the Cal State University, Fullerton Extension Campus, agricultural operations, and recreational vehicle storage.

The former MCAS El Toro base generally consists of approximately 500 existing structures with approximately 4.6 million square feet of space. There are approximately 1,100 existing military housing units. Development includes the MCAS and COMCABWEST headquarters building and the officers club, unoccupied residential housing, maintenance, operation, and storage uses, the airfield operations building, an equestrian center, golf course and industrial uses, with predominantly hangers and warehouses.

The former base airfield includes five runways. There are two 10,000-foot long north-south parallel runways (Runways 16L/34R and 16R/34L). There are two 8,000-foot east-west runways (Runways 7L/25R and 7R/25L). There is also a 3,900-foot long limited-use runway (Runway 3-71), taxiways, and aircraft parking aprons.

Land uses within PA 51 northeast of Irvine Boulevard include unoccupied residential housing areas and an approximately 995-acre parcel of open space containing a pistol range, explosive ordnance disposal site, and archery area.

The northern boundary of PA 51 is adjacent to large open spaces in unincorporated Orange County, within the City's Sphere of Influence. The City of Irvine General Plan designates this "Northern Sphere" area for a mix of residential, industrial, commercial, recreational, institutional, and open space uses. PAs 51 and 30 abut portions of the Irvine Spectrum to the east and west (Irvine Industrial Complex East B (PA 35) and Irvine Technology Center B (PA 32). Existing and planned residential uses are north and east of the former base. The Irvine Transportation Center is on the southern boundary of PA 51 and on the eastern side of Barranca Parkway. An existing rail line crosses the southern part of PA 51 and is used for Metrolink commuter rail and Amtrak passenger and freight services. The James A. Musick Jail facility is adjacent to the eastern boundary of the base, as is the eight-acre IRWD parcel. There are some existing agricultural uses to the north and west of the project area.

James A. Musick Jail Facility (Portion of PA 35)

The James A. Musick Jail facility (portion of PA 35) is currently a minimum-security detention and corrections facility housing approximately 1,250 inmates. The inmate housing and detention facilities are located in the northeast corner of the site. The remainder of the site is used for agricultural activities associated with inmate detention.

IRWD Parcel (Portion of PA 35)

The IRWD parcel (portion of PA 35) is an eight-acre facility providing water storage and pumping. The parcel contains the East Irvine Zone 4 Pumping Station, and the East Irvine Zone 5.0 million gallon and 7.0 million gallon potable water reservoirs.

Local and Regional Plans

City of Irvine General Plan and Zoning Ordinance

The City of Irvine's General Plan represents the long-range vision of the City. It is a comprehensive statement of Irvine's development and preservation policies for all geographic areas of the City and its sphere of influence, and the relationships between

social, financial, environmental, and physical characteristics. The City's first General Plan was adopted in December 1973. According to the City's 1973 General Plan, after base closure, PAs 51 and 30 were planned for multi-use (non-aviation) development compatible with the City's and surrounding development patterns. The General Plan has been modified by City Council action over the years to address changing City priorities and planning goals.

In April 1993, the City initiated a multi-phased General Plan amendment (13309-GA) that proposed revisions to all elements of the General Plan to clarify and update the objectives, policies, supporting text, and diagrams consistent with current City policy, codes, and procedures. In August 1993, the City adopted General Plan Amendment (GPA) 13309-GA for the Phase I General Plan Update. In April 1995, the City adopted GPA 15032-GA for the Phase II General Plan Update. On March 9, 1999, the City adopted GPA 18930-GA for the Phase III General Plan Update. The Phase III Update revised the text and exhibits of the Land Use, Circulation, Seismic, Cultural Resources, Noise, Public Facilities and Services, Integrated Waste Management, Energy, Safety, Parks and Recreation, Conservation and Open Space, and Growth Management Elements. The General Plan was again amended in 2000 to reflect the changes in PAs 30 and 51 as a result of the previously approved Millennium Plan II for the El Toro Property (39399-GA, 39400-ZC). The General Plan Updates in March 1999 and February 2000 revised the General Plan to reflect the closure of MCAS El Toro. The General Plan was again updated in June 2002 to reflect the adoption of the General Plan Amendment for the Northern Sphere area as is described in more detail below.

The City has initiated two annexations to develop physical infrastructure in the vicinity of the project area. The 1972 annexation addressed most of what is now designated PA 30 (the southern portion of the former MCAS El Toro property). The 1984 annexation included what is now PA 32 (the Irvine Technology Center). The property owner at the time of annexation for both PA 30 and PA 32 was The Irvine Company. These annexations facilitated the development of local and regional circulation improvements such as Alton Parkway, Bake Parkway, and Barranca Parkway through PA 30. The federal government purchased the property in PA 30 from The Irvine Company in 1975 and added to it in 1988 for the clear zone for the flight approach for runways 34/R and 34/L.

In June 2002, the City adopted a General Plan Amendment and Zone Change for the Northern Sphere Area of the City, which consists of City of Irvine Planning Areas 3, 6, and 9, and a portion of Planning Areas 5 and 8. The Northern Sphere project amended the City's General Plan and Zoning Ordinance to permit development of a mix of residential, industrial, commercial, recreational, institutional uses, and open space dedications. Following adoption of the Northern Sphere project, the Irvine Company made a formal application to LAFCO for annexation of Planning Areas 8A and 9A.

The City's General Plan has thirteen elements, seven of which are mandated by State Law. The policy guidance in all of these elements will be applied to the future development of the project area consistent with the new land uses proposed as part of the OCGP GPA and Zone Change. The following discussion identifies the relationship of these elements to the project area.

Land Use Element. The goal of the Land Use Element is to "promote land use patterns that maintain safe residential neighborhoods, bolster economic prosperity, preserve open space, and enhance the overall quality of life in Irvine." The Land Use Element currently designates the unincorporated portion of the former MCAS El Toro property (PA 51) as Research and

Industrial, Community Commercial, Institutional, Multi-Use, Commercial Recreation, Low Density and Medium Low Density Residential, Recreation, and Preservation.

The portion of the former MCAS El Toro property within the City of Irvine (PA 30) is designated Community Commercial, Commercial Recreation, Research and Industrial, Institutional, Preservation, and Recreation in the General Plan. The zoning districts are: 4.3B Community Commercial; 4.4 Commercial Recreation; 5.5 Research and Industrial; 6.1 Institutional; 1.4 Preservation; and 1.5 Recreation.

Both the James A. Musick Jail facility and IRWD Parcel (portion of PA 35) are designated as Institutional in the adopted Irvine General Plan.

Circulation Element. The goal of the Circulation Element is to “provide a balanced transportation system.” The Circulation Element addresses four separate circulation systems: air, road, public transit, and trails.

Objective B-7, Air Transportation Program, Policy (c) states “oppose commercial use of El Toro MCAS and continue liaison with surrounding communities in organizing and supporting opposition to such use.” Policy (d) states:

“....Encourage use of Los Angeles and Ontario International Airports for continental and international flights. Explore commercial airport potential of existing and closing military facilities with Los Angeles, San Bernardino, Riverside and San Diego counties, as well as existing commercial airport and general aviation airports which have expansion potential in order to meet the growing passenger demand on a regional basis. Discourage the development or expansion of airfields which are not now operating as commercial airports, or the expansion of existing commercial airports which would adversely impact existing urban communities.”

Housing Element. The Housing Element’s goal is to “provide for safe and decent housing for all economic segments of the community.” A primary purpose of the Housing Element is to identify ways in which the City will encourage a variety of housing types to meet the City’s Regional Housing Needs as identified by SCAG. Objective C-7, Military Base Housing Reuse, Policy (c) states the City will “request release of MCAS El Toro base housing by the federal government, and pursue immediately civilian use.” Policy (c) further states the City will “pursue annexation of MCAS El Toro, and explore opportunities for maintenance of the housing stock.”

Seismic Element. The goal of the Seismic Element is to “minimize the loss of life, disruption of goods and services, and the destruction of property associated with an earthquake.” All areas of the City are classified as one of five Seismic Response Areas (SRA). Each SRA zone describes the magnitude and types of potential seismic hazards present. The majority of the site (flat elevations) is located within the SRA-2 zone. The hillside area north of Irvine Boulevard is SRA-3 and SRA-4 zones. The meaning of these zone classifications is as follows:

- SRA 1: Areas with soft or loose soils/high groundwater and a greater potential for ground failure in the form of liquefaction.
- SRA 2: Areas with denser soils/deeper ground water with ground failure posing the greatest seismic hazard.
- SRA 3: Areas with shallow alluvium over and abutting bedrock with ground motion posing the greatest seismic threat.

- SRA 4: Areas with highlands characteristically over 20 percent slope that are potentially less stable than SRA 3 areas due to the greater slope.
- SRA 5: Areas containing less stable geologic formations, such as mapped landslide areas.

Cultural Resources Element. The goal of the Cultural Resources Element is to “ensure the proper disposition of historical, archaeological, and paleontological resources to minimize adverse impacts, and to develop an increased understanding and appreciation for the community’s historic and prehistoric heritage, and that of the region.” The majority of the site (flat elevations) is identified as a low paleontological sensitivity zone. The hillside area north of Irvine Boulevard is identified as a high paleontological sensitivity zone.

Noise Element. The goal of this Element is to “contribute to a healthy and safe environment by minimizing noise impacts.” The Noise Element divides unwanted noise into two categories of noise sources - mobile and stationary. The Noise Element states:

“MCAS El Toro was closed in July 1999. In its place, the County of Orange has proposed a commercial airport, which will likely have an impact on aircraft noise as well as vehicular noise. The City of Irvine actively opposes a commercial airport.”

“The El Toro Reuse Planning Authority, which consists of the cities of Irvine, Mission Viejo, Laguna Hills, Lake Forest, Laguna Beach, Dana Point and Laguna Niguel, has prepared the Millennium Plan for the reuse of MCAS El Toro. The Millennium Plan consists of a mix of non-aviation land uses which may have different vehicular and stationary noise levels than currently associated with military activities at MCAS El Toro.”

Public Facilities and Services Element. The goal of the Public Facilities and Services Element is to “provide a full range of necessary public facilities and services that are convenient to users, economical, reinforce City and community identity, and reflect the participation of citizens.”

Integrated Waste Management Element. The Integrated Waste Management Element’s goal is to “encourage solid waste reduction and provide for the efficient recycling and disposal of refuse and solid waste material without deteriorating the environment.”

Energy Element. The Energy Element’s goal is to “promote energy conservation and the use of renewable energy sources throughout the City in a cost effective way.”

Safety Element. The goal of the Safety Element is to “minimize the danger to life and property from man made and natural hazards, including fire hazards, flood hazards, non-seismic geologic hazards and air hazards.” The portion of the project area north of Irvine Boulevard and east to Sand Canyon Avenue is designated a High Fire Severity Rating on Figure J-2, Fire Hazard Areas. Portions to the north of the project area are also identified as Flood Hazard Areas in Figure J-3. Policy J-1.d and Figure J-4, Clear and Accident Potential Zones, address hazards associated with aircraft operations. Policy J-1.d uses the most current available Airport Environs Land Use Plan as a planning resource for evaluating aircraft operations, land use compatibility, and land use intensity.

Parks and Recreation Element. The Parks and Recreation Element’s goal is to “provide park and recreation opportunities at a level that maximizes available funds and enables residents of all ages to utilize their leisure time in a rewarding, relaxing, and creative manner.”

Conservation and Open Space Element. The goal of the Conservation and Open Space Element is to “maintain and preserve the environmental systems as a major feature in the City.” This element locates the project area in the Northern Flatlands landform zone. The northeastern portion of PA 51 is also identified as NCCP Habitat Reserve.

Growth Management Element. The goal of this Element is “to ensure that growth and development are integrally planned with, and phased concurrently with, the City of Irvine’s ability to provide an adequate circulation system and public facilities.”

Orange County General Plan

The County General Plan shows the majority of PA 51, the James A. Musick Jail facility and IRWD parcel as Public Facilities. The northernmost arm of PA 51 is designated for Open Space. However, in 1994, the voters in Orange County approved Measure A. Measure A amended the County’s General Plan to designate the unincorporated portion of the former MCAS El Toro property (PA 51) for commercial aviation and related uses. Since that time, several plans for the reuse of the site have been prepared. In March of 2002, the voters of Orange County passed the “Orange County Central Park and Nature Preserve Initiative” (Measure W). This initiative amended the County General Plan north of the SCRRA Metrolink rail line (PA 51) to designate the unincorporated County land for park, open space, and other uses, effectively removing the designation of the site as a commercial airport from the General Plan. Following this initiative, the Board of Supervisors decided to cease further planning for El Toro and to support the annexation and land use planning of the property by the City of Irvine.

MCAS El Toro Land Use Compatibility Plans

The DOD established the Air Installations Compatible Use Zones (AICUZ) program to ensure compatible development in high-noise exposure areas, minimize public exposure to potential safety hazards associated with aircraft operations, and protect the operational capability of the air installation. In accordance with the Department of Navy’s instructions governing the AICUZ program, the AICUZ program recommends that communities adopt land use plans prohibiting land uses deemed incompatible with military air operations. The AICUZ itself does not impose any land use restrictions.

The Airport Land Use Commission (ALUC) for Orange County has Airport Environs Land Use Plans (AELUP) for John Wayne Airport (adopted 2002), Fullerton Municipal Airport (2002), Joint Forces Training Base Los Alamitos (2002), Heliports projects (2002), and for the former MCAS El Toro (1995). The purpose of the AELUP is to protect aviation facilities from encroachment by incompatible land uses. It establishes noise/land use acceptability criteria for sensitive land uses at 65 dB CNEL for outdoor areas and 45 dB CNEL for indoor areas of residential uses. The AELUP utilizes the AICUZ and Accident Potential Zones (APZ) for MCAS El Toro. Figures found in Appendix D of the 1995 AELUP depict the noise and safety zones for the former MCAS EL Toro. Figure 5.1-1 depicts the APZs for the former MCAS El Toro as shown in the 1995 AELUP.

The MCAS El Toro property is still owned by the federal government. The 1995 AELUP applicable to the property remains in effect and has not been amended. California Public Utilities Code Section 21670, et. seq. requires that local General Plans and Zoning be consistent

with the AELUP. The Public Utilities Code provides a method whereby a local jurisdiction may override an ALUC finding of inconsistency with the AELUP.

The County's Noise Element adopts the AELUP restrictions, including a Policy Implementation Line (PIL), which defines the area subject to land use development restrictions. Historically, this PIL has been the MCAS El Toro 1981 PIL 65 dB CNEL contour. The adopted PIL for the former MCAS El Toro is depicted in Figure 5.1-1. These land use, safety, and noise restricted areas as identified in the AICUZ, AELUP, and the PIL are still adopted by the ALUC, but no longer are impacted by aircraft noise from military air operations since the former base closed its operations in July 1999.

Contrary to the adopted Orange County General Plan (as amended by Measure W in March 2002), the adopted City of Irvine General Plan, the DON's Final Record of Decision (ROD) regarding the disposal and reuse of the former base property, and all current regional planning activities regarding air transportation resources in Southern California, the ALUC on December 16, 2002 continued to plan for an airport at the former MCAS El Toro site. The plan reflects the AELUP for the airbase adopted in November 1995. This plan is based on the 1981 AICUZ.

Specifically, all other federal and local agencies with jurisdiction over the site have concluded that MCAS El Toro will not be used as a military or commercial aviation facility. A letter dated October 9, 2002 from Deputy Assistant Secretary of the Navy Wayne Arny states, "the Navy has formally determined to close MCAS El Toro and has no plan to recommission the site as a military installation." Mr. Arny's letter continues, "the 1981 AICUZ is not applicable to the closed military facility and should not be used as a basis for any land use planning effort undertaken by the ALUC."

James A. Musick Jail Facility Expansion Plan

The County has approved the expansion of the Musick Jail facility to house 7,584 inmates in a minimum/medium/maximum security facility. This expansion would occur in three phases and include a Sheriff's Southeast Station, ancillary jail facilities (warehouse, central plant, food service, laundry, staff and visitor parking, etc.), and a relocated Interim Care Facility. However, construction has not yet commenced on the expansion.

Orange County Master Plan of Arterial Highways

The County of Orange Master Plan of Arterial Highways (MPAH) forms part of the Orange County General Plan and designates the arterial system in the circulation element of the General Plan. Defined according to specific arterial functional classifications, the MPAH serves to define the intended future roadway system for the County. Cities within the

Former MCAS El Toro AICUZ and PIL

County are expected to achieve consistency with the MPAH in individual General Plan circulation elements.

Southern California Association of Governments (SCAG)

Orange County and the City of Irvine are located at the western edge of a six-county metropolitan region composed of Orange, Los Angeles, Ventura, Riverside, San Bernardino and Imperial Counties. The Southern California Association of Governments (SCAG) serves as the federally recognized Metropolitan Planning Organization for this Southern California region. Orange County and its jurisdictions constitute the Orange County Subregion within the SCAG region. The Orange County Subregion is governed by the Orange County Council of Governments (OCCOG).

Regional Comprehensive Plan and Guide

SCAG has developed a Regional Comprehensive Plan and Guide (RCPG) to help coordinate transportation and infrastructure, open space and environmental planning with population, housing, and employment growth within the multi-county region. The RCPG adopted in 1995 presents policies addressing planning priorities for the region adopted by SCAG's governing board, the Regional Council. Some of these are "core" policies that implement state or federal mandates, while most of the policies are "ancillary" or advisory only guidance for local jurisdictions and public agencies.

SCAG's RCPG includes a package of policies related to growth and development that seek to coordinate infrastructure with projected population and housing growth. In general, SCAG policies encourage job and housing opportunities to be balanced at the County or Regional Statistical Area. SCAG policies also encourage job growth to be concentrated near transit services and transit nodes, and existing freeways, high occupancy vehicle (HOV) lanes, and toll roads. Given the scope and expansive nature of the RCPG, not all of the RCPG policies apply to every project.

Regional Transportation Plan (RTP)

SCAG has also adopted a Regional Transportation Plan (RTP) to help coordinate development of the region's transportation improvements. SCAG's 2001 RTP designates the El Toro property as a commercial airport. However, in response to a recent lawsuit settlement with ETRPA, the SCAG Regional Council passed a resolution that the 2004 RTP will not include an airport at El Toro.

County of Orange Natural Community Conservation Plan/Habitat Conservation Plan (NCCP/HCP)

The County's Natural Community Conservation Plan/Habitat Conservation Plan (NCCP/HCP) is a program designed to provide long-term regional protection of the natural vegetation and wildlife diversity of the region while allowing compatible land use and appropriate development to occur. In April 1996, the Orange County Board of Supervisors adopted the Central-coastal Subregion NCCP/HCP program. The habitat preserve area located in the eastern portion of PA

51 is identified for incorporation into the NCCP/HCP. Figure 5.9-1 in Section 5.9 Biological Resources of this EIR depicts the project site in relation to the NCCP/HCP.

Special Area Management Plan (SAMP)

The Army Corps of Engineers Special Area Management Plan (SAMP) consists of identification and characterization of aquatic resources, evaluation of alternatives for proposed impacts to aquatic resources, and identification of an aquatic reserve program. Under Section 404 of the Clean Water Act, the Corps of Engineers is authorized to regulate discharge of dredge or fill material into waters of the United States. By implementing Special Area Management Plans (SAMPs), the Corps can analyze potential impacts to waters of the United States at the watershed scale in order to identify priority areas for preservation, identify potential restoration areas, and determine the least environmentally damaging locations for proposed projects. The SAMP process is designed to complement the California Department of Fish and Game's (CDFG's) Natural Communities Conservation Planning (NCCP) program, as well as the U.S. Fish and Wildlife's Habitat Conservation Plan (HCP). The Corps continues to work with other agencies such as the U.S. Environmental Protection Agency and the Regional Water Quality Control Board to implement the SAMP in Orange County.

5.1.2 Threshold For Determining Significance

Appendix G of the CEQA Guidelines outlines the threshold significance criteria that a project is measured against for land use and planning.

Would the project:

1. *Physically divide an established community?*
2. *Conflict with any applicable land use plan, policy, or regulation of an agency with jurisdiction over the project (including, but not limited to the general plan, specific plan, local coastal program, or zoning ordinance) adopted for the purpose of avoiding or mitigation an environmental effect?*
3. *Conflict with any applicable habitat conservation plan or natural community conservation plan?*

5.1.3 Environmental Impact

Proposed Land Use

The entire project area is within the City of Irvine or has been within the City of Irvine's Sphere of Influence since 1973. A portion of the former base, PA 51, is in the unincorporated territory of the County of Orange. Currently, these two jurisdictions are responsible for the planning of the former MCAS El Toro property. Both the City's and County's General Plans designate land uses for reuse of the former base now that it has closed. The County had previously prepared an aviation land use plan; however, Measure W, which was passed in March 2002, amended

the County General Plan north of the Southern SCRRRA Metrolink rail line to designate the unincorporated land within PA 51 for park, open space, and other uses.

Base Plan and Overlay Plan

The project proposes to change the existing designations within the project area to a variety of non-aviation uses. Implementation of the proposed General Plan Amendment (GPA) and Zone Change would result in a non-aviation reuse of the former MCAS El Toro property, consistent with goals and policies contained in the adopted Irvine General Plan and as mandated by the voters of Orange County with the passage of Measure W. Figure 3-3 and Tables 3-3 and 3-4, in Section 3.0 – Project Description of this Final Program EIR, depict and list the proposed land uses per the Base Plan and Overlay Plan.

As depicted in Table 3-3, buildout of the proposed Base Plan will result in approximately 225 dwelling units, a 272-acre sports park, and 3,856,500 square feet of non-residential land uses (including retail, education, research and development, cultural and institutional, transportation facilities, and other uses). Implementation of the Base Plan will result in over 62 percent of the project area being preserved for open space and recreational uses including a 974-acre habitat preserve consistent with the NCCP/HCP. Two golf courses providing 54 holes of golf, an outdoor sports complex, various neighborhood and community parks, and open space corridors and linkages will also be developed.

As depicted in Table 3-4, buildout of the Overlay Plan will result in approximately 3,625 dwelling units, a 165-acre sports park, and 6,585,594 square feet of non-residential land uses (including education, research and development, retail, fairgrounds/commercial recreation, cultural and institutional, transportation facilities, and other uses). Implementation of the Overlay Plan will result in the majority of the project area being preserved for open space and recreational uses including a 974-acre habitat preserve consistent with the NCCP/HCP. Two golf courses for public play providing 54 holes of golf, an outdoor sports complex, various neighborhood and community parks, fairgrounds/commercial recreation, a cemetery, and open space corridors and linkages will also be developed.

Under both the Base Plan and Overlay Plan, a wildlife corridor/natural area will be preserved along the southern portion of PA 51, crossing over to the northern side of PA 30. The golf courses and the wildlife corridor/natural area will be located adjacent to the NCCP/HCP preserve and will provide open space buffers between urban development and the habitat preserve.

Threshold 1: Would the project physically divide an established community?

Base Plan and Overlay Plan

All of the project area is located in the City of Irvine's Sphere of Influence, except for a portion that is already within City limits (PA 30 and a portion of PA 35). There are no residents living within the former MCAS El Toro site, nor on the IRWD parcel. While there are persons residing within the James A. Musick Jail facility, any community created within the facility is contained within the jail confines. In addition, no change is proposed for the James A. Musick Jail facility

under either the Base Plan or Overlay Plan. As a result, no significant impact to established communities is anticipated.

Threshold 2: *Would the project conflict with any applicable land use plan, policy, or regulation of an agency with jurisdiction over the project (including, but not limited to the general plan, specific plan, local coastal program, or zoning ordinance) adopted for the purpose of avoiding or mitigating an environmental effect?*

Base Plan and Overlay Plan

City of Irvine General Plan and Zoning Ordinance

The site is currently planned and zoned for non-aviation uses. Several objectives, policies, and programs within the City's General Plan also oppose commercial aviation use of the former MCAS El Toro facility, and support continued liaison with surrounding communities in organizing and supporting opposition to such use.

The project proposes to amend the various Elements within the adopted Irvine General Plan to reflect the land use changes proposed for the former MCAS El Toro property as approved by the voters of Orange County with the passage of Measure W in March 2002 and ensure internal consistency within the General Plan. The following sections summarize the proposed changes to the General Plan Elements and a more detailed description is provided in Section 3.0 – Project Description of this Final Program EIR.

Land Use Element: The proposed project amends the Land Use Element to reflect a park oriented plan that implements a non-aviation plan for PAs 51 and 30. General Plan Figure A-3, Land Use, will be changed to reflect the proposed land uses designated in the GPA as shown on Figure 3-3. The General Plan's Figure A-4 Scenic Highways will be amended to remove Millennium Parkway. The General Plan's Table A-1, Maximum Intensity Standards by Planning Area, and Table A-2, Maximum Intensity Standards, will be revised to reflect the proposed land uses for Planning Areas 51 and 30.

The GPA will implement all of the Land Use Element objectives (i.e., promote land use patterns that maintain safe residential neighborhoods, bolster economic prosperity, preserve open space, and enhance the overall quality of life in Irvine) and implementing policies.

Circulation Element: Four General Plan circulation exhibits will be changed under the proposed GPA to reflect the proposed circulation system within PAs 51 and 30: General Plan Figure B-1, Master Plan of Arterial Highways as shown on Figure 3-5 of the Project Description; General Plan Figure B-2, Operational Characteristics as shown on Figure 3-6 of the Project Description; General Plan Figure B-3, Public Transit; and General Plan Figure B-4.

The General Plan Amendment will modify Policy B-1 (c) to add the following sentence:

In conjunction with individual subdivision map level traffic studies for development proposed in Planning Areas 30 and 51, a LOS "E" would be considered acceptable for application to intersections impacted in Planning Areas 13, 30, 31, 32, 34, 35, and 39.

The impact associated with the LOS “E” policy change is evaluated in Section 5.2 Traffic/Circulation of this EIR. Please refer to Section 5.2 for an analysis related to this issue.

The GPA will implement all of the adopted Circulation Element objectives (Roadway Development, Roadway Design, Pedestrian Circulation, Bicycle Circulation, Riding and Hiking Trail, Public Transit Program, Air Transportation Program, and Telecommunications Program) and implementing policies.

Housing Element: The GPA will not change the adopted Housing Element objectives (New Construction, Quality Design and Construction, Fair Housing, Housing Types, Existing Housing, Monitoring, Military Base Housing Reuse, and Balanced Employment/Residential Growth). All of the adopted objectives and implementing policies will be implemented as part of the proposed project. Policy (c) states the City will “pursue annexation of MCAS El Toro, and explore opportunities for maintenance of the housing stock.” The additional housing units that will be developed under either the Base Plan (225 dwelling units) or Overlay Plan (3,625 dwelling units) will help Irvine meet its Regional Housing Needs Assessment through 2025. Additionally, the project through the Development Agreement will convey 165 units to homeless providers.

Seismic Element: No objective (Potential Hazards, Response to Hazards, and Citizen Participation) or implementing policy of the Seismic Element will be changed by the proposed project. All of the adopted objectives and implementing policies will be implemented as part of the proposed project. Section 5.6 – Geology and Seismicity of this Final Program EIR analyze the potential impacts of the proposed project related to seismic issues.

Cultural Resources Element: No objective (Historical, Archaeological and Paleontological Surveys, and Hazard Occurrence) or implementing policy of the Cultural Resources Element will be changed by the proposed project. All of the adopted objectives and implementing policies will be implemented as part of the proposed project. Additionally, substantial land area is designated for cultural facilities in both the Base Plan and Overlay Plan.

Noise Element: No objective (Mobile Noise, Stationary Noise, and Noise Abatement) or implementing policy will be modified under the proposed GPA. All of the adopted objectives and implementing policies will be implemented as part of the proposed project.

Public Facilities and Services Element: The GPA will not change the adopted objectives (Public Facilities Development, Public Participation, City Services, and Maintenance and Rehabilitation) or implementing policies. All of the adopted objectives and implementing policies will be implemented as part of the proposed project. To implement the adopted objectives, the City of Irvine has involved the public in developing the proposed project. In addition, the City will prepare an Urban Service Plan for the project area to identify and plan for the future need for public facilities and services resulting from the implementation of the proposed project.

Integrated Waste Management Element: The GPA will not change the adopted objectives (Solid Waste, Waste, Wastewater, and Solid Waste Facility Siting Requirements) or implementing policies. All of the adopted objectives and implementing policies will be implemented as part of the proposed project.

Energy Element: The GPA will not change the adopted objectives (Energy Conservation, Retrofit Programs, and Municipal Conservation) or implementing policies. All of the adopted objectives and implementing policies will be implemented as part of the proposed project.

Safety Element: The GPA will not change the objectives (Hazard Occurrence, Disaster Response, and Insurance Programs) or the implementing policies. All of the adopted objectives and implementing policies will be implemented as part of the proposed project.

Parks and Recreation Element: The GPA will not change the objectives (Recreational Opportunities, Park Dedication, Park Location, and Park Maintenance and Rehabilitation) or implementing policies. The GPA amends the General Plan's Figure K-1 Recreational Facilities to add public golf courses, public and private exposition centers, and regional park as proposed for PAs 51 and 30.

Conservation and Open Space Element: The GPA will not change the objectives (Implementation Action Program, Biotic Resources, NCCP/HCP Implementation Areas, Geophysical Hazards, Geophysical Resources, Societal Hazards, Societal Resources, Preservation Areas, Recreation Areas, Permanent Agriculture, Landfill Overlay, Water) or implementing policies. Please refer to Section 5.8 – Agricultural Resources for a detailed discussion of how the project specifically implements Objective L-10 Permanent Agriculture. General Plan Figure L-2, Conservation and Open Space will be revised to reflect Preservation, Recreation, and Agriculture uses within PAs 51 and 30.

Growth Management Element: General Plan Figure B-1, Master Plan of Arterial Highways, as shown in Figure 3-5 of the Project Description, and General Plan Figure B-2 Operational Characteristics, as shown in Figure 3-6, will be modified as discussed above under the Circulation Element. The objectives (Cooperative Implementation, Integrate Land Use and Transportation Planning, Roadway Maintenance and Capacity Enhancement, Transportation Demand Management, Transit Systems and Service, Balanced Growth, Phased Growth, Monitoring, and Management of Funds) or implementing policies of the Growth Management Element will not be changed by the GPA.

The proposed project amends the various Elements within the adopted General Plan to reflect the land use changes proposed for the former MCAS El Toro property to ensure internal consistency within the General Plan. Implementation of the proposed Base Plan or Overlay Plan will not result in a significant adverse impact to the City's adopted General Plan. The amended General Plan will replace the currently adopted version of the City's General Plan.

No change is proposed to the General Plan designation of the Musick Jail facility, therefore, annexation of the jail will not result in a conflict with the adopted General Plan.

No change is proposed to the General Plan designation of the IRWD parcel, therefore, annexation of the parcel will not result in a conflict with the adopted General Plan.

Federal Property Conveyances

As part of the federal property disposal process, portions of closed military bases may be conveyed to other military departments; federal, State, and local agencies; federally-recognized Native American tribes; and homeless providers. The County of Orange, as the currently designated Local Redevelopment Agency (LRA), has made nine recommendations for conveyance to the DON. These proposed conveyances are provided in Appendix F of this EIR and include conveyances to the Salvation Army, Orange County Community, Community Housing Assistance Program, SBC Community Homeless Coalition, Council of Orange County Society of St. Vincent de Paul, Orange County Community Housing Corporation, Orange County Social Services Agency, Families Forward, and American Riding Club for the Handicapped. The City of Irvine supports the conveyance process and will incorporate any approved conveyances that are compatible with the City's proposed land uses for this area. The DON will sell the remaining portions of the base by means of a public auction managed by the General Services Administration.

The proposed project does not modify the designated land uses for the Musick Jail facility. Under the proposed jail expansion plan, the jail facility may be expanded to house 7,584 inmates in a minimum/medium/maximum security facility if all appropriate approvals and environmental analyses are completed in a legally valid manner.

The proposed project does not modify the designated land uses for the IRWD parcel.

Zoning Ordinance

The proposed project involves zone changes in PA 51 and 30 to implement the Orange County Great Park designations for the Base Plan and Overlay Plan. The project also involves the creation of new or expanded zoning categories and overlay zones to address the other components of the Great Park land use designations. Interim uses may occur within the project area consistent with these zoning designations. No conflict with the zoning ordinance is anticipated.

Orange County General Plan

Since passage of Measure W in March 2002, the portion of the planning area within the jurisdiction of the County (i.e., the area north of the SCRRRA Metrolink rail line) has been designated for park, education, open space, and other uses, effectively removing the previous County General Plan designation of the site as a commercial airport. Following this initiative on April 16, 2002, the Board of Supervisors decided to cease further planning for El Toro and to support the annexation and land use planning of the property by the City of Irvine.

Orange County Master Plan of Arterial Highways

As part of the proposed project, the City will amend both the Land Use Element and the Arterial Plan contained in the General Plan. This is a necessary part of the proposed project to ensure internal consistency of the Irvine General Plan and the proposed project. The amended Arterial Plan will not be consistent with the adopted Orange County Master Plan of Arterial Highways (MPAH). The Orange County MPAH will need to be amended to reflect the GPA and Zone

Change. This potential impact is addressed in Section 5.2 –Traffic/Circulation of this Final Program EIR.

MCAS El Toro Land Use Compatibility Plans

The land use, safety, and noise restricted areas as identified in the AELUP, AICUZ, and the PIL for the former MCAS El Toro facility are no longer impacted by aircraft noise from military air operations now that the base has closed for military use. The MCAS El Toro property is still owned by the federal government. The 1995 AELUP applicable to the property remains in effect and has not been amended. California Public Utilities Code Section 21670, et. seq. requires that local General Plans and Zoning be consistent with the AELUP. The Public Utilities Code provides a method whereby a local jurisdiction may override an ALUC finding of consistency with the AELUP. On December 16, 2002 the ALUC chose not to amend the AELUP to reflect the base closure and future non-aviation uses for the site as agreed upon by the voters of the County of Orange and agencies with jurisdiction over the land (Department of Navy, the County of Orange, and the City of Irvine). Since with base closure there are no actual noise or safety hazards generated by aircraft flight which would threaten the proposed development, implementation of the proposed project would not result in a significant land use compatibility impact, even though it would conflict with the adopted AELUP. Proposed land uses will remain in conflict with the AELUP until the AELUP is amended to reflect the non-aviation uses.

During operation of the former MCAS El Toro, communities in Orange County adopted and implemented land use plans that attempted to achieve compatibility with the noise and other hazards associated with the aircraft and other operations of the active base. In response to the passage of Measure W and the subsequent designation of the former base property for non-aviation uses, several jurisdictions within the area have begun reevaluating existing and planned land uses within areas that were formerly affected by noise and other hazards associated with aircraft overflight. For example, the City of Lake Forest is currently studying the potential to change land use designations on approximately 950 acres of vacant land within the City that were previously encumbered by the 65 CNEL contour as a result of that portion of the City's proximity to the former base. Implementation of the Base Plan or Overlay Plan would result in a non-aviation reuse of the former MCAS El Toro property; as such, the project would be consistent with these plans.

James A. Musick Jail Facility Expansion Plan

The proposed annexation of the Musick Jail will not conflict with the jail's proposed expansion plan since no change in the General Plan or zoning designation is proposed. EIR No. 564 does not identify any land use impacts for the jail expansion. The County has requested that 40 acres within PA 51 to the north and east of the jail facility be conveyed to the jail for agricultural use to off-set the agricultural land which will be lost with the expansion of the jail facility.

The areas proposed in EIR No. 564 for mitigation are located within land designated for agriculture in the proposed Orange County Great Park project. If the jail is expanded, the proposed project would allow for the loss of agricultural land resulting from the proposed jail expansion to be mitigated as identified in the recirculated sections of EIR No. 564. As such, there is no conflict between the proposed project and the jail expansion plan mitigation measure for loss of agriculture. No significant impact to this issue is anticipated.

Southern California Association of Governments

Consistency with SCAG RCPG Policies

The Growth Management Chapter of the Regional Comprehensive Plan and Guide (RCPG) contains a number of policies that are particularly applicable to the proposed project.

Core Regional Plan Policies

The population, housing and jobs forecasts, which are adopted by SCAG's Regional Council, and that reflect local plans and policies, shall be used by SCAG in all phases of implementation and review.

The project's consistency with SCAG's population, housing and jobs forecasts is analyzed in Section 5.13 – Population and Housing of this Final Program EIR. Please refer to Section 5.13 for this analysis.

- 3.01 The timing, financing, and location of public facilities, utility systems, and transportation systems shall be used by SCAG to implement the region's growth policies.

The Base Plan includes development of approximately 225 dwelling units, a 272-acre sports park, and 3,856,500 square feet of non-residential land uses (including retail, education, research and development, cultural and institutional, transportation facilities, and other uses). Under the Overlay Plan approximately 3,625 dwelling units, a 165-acre sports park, and 6,585,594 square feet of non-residential land uses (including education, research and development, retail, fairgrounds/commercial recreation, cultural and institutional, transportation facilities, and other uses) would be developed. These uses will be phased between 2007 and 2025.

Existing and planned public facilities, utility systems, and transportation systems consistent with SCAG's regional plans will be available to serve the site. A traffic study has been prepared for the project, which indicates that existing arterials can be improved to serve the project within acceptable levels of service or perform no worse than the level of service for the no project condition. Sections 5.14 – Public Services and Facilities and 5.15 – Utilities explain that the project will provide for the construction and operation of necessary services and facilities to serve the area. Property owners will also be required to enter into service agreements with utility and service providers prior to operation of any future new development. As part of the annexation application to LAFCO, the City will prepare an Urban Services Plan which demonstrates the City's ability to provide public services, facilities, and utilities to serve the unincorporated portion of the project site (PA 51 and PA 35) upon annexation into the City. These on-site improvements, extension of infrastructure, and required service agreements make the project consistent with this core policy.

The 1998 Regional Transportation Plan (RTP) also has policies, all of which are core, that pertain to this project. The RTP links the RCPG goal of sustaining mobility with the goals of fostering economic development, enhancing the environment, reducing energy consumption, promoting transportation friendly development patterns, and encouraging fair and equitable access to residents affected by socio-economic, geographic, and commercial limitations. Among the relevant policies in the RTP are the following:

4.01 Transportation investments shall mitigate environmental impacts to an acceptable level.

SCAG has adopted the following Regional Performance Indicators and associated objectives in support of this policy:

Mobility – Transportation Systems should meet the public need for improved access, and for safe, comfortable, convenient, and economical movements of people and goods.

Accessibility – Transportation Systems should ensure the ease with which opportunities are reached. Transportation and land use measures should be employed to ensure minimal time and cost.

Environment – Transportation Systems should sustain development and preservation of the existing system and environment. (all trips)

Safety – Transportation Systems should provide minimal risk, accident, death, and injury. (all trips)

Livable Communities – Transportation Systems should facilitate Livable Communities in which all residents have access to all opportunities and travel times. (all trips)

Equity – The benefits of transportation investments should be equitably distributed among all ethnic, age, and income groups.

Cost effectiveness – Maximize return on transportation investment. (all trips)

The proposed project addresses this policy and SCAG's performance measures for Mobility, Accessibility, Environment, and Livable Communities in several ways. First, with proposed improvements and mitigation, all intersections in the project vicinity will operate at acceptable levels of service and perform no worse than levels of service for the no project condition. Second, the project is located adjacent to the Santa Ana Freeway and the Foothill and Eastern Transportation Corridor toll roads, all with available capacity. Third, the project is located near existing major employment centers including the Irvine Business Center and the Irvine Spectrum, which are major employment and activity centers. The uses proposed by the project maximizes the use of existing urbanized areas and increases alternatives to the single-occupant vehicle, both of which minimize emissions and congestion impacts. Fourth, the proposed project provides a wide range of housing opportunities that will be available to a variety of income groups. By providing additional housing near existing and proposed employment centers, the project will also increase opportunities to shorten or eliminate trips and the associated congestion and air quality impacts. In addition, the project is in proximity to rail service at the existing Metrolink stop in Irvine Spectrum.

4.02 Transportation investments shall mitigate environmental impacts to an acceptable level.

Section 5.2 – Traffic/Circulation of this Final Program EIR identifies various transportation impacts and details measures to mitigate these impacts. Roadway and intersection improvements adjacent to and in the vicinity of the proposed project are identified in Section 5.2, which mitigate the traffic impacts of the proposed project.

Project-specific transportation improvements will be constructed prior to operation of proposed development. The project is consistent with this core policy.

4.04 Transportation Control Measures shall be a priority.

Various Transportation Control Measures are set forth in the South Coast Air Quality Management District AQMP as set forth in the subsequent two year segment of the Regional Transportation Improvement Program), including:

- High Occupancy Vehicle projects and pricing alternatives, park and ride lots, and intermodal facilities.
- Transportation improvements, urban freeway system management improvements, smart corridors TSM programs, railroad consolidation programs, CMP-based demand management strategies, vanpool programs, and bicycle and pedestrian facilities.
- Marketing information services for employers and activity centers to encourage shared rides and transit use, and transit pass centers.

Transportation Control Measures (TCMs) consist of regionally significant transportation projects in the first two years of the Regional Transportation Improvement Program. The proposed project supports SCAG's policy by addressing two relevant categories of TCMs: 1) High Occupancy Vehicle projects and pricing alternatives, park and ride lots, and intermodal facilities; and 2) transit improvements, urban freeway system management improvements, smart corridors, TSM programs, railroad consolidation programs, CMP-based demand management strategies, vanpool programs, telecommunications facilities, demonstration programs, and bicycle and pedestrian facilities.

The project will increase densities around the Foothill and Eastern Transportation Corridor toll roads, thereby increasing the use of these priced alternatives to HOV lanes. The Foothill and Eastern Transportation Corridors are TCMs within SCAG's 2001 RTP and the applicable 1997 Air Quality Management Plan. Increase use of the toll roads will relieve congestion and related emissions.

Project components and mitigation measures identified throughout the EIR will enhance the provision of TCMs such as transit improvements and bicycle and pedestrian facilities, which will extend the local transit system and encourage its use. The proposed project supports TCMs and is consistent with this policy.

4.07 Projects proposed for the Regional Transportation Improvement Program that do not indicate a reasonable phasing of construction between segments will not be approved.

The proposed project does not interfere with the provision of any new transportation projects that are included in the RTIP. Consistent with the intent of this policy, project-specific transportation improvements will be constructed prior to occupancy of development.

The Air Quality Chapter core action that is generally applicable to the project is as follows:

5.11 Through the environmental document review process, ensure that plans at all levels of government (regional, air basin, county, subregional, and local) consider air quality, land

use, transportation, and economic relationships to ensure consistency and minimize conflicts.

Section 5.3 – Air Quality of this Final Program EIR addresses the matter of regional transportation and air quality modeling consistency. Regional transportation/air quality impacts are mitigated by traffic improvements, increased accessibility to priced transportation alternatives, energy conservation measures, transit improvements, housing opportunities within proximity to employment centers, required Transportation Control and Transportation Demand Management measures, and pedestrian and bicycle improvements.

The Water Quality Chapter core recommendations and policy options relate to the two water quality goals: to restore and maintain the chemical, physical, and biological integrity of the nation's water; and to achieve and maintain water quality objectives that are necessary to protect all beneficial uses of all waters. The core recommendations and policy options that are particularly applicable to the project include the following:

- 11.02 Encourage “watershed management” programs and strategies, recognizing the primary role of local government in such efforts.

Section 5.7 – Hydrology/Water Quality of this Final Program EIR addresses the subject of watershed management strategies and project components and mitigation measures that have been incorporated into the project. The project provides opportunities to enhance regional drainage and water quality facilities on the project site (PAZs 22a and 22b). The project is consistent with this core RCPG policy.

- 11.05 Support regional efforts to identify and cooperatively plan for wetlands to facilitate sustaining both the amount and quality of wetlands in the region.

Section 5.9 – Biological Resources of this Final Program EIR acknowledges the loss of some highly disturbed wetland/riparian habitat that can be mitigated to restore significant wetland resources. Additionally, wetland creation would occur within the proposed Wildlife Corridor (see PAZs 22a and 22b) on Figure 3-3. The establishment of the Wildlife Corridor and Drainage Corridor will sustain important wetland resources in the project area.

- 11.07 Encourage water reclamation throughout the region where it is cost effective, feasible, and appropriate to reduce reliance on imported water and wastewater discharges. Current administrative impediments to increased use of wastewater should be addressed.

Reclaimed water will be used for park area and landscaping. The project is consistent with this core policy.

Ancillary (Advisory Only) Regional Plan Policies

- 3.04 Encourage local jurisdictions' efforts to achieve a balance between the types of jobs they seek to attract and housing prices.

The Base Plan would provide 225 multi-family units while the Overlay Plan would provide 1,100 low density, 860 medium density, and 1,500 medium-high density residential dwelling units, as well as 165 multi-family units that will be ensured for homeless providers through the Development Agreement. These additional housing units will be developed for a variety of income levels, which will help achieve the workforce housing goals of the City of Irvine 2000-2005 Housing Element, which is designed to achieve the SCAG-prepared Regional Housing Needs Assessment targets. The project is consistent with the intent of this ancillary RCPG policy.

- 3.05 Encourage patterns of urban development and land use that reduce costs on infrastructure construction and make better use of existing facilities.

The proposed project redevelops a property that was previously developed and used for military operations. The project is located in and adjacent to an existing urban area, allowing the optimal use of existing facilities, and orderly expansion of facilities, when necessary. Sections 5.14 and 5.15 of this Final Program EIR include a discussion of utilities and service systems. Since existing infrastructure is used to the extent possible, the project is supportive of this ancillary RCPG policy.

- 3.09 Support local jurisdictions' efforts to minimize the cost of infrastructure and public service delivery, and efforts to seek new sources of funding for development and the provision of services.

As discussed in Sections 5.14 and 5.15 of this Final Program EIR, infrastructure and services necessary to serve the site are readily available on-site and adjacent to the project site. The proximity and available capacity minimizes the cost of extending infrastructure into the project area. Funding improvements have been and will be made to ensure that these improvements are accomplished in a cost effective manner. Therefore, the project is fully supportive of this ancillary policy.

- 3.10 Support local jurisdictions' actions to minimize red tape and expedite the permitting process to maintain economic vitality and competitiveness.

The proposed project includes a General Plan Amendment and Zone Change for an approximately 4,400 acre project. Annexation of this area is anticipated by the end of 2003. This approach to processing the proposed project is consistent with this advisory policy.

- 3.11 Support provisions and incentives created by local jurisdictions to attract housing growth in job rich subregions and job growth in housing rich subregions.

The proposed Base Plan will allow for the creation of approximately 11,380 jobs on-site and 225 dwelling units. The 11,380 jobs are within the OCP 2000 projections for this area; however, the 225 housing units are additional units that are proposed in order to partially address that the project is located in a jobs rich subregion.

The Overlay Plan is expected to result in 1,100 low density, 860 medium density, and 1,500 medium-high density residential dwelling units as well as 165 multi-family units and 16,510 jobs on-site at buildout. The number of jobs does not exceed current OCP 2000 projections for the project area. Since the Orange County subregion is

considered to be jobs-rich and housing-poor, the provision of these housing units in terms of the subregional jobs/housing balance is considered beneficial.

Although the Subregion and City are expected to continue to be jobs rich in the future due to their attractive characteristics for business and economic forces in the region, the proposed project will provide housing in excess of OCP 2000 projections for the area.

- 3.12 Encourage existing or proposed local jurisdictions' programs aimed at designing land uses that encourage the use of transit and thus reduce the need for roadway expansion, reduce the number of auto trips and vehicle miles traveled, and create opportunities for residents to walk and bike.

As shown and discussed in Section 3.0 – Project Description of this Final Program EIR, the Base Plan proposes 99 acres of Transportation and Transit related facilities and 20 acres of Transit Oriented Development in the southern portion of the project area. The Overlay Plan proposes 210 acres of Transit Oriented Development in the southern portion of the project area. These land use proposals take advantage of the existing commuter rail station (the Irvine Multimodal Transportation Center) located within the project vicinity and encourage the increased use of transit in this area. As is also shown in the Section 3.0, both the Base Plan and Overlay Plan provide Class 1 trail facilities that traverse the project area. Additionally, as mitigation for the project, the City will coordinate with the Orange County Transportation Authority to restructure transit service plans to provide effective service to the project area.

- 3.13 Encourage local jurisdictions' plans that maximize the use of existing urbanized areas accessible to transit through infill and redevelopment.

The project is surrounded by existing development to the south, east and west and an existing rail line crosses the southern part of PA 51, which is used for Metrolink commuter rail and Amtrak passenger and freight services. By developing immediately adjacent to an existing urbanized area and in the vicinity of commuter rail and passenger facilities, the project enhances the options for non-motorized access throughout the larger area. The project proposes pedestrian sidewalks, bikeways and transit routes that will link to surrounding trails, land uses, and activity centers. Additionally, as mitigation for the project, the City will coordinate with the Orange County Transportation Authority to restructure transit service plans to provide effective service to the project area.

- 3.14 Support local plans to increase density of future development located at strategic points along the regional commuter rail, transit systems, and activity centers.

The proposed project is located in close proximity to the Irvine Multimodal Transportation Center, the I-5, the Foothill and Eastern Transportation Corridor toll facilities, and activity centers such as the Spectrum and Irvine Business Center. The proposed mix of land uses would create a major activity center at the project site, and would result in additional residents and businesses in proximity to these commuter rail, transit systems, and other major activity centers. The project is supportive of this ancillary policy.

- 3.15 Support local jurisdictions' strategies to establish mixed use clusters and other transit-oriented developments around transit stations and along transit corridors.

The proposed project is located in close proximity to the Irvine Multimodal Transportation Center, and the I-5, the Foothill and Eastern Transportation Corridor toll facilities. As shown in Section 3.0 – Project Description of this Final Program EIR, the Base Plan proposes 99 acres of Transportation and Transit related facilities and 20 acres of Transit Oriented Development in the southern portion of the project area. The Overlay Plan proposes 210 acres of Transit Oriented Development in the southern portion of the project area. These land use proposals take advantage of the existing commuter rail station (the Irvine Multimodal Transportation Center) located within the project vicinity, encouraging the increased use of transit in this area. The project is supportive of this ancillary policy.

- 3.16 Encourage developments in and around activity centers, transportation corridors, underutilized infrastructure systems, and areas needing recycling and redevelopment.

Per SCAG's policy, the proposed project is located in close proximity to the Irvine Multimodal Transportation Center, the Foothill and Eastern Transportation Corridor toll facilities, and activity centers such as the Spectrum and Irvine Business Center. Existing infrastructure serves the site, which was previously developed for military uses. Closure of the military base created a large area in the region that offered opportunity for recycling and redevelopment. The proposed project will redevelop the area, using some of the available capacity of the toll roads and the existing infrastructure on-site. Use of the existing toll roads will have benefits throughout the County, as the toll roads relieve congestion on competing free routes. SCAG's RTP supports the development of toll corridors as an innovative means of providing mobility and reducing congestion. Payment of fees and toll revenue provides additional funding sources for buildout of the transportation corridor system, while use of some of the existing infrastructure on-site provides for an economical and efficient use and extension of services and utilities in the subregion. The project is supportive of this ancillary policy.

- 3.17 Support and encourage settlement patterns that contain a range of urban densities.

As described in Section 3.0 – Project Description, the Base Plan will provide for the development of approximately 225 high density multi-family dwelling units on-site. The addition of multi-family units into this area will help provide a range of densities in a subregion that is largely developed with single-family homes. The Overlay Plan is expected to result in 1,100 low density, 860 medium density, and 1,500 medium-high density residential dwelling units, as well as 165 multi-family units, providing a range of urban densities within the project site. The project is supportive of this ancillary policy.

- 3.18 Encourage planned development in locations least likely to cause adverse environmental impact.

The project proposes redeveloping an area in which significant portions were previously disturbed by years of military use. The most environmentally and agriculturally significant areas of the project area will be preserved within the proposed Habitat Preserve, Open Space, Agriculture, Drainage/Riparian Corridor, and Wildlife Corridor

designations. Table 2-1 acknowledges that all biological impacts will be mitigated to a level less than significant. The project is supportive of this ancillary policy.

- 3.19 SCAG shall support policies and actions that preserve open space areas identified in local, state, and federal plans.

The Base Plan will preserve 716 acres within Open Space/Park, 438 acres of Agriculture, 974 acres of Habitat Preserve, 229 acres of Drainage/Riparian Corridor and 179 acres of Wildlife Corridor, which is consistent with the NCCP and City of Irvine agricultural preservation policies and programs. The Overlay Plan will preserve 382 acres within Open Space Park, 303 acres of Agriculture, 974 acres of Habitat Preserve, 229 acres of Drainage/Riparian Corridor, and 179 acres of Wildlife Corridor. The project is supportive of this ancillary policy.

- 3.20 Support the protection of vital resources such as wetlands, groundwater recharge areas, woodlands, production lands, and lands containing unique and endangered plants and animals.

Section 5.9 – Biological Resources of this Final Program EIR acknowledges the loss of some biological resources. Impacts to biological resources will be mitigated to a level less than significant with proposed mitigation and project components. For example, under either the Base Plan or Overlay Plan, wetland creation would occur within the proposed Wildlife Corridor (see Subareas 22a and 22b) on Figure 3-3. The establishment of the Wildlife Corridor and Drainage Corridor will sustain important wetland resources in the project area. Additionally, under both projects, the most significant ecological and agricultural areas are preserved within the Habitat Preserve, Drainage/Riparian Corridor, Wildlife Corridor and Agricultural Areas. The project supports this ancillary policy.

- 3.21 SCAG shall encourage the implementation of measures aimed at preservation and protection of recorded and unrecorded cultural and archaeological sites.

Section 5.11 – Cultural Resources includes a discussion of potential impacts to cultural and archaeological sites and proposes mitigation measures appropriate to reduce these impacts to a level less than significant. The project supports this ancillary policy.

- 3.22 SCAG shall discourage development, or encourage the use of special design requirements in areas with steep slopes, high fire, flood, and seismic areas.

Section 5.6 – Geology and Seismicity addresses potential hazards associated with steep slopes and seismicity. Sections 5.5 – Public Health and Safety and 5.7 – Hydrology and Water Quality address high fire and flood hazards and propose mitigation to reduce these hazards to a level less than significant. The project supports this ancillary policy.

- 3.23 Encourage mitigation measures that reduce noise in certain locations, measures aimed at preservation of biological and ecological resources, measures that would reduce exposure to seismic hazards, minimize earthquake damage, and to develop emergency response and recovery plans.

Various sections of this Final Program EIR (5.4 – Noise, 5.9 – Biological Resources, 5.6 – Geology and Seismicity, and 5.5 – Public Health and Safety) provide mitigation for potential impacts related to these environmental issue areas. The project supports this ancillary policy.

- 3.24 Encourage efforts of local jurisdictions in the implementation of programs that increase the supply and quality of housing and provide affordable housing as evaluated in the Regional Housing Needs Assessment.

The proposed project contributes to the City's Housing Element Goal of providing more housing for workers in the City. As described in Section 3.0 – Project Description, the Base Plan will provide for the development of approximately 225 high density multi-family dwelling units on-site. The addition of multi-family units into this area will help provide a range of densities in a subregion that is largely developed with single-family homes. The Overlay Plan is expected to result in 1,100 low density, 860 medium density, and 1,500 medium-high density residential dwelling units as well as 165 multi-family units, providing a range of urban densities within the project site. Each of the proposed project's will help meet the needs of different types of workers and will help meet the City's fair share allocation through 2025. The project supports this ancillary policy.

- 3.27 Support local jurisdictions and other service providers in their efforts to develop sustainable communities and provide, equally to all members of society, accessible and effective services such as: public education, housing, health care, social services, recreational facilities, law enforcement and fire protection.

Sections 5.14 – Public Services and Facilities and 5.15 – Utilities explain how the project will provide effective services to the project area. Section 5.13 – Population/Housing addresses how the Base Plan and Overlay Plan will provide a variety of additional housing opportunities for the City's workers. The project supports this ancillary policy.

- 9.01 Provide adequate land resources to meet the outdoor recreation needs of the present and future residents in the region and promote tourism in the region.

As described in Section 3.0 – Project Description of this Final Program EIR, the Base Plan will provide for 1,564 acres of Open Space/Park, Sports Park, and Golf Course uses as well as 478 acres of Cultural/Institutional and Exposition Center uses. The Overlay Plan will provide for 1,073 acres of Open Space/Park, Sports Park, and Golf Course uses as well as 156 acres of Cultural/Institutional uses. Each of the proposed projects is intended to help meet the City's and region's parks and recreational needs, as well as draw tourists to the area. The proposed project supports this ancillary policy.

- 9.02 Increase the accessibility to open space lands for outdoor recreation.

As described in Section 3.0 – Project Description of this Final Program EIR, the Base project will provide for 1,564 acres of Open Space/Park, Sports Park, and Golf Course uses as well as 478 acres of Cultural/Institutional and Exposition Center uses. The Overlay project will provide for 1,073 acres of Open Space/Park, Sports Park, and Golf Course uses as well as 156 acres of Cultural/Institutional uses. Bicycle and pedestrian

paths will also traverse the project site. The project's location and proximity to regional activity centers, transit, and regional corridors will increase accessibility to open space for outdoor recreation. The project supports this ancillary policy.

9.03 Promote self-sustaining regional recreation resources and facilities.

Discussions occur throughout the Final Program EIR regarding the project's recreation resources and facilities. The project is supportive of this ancillary policy.

9.04 Maintain open space for adequate protection of lives and properties against natural and man-made hazards.

Preservation of areas of permanent open space within the project area will protect lives and properties against natural and human-caused hazards by avoiding development within areas where developmental hazards occur. The project is supportive of this ancillary policy.

9.05 Minimize potentially hazardous development in hillsides, canyons, areas susceptible to flooding, earthquakes, wildfire, and other known hazards, and areas with limited access for emergency equipment.

Preservation of areas of permanent open space within the project area will protect lives and properties against natural and human-caused hazards by avoiding development within areas where developmental hazards occur. The project is supportive of this ancillary policy.

9.06 Minimize public expenditure for infrastructure and facilities to support urban type uses in areas where public health and safety could not be guaranteed.

Preservation of areas of permanent open space within the project area will protect lives and properties against natural and human-caused hazards by avoiding development within areas where developmental hazards occur. Retaining these areas as permanent open space will reduce the need for the extension of infrastructure and facilities into these areas. The project is supportive of this ancillary policy.

9.07 Maintain adequate viable resource production lands, particularly lands devoted to commercial agriculture and mining operations.

Both the Base Plan and Overlay Plan will impact land currently used for agricultural production. Section 5.8 – Agricultural Resources provides a detailed discussion of how the project will help protect and preserve remaining viable agricultural resources by helping to implement the Agricultural Legacy Program.

9.08 Develop well-managed viable ecosystems or known habitats of rare, threatened, and endangered species, including wetlands.

Section 5.9 – Biological Resources acknowledges that the Base Plan and Overlay Plan have the potential to impact the southern tarplant, which is a federal species of concern, disturbed wetland habitat, and a wide range of mature trees. However, under both the Base Plan and Overlay Plan, the most significant of these resources will be retained or

restored in the 974-acre Habitat Preserve area and within the Wildlife Corridor and Drainage/Riparian Corridor areas. Additional mitigation measures will reduce impacts to these ecosystems to a level less than significant. The project supports this ancillary policy.

Threshold 3. Would the project conflict with any applicable habitat conservation plan or natural community conservation plan?

Both the Base Plan and Overlay Plan incorporate the 974-acre NCCP Habitat Preserve into the project design. The Habitat Preserve has been conveyed to the Federal Aviation Administration, with the Department of the Interior managing the land as part of the NCCP/HCP. Since inclusion of the Habitat Preserve in the NCCP/HCP is consistent with the adopted NCCP/HCP, the proposed project will not result in an impact to any applicable conservation plan or natural community conservation plan.

Special Area Management Plan (SAMP)

The SAMP process is designed to complement the California Department of Fish and Game's (CDFG's) Natural Communities Conservation Planning (NCCP) program, as well as the U.S. Fish and Wildlife's Habitat Conservation Plan (HCP). Both the Base Plan and Overlay Plan incorporate the 974-acre NCCP/HCP Habitat Preserve into the project design. Additionally, under both the Base Plan and Overlay Plan, wetland creation would occur within the proposed Wildlife Corridor (see Subareas 22a and 22b) on Figure 3-3. The establishment of the Wildlife Corridor and Drainage Corridor will sustain important wetland resources in the project area. Additionally, all future projects developed in the project area will be required to meet federal, state, regional and local requirements regarding potential impacts to sensitive resources, which includes waters of the U.S., riparian and wetland areas, and streambeds. No impact associated with the SAMP will occur.

5.1.4 Significant Impacts

Base Plan and Overlay Plan

No significant land use impact has been identified.

5.1.5 Mitigation Measures

Base Plan and Overlay Plan

No significant land use impact has been identified. As a result, no mitigation measure is proposed.

5.1.6 Significance of Impacts After Mitigation

Base Plan and Overlay Plan

Not applicable.

5.10 Paleontological Resources

5.10.1 Environmental Setting

Former MCAS El Toro (PAs 51 and 30)

Paleontology is the study of forms of life existing in prehistoric or geologic times. Paleontological resources within the project area include: fossil specimens; three recorded and an undetermined number of unrecorded fossil sites, associated geologic and geographic site data; and fossil-bearing rock units. The potential for discovering paleontological resources varies depending upon the geologic formations, or rock units underlying the project area. Certain formations or units are characterized as having a high potential for yielding significant paleontological resources due to the abundance, densities or importance of fossils that have been uncovered in the region. Other formations are characterized as low or moderate as the formations have historically produced lesser amounts of fossils of importance.

A fossil specimen is considered scientifically highly important if it is identifiable, complete, well-preserved, age diagnostic, useful in environmental reconstruction, a type of specimen, a member of a rare species and/or a species that is part of a diverse grouping. Identifiable land mammal fossils, for example, are considered scientifically highly important because of their potential use in providing very accurate age determinations and environmental reconstructions for rock units in which they occur. Such remains are comparatively rare in the fossil record. While the paleontological importance of a rock unit is a measure of its potential for yielding valuable material, any fossil site containing identifiable fossil remains and the fossil bearing layer are considered highly important paleontologically.

The majority of Planning Areas 51, 35, and 30 (PAs 51, 35, and 30) lie on the Tustin Plain, a coastal alluvial plain. Alluvium from the Late Pleistocene to Holocene Epochs (approximately 2 million to 11,000 years ago) immediately underlies the majority of the project area, including the part occupying the coastal plain and the washes in the eastern portion of PA 51.

The eastern portion of PA 51 occupies the western foothills of the northern Santa Ana Mountains. The hills and ridges in the eastern part of PA 51 are composed of older, underlying, marine and nonmarine rock units of early Oligocene to late Pleistocene age (23 million to 2 million years ago). In order of decreasing geologic age, these latter rock units include the undifferentiated Sespe and Vaqueros Formations, Topanga and Monterey Formations, Oso Member of the Capistrano Formation, Niguel Formation, and Nonmarine Terrace Deposits. Nonmarine Terrace Deposits also underlie the terraces at the south corner of the PA 51. The northwestern corner of PA 51 contains a small portion of the Santa Ana Mountain foothills, which were separated from the main formation by erosion. This small portion is composed of undifferentiated late Cretaceous (135 million years ago) marine Williams Formation. The rock units underlying parts of PA 51 have previously yielded scientifically highly important fossil remains at recorded fossil sites on and near the site.¹ Three recorded fossil sites have been identified in PA 51 (vicinity of former MCAS El Toro).² These fossil sites occur in undifferentiated Sespe and Vaqueros Formation and in

Topanga Formation, dating from the early Oligocene to the early and middle Miocene (38 million to 15 million years ago). Fossil types include marine invertebrates and vertebrates, continental vertebrates, land plants, and land mammals. The three recorded fossil sites lie within the proposed habitat preserve portion of PA 51.

The majority of PA 30 is underlain by Pleistocene Alluvium. This formation is widespread in the Tustin Plain area, and is believed to extend to depths of 1,000 feet in PA 30. A significant deposit of Pleistocene terrestrial vertebrates was recovered during excavation of a flood control basin 4 miles from the PA 30. These finds were buried approximately ten feet below existing grade and consisted of partially articulated skeletons of camel, sloth, mammoth, horse, and bison. It is possible that similar beds underlie PA 30.³

In addition to already identified paleontological resources, as described previously, various rock units can be assigned levels of paleontological importance. The paleontological importance of a rock unit reflects its potential productivity and the scientific importance of the fossils it has produced locally. Potential paleontological productivity is based on the abundance or densities of fossil specimens and/or recorded fossil sites in exposures of the rock unit on or near the site. Exposures of a specific rock unit in the project area are most likely to yield fossil remains similar in species quantities and densities to nearby rock units. The location and paleontological importance of the rock units found in the project area is summarized in Table 5.10-1. Figure 5.10-1 depicts the paleontological sensitivity zones of the project area and surrounding areas.

**Table 5.10-1
Paleontological Importance of Rock Units
Found Within the Project Area**

Rock Unit	Project Area Vicinity	Planning Area	Paleontological Importance
Alluvium Less than 8' in depth Greater than 8' in depth	Coastal Plain and Washes	51, 35, 30	Low Moderate
Sespe and Vaqueros Formations, Topanga and Monterey Formations, Oso Member of the Capistrano Formation, Niguel Formation, nonmarine terrace deposits	Northeastern Hills and Ridges	51	Moderate to High
Nonmarine terrace deposits	South Corner	51	Moderate
Undifferentiated marine Williams Formation	Northwestern Corner	51	High

Draft Environmental Impact Report #563, August 1996

Notes: 1. The James A. Musick Jail Expansion and Operation EIR No. 564.

**Figure 5.10-1
Paleontological Sensitivity Zones**

Source: City of Irvine, General Plan

Figure 5.10-1
Paleontological Sensitivity Zones

A portion of the project area has been subject to substantial disturbance during more than 50 years as an operational military base. Base operations including ordnance storage, explosions, as well as runway and other facilities construction and operations may have previously impacted paleontological resources.

James A. Musick Jail Facility (Portion of PA 35)

James A. Musick Branch Jail is a relatively small portion of PA 35. The Musick Jail site lies on the Tustin Plain, a coastal alluvial plain. The site is located roughly northeast of the center of PA 51, near the western foothills of the northern Santa Ana Mountains. The Borrego Wash lies to the west/northwest of the jail site. As shown in Figure 5.10-1, the jail site is located in a low paleontologically sensitive zone. Areas in this zone typically have altered or geologically young rocks exposed at the surface and generally do not yield significant paleontological resources.

IRWD Parcel (Portion of PA 35)

The Irvine Ranch Water District (IRWD) parcel is also a relatively small portion of PA 35. The IRWD parcel also lies on the Tustin Plain, a coastal alluvial plain. The IRWD parcel lies roughly northeastern of the center of PA 51, near the western foothills of the northern Santa Ana Mountains. As shown in Figure 5.10-1, the IRWD parcel is located in a low paleontologically sensitive zone. Areas in this zone typically have altered or geologically young rocks exposed at the surface and generally do not yield significant paleontological resources.

5.10.2 Threshold for Determining Significance

The CEQA Environmental Checklist, Appendix G outlines the thresholds for determining significance for paleontological resources.

Would the project:

1. *Directly or indirectly destroy a unique paleontological resource or site or unique geologic feature?*

5.10.3 Environmental Impact

The following analysis focuses on the potential paleontological impacts associated with implementation of the Base Plan and the Overlay Plan for the Former MCAS El Toro (PAs 51 and 30). The Musick Branch Jail and the IRWD parcels are a portion of the annexation component of the proposed project; however, no new development is proposed for these parcels under the proposed project. Additionally, these parcels are located in a low paleontologically sensitive zone, as depicted in Figure 5.10-1, and this area is unlikely to produce fossils. As a result, implementation of the proposed project will not result in a

significant paleontological impact associated with the annexation of the James A. Musick Jail Facility and the IRWD Parcel.

Threshold 1: Directly or indirectly destroy a unique paleontological resource or site or unique geologic feature?

Base Plan and Overlay Plan

Direct impacts to paleontological resources occur when earthwork activities, such as grading and trenching operations, cut into the geologic deposits (formations) within which fossils are buried. These impacts will occur during buildout of the project area. These direct impacts are in the form of physical destruction of fossil remains and could result in the loss of paleontological resources, including, an undetermined number of unrecorded fossil sites, associated geologic and geographic site data, and fossil bearing rocks. As shown in Table 5.10-1, future grading in the project area associated with future development has the potential to impact paleontological resources in the coastal plain and washes, northeast, northwest and southern portions of PA 51. These areas are identified as moderately to highly paleontologically sensitive. Earthmoving operations, such as grading and trenching, have the potential to impact buried paleontological resources.

The three previously recorded fossil sites in PA 51 lie within the proposed habitat preserve portion of PA 51. No development is proposed in this portion of the project area under the proposed land uses. No significant impact to these sites is anticipated from implementation of the proposed project. The proposed habitat preserve has been identified for ownership by the US Department of the Interior to complement the adjacent Natural Community Conservation Program/Habitat Conservation Program (NCCP/HCP) Reserve System (refer to Section 5.9 for a discussion of the NCCP/HCP). Any activities in this area will be under the discretion of the Department of the Interior, upon transfer of the land from the DON.

Pleistocene terrestrial vertebrates were discovered four miles from PA 30. Similar beds of Pleistocene terrestrial vertebrates may underlie PA 30. Development proposed by the OCGP Base Plan, including the transit oriented development, sports park, agriculture, and autocenter land uses, may impact beds of Pleistocene terrestrial vertebrates located in the area. According to the proposed Overlay Plan, development in this area would include low density residential, research and development, and autocenter uses, which may impact beds of Pleistocene terrestrial vertebrates.

The scientific knowledge associated with paleontological resources and formations can benefit from uncovering buried resources during development activity. For example, fresh exposure of fossil bearing rock could allow for the discovery of an undetermined number of unrecorded fossil sites and the recovery of scientifically highly important fossil remains that otherwise might not have been exposed without the earth moving. These remains and associated geologic and geographic data, instead of being lost to grading or unauthorized fossil collecting, would be preserved in an institution, where they would be available for future study by qualified investigators. There is potential that some of these remains might represent new or rare species, new geologic or geographic records and/or more complete specimens for some species than have been found previously in the fossil bearing rock unit of Orange County. These remains would provide a more comprehensive paleontological

resource inventory of the project site and the surrounding area than is now available or would have been available without the proposed project.

5.10.4 Significant Impacts

Base Plan and Overlay Plan

- P1.** Earthmoving operations such as grading and trenching has the potential to impact buried paleontological resources in the moderately to highly sensitive areas in the coastal plain and washes, northeast, northwest and southern portions of PA 51. This is considered a significant impact.

Additionally, pleistocene terrestrial vertebrates have been discovered four miles from PA 30. Similar beds of Pleistocene terrestrial vertebrates may underlie PA 30. This impact is considered significant.

5.10.5 Mitigation Measures

Base Plan and Overlay Plan

- P1.** Prior to issuance of a grading permit for any portion of the project area, a qualified paleontologist shall be retained by the City or designee to carry out an appropriate paleontology investigation of the area proposed for grading. (A qualified paleontologist is defined as an individual with an M.S. or Ph.D. in paleontology or geology who is familiar with paleontological procedures and techniques.) The City of Irvine has standard conditions applied prior to the issuance of grading permits when a project site includes potentially significant paleontological sites, and paleontological monitoring conditions have not been attached to the previous map approval. These standard conditions include retaining a qualified paleontologist, establishing procedures for cultural and scientific resource surveillance, and protection of any resources discovered during the grading process.

When fossils are discovered, the paleontologist (or paleontological monitor) shall recover them. In most cases, this fossil salvage can be completed in a short period of time. However, some fossils specimens (such as a complete large mammal skeleton) may require an extended salvage period. In these instances the paleontologist (or paleontological monitor) shall be allowed to temporarily direct, divert or halt grading to allow recovery of fossil remains in a timely manner. Because of the potential for the recovery of small fossil remains, such as isolated mammal teeth, it may be necessary in certain instances to set up a screen-washing operation on-site.

Fossil remains collected during the monitoring and salvage portion of the mitigation program shall be cleaned, repaired, sorted, and cataloged. Compliance with this measure shall be verified by the Community Development Department.

5.10.6 Significance of Impacts After Mitigation

Base Plan and Overlay Plan

Less than significant.

5.11 Cultural Resources

Cultural resources include archaeological and historical resources. The CEQA Guidelines define “historical resources” in Section 15064.5. When a project will impact an archaeological site, CEQA requires a determination of whether the site is a historical resource.

The following analysis of cultural resources is based on Marine Corps Air Station El Toro Reuse Plan Technical Report J: *Cultural and Scientific Resources*, Greenwood and Associates, July 16, 1996.

The report referenced above is included as Appendix J of the County of Orange MCAS El Toro Community Reuse Plan Draft Environmental Impact Report No. 563 (DEIR 563).

5.11.1 Environmental Setting

Carbon dating indicates human habitation of the Southern California coastline began as long as 14,800 to 17,150 years ago. The first human inhabitants of this area have been described as small bands of roaming hunters, probably arriving in search of pristine hunting grounds. The majority of artifacts identified from this period consist of stone tools for hunting and butchering, with a marked absence of grinding implements. Few prehistoric sites from this period have been recorded, and there are only a handful of sites in Los Angeles and Orange counties.

By about 7,500 years ago, an increase in the use of grinding implements became visible in the archaeological record initiating a new phase in California’s prehistory. Often referred to as the Milling Stone Horizon, this period demonstrates an increase in the size and duration of prehistoric settlements. More is known about this cultural horizon because a greater number of archaeological sites from this period have been recorded, especially in the Southern California coastal region where numerous archaeological surveys have been conducted.

Between 1,500 and 2,500 years ago, the cultural groups of Southern California were subject to the intrusion of a culture that migrated west from the Great Basin area. The new culture brought new technologies and practices, as well as a new language known as Shoshonean. Shoshonean groups are believed to have been well established in Southern California a minimum of 1,200 years ago and possibly as early as 3,000 years ago. Resident coastal and inland populations were apparently displaced to the north and south by the Shoshoneans, forming a wedge between the linguistically similar Hokan-speaking Chumashan and Yuman peoples.

The Shoshoneans were the dominant culture in the Los Angeles Basin until the arrival of Spanish Missionaries in the early 16th century. Mission San Gabriel was established in 1771 and began slowly integrating the surrounding population. The Shoshonean culture inhabited portions of the project area. The project area fell within the sphere of influence of

Mission San Gabriel and the native population in this area became known as Gabrielinos. Three miles south of the project area is Aliso Creek, the dividing line between the Gabrielinos and the Juanenos, similarly named after the Mission San Juan Capistrano.

Former MCAS El Toro (PAs 51 and 30)

James Irvine, a Scotch-Irish pioneer, created the Irvine Ranch (the predecessor to The Irvine Company) between 1864 and 1876 by purchasing three distressed ranchos: San Joaquin, Santiago de Santa Ana and Lomas de Santiago. He consolidated 110,000 acres, including a portion of the project area, into what became known as the Irvine Ranches. The land was devoted primarily to agricultural production of cattle, fruits and vegetables. In 1942, a military pilot's fleet operational training facility was established through condemnation of a portion of the project area, approximately 2,340 acres of the Irvine Ranch Corporation. In the following year, the facility was commissioned as MCAS El Toro. No permanent structures existed on the property prior to those built by the military.

Historic Cultural Resources

National Register criteria for evaluation (36 CFR 60.4) state that ordinarily a property that has achieved significance within the past 50 years shall not be considered eligible for the National Register unless it is of exceptional importance. However, in 1991 Congress created the Legacy Cold War Project (Public Law No. 101-511, §8120) to be carried out by the DOD. The project's purpose is to aid in the preservation of physical and literary properties and objects from the Cold War period (from the end of World War II (WWII) to the break-up of the former Soviet Union in 1991). Because this period was mostly within the last 50 years, many Cold War Legacy sites might not otherwise be eligible for the State or National Register of Historic Places (SRHP, NRHP). Portions of PA 51 and 30 (the former MCAS El Toro) were established during WWII, and no structure earlier than this period is present at the former MCAS El Toro. Therefore, the historical significance of any structures at the former MCAS El Toro would be as part of the Cold War Legacy. However, surveys by the US Army Corps of Engineers and the DON prepared in conjunction with the closure of MCAS El Toro concluded that there were no structures eligible for designation as Cold War Legacy or for inclusion on the NRHP.

There are no features or characteristics of the project area that define or include unique ethnic cultural values. There are no known or documented religious or sacred uses associated with the project area.

Prehistoric Cultural Resources

Ten prehistoric archaeological sites and eight isolated prehistoric artifacts have been recorded in the northeastern habitat preserve portion of PA 51 (Orange County General Plan Planning Area Zone 3). The known sites occur on ridges between Borrego Canyon Wash and Agua Chino Wash. The sites appear to be ineligible for inclusion in the State's Sparse Lithic Scatters Program (Jackson, et al. 1988:1). The US Corps of Engineers, with concurrence of the State Office of Historic Preservation, recommended that seven of the recorded prehistoric sites be evaluated to determine eligibility for nomination to the NRHP. As part of the Base Realignment and Closure Cleanup Plan for MCAS El Toro further

evaluation of one additional archaeological site located in the central portion of PA 51 was recommended.

There are two prehistoric sites, CA-ORA-551 and -602, and one prehistoric isolate located within a one-half mile radius of PA 30 (potentially located in PA 51). There are no recorded prehistoric or historic sites within PA 30, although approximately 95 percent of PA 30 has yet to be surveyed.

James A. Musick Jail Facility (Portion of PA 35)

Historical/archaeological resources were not analyzed in the County of Orange James A. Musick Jail Expansion and Operation EIR No. 564. According to the City of Irvine General Plan (Figure E-1), there are no historical/archaeological resources identified on the Musick Jail site.

IRWD Parcel (Portion of PA 35)

The IRWD parcel contains two water storage reservoirs and associated pumping and distribution facilities. According to the Irvine General Plan (Figure E-1), there are no historical/archaeological resources identified on the IRWD parcel.

5.11.2 Threshold For Determining Significance

The CEQA Environmental Checklist, Appendix G outlines the thresholds for determining significance for cultural resources.

Would the project:

1. *Cause a substantial adverse change in the significance of a historical resource as defined in § 15064.5 of the CEQA Guidelines;*
2. *Cause a substantial adverse change in the significance of an archaeological resource pursuant to § 15064.5 of the CEQA Guidelines; or*
3. *Disturb any human remains, including those interred outside of formal cemeteries?*

5.11.3 Environmental Impact

The following analysis focuses on the potential cultural resources impacts associated with implementation of the Base Plan and the Overlay Plan for the Former MCAS El Toro (PAs 51 and 30). The Musick Branch Jail and the IRWD parcels are a portion of the annexation component of the proposed project; however, no new development is proposed for these parcels under the proposed project. Additionally, Figure E-1 of the City of Irvine General Plan indicates there are no historical/archaeological resources on the Musick Jail site. As a result, implementation of the proposed project will not result in a significant cultural

resources impact associated with the annexation of the James A. Musick Jail Facility and the IRWD Parcel.

Threshold 1: Would the project cause a substantial adverse change in the significance of a historical resource?

Base Plan and Overlay Plan

Demolition of existing structures on the former MCAS El Toro site (PA 51) and future development of the former MCAS El Toro could potentially degrade historical resources. The DON has determined that buildings on-site are not Cold War Legacy eligible, nor are they eligible for the NRHP. No significant impact to National Register-eligible property will result from implementation of the Base Plan or Overlay Plan.

The historical museum/collection that was previously located on former MCAS El Toro in Buildings 243 to 245 and the vintage aircraft on the base has been relocated to Marine Corps Air Station Miramar (MCAS Miramar) in San Diego, California. Therefore, implementation of the Base Plan or Overlay Plan will not result in a significant impact to the museum and the vintage aircraft.

Because there are no features or characteristics of the project area, which define or include unique ethnic cultural values, the Base Plan or Overlay Plan will not result in a significant impact to unique ethnic cultural values.

Because there are no known or documented culturally significant religious or sacred uses associated with the project area, the Base Plan or Overlay Plan will not result in a significant impact to culturally significant religious or sacred uses.

In summary, development of the project area according to the Base Plan or Overlay Plan will not cause a substantial adverse change in the significance of any historical resource.

Threshold 2: Would the project cause a substantial adverse change in the significance of an archaeological resource?

Base Plan and Overlay Plan

The majority of previously documented archeological resources in the project area are located in the portion of Planning Area 51 designated as Habitat Preserve. Under both the Base Plan and the Overlay Plan, this area will be used as natural open space to protect sensitive wildlife habitat. No intensive development is proposed under the Base Plan or Overlay Plan in this area and no significant impact to this issue is anticipated. Public access will be limited in keeping with the habitat management plan (see Section 5.9 – Biological Resources).

There are two prehistoric sites, CA-ORA-551 and -602, and one prehistoric isolate located within a one-half mile radius of PA 30. There are no recorded prehistoric or historic sites within PA 30, although, approximately 95 percent of PA 30 has not been surveyed. Development is proposed in this area, and there is the potential that archaeological resources are present that may be disturbed during grading activities associated with future development of this area.

Grading activities associated with future development of the project area under the proposed Base Plan or Overlay Plan may result in a significant impact to archaeological sites in PA 51 and PA 30. Additionally, the proposed project would result in substantial soil disturbance in areas where construction is proposed. Construction activities may uncover previously unknown archaeological resources. The potential to encounter unknown archaeological resources is a significant impact.

Threshold 3: Would the project disturb any human remains, including those interred outside of formal cemeteries?

Base Plan and Overlay Plan

There are no known human remains in the project area. However, grading activities could uncover previously unknown human remains especially in PA 30 where 95 percent of the area has not been surveyed. Grading activities will result in a significant impact to this issue throughout development of the project area. Implementation of the Base Plan and the Overlay Plan has the potential to uncover previously unknown human remains, including those interred outside of formal cemeteries, and the impact is considered significant.

5.11.4 Significant Impacts

Base Plan and Overlay Plan

- Cult1.** Grading activities associated with future development of the project area may cause a substantial adverse change in the significance of an archaeological resource. Mitigation Measures Cult B1 through Cult B3 will reduce this impact to a level less than significant.
- Cult2.** Grading activities could uncover previously unknown human remains, including those interred outside of formal cemeteries. Mitigation Measure Cult B4 will reduce this impact to a level less than significant.

5.11.5 Mitigation Measures

The following measures have been developed to provide assurances that significant cultural resource impacts or potentially significant cultural resource impacts associated with the proposed project will be mitigated to a level less than significant. This assurance is obtained by verification, which would occur at subsequent levels of environmental review. Finally, in some instances, it is not possible at this program level of analysis to determine if cultural resource impacts would occur from the implementation of specific actions. For these situations, mitigation measures provide for further review at the time of specific development proposals in the project area. Increased planning detail developed at the development proposal level will clarify the specific impacts and options available for mitigation. As such, these measures are not intended to restrict the development of appropriate mitigation measures, as determined through analysis at a subsequent level of review.

Base Plan and Overlay Plan

Cult1. Prior to subdivision for development, a detailed archaeological report(s) shall be prepared within PAs 51 and 30. This report(s) shall specifically address the potential for encountering archaeological resources at the time specific development is proposed. The report(s) shall provide recommendations to prevent degradation of archaeological resources such as site avoidance and data recovery. Recommendations contained in the report shall be implemented. Compliance with this measure shall be verified by the Community Development Department.

Cult2. Monitoring of excavation and grading activities associated with future development in PAs 51 and 30 shall be conducted by a certified archaeologist in accordance with the report required in Mitigation Measure Cult1. If resources are encountered in the course of ground disturbance, the archaeological monitor shall be empowered to halt grading and to initiate an archaeological testing program. The testing shall include recordation of artifacts, controlled removal of the materials, and an assessment of their importance under CEQA and the City's local guidelines. Compliance with this measure shall be verified by the Community Development Department.

Cult3. Prior to the issuance of grading permits and/or building permits for any future development in PAs 51 and 30, a detailed mitigation program shall be submitted by the applicant to the City of Irvine to address archaeological resources discovered during grading. Provisions of the program shall include an immediate evaluation of the find by a qualified archaeologist. If the find is determined to be a unique archaeological resource, contingency funding and a time allotment sufficient to allow for implementation of avoidance measures or appropriate mitigation shall be available. Work may continue on other parts of the construction site while archaeological resource mitigation takes place. The City of Irvine has standard conditions applied prior to the issuance of grading permits when a project site includes potentially significant archaeological sites. These include retaining a qualified archaeologist, establishing procedures for cultural and scientific resource surveillance, and protection of any resources discovered during the grading process. Compliance with this measure shall be verified by the Community Development Department.

Cult4. Prior to the issuance of any grading and/or building permits, a mitigation program shall be submitted by the developer to the City of Irvine to address the accidental discovery or recognition of any human remains. The program shall include the following:

There shall be no further excavation or disturbance of the site or any nearby area reasonably suspected to overlie adjacent human remains until:

C The county coroner must be contacted to determine that no investigation of the cause of death is required, and

If the coroner determines the remains to be Native American:

- C *The coroner shall contact the Native American Heritage Commission within 24 hours.*
- C *The Native American Heritage Commission shall identify the person or persons it believes to be the most likely descended from the deceased Native American.*
- C *The most likely descendent may make recommendations to the landowner or the person responsible for the excavation work, for means of treating or disposing of, with appropriated dignity, the human remains and any associated grave goods as provided in Public Resources Code Section 5097.98, or*
- C *Where the following conditions occur, the landowner or his authorized representative shall rebury the Native American human remains and associated grave goods with appropriate dignity on the property in a location not subject to further subsurface disturbance.*
 - o *The Native American Heritage Commission is unable to identify a most likely descendent or the most likely descendent failed to make a recommendation within 24 hours after being notified by the commission.*
 - o *The descendant identified fails to make a recommendation; or*
 - o *The landowner or his authorized representative rejects the recommendation of the descendant, and the mediation by the Native American Heritage Commission fails to provide measures acceptable to the landowner.*

Compliance with this measure shall be verified by the Community Development Department.

5.11.6 Significance of Impacts After Mitigation

Base Plan and Overlay Plan

Less than significant.

5.12 Aesthetics

5.12.1 Environmental Setting

Project Area Viewsheds

Access to the project area is generally restricted. Public views are only available from adjacent roadways such as Irvine Boulevard, Trabuco Road, Alton Parkway, Sand Canyon Road, Barranca Parkway, I-5, SR-133, SR-241, and the Eastern Transportation Corridor. The major feature within the project area is the former MCAS El Toro property (PAs 51 and 30). Views of the former MCAS El Toro property include a variety of land uses, structures and facilities of differing types, sizes, architectural styles, and age. The structures include runways and aprons, hangars, warehouses, barracks housing, offices, commercial structures, recreational facilities, a golf course, single-family housing units, and agricultural areas. In addition, the Musick Branch Jail Facility and IRWD parcel (portions of PA 35) are located adjacent to the northeastern edge of the base. Views of the Musick Jail Facility are limited as it is surrounded by a security fence, as well as office and light industrial buildings within the bordering Irvine Spectrum and City of Lake Forest. The water storage and distribution facilities located on the IRWD parcel are visible from Irvine Boulevard. Due to the size of the entire project area, views from locations near the site are often limited to the immediate foreground area, while more distant locations afford panoramic views of the area.

There are no designated County or State scenic highways in or near the project area. However, Sand Canyon Avenue is a designated rural/natural character Scenic Highway in the City of Irvine General Plan. The General Plan also designates the Santa Ana (I-5) Freeway as an urban character Scenic Highway.

A number of residential areas near the site also have views of the project area. These include the residential areas west of Jeffrey Road in the City of Irvine, west of the project area. The residents of this area can view the western edge of the project area through the eucalyptus windrow trees on Sand Canyon Road. To the south, the residential areas of Laguna Woods, Laguna Hills and Aliso Viejo are at higher elevations than the project area and thus have panoramic views of the project area. Residences at Foothill Ranch to the northeast are also located at a higher elevation and have panoramic views of the project area.

Visual Quality

Former MCAS El Toro (PAs 51 and 30)

The physical qualities of the former MCAS El Toro property (PAs 51 and 30) depend on the land uses and structures found in various areas. The most prominent features of the central portion of the property are the aircraft runways, which, together with the connecting aprons between the runways, form a large concrete "X" on the ground when viewed from higher elevations. Turf areas are interspersed between and around the runways and aprons.

The areas north of Irvine Boulevard (PA 51) and south of Barranca Parkway (PA 30) (the northern and southern portions of the former MCAS El Toro property) are used for agriculture and are characterized by flat, open fields and low plantings. Agricultural areas are also located on the eastern section of the property along Irvine Boulevard and adjacent to the facility to the west, east, and southeast.

The eastern section of PA 51 (east of Irvine Boulevard) is a vacant rolling hillside area with one-story beige and brown single-family detached homes at the foot of the hill. This area is referred to as the Wherry Housing Area and is developed with nearly identical homes on curvilinear streets lined with mature trees. The vacant hillsides are occupied primarily by coastal sage scrub and are an extension of the hillside areas within Limestone Canyon Regional Park to the north and east. A dirt road winds through the undeveloped hillside area.

The southeastern section of PA 51 (west of the Borrego Canyon Wash and Alton Parkway) is developed with the Marine Memorial Golf Course and warehouse structures used for storage, maintenance, and operation of the facility. The golf course offers views of open grassy areas and stands of trees, while the warehouse structures are mainly cream-colored box buildings surrounded by pavement.

The northeastern section of PA 51 (west of Irvine Boulevard and Trabuco Road) is also occupied by a number of warehouse structures and paved areas around the runway and aprons. An elementary school is located within this area. A barbed wire fence surrounds the eastern edge of this area, with a few scattered trees. The land along Irvine Boulevard is used for agriculture and as an equestrian center.

The northwestern section of PA 51 (east of the Eastern Transportation Corridor) is developed with former barracks housing, commercial buildings, office structures, open fields, and recreational areas. The structures consist of one- to four-story buildings, with a mix of old and new structures, and reflecting a variety of architectural styles. Game fields, a tot lot, and picnic areas are found on the northern end and mature trees and landscaping are found throughout this area. This area has the highest intensity of development on the property. The range of land uses and structures within this area create visual variety not found in other areas of the facility.

The southwestern section of PA 51 (east of the Southern California Regional Rail Authority [SCRRA] railroad line) is developed with three aircraft hangars, warehouse buildings, storage areas, and paved areas for aircraft storage and circulation. The structures in this area are larger than most other structures found on the property and create an industrial section at the former military facility.

James A. Musick Jail Facility (Portion of PA 35)

The existing development within the Musick Jail Facility (located in PA 35) includes open areas used for agriculture on the western and southern portions of the jail site and scattered buildings at the northeastern section consisting of offices, men's and women's compounds, shops, warehouse, nursery, chicken coops, and maintenance facilities. The existing structures resemble light industrial and office buildings, similar to those found in the surrounding area. Public views of the jail facility are limited to the trees and security fencing along the perimeter of the site, and distant views of the on-site buildings.

IRWD Parcel (Portion of PA 35)

The IRWD parcel contains two water storage reservoirs and associated pumping and distribution facilities. These facilities are visible from Irvine Boulevard.

Light and Glare

Former MCAS El Toro (PAs 51 and 30)

Existing sources of light at the former MCAS El Toro property (PAs 51 and 30) include street lights along on-site roadways, runway lighting, lights along the runway aprons, parking lot lighting, and security lighting around the site and the buildings on-site. These light sources do not adversely affect adjacent land uses since only industrial, office and agricultural uses are found near the property. Residences with views of the facility are not impacted by existing light sources on the site since the residences are located at least two miles from the property. The agricultural areas to the north and south and the golf course to the east are not an existing light source. Sources of glare such as glass, metal and polished exterior building materials are not generally found on existing structures on the former MCAS El Toro property and do not create glare problems. However, the large expanses of concrete pavement and building walls on-site, as well as the overall lack of landscaping, generate some glare on adjacent uses.

James A. Musick Jail Facility (Portion of PA 35)

Exterior lighting at the jail (located in PA 35) consists of security lighting around buildings, with some light standards exceeding 16 feet in height. All lighting is directed toward buildings and not outward from the jail site. Agricultural lands surround the jail to the north and west. Structures housing light industrial uses surround the jail to the east and south. Thus, adjacent land uses are not adversely affected by lighting associated with the jail facility.

IRWD Parcel (Portion of PA 35)

On-site lighting for the IRWD parcel is provided for security reasons. The lighting is minimal and is directed toward the existing structures. Vacant land and the Musick Jail Facility surround the IRWD parcel. As a result, adjacent land uses are not adversely affected by on-site lighting.

Topography

Former MCAS El Toro (PAs 51 and 30)

The majority of the former MCAS El Toro property (PAs 51 and 30) has little topographic relief, with a slight slope (1.5 to 2.5 percent) to the west and southwest, and a gently sloping to steep hillside area at the eastern section of the site. Elevations in this portion of the project area range from approximately 200 feet above mean sea level (MSL) at the western corner of PA 51 to approximately 450 feet above MSL on Irvine Boulevard at the Wherry Housing Area and rising to over 750 feet above MSL at the eastern corner by the Foothill Transportation Corridor. The Santa Ana Mountains are north and east of the property and rise to 6,698 feet above MSL. The San Joaquin Hills south of the site rise to approximately 1,170 feet above MSL. The area south of Barranca Parkway has moderate slopes ranging from five to 20 percent. The former MCAS El Toro's general southwestern slope is interrupted by the manmade undulations at the Marine Memorial Golf Course (southeastern section) and the drainage areas along this course.

James A. Musick Jail Facility (Portion of PA 35)

The Musick Jail Facility property (portion of PA 35) is relatively flat, with a slight slope to the southwest. No visually significant topographic features are present on the site.

IRWD Parcel (Portion of PA 35)

The IRWD parcel (portion of PA 35) is also relatively flat with no visually significant topographic features present on the parcel.

5.12.2 Threshold For Determining Significance

The CEQA Environmental Checklist, Appendix G outlines the thresholds for determining significance for aesthetics.

Would the project:

1. *Result in the visible grading of over 5,000 cubic yards on any 20-acre portion of the project site; or visible cut and fill slope over 25 vertical feet?*
2. *Result in the obstruction of views from officially designated vista points or scenic routes?*
3. *Result in the creation of light spillover and glare effects that present a nuisance to residential land uses?*
4. *Result in the substantial alteration of the existing landform of the site or of a unique topographic feature on the site?*

5. *Substantially degrade the existing visual character or quality of the project area and its surroundings?*
6. *Substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historical buildings within a state scenic highway?*
7. *Create a new source of substantial light or glare which would adversely affect day or nighttime views in the area?*

5.12.3 Environmental Impact

The following analysis focuses on the potential aesthetic impacts associated with implementation of the Base Plan and the Overlay Plan for the Former MCAS El Toro (PAs 51 and 30). The Musick Branch Jail and the IRWD parcels are a portion of the annexation component of the proposed project; however, no new development is proposed for these parcels under the proposed project. EIR No. 564 was prepared by the County of Orange and identifies mitigation measures for aesthetic impacts that may occur with the expansion of the Musick Jail Facility. The mitigation measures address landscaping, building design, and screening walls to avoid negatively impacting neighboring areas. Should the jail be expanded in the future, it would not negatively impact land uses in the project area, as proposed land uses in this portion of PA 51 consist of habitat preserve, agricultural, and open space uses. As a result, implementation of the proposed project will not result in a significant aesthetic impact associated with the annexation of the James A. Musick Jail Facility and the IRWD Parcel.

Base Plan

Implementation of the proposed project will lead to the eventual demolition of the majority of the existing structures in the former MCAS El Toro property (PAs 51 and 30) and the possible reuse of some structures. Development sequencing will be linked to the availability of infrastructure, the completion of hazardous materials cleanup, and the removal of runways. Thus, the visual characteristics of the site will slowly change as parkland improvements are implemented, new structures are built and new roads and landscaping are provided. As defined in the OCGP Base Plan land use plan, the former MCAS El Toro property will be primarily developed with open space and recreational uses.

The northeastern section of the project area, referred to as PAZ3, is currently a generally undeveloped hillside area. This area is proposed as Habitat Preserve, and the existing open space within this area will be preserved. No changes to the visual character of the hillsides will occur under the proposed project.

The northwestern portion of PA 51 is proposed to be retained for agricultural land uses. The central and eastern portions of PA 51 will feature a park, sports park, and golf course. A wildlife corridor traverses PA 51 generally in north to south direction in the eastern portion of the area.

On the western site of PA 51, educational uses, research and development, and sports park uses are proposed.

The southern section of PA 51 and a portion of PA 30 will be developed with institutional uses and transportation facilities. Most of PA 30 consists of agriculture, sports park, and transit oriented development. The wildlife corridor traverses the planning area in a north to south direction. The southernmost portion of PA 30, south of Bake Parkway, will consist of an autocenter.

The primary land use component of the OCGP Base Plan will be open space. Open space land uses, including parks, golf courses, sports parks, and exposition center, will be provided throughout PAs 51 and 30, which will provide visual amenities to the entire area. Furthermore, this formerly restricted area will become accessible to the general public which will benefit from visual enhancements provided by the project with respect to the expanded golf course area, wildlife corridor, and central park. Landscaped parkways and pedestrian greenways will provide linkages to different areas of the community and between sectors and parks.

Overlay Plan

As defined in the OCGP Overlay Plan land use plan, the former MCAS El Toro property will be primarily developed with open space and recreational uses. Additionally, low density residential, transit oriented development, and research and development land uses would occupy substantial portions of the project area.

The northeastern section of the project area, referred to as PAZ3, is currently a generally undeveloped hillside area. This area is proposed as Habitat Preserve, and the existing open space within this area will be preserved. No changes to the visual character of the hillsides will occur under the proposed project.

The northwestern portion of PA 51 is proposed to be retained for agricultural land uses. The central and eastern portions of PA 51 will feature a park, sports park, and golf course. A wildlife corridor traverses PA 51 generally in a north to south direction in the eastern portion of the area. The southern section of PA 51 will be developed with mainly institutional and transit oriented land uses.

Most of the PA 30 consists of transit oriented development and research and development. The wildlife corridor traverses the planning area in a north to south direction. The southernmost portion of PA 30, south of Bake Parkway, will consist of an autocenter.

The primary land use component of the OCGP Overlay Plan will be open space. Open space land uses, including parks, golf courses, sports parks, and exposition center, will be provided throughout PA 51, which will provide visual amenities to the entire area. Furthermore, this formerly restricted area will become accessible to the general public which will benefit from visual enhancements provided by the project with respect to the expanded golf course area, wildlife corridor and central park. Landscaped parkways and pedestrian greenways will provide linkages to different areas of the community and between sectors and parks.

Threshold 1: Result in the visible grading of over 5,000 cubic yards on any 20-acre portion of the project site; or visible cut and fill slope over 25 vertical feet?

Base Plan and Overlay Plan

The portion of PA 51 proposed for development and park uses, and all of PA 30 consist of relatively flat or slightly sloping terrain, and grading activities associated with any future development of PAs 51 and 30 pursuant to the proposed GPA and Zone Change, and consistent with the Orange County Great Park land use plan, will not be expected to adversely affect existing topography of the site.

The hillside areas of PA 51 to the east (PAZ 3) will be preserved as a natural habitat area and no grading or cut and fill on slopes over 25 vertical feet will occur. The Marine Memorial Golf Course will likewise be retained and the manmade terrain on this golf course generally maintained. A portion of the existing agricultural area south of Barranca Parkway (PA 30) will be retained; however, the areas of PA 30 proposed for sports park and auto center under the Base Plan, and transit oriented development and research and development may require filling to achieve a flat terrain suitable for development. Grading, due to the implementation of the proposed project, on the flatter areas of the former MCAS El Toro facility are not expected to involve over 5,000 cubic yards on any 20-acre portion of the property since the proposed developments are expected to maintain the flat topography of the site. Only minor grading will be required to create level pads. No grading related aesthetic impacts on PAs 51 and 30 are anticipated to occur.

Threshold 2: Result in the obstruction of views from officially designated vista points or scenic routes?

Base Plan and Overlay Plan

Since there are no scenic routes in the area, no impact on the existing scenic resources of the City or the region is anticipated with new development resulting from implementation of the proposed project.

Threshold 3: Result in the creation of light spillover and glare effects that present a nuisance to residential land uses?

Base Plan and Overlay Plan

Future development of PAs 51 and 30 pursuant to the proposed GPA and Zone Change, and consistent with the Orange County Great Park land use plan, will lead to the introduction of new sources of light and glare within the project area. These sources include street lighting along planned roadways, exterior lighting (including security lighting and parking lot lighting) for various educational and institutional developments, lighting associated with auto center, and recreational sports field lighting. The project will involve development of athletic fields which will likely contain night lighting. The City has adopted a standard for athletic field lighting to minimize light spillover to adjacent property and reduce glare (City of Irvine Park Standards Manual). Section II Environmental Control requires that the luminaries used to provide light on the recreational athletic fields shall include reflectors and application technology designed to protect the environment surround the facility. However, the potential for a significant light and glare impact may occur should proposed light sources be directed into or located near existing or planned residential uses, which are sensitive to light intrusion during nighttime hours. Reflective materials and glazed

or polished exterior surfaces associated with the research and development land uses may create glare, which could cause visual nuisance residential land uses. This is considered a significant impact.

Threshold 4: Result in the substantial alteration of the existing landform of the site or of a unique topographic feature on the site?

Base Plan and Overlay Plan

No unique geologic or topographic feature exists within the project area. The majority of planned development proposed under the GPA and Zone Change, consistent with the Orange County Great Park Base Plan, will occur on the flat areas of the former MCAS El Toro facility (PAs 51 and 30). Under the proposed habitat preserve designation, in the eastern section of PA 51 the existing moderate to steep terrain and hillsides in this area will be preserved. No impact on the topography of the Santa Ana Mountains to the north and east is expected as a result of implementing the proposed project. The continued use of the Marine Memorial Golf Course will also preserve the manmade topography of the golf course area. The rolling area located south of Barranca Parkway may require filling to achieve a flat terrain for the sports park under the Base Plan, or research and development uses under the Overlay Plan. This is not expected to represent a significant impact since the surrounding properties all have flat terrain. Future development under the proposed project is expected to maintain the flat topography of the rest of the former MCAS El Toro property.

Threshold 5: Substantially degrade the existing visual character or quality of the project area and its surroundings?

Base Plan and Overlay Plan

New development proposed under the GPA and Zone Change, consistent with the Orange County Great Park Base Plan, would change the visual appearance of the former MCAS El Toro facility (PAs 51 and 30) from the current air station facilities and associated uses to that, in the western portion of the project area, of more intensive urban development. New buildings and roadways are proposed on the property, some of which may be several stories tall. These new developments would be visible to motorists along existing adjacent roadway (Sand Canyon Road) and from homes located west and at higher elevations southeast and northeast of the site. Additionally, under the Overlay Plan low density residential development is proposed for PAZ 2, located in the northern portion of the PA 51. New public roadways are planned in the project area that will increase the visibility of the area to the public. Educational, research and development, and institutional development will be readily visible within the western portion of the property. The visual characteristics of the site will slowly change as new structures are built and new roads and landscaping are provided. This change in the visual appearance of the project area has the potential to result in a significant aesthetic impact.

However, new development within PAs 51 and 30 will be required to comply with the development standards in the City's Zoning Ordinance. This entails City approval of architectural plans, landscape plans, and signage for each development to ensure new development is consistent with the City's Land Use Element, Circulation Element design policies, Zoning Ordinance, and the Landscape Ordinance and Guideline Manual of the City of Irvine, as well as surrounding land uses.

Threshold 6: *Substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historical buildings within a state scenic highway?*

Base Plan and Overlay Plan

There is no designated state scenic highway in the vicinity of the project area. Therefore, no impact to scenic resources within a state scenic highway would occur with the implementation of the project under the Base Plan and the Overlay Plan.

Threshold 7: *Create a new source of substantial light or glare which would adversely affect day or nighttime views in the area?*

Base Plan and Overlay Plan

Future development of PAs 51 and 30 pursuant to the proposed GPA and Zone Change, and consistent with the Orange County Great Park land use plan, will lead to the introduction of new sources of light and glare within the project area. These sources include street lighting along planned roadways, exterior lighting (including security lighting and parking lot lighting) for various educational and institutional developments, the auto center and lighting associated with recreational sports fields. The potential for a significant light and glare impact may occur should proposed light sources be directed into or located near existing or planned residential uses, which are sensitive to light intrusion during nighttime hours. This is considered a significant impact.

5.12.4 Significant Impacts

Base Plan and Overlay Plan

- A1.** Future development of PAs 51 and 30 pursuant to the proposed GPA and Zone Change, and consistent with the Orange County Great Park land use plan, will lead to the introduction of new sources of light within the project area. These sources include street lighting along planned roadways and exterior lighting (including security lighting and parking lot lighting) for various educational and institutional developments, and lighting associated with athletic fields. The potential for a significant light impact may occur should proposed light sources be directed into or located near existing or planned residential uses, which are sensitive to light intrusion during nighttime hours. This is considered a significant impact. Implementation of Mitigation Measures A1 and A2 will reduce the impact to a level less than significant.
- A2.** Future development of PAs 51 and 30 pursuant to the proposed GPA and Zone Change, and consistent with the Orange County Great Park Base Plan, will lead to the introduction of new sources of glare within the project area. Reflective materials and glazed or polished exterior surfaces associated with the research and development land uses may create glare, which could cause visual nuisance to residential land uses. This is considered a significant impact. Implementation of

Mitigation Measures A1 and A2 will reduce the impact to a level less than significant.

5.12.5 Mitigation Measures

Base Plan and Overlay Plan

- A1. Prior to issuance of grading permits, lighting plans and signage plans for new development shall be reviewed by the Community Development Department to ensure that minimal light intrusion and spillover into adjacent residential areas occurs.
- A2. Prior to the issuance of grading permits, and during the master plan review process for future development in the project area, the Director of Community Development shall ensure that mirrored and highly reflective surfaces are discouraged or, where proposed, shall be accompanied by a design-level glare impact analysis that demonstrates no adverse visual impairment to motorists or other visual nuisance occurs.

5.12.6 Significance of Impacts After Mitigation

Base Plan and Overlay Plan

Less than significant.

Notes and References

None.

5.13 Population and Housing

This section incorporates by reference a general discussion of the population, housing, and employment trends cited in the City of Irvine's Northern Sphere Area General Plan Amendment and Zone Change EIR¹¹ as well data projections from the Orange County Great Park Plan and its supporting technical documents.³

5.13.1 Environmental Setting

The former MCAS El Toro is currently in caretaker status. A limited number of military and civilian staff work at the site to carry out continuing base closure and maintenance activities; however, no one lives at the base. The number of vacant dwelling units on the site is as follows: 4,380 group quarter units and 1,209 residential family units.⁴

Local and Regional Planning Projections

The project area's demographics are best examined in the context of existing and projected population for the Orange County region and the City of Irvine. Information on population, housing, and employment for the project area is available from several sources:

U.S. Census Data

The United States Bureau of the Census publishes population, household and employment data gathered through the decennial census. This data provides a record of historic growth rates in Orange County and the City of Irvine. Table 5.13-1 shows Orange County's population, housing, and employment and its rate of growth since 1980. Table 5.13-2 presents City of Irvine's population, housing, and employment and its rate of growth since 1980.

Table 5.13-1
Orange County Population, Housing, and Employment
1980 Through 2000

	1980	1990	2000
Population	1,932,709	2,410,556	2,846,289

Orange County Projections

Orange County jurisdictions and public agencies develop demographic estimates and projections to provide a common foundation for regional and local planning, policymaking, and infrastructure provision. Orange County agencies have executed a Memorandum of Understanding with the Orange County Council of Governments (OCCOG) to contract with the Center for Demographic Research at California State University, Fullerton, to develop and periodically update demographic projections for Orange County. OCCOG adopted the most recent projections, entitled Orange County Projections 2000 (OCP-2000), at the Jurisdiction, Regional Statistical Area, Community Analysis Area, and Census Tract levels. In addition, the Center for Demographic Research and the Orange County Transportation Authority distribute OCP-2000 projections to small geographic areas called Traffic Analysis Zones (TAZ) for small scale planning purposes. For example, OCP-2000 TAZs can be aggregated to approximate the boundaries of the proposed project.

OCP-2000 provides the best available projections of anticipated growth for Orange County. OCP-2000 projects the amount and distribution of population, housing, and employment growth based on detailed information about growth trends, development and local land use provided by Orange County jurisdictions and public agencies; infrastructure, utility and service providers; and the private sector. The process for developing the projections is described in "Orange County Projections 2000." (California State University, Fullerton, Center for Demographic Research, September 2000).

The OCP-2000 projections correlate closely with the 2000 US Census results. Orange County's 2000 census population is within 1.2 percent of the OCP-2000 figure. The City of Irvine's OCP-2000 population for 2000 varies less than one percent from the census count. Likewise, both the City's and the County's census housing counts are less than one percent below OCP-2000. Direct comparisons of employment projections are not possible at this time, as 2000 Census employment estimates will not be released until sometime in 2003. In the interim, the Center for Demographic Research adjusts OCP projections to reflect California Employment Development Department employment projections.

Table 5.13-3 presents OCP-2000 projections for Orange County and City of Irvine population, housing and employment for the 2000 through 2025 period.

Table 5.13-3
OCP-2000 Projections for Orange County and the City of Irvine
2000 Through 2025

	2000	2005	2010	2015	2020	2025
Population						
County	2,853,757	3,031,440	3,168,942	3,270,677	3,342,829	3,416,037
Irvine	144,802	173,182	179,836	182,933	192,836	194,913
Dwelling Units						
County	978,004	1,018,873	1,056,882	1,080,430	1,096,824	1,115,823
Irvine	53,750	63,200	64,904	66,686	68,439	68,883
Employment						
County	1,502,434	1,667,778	1,796,726	1,897,350	1,975,074	2,043,665
Irvine	176,986	209,464	227,879	248,731	252,940	261,309

Source: OCP-2000, adopted by the Orange County Council of Government, June 2000.

Note: Projections are for July, 2000, 2005, 2010, 2015, 2020, and 2025.

Regional Projections

OCP-2000 projections are submitted as Orange County's input to regional growth projections prepared for the six-county Southern California region by the Southern California Association of Governments (SCAG). OCP-2000 provided the background for SCAG's adopted 2001 Regional Forecast for Orange County which is similar, but not identical, to OCP-2000 for 2025. SCAG's regional forecast modifies the OCP-2000 growth distribution to reflect regional transportation and housing policies and is not constrained by local general plans like OCP-2000.

Population Growth – Orange County

Population growth in Orange County has maintained a strong but diminishing pace in recent decades. From 1980 to 1990, population increased 47,785 annually, slowing to an average annual increase of 43,573 people during the 1990's. Orange County's current population is 2,846,289 as reported by the 2000 Census.

Based on Orange County's historic share of California's and the region's employment growth; migration and immigration trends; fertility rates; and local General Plans and zoning, OCP-2000 projects that this trend will continue at a diminished rate, with the County growing by an average of 22,491 people per year, from 2000 to 2025. Population growth will be fueled in large part by natural increase. Births are expected to account for 85 percent of the County's future population growth (The Orange County Planner, August/September 2001).

Population Growth – City of Irvine

The City of Irvine mirrors the County's growth. During the 1980's the City's population increased 77 percent, an annual average increase of 4,757 people. This rate cooled in the 1990's, yielding a 30 percent increase (3,337 annual average increase) over the decade. The 2000 Census reports that the City's current population is 143,072.

OCP-2000 projects how population growth within the County will be distributed over the next 25 years. OCP-2000 projects an annual average population increase of 2,004 between 2000 and 2025. In 2000, the City of Irvine's population represented 5.07 percent of the total County population. In 2025, this proportion is projected to climb to 5.71 percent.

Housing Growth – Orange County

Housing growth in Orange County has not matched the pace set by population growth. From 1990 to 2000, Countywide households increased 11 percent at an annual average rate of 9,441 units.

At present, Orange County has 969,484 households, with 2.9 persons per household on average; approximately 62 percent of the County's housing stock is single family units (2000 Decennial Census). The California Department of Finance estimated the January 2001 vacancy rate at 3.52 percent. As approved with input from local jurisdictions, OCP-2000 projects that the County's housing stock will increase by 137,819 units (14.1 percent) by 2025, an average rate of 5,513 dwelling units per year. Thus, the number of persons per household is projected to rise slightly to accommodate a population that is growing faster than the housing stock.

Housing Growth – City of Irvine

The City of Irvine reflects the County's housing growth. During the 1990's the City's housing increased 27 percent, at an annual average rate of 1,149 units. By 2025, OCP-2000 projects a 28 percent increase of 15,133 units (an average of 605 units per year), a housing growth rate half that experienced during the 1990's. In 2025, the City's housing units would grow to 6.2 percent of the County total despite the projected slowdown in housing production rates.

Table 5.13-4 summarizes the City's current housing stock. In 2000, the City of Irvine's dwelling units represented 5.5 percent of the total County housing stock. The City's housing stock is 64 percent single-family units, compared with 61 percent countywide. According to the California Department of Finance, January 2001 vacancy rate was 4.68 percent, above the countywide rate of 3.52 percent. The City's 2000-2005 Housing Element defines 3.1 percent as an optimal vacancy rate.

Table 5.13-4
City of Irvine 2000 Housing Units by Type

	Units	Percent of Total Units
Single-Family Detached	20,191	39.7
Single-Family Attached	12,262	24.1
Multi-Family, 2-4 Units	3,084	6.1
Multi-Family, 5 or More Units	14,307	28.1
Mobile Homes	1,000	2.0
Total Units	50,844	100.0

Source: California Department of Finance, January 2000 estimate.

Note: 2000 Census details on housing units by type is not yet available.

Housing affordability and availability have become major housing policy issues within the City, regions and state. The City of Irvine prepared the 2000-2005 Housing Element of its General Plan to provide a long-term blueprint for housing within the context of local and regional trends and housing production and housing affordability goals.

Housing affordability is a function of income and housing cost. Housing costs in Irvine have escalated steeply in recent years. Median home sales prices in the City ranged from \$304,000 to \$337,000, depending on zip code, as of August 2001 (DataQuick, August 2001). The City of Irvine's Housing Element adopted the objective of increasing affordable housing opportunities through new construction, and establishes a citywide Affordable Housing Needs goal of devoting five percent of units built for households earning less than 50 percent of the County's median family income, and five percent of units for households earning 81 to 120 percent of the County's median family income. These goals may be satisfied through on-site or off-site construction based on the availability of financial incentives (City of Irvine, 2000-2005 Housing Element, November 2000).

The Housing Element notes that the Affordable Housing Needs goal and implementation programs are needed to meet new production targets set by California's Department of Housing and Community Development to encourage each jurisdiction in the state to provide its fair share of very low, low and moderate income housing needed during the 2000-2005 time period. These numerical housing production goals are known as Regional Housing Needs Assessment (RHNA) targets. State law requires that the Housing Element of the General Plan identifies RHNA targets and document programs designed to meet the targets. To this end, the Housing Element analyzes housing needs within the City's demographic context; reviews potential market, governmental, and other constraints to meeting the City's housing needs; evaluates the resources available to meet housing needs; and finally, establishes policies and objectives to make progress in meeting its housing needs during the five-year period. The Department of Housing and Community Development certified the City's Housing Element in May 2002.

Irvine's Housing Element contains a package of goals, objectives and policies designed to meet its 2000-2005 RHNA targets as well as other housing needs in the City. Table 5.13-5 shows the City's RHNA goal of providing 10,782 additional units to meet the needs of very low, low, moderate, and upper income households in the City.

Table 5.13-5
City of Irvine Regional Housing Needs Assessment Targets
2000-2005

Household Income Category	Target
Very Low Income	1,942 units
Low Income	1,186 units
Moderate Income	2,049 units
Upper Income	5,605 units
Total	10,782 units

Source: City of Irvine, 2000-2005 Housing Element, November 2000.

Notes:

Very Low = 0-50% of Area Median Family Income (MFI)

Low = 51-80% of MFI

Moderate = 81-120% of MFI

Upper = Greater than 120% of MFI

Employment Growth – Orange County

From 1990 to 2000, countywide employment increased 15.1 percent, an average of 19,734 jobs annually. As of June 2000, Orange County has 1.5 million jobs. California's Employment Development Department estimates the current unemployment rate at 2.5 percent. OCP-2000 projects the County will continue to grow by 541,231 jobs, an average of 21,649 jobs per year through 2025. This constitutes a 36 percent increase over the 25-year period.

Employment Growth – City of Irvine

The City of Irvine's employment increased 16 percent during the 1990's, with an annual average increase of 2,555 jobs. The City's 2000 employment base was 176,986 jobs. The City's resident labor force is composed of 71,280 workers, with an unemployment rate of 1.9 percent. (California Employment Development Department, June 2000). The City of Irvine estimates that 13 percent of these workers both reside and work within the City (GPA 40 EIR: Larson, City of Irvine, 2000). Universities, bio-medical and high technology firms are the largest employers within the City.

OCP-2000 projects a 48 percent employment increase of 84,323 jobs, an annual average increase of 3,373 jobs between 2000 and 2025. In 2000, the City of Irvine's employment represented 11.8 percent of the total County employment. In 2025, Irvine is projected to garner 12.8 percent of county employment.

Jobs/Housing Ratio

The ratio of jobs to housing units in the area has environmental implications related to transportation and air quality. According to SCAG, areas having a jobs/housing ratio greater than the regional average are considered jobs-rich, while areas with ratios lower than the regional average are considered housing-rich. The SCAG regional average jobs/housing ratio was 1.25 in 1997, whereas the Orange County subregion had a jobs/housing ratio of 1.52 during the same period. The SCAG 2001 Regional Transportation Plan adopted forecast and the OCP-2000 data both indicate that the area surrounding the former MCAS El Toro and Orange County as a whole are considered jobs-rich and housing-poor. Thus, a major focus of regional planning efforts has been to improve the balance in all affected subregions in order to reduce vehicular trips, costly infrastructure improvements, and resultant air emissions.

Vehicle miles traveled (VMT) relates directly to the amount of vehicular air pollutants produced in a given region. Therefore, the Air Quality Management Plan (AQMP)⁷ adopted by the South Coast Air Quality Management District (SCAQMD) attempts to reduce VMT via trip reduction incentives and programs, including the analysis of new development to determine its effect on the subregional jobs/housing balance. According to SCAG projections, the Orange County subregion's jobs/housing balance will worsen through 2025 as the number of jobs surpasses gains in housing.

5.13.2 Threshold For Determining Significance

The CEQA Environmental Checklist, Appendix G of the CEQA Guidelines, outlines the thresholds for determining significance for population/housing.

Would the Project:

1. *Induce substantial population growth in the area, either directly (for example, by proposing new homes and businesses) or indirectly (for example through extension of roads or other infrastructure).*
2. *Displace substantial numbers of existing housing necessitating the construction of replacement housing elsewhere.*
3. *Displace substantial numbers of people, necessitating the construction of replacement housing elsewhere.*

Section 15131 of the Guidelines indicates that socioeconomic impacts may be considered significant if a physical change caused by the project results in a social or economic impact, or if the economic or social impact results in a physical change in the environment. Section 21082.2 of CEQA states that "social or economic impacts which do not contribute to, or are not caused by, physical impacts on the environment . . ." do not qualify as evidence to support the finding of a potentially significant impact. Since the mere occurrence of social or economic impacts are not considered potentially significant unless causally related to a particular change in the physical environment, economic, and social impacts can only be ascribed significance if currently available analytical evidence suggests such an impact.

5.13.3 Environmental Impact

The following analysis focuses on the potential impacts associated with implementation of the Base Plan and the Overlay Plan for the Former MCAS El Toro (Pas 51 and 30). The Music Jail and the IRWD parcels are a portion of the annexation component of the proposed project; however, no new development is proposed for these parcels under the proposed project. As a result, implementation of the proposed project will not result in a significant population and housing impact associated with the annexation of the James A. Music Jail Facility and the IRWD Parcel.

Threshold 1: Induce substantial population growth in the area, either directly (for example, by proposing new homes and businesses) or indirectly (for example through extension of roads or other infrastructure).

Base Plan

The proposed OCGP Base Plan will result in provision of housing (and related population), businesses (and related employment), and infrastructure. Direct population growth from provision of on-site housing is examined in this section. Indirect growth inducement (from provision of infrastructure and employment) is examined in Section 7.2 – Growth Inducing Impacts.

Population

The proposed Base Plan is expected to result in the provision of 225 dwelling units. Based on the City of Irvine's zoning categories planned for the site, these dwelling units could accommodate up to 500 people. This increase in population will not substantially exceed OCP-2000 projections for the site. As discussed previously, the provision of on-site housing and the associated population will be beneficial in regards to Orange County's jobs/housing ratio. No significant impact associated with this issue will occur.

Housing

The proposed Base Plan is expected to result in 225 dwelling units at buildout. The provision of these housing units will not substantially exceed projections contained in OCP-2000. This is not considered a significant impact. Since the Orange County subregion is considered to be jobs-rich and housing-poor, the provision of these housing units in terms of the subregional jobs/housing balance is considered beneficial.

Employment – Short-Term Impacts

Temporary short-term construction jobs will be created during the lifetime of the proposed project. The number and type of jobs will fluctuate over time depending on the type and size of construction projects. Since construction jobs will be created for the duration of the project buildout, consideration of all types of employment is discussed below in regards to long-term impacts for the entirety of project implementation. No significant project-related, short-term impact will occur in terms of population and housing concentrations because adequate infrastructure and public services will be required prior to construction of residential units.

Employment – Long-Term Impacts

The proposed Base Plan is expected to result in the generation of approximately 11,380 jobs on-site. These jobs will not exceed OCP-2000 projections for the site. However, the provision of these jobs will contribute to worsening Orange County's jobs/housing ratio imbalance. This impact is considered significant.

Overlay Plan

Population

The proposed Overlay Plan is expected to result in provision of 3,625 dwelling units as discussed above. Based on the City of Irvine's zoning categories planned for the site, these dwelling units could accommodate up to 9,000 people. This increase in population will not substantially exceed projections contained for the site in OCP-2000, and this impact is not considered significant. As discussed previously, the provision of on-site housing and the associated population will be beneficial in regards to Orange County's jobs/housing balance.

Housing

The proposed Overlay Plan is expected to result in 1,100 low density, 860 medium density, and 1,500 medium-high density residential dwelling units at buildout. Additionally, 165 dwelling units will be ensured for homeless providers through an agreement with the DON. The provision of these housing units will not substantially exceed projections contained in OCP-2000. Since the Orange County subregion is considered to be jobs-rich and housing-poor, the provision of these housing units in terms of the subregional jobs/housing ratio is considered beneficial. No impact associated with this issue will occur.

Employment – Short-Term Impacts

Temporary short-term construction jobs will be created during the lifetime of the proposed project. The number and type of jobs will fluctuate over time depending on the type and size of construction projects. Since construction jobs will be created for the duration of the project buildout, consideration of all types of employment are discussed in regards to long-term impacts below for the entirety of project implementation. No significant project-related, short-term impact will occur in terms of population and housing concentrations because adequate infrastructure and public services will be required prior to construction of residential units.

Employment – Long-Term Impacts

The proposed Overlay Plan is expected to result in approximately 16,510 jobs on-site. These jobs will not exceed OCP-2000 projections for the site. However, the provision of these jobs will contribute to worsening Orange County's jobs/housing imbalance. This impact is considered significant.

Other Considerations with the Base Plan and Overlay Plan

Project Plan Implementation

The primary purpose of the Orange County Great Park Base and Overlay Plans is to provide open space/park/recreational opportunities at the former MCAS El Toro. Another intention of the proposed project is to provide uses oriented toward a diverse range of jobs.

Base Closure Homeless Act Compliance

Objective C-7 of the City of Irvine Housing Element includes the preparation of policies and implementation plans for compliance with the Base Closure Community Redevelopment and Homeless Assistance Act of 1994.⁹ The County of Orange, as the designated LRA, has prepared a homeless assistance plan, which is the only such plan currently proposed for implementation at this time. The City supports this plan.

Infrastructure and Social Support Services Demanded by Increased Land Use Intensity

Despite employment and housing increases, development and infrastructure phasing will ensure that such increases are according to a plan that provides adequate physical and social support systems. Project growth has been determined by affected utility purveyors and service agencies to be compatible with existing and planned support systems (i.e., infrastructure, utilities, public services, housing, recreation, public health facilities, etc.). Housing and employment opportunities within the project area will serve to lessen vehicle trips outside of the project area and will enhance the interrelated nature of the project land uses.

Consistency With Regional Planning Projections

Table 5.13-6 shows the population, housing, and employment levels that are anticipated to result in the annexation area from development of the proposed project land uses. Relative differences among the proposed project, baseline conditions, and OCP-2000 are evident. Changes associated with the County's proposed expansion of the James A. Musick Jail are not incorporated into the figures since the proposed annexation is not determinant of the eventual outcome of that proposed expansion and will, therefore, not result in project-related changes at the jail site.

In net figures (i.e., project buildout minus baseline conditions), the proposed Base Plan would generate an estimated 11,380 new jobs; increase the project area population by approximately 500 persons; and provide up to 225 new residential units. The proposed Overlay Plan would generate an estimated 16,510 jobs; increase the project area population by approximately 9,000 persons; and provide up to 3,625 new residential units. In terms of consistency with 2001 SCAG population, housing, and employment figures, the project differences are potentially significant from a planning perspective. However, the same projections in SCAG's 1998 RTP differ from those currently adopted by SCAG. Table 5.13-7 shows 1998 and 2001 SCAG projections for future years.

**Table 5.13-6
Future Population, Housing, and Employment**

	Baseline (1999)	OCP-2020 (2025)¹	Base Plan (2040)	Overlay Plan (2040)
Population	0	5,468	538 ²	8,676 ²
Housing	1,209 residential family units and 4,380 group quarter units	2,079 dwelling units	225 multi-family residential units	3,625 single and multi- family residential units
Employment	0	28,931 jobs	11,380 jobs on-site	16,510 jobs on-site

¹ Column based on demographic projections provided by the County of Orange that assume a non-specific, mid-size aviation operation at the former MCAS El Toro for Community Analysis Area (CAA) 54. Since EIR 563, OCP-2000, and 1990 Census data do not identify specific growth estimates for the portion of the former MCAS El Toro within CAA 53 only, CAA 54 is used exclusively as the year 2025 estimate adopted in regional growth projections. Actual growth estimates for the former MCAS El Toro are slightly higher.

² Based on State Department of Finance Census 2000 per household population of 2.96 for the County of Orange.

Table 5.13-7
Variation in SCAG Projections for Orange County
1998 RTP and 2001 RTP

	2000	2010	2015
Population			
1998 RTP	2,868,000	3,105,500	3,165,400
2001 RTP	2,699,585	3,160,512	3,272,412
Projection Difference	-159,515	+55,012	+107,012
2025 Base Plan-Related Increase	500		
2025 Overlay Plan-Related Increase	9,000		
Housing			
1998 RTP	910,000	1,013,100	1,064,100
2001 RTP	917,169	1,009,370	1,035,379
Projection Difference	+7,069	-3,730	-28,721
2025 Base Plan-Related Increase	225		
2025 Overlay Plan-Related Increase	3,625		
Employment			
1998 RTP	1,381,700	1,717,400	1,882,600
2001 RTP	1,501,864	1,798,090	1,888,935
Projection Difference	+120,164	+80,690	+6,335
2025 Base Plan-Related Increase	11,380		
2025 Overlay Plan-Related Increase	16,510		

Sources: *Regional Transportation Plan 1998 and 2001*. Southern California Association of Governments.

Table 5.13-7 indicates that regional projections are dynamic and, as a compilation of local land use projections, reflect changing community views on the location and types of growth desired. The data also indicates the project's incremental effects on those projections are also variable in their significance when evaluated against those regional projections.

In addition, the environmental significance of the deviation from SCAG projections is weighed not only in terms of numerical differences but also in terms of the project's conformity with goals and policies relating to mobility, job creation, housing provision, and environmental protection.

Jobs/Housing Ratio

As noted previously, the area surrounding the former MCAS El Toro and the Orange County Subregion are considered jobs-rich and housing-poor. Therefore, SCAG seeks to encourage housing growth over job growth in the Orange County subregion. Theoretically, the relative abundance of employment and lack of housing opportunities in the Orange County subregion results in increased vehicle miles traveled (VMT) since part of the work force consists of commuters who are drawn into the Orange County region for employment.

The proposed Base Plan and Overlay Plan for the former MCAS El Toro site would substantially alter the projected employment generation characteristics of Irvine. Since the Orange County Subregion is anticipated to become increasingly jobs-rich over the next 20 years, the project-related employment would exacerbate the subregional jobs/housing imbalance. As a result, the proposed project will not improve and would only exacerbate the Orange County's overall jobs/housing imbalance and the impact is considered significant and unavoidable.

New employment opportunities on the former MCAS El Toro site would generate increased demand for a range of housing in the area as some new employees may relocate to be nearer to their jobs. According to the City of Irvine 2000-2005 Housing Element, an additional 10,782 housing units are needed to achieve the City's Regional Housing Needs Assessment (RHNA) goal. A portion of this housing demand is expected to be absorbed in existing residential projects currently being developed in the surrounding area. A portion of this induced housing growth would be absorbed in residential projects currently planned and/or under development. Additionally, the opening of new development areas as a result of completion of the Foothill and Eastern Transportation Corridors would thereby increase the potential supply of housing in the surrounding area.

A primary purpose of SCAG jobs/housing objectives is to reduce VMT and consequent congestion and air pollution. A study prepared for the California Air Resources Board (CARB) by JHK Associates in 1995 provides a well-documented methodology by which to analyze the land use effects of a given project. The report, *Transportation-Related Land Use Strategies to Minimize Motor Vehicle Emissions: An Indirect Source Research Study*, analyzes the efficiency of numerous land use planning factors that have the greatest potential for reducing VMT and mobile source emissions. The study contains a list of recommended strategies, many of which are present in both the proposed Base Plan and the Overlay Plan land use plans. The strategies listed below serve as confirmation that the land use tools and planning practices employed in the proposed project are supported by other objective planning research. A brief description of a few strategies employed in the formulation of the proposed project programs is provided below.

- C *Provide Pedestrian Facilities.* This strategy emphasizes pedestrian accessibility through the provision of convenient and direct pedestrian facilities, including sidewalks, crosswalks, and protection from fast vehicular traffic. The project plans will incorporate a network of interconnected pedestrian and biking trails, many of which are completely separated from roadway rights-of-way.
- C *Increase Density Near Transit Corridors.* This strategy consists of efforts to intensify land uses within walking distance of a transit corridor or surface transit route. This strategy is accommodated in the proposed project by the

concentration of recreation areas and employment centers in proximity to existing and planned commuter rail, bus, and transportation corridor facilities.

- C *Increase Density Near Transit Stations.* This strategy encourages efforts to intensify land uses around existing or planned high-capacity transit stations (bus and/or rail). It includes new development, infill and redevelopment, and incorporates direct and convenient pedestrian linkages, such as those planned in the project area.
- C *Encourage Mixed-Use Development.* This strategy encourages the location of compatible land uses within walking distance of each other. Mixed-use development such as that proposed in the proposed project land use plans typically results in a higher level of walking, as well as a greater potential for transit use, compared to single-use development.
- C *Strengthen Downtown and Urban Activity Centers.* The proposed project area is envisioned to serve as a commercial, employment, recreational, and cultural center that can encourage pedestrian travel within the area and also provide an important focal point for an area-wide transit system.

The above strategies, whether specifically for the purpose of reducing vehicular emissions or for creating a park/recreation destination, corroborate the land use planning principles presented in the proposed Base and Overlay Plans and will serve to offset some of the jobs/housing imbalance effects; however, the jobs/housing balance impact will remain significant and unavoidable.

Additionally, it should be noted that while the jobs/housing ratio is not met in terms of a mere calculation, when viewed from a more regional perspective the provision of additional jobs in the project area would provide jobs closer to South Orange County residents who would otherwise have to travel farther north or east to work. South Orange County Regional Statistical Areas have extremely housing-rich jobs/housing ratios. The 2000 jobs/housing ratio for RSA C-43 and RSA D-40 (See Figure 7-1 provided in Section 7.0 Cumulative Impacts) is .83 and .60, respectively. The 2020 projected job/housing ratio is 1.04 and .89, respectively.

Finally, the population-induced demand for public and private services will not be significantly adverse. Future development of the former MCAS El Toro in various different scenarios (both aviation and non-aviation reuse plans) has been consistently considered in public facilities planning for the past several years.

Housing Provisions

According to the City of Irvine 2000-2005 Housing Element, an additional 10,782 housing units are needed to achieve the City's RHNA goal. Therefore, a portion of the project's indirect housing growth will be absorbed in residential projects currently being developed or planned in the surrounding area. Based on the amount of planned and undeveloped residential land in the surrounding area, a substantial portion of this induced housing growth is expected to be absorbed in residential projects currently in the planning stages or under development. Furthermore, substantial new areas of residential development will be opened for development with the completion of several planned transportation

improvements in the County, including the Foothill Transportation Corridor (FTC) and Eastern Transportation Corridor (ETC). This effect of these transportation improvements could be to increase access to the potential supply of housing in the surrounding area.

Workforce Housing

The project will result in the generation of employment and workers are expected to live both on the project site, and in other portions of the County. Table 5.13-8 depicts the anticipated employment generated under the Base Plan and Overlay Plan and the number of workers that are expected to reside in the project area. As shown, under the Base Plan approximately 11,380 jobs will be generated and approximately 425 workers would be housed on-site. Under the Overlay Plan, approximately 16,510 jobs will be generated and approximately 6,851 workers will be housed on-site. A portion of the workers housed on-site would be expected to work within the project area.

Other workers are expected to reside in other portions of the County or in adjacent counties.

**Table 5.13-8
Project Employment Generation vs. Workers Housed On-Site**

	Base Plan	Overlay Plan
Employment	11,380	16,510 jobs
Total Workers House On-Site ¹	425	6,851
¹ Based on a factor of 1.89 workers per each housing unit.		

The City of Irvine provides a variety of ownership and rental housing opportunities for all income levels, including lower-income households. Unassisted average rental housing prices in the community range from about \$1,000 for a studio to \$1,600 for a 3-bedroom unit, while average sales prices range from about \$300,000 for a condo to \$480,000 for a single family home. As detailed in Irvine's 2000-2005 Housing Element, the City's success in providing integrated affordable housing development is evidenced by the extensive number of assisted rental projects in the community. In fact, of the more than 40,000 housing units in the City, more than 3,330 assisted rental units are currently available to very low and low income households in the City.

According to the 2000-2005 Housing Element, an additional 15,000 units, 6,647 of which would be affordable to very low- and low- income housing units, could be built within the City based on existing Zoning, redevelopment opportunities, and vacant land. This shows that the City has identified more than enough vacant and underutilized sites throughout the City to meet its Regional Housing Demand of 1,942 very low-income and 1,186 low-income units by 2005.

The Base Plan will help meet demands for housing units by allowing for the development of an additional 225 multi-family units on the project site. The Overlay Plan will help meet this demand by allowing for the development of 3,625 additional residential units on-site. Additionally, housing projects developed on the site under either the Base Plan or Overlay Plan will be required to be consistent with the City's Housing Element Affordable Housing Goal, which states that:

- Five percent of units should be affordable to households earning less than 50 percent of the County Median Family Income through rental housing.
- Five percent of the actual number of units built should be affordable as either rental or ownership housing for households earning between 51 and 80 percent of the County Median Family Income.
- Five percent of the units should be affordable to households earning between 81 and 120 percent of the County Median Family Income, satisfied through the development of ownership housing.

Surrounding housing-rich jurisdictions such as Lake Forest and Laguna Hills also provide a range of housing opportunities for workers. As shown in the Tables 5.13-9 and 5.13-10 below, surrounding Lake Forest and Laguna Hills provide a range of rental and homeownership opportunities for those working in the region. Each of these jurisdictions also have assisted units for low and very low income households and implement affordable housing programs through their adopted Housing Elements.

Table 5.13-9
Sales Prices in Irvine and Surrounding Jurisdictions

Jurisdiction	Units Sold	Average Sale Price
<i>Irvine (2001-2002)</i>		
Homes	1,744	\$480,738
Condos	1,532	\$306,478
<i>Lake Forest (1998-1999)</i>		
Homes	918	\$264,058
Condos	280	\$130,016
<i>Laguna Hills (2001-2002)</i>		
Homes	451	\$547,926
Condos	705	\$221,990

Threshold 2: Displace substantial numbers of existing housing necessitating the construction of replacement housing elsewhere.

Base Plan and Overlay Plan

Military operations at the former MCAS El Toro ceased in July 1999, and direct population and employment levels on the site are now negligible. Therefore, the loss of military jobs and housing is not a project-related effect. Depending on the decisions of future property owners of the former MCAS El Toro, it is likely that some or all of the existing vacant housing stock may be demolished. However, the proposed project will provide the opportunity for additional housing on the site. The Base Plan will provide up to 225 dwelling units and the Overlay Plan will provide up to 3,625 dwelling units. Impact will be beneficial.

Threshold 3: Displace substantial numbers of people, necessitating the construction of replacement housing elsewhere.

Base Plan and Overlay Plan

Military operations at the former MCAS El Toro ceased in July 1999, and direct population and employment levels, and the associated population, on the site are now negligible. Therefore, the displacement of people is not a project-related effect. The proposed project will provide additional housing on the site to accommodate demand for housing in Orange County and the impact will be beneficial.

5.13.4 Significant Impacts

Base Plan and Overlay Plan

A significant impact to jobs/housing ratio will occur.

5.13.5 Mitigation Measures

Base Plan and Overlay Plan

No mitigation is available to rectify conflicts with the numerical objectives of regional planning documents including the jobs/housing ratio.

5.13.6 Significance of Impacts After Mitigation

Base Plan and Overlay Plan

Although the proposed amendments to the City of Irvine General Plan will be incorporated into regional SCAG and County of Orange planning projections, the impact associated with jobs/housing balance will remain significant and unavoidable.

5.14 Public Services and Facilities

5.14.1 LAW ENFORCEMENT

5.14.1.1 Environmental Setting

Former MCAS El Toro (PAs 51 and 30)

The DON has contracted with the Orange County Sheriff to provide law enforcement to PA 51 during the interim caretaker period until final conveyance occurs. The Sheriff provides on-site, 24-hour protection to the former base, and staffs the front gate during daytime hours. The Irvine Police Department provides law enforcement to PA 30.

James A. Musick Jail Facility (Portion of PA 35)

The Musick Jail facility is operated by the Orange County Sheriff's Department. The jail has a permanently assigned staff of approximately 160 personnel that guards the jail 24 hours a day. The staff includes deputies, special officers, and correctional service technicians.

IRWD Parcel (Portion of PA 35)

The Orange County Sheriff is currently responsible for patrolling and/or responding to the IRWD parcel.

City of Irvine

The City of Irvine has its own Police Department that is headquartered at the Irvine Civic Center Complex located at One Civic Center Plaza. Irvine's Police Department also has a satellite facility located in the Irvine Spectrum Entertainment Complex. The current police facilities are adequate to handle the personnel and equipment that are employed and utilized by the department.

The Irvine Police Department provides all services normally associated with a municipal law enforcement agency including uniform patrol, investigations, crime analysis, crime prevention, K-9 patrol, Special Operations Unit, forensic investigations, accident investigation/traffic enforcement, drug abuse resistance education, and emergency management/disaster preparedness. The Department has access to contract helicopter service through Costa Mesa Police Department. Mutual aid assistance agreements exist, providing support from other Orange County law enforcement jurisdictions, state and federal agencies.

The Irvine Police Department is a full service Community Oriented Policing organization with officers trained and encouraged to solve community issues before they become

problems. The Department also supports a high profile Preventive Services Program tied closely to COP and focuses on a pro-active preventive approach to community safety. As part of a comprehensive Crime Prevention philosophy, the Department has been active the past 24 years in Advanced Physical Planning and has a state of the art Building Security Code in place. The Department has also adopted a strategy to deal with the problem of police response to false alarms. A strong False Alarm Ordinance is in place. The Irvine Police Department coordinates the City of Irvine Emergency Management Program. Focused on disaster preparedness and using the State of California Standardized Emergency Management System model, the Department maintains a written plan document and a trained citywide liaison group. A new state of the art Emergency Operations Center has recently been completed.

The City of Irvine Police Department's current response guidelines are:

- C Responding to "emergency" events within six minutes, 85 percent of the time;
- C Responding to "crimes in progress" events within 10 minutes, 85 percent of the time;
- C Responding to "less serious crimes occurring now" events within 20 minutes, 90 percent of the time; and
- C Responding to "routine calls for service" within 60 minutes, 85 percent of the time.

Currently the Irvine Police Department is meeting these response time guidelines for "emergency" events and "routine calls for service." Response times to "crimes in progress" and "less serious crimes occurring now" are only about three percent below the desired percentage. Unfilled active police officer positions may have accounted for this slight decline, as there were an abnormally high number of officers who were either on disability or retired from the department, which has resulted in vacant positions. The ratio of police to population also has been reduced from a 1999 average of 1.13 officers per 1000 residents to the current ratio of 1.09 officers. At any given time, there is a mandatory minimum of nine officers and a maximum of as many as 23 officers available to respond to calls for service anywhere in the City.

The Irvine Police Department currently does not provide service to PA 51; however, the Irvine Police Department does provide service to PA 30 and will provide service to the entire base and IRWD parcel once the area is annexed. The Irvine Police Department also has a mutual aid agreement with the County Sheriff's Department and is available to assist the Sheriff with law enforcement at the Musick Jail facility if requested by the Sheriff.

Existing Approved Plans

City of Irvine

The City of Irvine Police Department is currently researching the expansion of their facilities. It is unknown at this time when or where the substation would be built and the size of the facility. Staffing goals are adjusted annually as addressed in the City's Strategic Business Plan to ensure that the City's emergency response standards identified above are met.

Orange County Sheriff

The Orange County Sheriff has proposed to construct a 20,000 square foot station on the Musick Jail property (referred to as the Saddleback Substation). This facility would operate as a substation to serve the surrounding areas with an estimated 218 personnel and provide back-up sheriff support to the permanent jail staff. At this time, there are not immediate plans to proceed with construction of the Saddleback Substation.

5.14.1.2 Threshold for Determining Significance

The CEQA Environmental Checklist, Appendix G outlines the thresholds for determining significance for law enforcement services.

Would the project:

1. *Result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable levels of service ratios, response times or other performance objectives for police protection?*

5.14.1.3 Environmental Impact

As defined by the thresholds for determining significance, impacts related to the provision of law enforcement services are described below:

Threshold 1: Would the project result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable levels of service ratios, response times or other performance objectives for police protection?

Base Plan

The Irvine Police Department would be responsible for providing law enforcement to the entire Great Park area and PA35, after annexation. The Police Department will be instituting Geographic Policing in the near future. This will affect the manner in which the department will service the Great Park and PA35 and subsequent staffing levels. As Geographic Policing is still in the study stages, estimates of police personnel required are based upon current demand levels coupled with anticipated calls for service. The Base Plan contains very diverse land uses, some of which are not currently within the City and therefore without a history of demand on police services.

There will be 3,390 acres of Agriculture, Habitat Preserve, Wildlife Corridor, and Riparian Corridor that will contain natural areas, walking trails, agriculture, and open space areas. This large area with its unique terrain will need to be patrolled, thus requiring equipment and methods of patrolling, (e.g., equestrian) which will be new to the Police Department. Depending upon the type of events, the sports parks, recreational and cultural facilities, could require additional police personnel beyond the normal allocated for patrol. Demand on police resources of the various land uses will be evaluated when detailed information is available during the development review process as individual projects are proposed.

Based on the Department's current staffing formula and anticipated calls for service to the project area based on proposed land uses, personnel required to service the project would be five to ten sworn police officers, one to two sworn police supervisors, three to five non-sworn support staff, two to three police vehicles, two off-road vehicles, and an equestrian unit (unknown number). Through the continued implementation of the City's Strategic Business Plan and Budgeting process, adequate provision will be made for the maintenance of acceptable law enforcement levels of service. Police protection services for the project area under the Base Plan will be funded through the use of City General Fund revenues.

The general impacts associated with the construction and operation of public facilities has been addressed within this Final Program EIR in terms of planned land use, which could accommodate a new police substation should one be constructed. Mitigation Measures required for any significant impacts identified in preceding sections of this Final Program EIR would apply to the possible future construction and operation of a substation in the northern portion of the City. Project-level environmental review, at the time the specific location of a future police substation is known, and when specific development plans have been prepared, will also be required.

James A. Musick Jail Facility (Portion of PA 35)

Annexation of the Musick Jail will not change the provider of law enforcement services to the property. Since the jail is a County correctional facility, the Orange County Sheriff will continue to provide the same level of law enforcement services to the jail after annexation of this area to the City. Additionally, the proposed project will not result in a change in land use designation for this parcel. As such, implementation of the proposed project will not generate a demand for police protection for the jail facility that would require the construction or expansion of police facilities, and no significant environmental impact as a result of the proposed project is anticipated.

The Musick Jail facility may be expanded in the future to increase inmate capacity of the jail as described in Section 3.0 of this Final Program EIR. The expansion of the jail is a County of Orange initiated action, and the expansion is not proposed as part of this project. EIR No. 564 was prepared by the County of Orange and did not identify any potential impact to law enforcement that may result from the proposed jail expansion.

IRWD Parcel (Portion of PA 35)

Once the IRWD parcel is annexed, the City of Irvine Police Department will provide police protection to this parcel at approximately the same level of service that the parcel currently receives from the County Sheriff. This public facility parcel does not have any residents and no further development of this parcel is proposed as part of the proposed project, and none is expected in the future. Annexation of this parcel will not result in the need to construct or expand police facilities, and no significant environmental impact related to the provision of police facilities is anticipated.

Overlay Plan

The Irvine Police Department would be responsible for providing law enforcement to the entire Great Park area, and PA35, after annexation. The Police Department will be instituting Geographic Policing in the near future. This will affect the manner in which the department will service the Great Park and subsequent staffing levels. As Geographic Policing is still in the study stages, estimates of police personnel required for such as park are based upon current demand levels coupled with anticipated calls for service. The Great Park Overlay Plan contains very diverse land uses, some which are not currently within the City and therefore without a history of demand on police services.

There will be 3,070 acres of Agriculture, Habitat Preserve, Wildlife Corridor, and Riparian Corridor that will contain natural areas, walking trails, agriculture, and open space areas. This large area with its unique terrain will need to be patrolled, thus requiring equipment and methods of patrolling, (i.e. equestrian) which will be new to the Police Department. Depending upon the type of events, the sports parks, recreational, and cultural facilities, could require additional police personnel beyond the normal allocated for patrol. Demand on police resources of the various land uses will be evaluated when detailed information is available during the development review process as individual projects are proposed.

Based on the department's current staffing formula and anticipated calls for service to the project area based on proposed land uses, personnel required to service the project would be 17 to 22 sworn police officers, three to five sworn police supervisors, eight to 11 non-sworn support staff, six to nine police vehicles, two off-road vehicles, and an equestrian unit (unknown number). Through the continued implementation of the City's Strategic Business Plan and Budgeting process, adequate provision will be made for the maintenance of acceptable law enforcement levels of service. Police protection services for the park itself will be funded through the use of a special park assessment under the Overlay Plan.

The general impacts associated with the construction and operation of public facilities has been addressed within this Final Program EIR in terms of planned land use, which would accommodate the construction and operation of a new police substation. Mitigation Measures required for any significant impacts identified in preceding sections of this Final

Program EIR would apply to the future construction and operation of a substation within the project area. Project-level environmental review, at the time the specific location of a future police substation is known, and when specific development plans have been prepared, will also be required.

James A. Musick Jail Facility (Portion of PA 35)

Annexation of the Musick Jail will not change the provider of law enforcement services to the property. Since the jail is a County correctional facility, the Orange County Sheriff will continue to provide the same level of law enforcement services to the jail after annexation of this area to the City. Additionally, the proposed project will not result in a change in land use designation for this parcel. As such, implementation of the proposed project will not generate a demand for police protection for the jail facility that would require the construction or expansion of police facilities, and no significant environmental impact as a result of the proposed project is anticipated.

The Musick Jail facility may be expanded in the future to increase inmate capacity of the jail as described in Section 3.0 of this Final Program EIR. The expansion of the jail is a County of Orange initiated action, and the expansion is not proposed as part of this project. EIR No. 564 was prepared by the County of Orange and did not identify any potential impact to law enforcement that may result from the proposed jail expansion.

IRWD Parcel (Portion of PA 35)

Once the IRWD parcel is annexed, the City of Irvine Police Department will provide police protection to this parcel at approximately the same level of service that the parcel currently receives from the County Sheriff. This public facility parcel does not have any residents and no further development of this parcel is proposed as part of the proposed project, and none is expected in the future. Annexation of this parcel will not result in the need to construct or expand police facilities, and no significant environmental impact related to the provision of police facilities is anticipated.

5.14.1.4 Significant Impacts

Base Plan and Overlay Plan

The general significant impacts associated with the construction and operation of public facilities have been addressed within this Final Program EIR, including the possible construction and operation of a new police substation. The need for new public facilities will be mitigated by utilizing existing City standards.

5.14.1.5 Mitigation Measures

Base Plan and Overlay Plan

Mitigation Measures identified in other sections of this Final Program EIR (5.1 - 5.13) address the impacts associated with the construction and operation of public facilities. These measures would be applicable to any new construction and operation of police facilities to serve new growth expected in the northern portion of the City.

5.14.1.6 Significance of Impacts After Mitigation

Base Plan and Overlay Plan

The general impacts associated with the construction and operation of public facilities has been addressed within the Final Program EIR. Mitigation Measures required for any significant impacts identified in preceding sections of this Final Program EIR would apply to the future construction and operation of a police substation within the project area. Project-level environmental review, at the time the specific location of a future police substation is known, and when specific development plans have been prepared, will also be required and project specific mitigation measures identified and implemented.

Notes and References

1. Comment letter from the Irvine Police Department (2002).

5.14.2 FIRE AND EMERGENCY MEDICAL SERVICES

5.14.2.1 Environmental Setting

Former MCAS El Toro (PAs 51 and 30)

The County of Orange has contracted with the Orange County Fire Authority (OCFA) to provide primary fire protection to PAs 51 and 30 during the interim caretaker period while development plans are finalized. There is one operational fire station on the former base (Station No. 20). Station No. 20 provides fire protection service to both the former base property, as well as the surrounding off-base properties. This station currently provides adequate fire protection to the former MCAS El Toro property.

The proposed annexation area is currently served by OCFA stations No. 20, 26, 36, 51, and 38. Table 5.14-1 depicts the location, equipment, and staffing of the fire stations which provide initial response to former MCAS El Toro property and the rest of the annexation area.

**Table 5.14-1
Local Fire Stations**

Facility	Equipment	Staffing
Fire Station No. 38 (Temporary) 26 Parker, Irvine	Engine Medic Van	5 personnel/shift
Fire Station No. 26 4861 Walnut Ave., Irvine	Engine Medic Van Engine (Reserve)	5 personnel/shift
Fire Station No. 36 301 E. Yale Loop, Irvine	Paramedic Assessment, Engine	3 personnel/shift
Fire Station No. 20 The Former MCAS El Toro Property	Paramedic Assessment Engine	3 personnel/shift
Fire Station No. 51 18 Cushing, Irvine Division Chief Headquarters	Paramedic Assessment Engine	4 personnel/shift

Source: OCFA, 2002.

James A. Musick Jail Facility (Portion of PA 35)

The Musick Jail facility is currently served by the OCFA facilities identified in Table 5.14-1.

IRWD Parcel (Portion of PA 35)

The IRWD parcel is currently served by the OCFA facilities identified in Table 5.14-1.

City of Irvine

Fire protection is also provided to the City of Irvine by the OCFA. The OCFA provides fire protection to 22 cities within the County of Orange, as well as the unincorporated areas of the County. The OCFA has 62 stations, which include structural engines, truck companies, paramedic units, airport crash trucks, hazardous materials response team, water dropping helicopters, and other various pieces of specialized equipment. OCFA provides fire suppression, emergency medical, rescue and fire prevention, hazardous materials coordination, and wildland management services. The OCFA is one of the largest regional fire service organizations in California. OCFA's goals for the provision of fire services are the following:

- C First-in engines should arrive on-scene to medical aids and/or fires within five minutes, 80 percent of the time;
- C First-in truck companies should arrive on-scene to fires within ten minutes, 80 percent of the time; and
- C First-in paramedic companies should arrive on scene at all medical aids within eight minutes, 90 percent of the time.

There are seven OCFA fire stations located within Irvine. An additional six nearby OCFA fire stations located outside of the City limits may respond to calls within the City if necessary.

Existing Approved Plans

OCFA is planning two additional fire stations. Station No. 55 will be located on the north side of Portola Parkway between Yale Avenue and Jeffrey Road, and Station No. 47 will be located near Sand Canyon and Interstate 405. These stations are in the planning stages and are anticipated to have a staffing level of four personnel per shift. Stations No. 38 and 20 are proposed for relocation, though specific locations have not been identified.

OCFA also has in place an agreement with The Irvine Company as part of the Northern Sphere Area that should provide adequate service to all areas around MCAS El Toro if development is constructed as currently planned.

5.14.2.2 Threshold for Determining Significance

The CEQA Environmental Checklist, Appendix G outlines the thresholds for determining significance for fire services and facilities.

Would the project:

1. *Result in substantial adverse physical impacts associated with the provision of new physically altered governmental facilities, need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable levels of service ratios, response times or other performance objectives for fire protection?*

5.14.2.3 Environmental Impact

As defined by the thresholds for determining significance, impacts related to the provision of fire and emergency medical service are described below:

Threshold 1: Would the project result in substantial adverse physical impacts associated with the provision of new physically altered governmental facilities, need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable levels of service ratios, response times or other performance objectives for fire protection?

Base Plan and Overlay Plan

PA 51 will be served by the OCFA upon annexation to the City and PA 30 will continue to be served by OCFA. Before closure, MCAS El Toro provided fire protection service from three military fire stations at the base. One of these stations is currently being reused by OCFA for Station No. 20. While OCFA is unable at this time to calculate the exact extent of new services that will be needed to support the proposed project, there is a likelihood that additional fire services infrastructure, such as additional fire stations, will be required within the former MCAS El Toro area and funds will need to be identified to design,

construct, equip, and operate the fire station(s). The existing military fire stations within the former base may be used in the short-term, but will need to be replaced with new facilities that meet OCFA standards.

A final determination of fire station needs and locations will be made at a future date when more information is known about risk, density, construction, layout, and types of occupancy. Appropriate capital improvements and resources will be required to meet anticipated fire service delivery requirements.

The proposed project will accommodate fire protection facilities within the former MCAS El Toro property. A fuel modification program will also be developed for structures adjacent to the natural open space habitat preserve to assure an adequate level of fire safety.

Consistent with OCFA practices, major developers would be required to enter into secured fire protection agreements with the OCFA prior to the issuance of the first building permits to mitigate the impact of these individual projects that will be developed pursuant to the Base Plan. Such agreements would be based upon the needs created by the project beyond the current abilities of the OCFA to service them. As with all projects, all standard conditions and guidelines will be applied to the project during the normal review process.

Since the City of Irvine is a Structural Fire Fund member, the OCFA will also receive a portion of the property taxes from the new development to help fund the required fire protection and emergency medical services. As much of the annexation area may not produce property taxes in the short- and long-term, a funding agreement must be reached between the City of Irvine and OCFA regarding the provision of fire protection and emergency medical services to the proposed annexation area.

The specific environmental impact of constructing the new fire facilities that may be needed to serve the proposed project cannot be determined at this General Plan level of analysis as specific site plans and locations have not been prepared. However, the general impacts associated with the construction and operation of public facilities has been addressed within this Final Program EIR. Mitigation Measures required for any significant impacts identified in preceding sections of this Final Program EIR would apply to the future construction and operation of fire protection facilities within the project area. Project-level environmental review, at the time the specific location of future facilities is known, and when specific development plans have been prepared, will also be required.

James A. Musick Jail Facility (Portion of PA 35)

After annexation, the OCFA would continue to serve the jail facility and provide the existing level of service. Any new fire protection facilities that would be constructed in and/or adjacent to PAs 51 and 30 as would be needed as a result of the Base Plan, will also serve the Musick Jail property. Additionally, the proposed project will not result in a change in land use designation for this parcel. As such, implementation of the proposed project will not generate a demand for fire and emergency medical service for the jail facility that would require the construction or expansion of fire stations, and no significant environmental impact as a result of the proposed project is anticipated.

The Musick Jail facility may be expanded in the future to increase inmate capacity of the jail as described in Section 3.0 of this Final Program EIR. This is a County of Orange initiated action, and the expansion is not proposed as part of this project. EIR No. 564 was prepared by the County of Orange and addresses the impacts to fire and emergency medical protection that may result from the proposed expansion. The Recirculated Sections of EIR No. 564 identified a potential impact to the provision of emergency medical service as a result of the increase in the number of inmates requiring emergency medical treatment. Mitigation measures identified in the Recirculated Sections required that prior to expanding the jail, the Orange County Sheriff-Coroner prove that the increased on-site medical staff will reduce the demand for emergency medical treatment to a level less than significant. The future expansion of the jail is not a component of this project, and environmental review and mitigation for impacts from the expansion will be the responsibility of the County of Orange.

IRWD Parcel (Portion of PA 35)

The OCFA will continue to serve the IRWD parcel at the existing level of service after annexation. The IRWD parcel is not expected to require additional fire or emergency medical services since no new growth is planned for the parcel.

Annexation of this parcel will not result in the need to construct or expand fire protection facilities, and no significant environmental impact related to the provision of fire protection facilities is anticipated.

5.14.2.4 Significant Impacts

Base Plan and Overlay Plan

The specific significant environmental impact of constructing new fire protection facilities that will be needed to serve the Base Plan cannot be determined at this General Plan level of analysis as specific site plans and locations have not been prepared. However, the general significant impacts associated with the construction and operation of public facilities has been addressed within this Final Program EIR, which would include the construction and operation of new fire protection facilities. The need for new public facilities will be mitigated by utilizing existing City standards.

5.14.2.5 Mitigation Measures

Base Plan and Overlay Plan

Mitigation Measures identified in other sections of this Final Program EIR (5.1 - 5.13) address the impacts associated with the construction and operation of public facilities. These measures would be applicable to any new construction and operation of fire protection facilities to serve new growth expected in the planning area.

5.14.2.6 Significance of Impacts After Mitigation

Base Plan and Overlay Plan

The general impacts associated with the construction and operation of public facilities has been addressed within the Final Program EIR, which would include the construction and operation of new fire protection facilities. Mitigation Measures required for any significant impacts identified in preceding sections of this Final Program EIR would apply to the future construction and operation of fire protection facilities within the project area. Project-level environmental review, at the time the specific location of future fire protection facilities is known, and when specific development plans have been prepared, will also be required and project specific mitigation measures identified and implemented.

Notes and References

1. Information for the fire protection section is based on information from Mick Rohde of the Orange County Fire Authority in his letter (January 7, 2002) and personal conversation (March 2002), as well as previous information provided by Nancy Foreman of the Orange County Fire Authority in her letter (January 22, 1999), Response to Comment letter (May 15, 1999), Response to Notice of Preparation (September 15, 1999), and personal conversation (September 1999).

5.14.3 PARKS AND RECREATION

5.14.3.1 Environmental Setting

Former MCAS El Toro (PAs 51 and 30)

Acting in a caretaker's role, the DON currently offers public access to a variety of existing recreational services located on PA 51 including the Marine Memorial Golf Course and equestrian stables. As there is no resident living on PAs 51 and 30, there is no on-site demand for these facilities.

James A. Musick Jail Facility (Portion of PA 35)

The Musick Jail provides a playing field on site for inmates. Because the jail is a correctional facility, it does not generate a demand for public parks and recreational services.

IRWD Parcel (Portion of PA 35)

The IRWD parcel does not contain any recreational facilities. Because the parcel contains a public water facility and no residential development, the parcel does not generate a demand for public parks and recreational services.

City of Irvine

The City of Irvine presently has approximately 13 community parks (including two senior centers) totaling 262 acres, two special facilities (Bommer Canyon Cattle Camp and Central Bark) for a total of 18 acres, 28 public neighborhood parks consisting of 131 acres, with numerous private neighborhood parks and landscaped public recreational trails.

The Irvine Park Code, which conforms with the Quimby Act, requires that developers of residential subdivisions dedicate park land, or pay in-lieu fees, at the rate of two acres of community parkland and three acres of neighborhood parkland for every 1,000 new residents. The City does not have parkland requirements for non-residential development.

Existing Approved Plans

Community and neighborhood parks are currently planned in the following City of Irvine PAs: PA 17, PA 27, PA 4 and the Northern Sphere (PAs 8A, 5A, 9, and 6).

The City of Irvine trail system is comprised of a single equestrian trail and numerous biking and hiking trails. These trails provide residents various recreational and commuter opportunities. Figure 3-7, in the Project Description of this Final Program EIR, shows the City of Irvine existing trails network and how it is proposed to be amended by the proposed project.

The County of Orange Master Plan of Regional Riding and Hiking Trails (MPRRHT) identifies two regional trails in the vicinity: Serrano Creek Trail along Serrano Creek from Whiting Ranch Wilderness Park to Trabuco Road and Hicks Canyon Trail along Hicks Canyon Wash from Limestone Canyon Wilderness Park toward the Peters Canyon Trail. Figure 3-7 shows the City of Irvine existing trails network and how it is proposed to be amended by the proposed project.

The Orange County Transportation Authority adopted a Strategic Bikeways Plan in 2001. Within the project area, this Plan identifies proposed Class I Bikeways along Borrego Canyon Wash and along the AT&SF railroad line. An adjacent Class I bikeway is proposed along Sand Canyon Avenue, that would be connected to the Peters Canyon Bikeway through the proposed Venta Spur Bikeway.

The County's Bikeways Plan identifies proposed Class I bikeways along Borrego Canyon Wash from the Whiting Ranch Wilderness Park to the Irvine Transportation Center and along Jeffrey Road from I-5 north to the Hicks Canyon Bikeway at Portola Bikeway.

5.14.3.2 Threshold for Determining Significance

The CEQA Environmental Checklist, Appendix G outlines the thresholds for determining significance for parks and recreational facilities.

Would the project:

1. *Result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable levels of service ratios, response times or other performance objectives for parks and recreational facilities?*
2. *Increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur to be accelerated?*

5.14.3.3 Environmental Impact

As defined by the thresholds for determining significance, impacts related to the provision of parks and recreational facilities are described below:

Threshold 1: Would the project result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable levels of service ratios, response times or other performance objectives for parks and recreational facilities?

Base Plan

The City of Irvine will provide for the park and recreational needs of PAs 51 and 30 after annexation. Based on the park threshold described above, the buildout of PAs 51 and 30 according to proposed land uses under the proposed Base Plan will generate a demand for an additional 2.6 acres of parkland, including one acre of community park and 1.6 acres of neighborhood park. Table 5.14-2 depicts the calculations of parkland need based on the Irvine Subdivision Ordinance household size assumptions for the Base Plan. Employees working at the non-residential uses allowed under the project may also choose to use local parkland facilities. The addition of new City personnel and equipment to maintain the new parks and recreational facilities will also be required at the same ratio as existing City facilities.

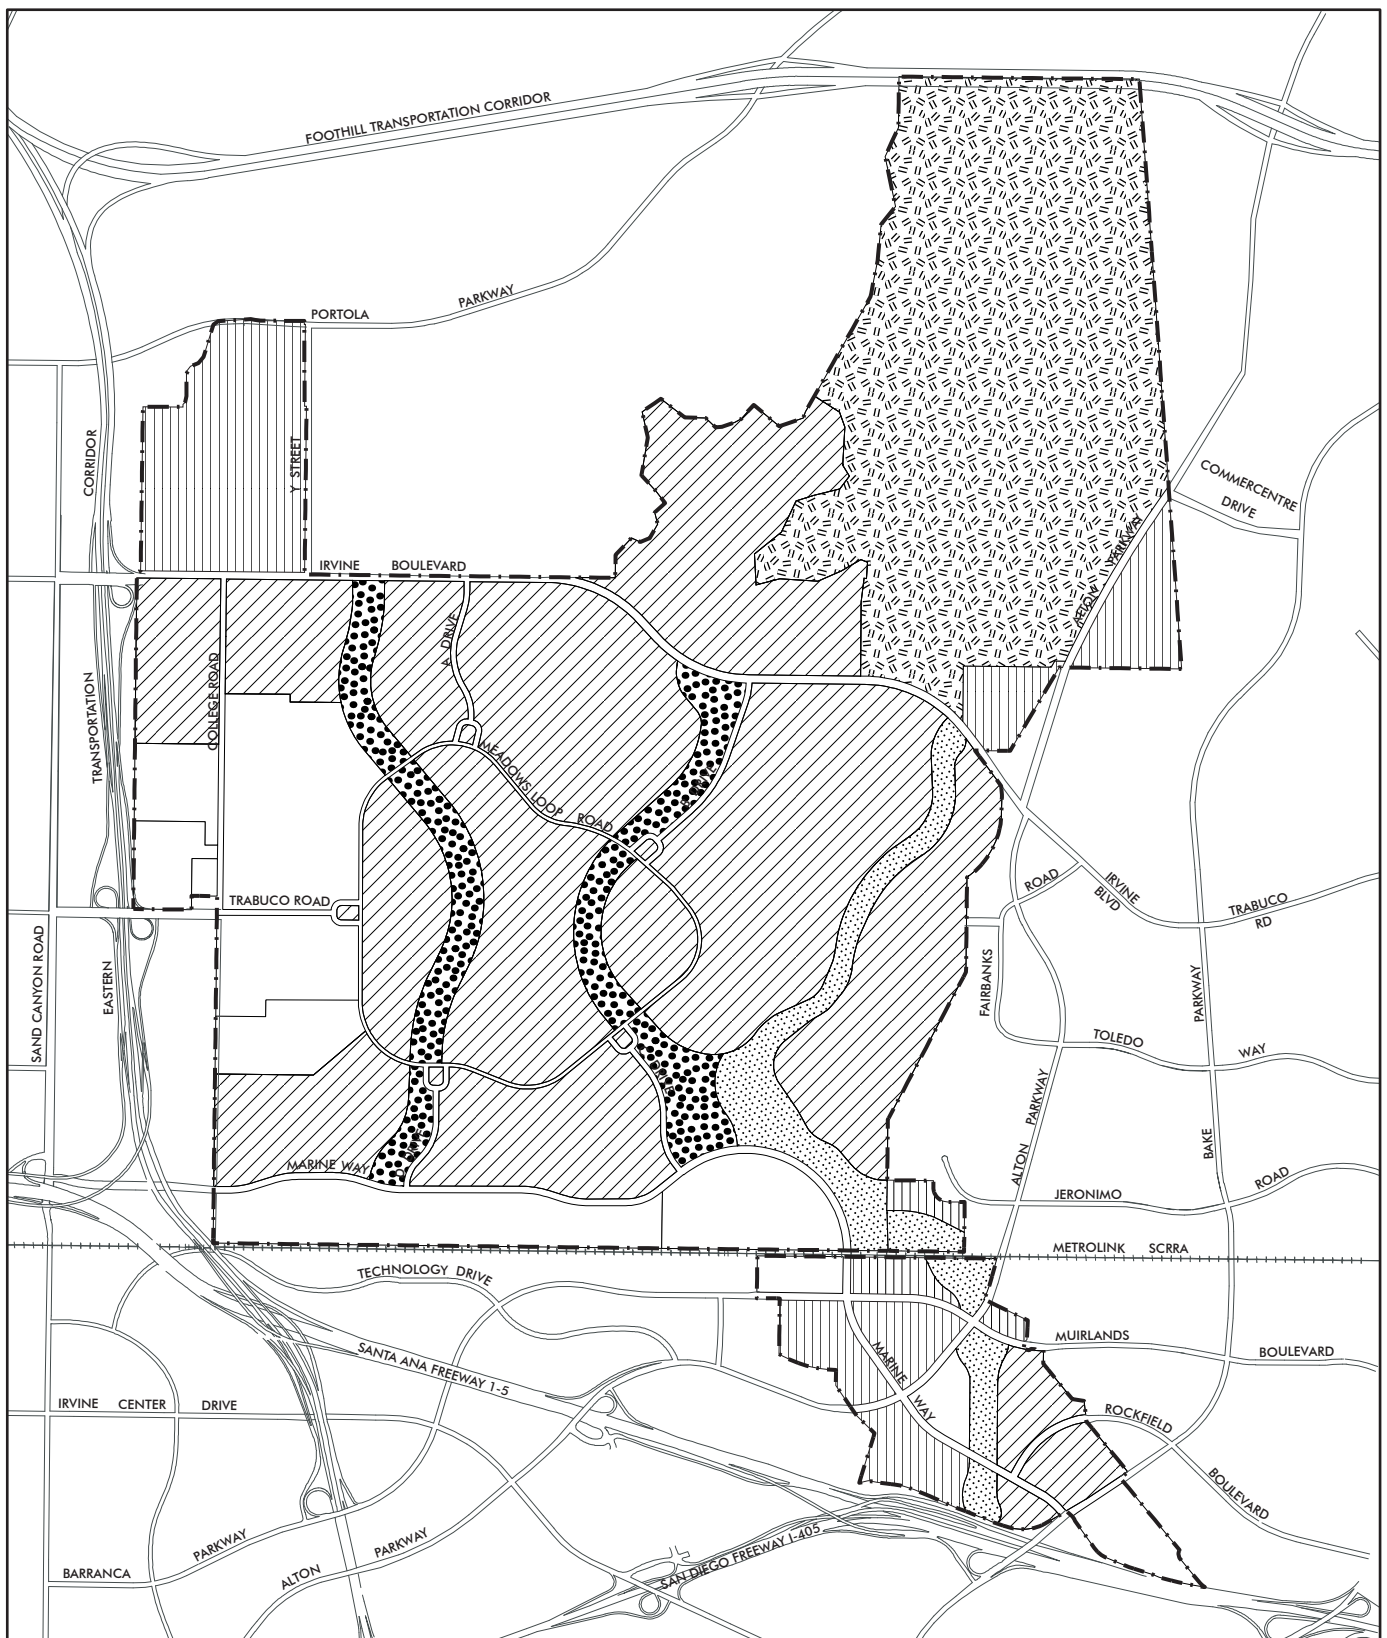

**Table 5.14-2
Base Plan Parkland Demand**

Dwelling Unit Type	# of Dwelling Units	Estimated Persons/HH	Required # of Total Parkland Acres
Low Density Residential	0	2.95	0
Medium Density Residential	60	2.60	0.8
Medium-High Density Residential	165	2.13	1.8
Total	225		2.6

According to the Base Plan, the majority of land uses in PAs 51 and 30 are proposed for open space and recreation. The Plan provides for a variety of open space features to serve the City and the surrounding region. These open space features include parks, sports parks, golf courses, habitat preserve, drainage and wildlife corridors, fairgrounds, and a cemetery. The parks and recreational features are identified in Figure 5.14-1. The parkland acreage proposed under the project will greatly exceed the existing City of Irvine's standards described above, providing a regional open space amenity consistent with Measure W. A portion of the required acres identified in Table 5.14-2 will need to go toward private neighborhood parks, primarily for pools and tot lots within close proximity of homes.

Overlay Plan

Based on the park threshold described above, the buildout of PAs 51 and 30 according to proposed land uses under the Overlay Plan will generate a demand for an additional 45 acres of parkland, including 18 acres of community park and 27 acres of neighborhood park. Table 5.14-3 depicts the calculations of parkland need based on the Irvine Subdivision Ordinance household size assumptions.

- ▧ Wildlife Corridor
- ▦ Habitat Preserve

Figure 5.14-1
Recreational and Open Space Features
Base Plan

**Table 5.14-3
Overlay Plan Parkland Demand**

Dwelling Unit Type	# of Dwelling Units	Estimated Persons/HH	Required # of Total Parkland Acres
Low Density Residential	1,100	2.95	16.2
Medium Density Residential	860	2.60	11.2
Medium-High Density Residential	1,665	2.13	17.7
Total	3,625		45.1

According to the Overlay Plan, the majority of land uses in PA 51 are proposed for open space and recreation. The Plan provides for a variety of open space features to serve the City and the surrounding region. These open space features include parks, sports parks, golf courses, habitat preserve, drainage and wildlife corridors, fairgrounds, and a cemetery. The parks and recreational features are identified in Figure 5.14-2. The parkland acreage proposed under the project will greatly exceed the existing City of Irvine's standards described above, providing a regional open space amenity for the benefit of all Orange County. A portion of the required acres identified in Table 5.14-3 will need to go toward private neighborhood parks, primarily for pools and tot lots within close proximity of homes.

Park and Recreational Plan

As stipulated in the Implementation Agreement Regarding the Natural Community Conservation Plan (NCCP) for the Central/Coastal Orange County Subregion of the Coastal Sage Scrub NCCP (July 1996), a Habitat Preserve will be established on approximately 974 acres in the northeastern portion of PA 51. This habitat preserve is intended to be conveyed to the US Department of the Interior to be administered by the USFWS for the preservation of coastal sage scrub and associated wildlife species. Activities within the Habitat Preserve will be restricted to those that are compatible with conservation goals, as determined by USFWS.

Two drainage corridors and one wildlife corridor are designated within the project area. One drainage corridor is located between the Marshburn and Bee Canyon Drainage Areas, while the other is located between the Bee Canyon and Agua Chino Drainage Areas. The wildlife corridor is located on the southern portion of the project area. This corridor links habitat areas north and south of the site. The wildlife corridor provides connection to the Habitat Preserve discussed above, as well as the Limestone-Whiting Wilderness Park. To the south, the corridor will connect to the Laguna Coast Wilderness Park through existing and future major open space linkages.

The Base Plan and Overlay Plan include opportunities for museums, theaters, gardens, and other cultural activities. North of the regional park located in the center of PA 51 (as shown in the Project Description Figure 3-3), there are approximately 250 acres designated for exposition center uses. PAZ 13, south of the central park, is 156 acres in size and can be used for cultural and institutional uses. The proposed project also provides for a sports park area totaling 165 acres.

- · — Orange County Great Park Boundary
- ▨ Recreational
- ▤ Agriculture
- ▧ Riparian Corridor
- ▩ Wildlife Corridor
- Habitat Preserve

Figure 5.14-2
Recreational and Open Space Features
Overlay Plan

The project includes two golf course areas. The project incorporates the existing Marine Memorial Golf Course into a 211 acre course, with a second, larger 315 acre course proposed to the north of the existing golf course. In addition, the project includes a cemetery and other open space areas.

The project provides for a bikeways system interconnecting recreational, educational, and institutional uses to off-site trail systems enhancing the recreational opportunities for the community and the region. Both on-road (Class II) and off-road (Class I) bikeways are planned for the site, linking with the regional bikeway system. A riding and hiking trail will parallel Irvine Boulevard until it reaches the Habitat Preserve. This system also includes other non-vehicular forms of circulation, such as pedestrian corridors and sidewalks.

The specific environmental impact of constructing the new park and recreational facilities that will be needed to serve the proposed project cannot be determined at this General Plan level of analysis as specific site plans and locations have not been prepared. However, the general impacts associated with the construction and operation of public facilities has been addressed within this EIR, which would include the construction and operation of new park and recreational facilities. Mitigation Measures required for any significant impacts identified in preceding sections of this Final Program EIR would apply to the future construction and operation of new park and recreational facilities within the planning area. Project-level environmental review, at the time the specific location of new park and recreational facilities is known, and when specific development plans have been prepared, will also be required.

James A. Musick Jail Facility (Portion of PA 35)

The Musick Jail will continue to be responsible for the provision and maintenance of any necessary recreational facilities located within the facility after annexation. Additionally, the Overlay Plan will not result in a change in land use designation for this parcel. As such, implementation of the proposed project will not generate a demand for park and recreational facilities that would require the construction or expansion of park and recreational facilities, and no significant environmental impact as a result of the proposed project is anticipated.

The Musick Jail Facility may be expanded in the future to increase inmate capacity of the jail as described in Section 3.0 of this Final Program EIR. The expansion of the jail is a County of Orange initiated action, and the expansion is not proposed as part of this project. EIR No. 564 was prepared by the County of Orange and no impact to parks and recreation impacts was identified. The future expansion of the jail is not a component of this project, and environmental review and mitigation for impacts from the expansion will be the responsibility of the County of Orange.

IRWD Parcel (Portion of PA 35)

Irvine would provide for any parks and recreational needs for the IRWD parcel after annexation. Since the IRWD is public facility without residential development, the parcel will not create future needs for open space and parkland. As a result, annexation of the IRWD parcel will not result in a parks and recreation impact.

Threshold 2: *Would the project increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur to be accelerated?*

Base Plan and Overlay Plan

Future development under the Base and Overlay Plans will result in additional population growth, and a resulting increase in demand for existing park and recreational facilities. There will not be a significant impact on the existing facilities since implementation of the proposed project will provide new recreational opportunities that are in excess of the City of Irvine's adopted standards for parks and recreation.

5.14.3.4 Significant Impacts

Base Plan and Overlay Plan

The specific significant environmental impact of constructing new recreational facilities that will be needed to serve the Base and Overlay Plans cannot be determined at this General Plan level of analysis as specific site plans and locations have not been prepared. However, the general significant impacts associated with the construction and operation of public facilities has been addressed within this Final Program EIR, which would include the construction and operation of new recreational facilities. The need for new public facilities will be mitigated by utilizing existing City standards.

5.14.3.5 Mitigation Measures

Base Plan and Overlay Plan

Mitigation Measures identified in other sections of this Final Program EIR (5.1 - 5.13) address the impacts associated with the construction and operation of public facilities. These measures would be applicable to any new construction and operation of park and recreational facilities to serve new growth expected in the planning area.

5.14.3.6 Significant of Impacts After Mitigation

Base Plan and Overlay Plan

The general impacts associated with the construction and operation of public facilities has been addressed within the Final Program EIR, which would include the construction and operation of new park and recreational facilities. Mitigation Measures required for any significant impacts identified in preceding sections of this Final Program EIR would apply to the future construction and operation of park and recreational facilities within the planning area. Project-level environmental review, at the time the specific location of park and

recreational facilities is known, and when specific development plans have been prepared, will also be required and project specific mitigation measures identified and implemented.

Notes and References

None.

5.14.4 SCHOOL SERVICES

5.14.4.1 Environmental Setting

Former MCAS El Toro (PAs 51 and 30)

PAs 51 and 30 are within the school service boundaries of the Irvine Unified School District (IUSD) and the Saddleback Valley Unified School District (SVUSD). IUSD serves the majority of PAs 51 and 30 (northern and central sections of PA 51, and all of PA 30), with the Saddleback Valley Unified School District serving the southern section of PA 51. Figure 5.14-3 depicts the school district boundaries for the project area.

The existing El Toro Marine Elementary School at 8171 Southeast Trabuco Road at the northeastern edge of PA 51 is located on land owned by the federal government and leased to the IUSD through June 30, 2016. Prior to closure of the base in 1999, elementary school-age children at the MCAS El Toro facility attended this school. The school was built in 1949 and has a capacity for approximately 600 elementary school students. While the base was operational, middle school and high school students at the base attended the Rancho San Joaquin Middle School at 4861 Michelson Drive and the University High School at 4771 Campus Drive, respectively. Now that there are no students generated within the project area, there are no assigned schools serving the area.

The SVUSD serves the southern section of PA 51. Since this portion of PA 51 did not contain residential uses while MCAS El Toro was operational, the area is not included within any school service boundary of the district. All schools in SVUSD are currently overcrowded and relocatable classrooms have been utilized to accommodate all students. No new schools are planned in the near future.

James A. Musick Jail Facility (Portion of PA 35)

The James A. Musick Jail is not used for school-age children and inmates do not attend public or private schools outside the jail facility. Thus, the jail does not currently generate school-age students who would require school services from the Irvine Unified School District.

-  Irvine Unified School District Boundary
-  Saddleback Valley Unified School District Boundary

 Project Area

Figure 5.14-3
Irvine and Saddleback Valley
Unified School Districts

IRWD Parcel (Portion of PA 35)

The IRWD parcel is a public facility and does not contain residential development. Thus, the parcel does not generate a demand for schools and educational services.

5.14.4.2 Threshold for Determining Significance

The CEQA Environmental Checklist, Appendix G outlines the thresholds for determining significance for public services and facilities.

Would the project:

1. *Result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable levels of service ratios or other performance objectives for public school facilities?*

5.14.4.3 Environmental Impact

As defined by the thresholds for determining significance, impacts related to the provision of school facilities are described below:

Threshold 1: Result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable levels of service ratios or other performance objectives for public school facilities?

Base Plan

Residential development proposed under the Base Plan includes a total of approximately 225 residential units, including 60 medium density and 165 medium-high density residential units. The majority of these units, approximately 165 to 225 units, will be within the Irvine Unified School District. The remainder, zero to 60 units will be within the Saddleback Valley School District.

The school district boundaries cross through PAZ 10, an area where residential uses are proposed. At this General Plan level of analysis, it is unknown where exactly the housing units will be placed within the planning area (i.e., whether the new units will be in IUSD or SVUSD). For analysis purposes of this Final Program EIR, the highest number of potential units is used to estimate the “worse-case” scenario for both districts. As a result, the analysis will over estimate the amount of new or expanded school facilities that will be needed to serve the project.

Irvine Unified School District (IUSD)

New development within PAs 51 and 30 has the potential to generate school-age children who would require school services from the IUSD. School-age children that would occupy the multi family units would require school services from the IUSD and would create a demand for new schools in the area. The IUSD has indicated that it is prepared to serve all K-12 students that will reside within the district boundaries. Table 5.14-4 estimates student generation by school and land use. Based on the IUSD factors, as many as 115 students could be generated.

Table 5.14-4
IUSD Estimated Students Generated by Base Plan

Student Type	Average Residential Generation Factor	Anticipated Maximum New Housing Units	Projected New Students
Elementary (K-6)	0.32	225	72
Middle (7-8)	0.07		16
High (9-12)	0.12		27
Total	0.50		115

Source: Irvine Unified School District for generation factors.

New development within this area will have to pay development fees to the IUSD. The maximum statutory school fees the District can collect for new residential development is \$2.14 per square foot. These fees will be used for the development of new schools, expansion or improvement of existing school facilities or to fund school services.

Due to the low number of students that would be generated with the buildout of the Base Plan, no new school facilities would be needed on-site. Most likely, students would be placed in existing schools and existing facilities expanded and modernized. IUSD may consider shifts in the school attendance boundaries for existing elementary, middle, and high schools when distributing the new students. This could result in existing communities within IUSD to change from their current school assignment to another District school in order to better accommodate new growth within PAs 51 and 30.

Saddleback Valley Unified School District

New development within PAs 51 and 30 has the potential to generate school-age children who would require school services from the SVUSD. School-age children that would occupy the multi family units would require school services from the SVUSD and would create a demand for new schools in the area. Based on the SVUSD factors, as many as 24 students could be generated. Table 5.14-5 depicts the number of students that may be generated within the project area.

**Table 5.14-5
SVUSD Estimated Students Generated by Base Plan**

Student Type	Average Residential Generation Factor*	Anticipated Maximum New Housing Units	Projected New Students
Elementary (K-6)	0.22	60	13
Middle (7-8)	0.056		3
High (9-12)	0.13		8
Total			24

* Student generation factors for detached residential are 0.34 for K-6, 0.065 for 7-8, and 0.16 for 9-12 and for attached residential are 0.10 for K-6, 0.046 for 7-8, and 0.10 for 9-12. An average of the two factors is used for this analysis.

Source: Saddleback Valley Unified School District for generation factors.

New development within this area will have to pay development fees to the Saddleback Unified School District in the amount of \$0.37 per square foot of non-residential development and \$2.13 per square foot of residential development to mitigate potential impacts to the district. These fees will be used for the development of new schools, expansion or improvement of existing school facilities or to fund school services.

The specific environmental impact of constructing new public educational facilities within the IUSD and SVUSD that will be needed to serve the Base Plan cannot be determined at this General Plan level of analysis. However, the general impacts associated with the construction and operation of public facilities within the project area has been addressed within this EIR, which would include the construction and operation of new educational facilities. Mitigation Measures required for any significant impacts identified in preceding sections of this Final Program EIR would apply to the future construction and operation of new educational facilities within the planning area. Project-level environmental review, at the time the specific location of new educational facilities within the project area or expansion or modernization of existing facilities is known, and when specific development plans have been prepared, will also be required.

IRWD Parcel (Portion of PA 35)

The annexation of the IRWD parcel will not generate a demand for school services since no residential development is proposed on this parcel. As a result, annexation of the IRWD parcel will not result in an impact related to the construction and operation of public school facilities.

Overlay Plan

Residential development proposed under the Overlay Plan includes a total of approximately 3,625 residential units, including 1,100 low density, 860 medium density, and 1,665 medium-high density residential units. The majority of these units, approximately 2,680 to 2,990 units, will be within the Irvine Unified School District. The remainder, 635 to 945 units, will be within the Saddleback Valley School District.

The school district boundaries cross through two planning areas (PAZ 10 and 18) that propose residential uses. At this General Plan level of analysis, it is unknown where exactly

the housing units will be placed within each individual planning area (i.e., whether the new units will be in IUSD or SVUSD). For analysis purposes of this Final Program EIR, the highest number of potential units is used to estimate the “worse-case” scenario for both districts. As a result, the analysis will over estimate the amount of new or expanded school facilities that will be needed to serve the project.

Irvine Unified School District (IUSD)

New development within PAs 51 and 30 has the potential to generate school-age children who would require school services from the IUSD. School-age children that would occupy the single family and multi family units would require school services from the IUSD and would create a demand for new schools in the area. The IUSD has indicated that it is prepared to serve all K-12 students that will reside within the district boundaries. Table 5.14-6 estimates student generation by school and land use. Based on the IUSD factors, as many as 1,525 students could be generated.

Table 5.14-6
IUSD Estimated Students Generated by Project

Student Type	Average Residential Generation Factor	Anticipated Maximum New Housing Units	Projected New Students
Elementary (K-6)	0.32	2,990	957
Middle (7-8)	0.07		209
High (9-12)	0.12		359
Total	0.50		1,525

Source: Irvine Unified School District for generation factors.

Based on Table 5.14-6, the IUSD estimated the cost for typical District elementary, middle, and high schools. According to the District, the estimated acreage needed for an elementary school is 10 acres with a total building area of 45,000 square feet and the estimated acreage for a middle school is 15 acres with a total building area of 65,000 square feet. The District also estimated that an acre of land would cost \$1,000,000 to 1,500,000, resulting in a total building cost of \$218 per square foot for elementary and middle schools (not including land for Oak Creek Elementary School in 2000). According to the District, the total building area needed for a high school expansion would be 20,000 to 30,000 square feet, resulting in a total cost of \$3.2 million.

New development within this area will have to pay development fees to the IUSD. The maximum statutory school fees the District can collect for new residential development is \$2.14 per square foot. These fees will be used for the development of new schools, expansion or improvement of existing school facilities or to fund school services.

Based on the District’s initial analysis of the project, the District estimates that it will require at buildout a 13 acre K-8 site and school located central to the Overlay Plan service area, as well as funding for modernization and expansion of existing middle and high school facilities. A 13 acre school site has been identified in PA 17a. To accommodate the expected student growth from the project during buildout of the proposed project and prior to final construction of the new elementary school, IUSD may re-open the El Toro Marine Elementary School and/or assign students residing in the project area to various schools

with available capacity. The District's consultants are currently analyzing the land bordering the existing El Toro Elementary site for purposes of realigning the property lines and/or expanding the site from approximately 10-acres to 13-acres better accommodate a K-8 school. The Overlay Plan would be implemented through participation in the Development Agreement described in Section 3.0 of this EIR. The Development Agreement requires dedication of a school site to IUSD.

In the event that a new school is not built, IUSD may consider shifts in the school attendance boundaries for existing elementary, middle, and high schools. This could result in existing communities within IUSD to change from their current school assignment to another District school in order to better accommodate new growth within PAs 51 and 30.

Saddleback Valley Unified School District

New development within PAs 51 and 30 has the potential to generate school-age children who would require school services from the SVUSD. School-age children that would occupy the single family and multi family units would require school services from the SVUSD and would create a demand for new schools in the area. Based on the SVUSD factors, as many as 384 students could be generated. Table 5.14-7 depicts the number of students that may be generated within the project area.

**Table 5.14-7
SVUSD Estimated Students Generated by Project**

Student Type	Average Residential Generation Factor*	Anticipated Maximum New Housing Units	Projected New Students
Elementary (K-6)	0.22	945	208
Middle (7-8)	0.056		53
High (9-12)	0.13		123
Total			384

* Student generation factors for detached residential are 0.34 for K-6, .065 for 7-8, and .16 for 9-12 and for attached residential are 0.10 for K-6, .046 for 7-8, and .10 for 9-12. An average of the two factors is used for this analysis.

Source: Saddleback Valley Unified School District for generation factors.

New development within this area will have to pay development fees to the Saddleback Unified School District in the amount of \$0.37 per square foot of non-residential development and \$2.13 per square foot of residential development to mitigate potential impacts to the district. These fees will be used for the development of new schools, school facilities or to fund school services.

The specific environmental impact of constructing new public educational facilities within the IUSD and SVUSD that will be needed to serve the proposed project cannot be determined at this General Plan level of analysis. However, the general impacts associated with the construction and operation of public facilities within the project area has been addressed within this Final Program EIR, which would include the construction and operation of new educational facilities. Mitigation Measures required for any significant impacts identified in preceding sections of this Final Program EIR would apply to the future construction and operation of new educational facilities within the planning area. Project-

level environmental review, at the time the specific location of new educational facilities within the project area or expansion or modernization of existing facilities is known, and when specific development plans have been prepared, will also be required.

James A. Musick Jail Facility (Portion of PA 35)

The annexation of the site of the jail to the City of Irvine will not lead to the generation of students. Additionally, the proposed project will not result in a change in land use designation for this parcel. As such, implementation of the proposed project will not generate a demand for educational facilities for the jail facility that would require the construction or expansion of educational facilities, and no significant environmental impact as a result of the proposed project is anticipated.

The Musick Jail Facility may be expanded in the future to increase inmate capacity of the jail as described in Section 3.0 of this Final Program EIR. This is a County of Orange initiated action, and the expansion is not proposed as part of this project. The proposed expansion of the jail facility in the future is not expected to generate students from inmates or employees of the facility due to the short-term stay of inmates and the rotation of deputies to different law enforcement functions, including only temporary assignments to the jail, and EIR No. 564 did not identify any significant impacts related to the proposed jail expansion. The future expansion of the jail is not a component of this project, and environmental review and mitigation for impacts from the expansion will be the responsibility of the County of Orange.

IRWD Parcel (Portion of PA 35)

The annexation of the IRWD parcel will not generate a demand for school services since no residential development is proposed on this parcel. As a result, annexation of the IRWD parcel will not result in an impact related to the construction and operation of public school facilities.

5.14.4.4 Significant Impacts

Base Plan and Overlay Plan

The specific significant environmental impact of constructing new educational facilities that will be needed to serve the proposed project cannot be determined at this General Plan level of analysis as specific site plans and locations have not been prepared. However, the general significant impacts associated with the construction and operation of public facilities has been addressed within this Final Program EIR, which would include the construction and operation of new educational facilities. The need for new public facilities will be mitigated by utilizing existing City standards.

5.14.4.5 Mitigation Measures

Base Plan and Overlay Plan

Mitigation Measures identified in other sections of this Final Program EIR (5.1 - 5.13) address the impacts associated with the construction and operation of public facilities. These measures would be applicable to any new construction and operation of educational facilities to serve new growth expected in the planning area.

5.14.4.6 Significance of Impact After Mitigation

Base Plan and Overlay Plan

The general impacts associated with the construction and operation of public facilities has been addressed within the Final Program EIR, which would include the construction and operation of new educational facilities. Mitigation Measures required for any significant impacts identified in preceding sections of this Final Program EIR would apply to the future construction and operation of educational facilities within the planning area. Project-level environmental review, at the time the specific location of educational facilities is known, and when specific development plans have been prepared, will also be required and project specific mitigation measures identified and implemented.

1. Comment letter from Don Chadd, Irvine Unified School District (October 31, 2002).
2. Personal conversation with Tom Tullar, Saddleback Valley Unified School District (December 2002).

5.15 Utilities

5.15.1 POTABLE WATER

5.15.1.1 Environmental Setting

The Irvine Ranch Water District (IRWD) is the jurisdictional agency responsible for providing plan approval and water service to the entire project area. The IRWD does not have any adopted expansion plans for the potable water system within the project area. The Metropolitan Water District of Southern California (MWD) is planning for a parallel pipeline to the Allen-McColloch Pipeline (AMP), which currently traverses the project area. The City of Irvine acknowledges that only existing infrastructure that meets current IRWD standards will be preserved for use in the future. Infrastructure considered below the IRWD standard will be replaced and/or upgraded based on IRWD recommendations during implementation of the proposed project.

Former MCAS El Toro (PAs 51 and 30)

A report, “The Orange County Great Park Program EIR Infrastructure Report” (Fusco Engineering, November, 21 2002) has been prepared for Orange County Great Park Plan. This report is provided in Appendix J of this Final Program EIR.

PAs 51 and 30 are located within Zone 3 North and Zone 4 of the IRWD water system. The original water system for the former MCAS El Toro property was designed and constructed as a stand-alone system. Currently, IRWD supplies potable water to the former base through four metered connections that connect to the IRWD Zone 3 North and Zone 4 water system. The on-site existing distribution system for the former MCAS El Toro property consists of a network of distribution system pipelines, six reservoirs, and two pump stations.

James A. Musick Jail Facility (Portion of PA 35)

The Musick Jail is located within Zone 4 of the IRWD water system. The jail receives its potable water from IRWD through two connections located at the northwest corner of the site.¹

IRWD Parcel (Portion of PA 35)

The IRWD parcel contains the IRWD East Irvine Zone 4 Pumping Station and Zone 3 5.0 million-gallon potable water reservoir and 7.0 million gallon potable reservoir.

City of Irvine

The IRWD provides potable water to the entire City of Irvine. Potable water sources currently available to IRWD include water imported by MWD through the AMP, the East Orange County Feeder No. 2 (EOCF#2), and the Orange County Feeder; and groundwater

from the Irvine Subbasin/Irvine Desalter and the Dyer Road Wellfield (DWRF)/Deep Aquifer Treatment System (DATS).² The 66-inch, reinforced-concrete AMP is located in a 50-foot-wide permanent easement that traverses the project area in a generally northwest-southwest direction.

5.15.1.2 Threshold for Determining Significance

The CEQA Environmental Checklist, Appendix G outlines the thresholds for determining significance for potable water.

Would the project:

1. *Require or result in the construction of new water treatment facilities or expansion of existing facilities, the construction of which could cause significant environmental effects?*
2. *Have sufficient water supplies available to serve the project from existing entitlements and resources, or are new or expanded entitlements needed?*

5.15.1.3 Environmental Impact

As defined by the thresholds for determining significance, impacts related to the provision of potable water service are described below:

Threshold 1. Would the project require or result in the construction of new water treatment facilities or expansion of existing facilities, the construction of which could cause significant environmental effects?

Base Plan and Overlay Plan

Former MCAS El Toro (PAs 51 and 30)

Projected total average day buildout demand for potable water service based on the land uses proposed in the proposed project is expected to be less than the 1.75 million gallons per day (MGD) calculated for the Overlay Plan since the Base Plan proposed less intense development than the Overlay Plan. Appendix J of this Final Program EIR contains the generation assumptions that were utilized to estimate future demand for potable water service for the Overlay Plan.

The proposed backbone domestic water system for PAs 51 and 30 as proposed in the project is illustrated in Figure 5.15-1. The Base and Overlay Plans potable water system assumes that selected on-site facilities will be preserved in place and remain operational at plan build-out. The existing transmission capacity of the potable water system on-site will be expanded to serve the proposed project. The Base and Overlay Plan system expands the existing MCAS El Toro potable water system to fully integrate into the IRWD system and provide backbone service to all user areas in the project.

Source: Fuscoe Engineering, City of Irvine, 2002.

LEGEND

- Existing Domestic Water
- Proposed Domestic Water

① Parcel Number (Typical)

Figure 5.15-1
Potable Water System

A looped system is the conventional and preferred method for delivery of potable water supplies since multiple sources of supply make the system more reliable and flexible. The proposed looped system features multiple connections to existing potable water facilities with a network of 12-inch, 16-inch, and 24-inch diameter pipes that generally coincide with the routing of existing and proposed roadways circulating throughout the project area. Two new booster stations will need to be constructed. These stations will pump water through the proposed potable water network from Zone 3 to Zone 4. Conversely, pressure-reducing stations will return excess water to Zone 3 as necessary in response to local demand. Storage calculations using IRWD storage criteria indicated that a new Zone 4 reservoir measuring 2.5 million gallons will be necessary to balance projected potable water demand. The new reservoir is expected to be in the vicinity of the existing potable water reservoir in the "Wherry" site. Reuse of the existing Wherry reservoir is also assumed.

Additional IRWD maintenance personnel and equipment may be required to operate and maintain the proposed potable water system. The project proponent(s) of individual projects will be responsible for applicable costs associated with protection, relocation, repair, replacement, extension or expansion of water facilities.

As discussed above, the MWD has also identified that a new potable water pipeline that will be located parallel to the existing AMP is being planned within the project area. MWD will be responsible for the project-specific environmental review for that project. As project-level development occurs, the City of Irvine and MWD will review projects to ensure that they do not negatively impact the existing and planned MWD facilities and that construction of necessary water infrastructure improvements occurs prior to, or concurrent with development. Since the proposed project is a General Plan level of planning, the specific impact to the AMP cannot be determined at this time since the specific location of future development is unknown at this time. As specific projects are proposed, all existing easements will be reviewed and mitigation measures required if necessary.

The proposed project will require the expansion of potable water facilities to increase transmission capacity. The specific environmental impact of constructing new potable water facilities that will be needed to serve the proposed project cannot be determined at this program level of analysis as site specific plans for the installation of the potable water backbone system have not been prepared. However, the general impacts associated with the construction and operation of public utilities have been addressed within this EIR, which would include the construction and operation of the potable water system. Mitigation Measures required for any significant impacts identified in preceding sections of this Final Program EIR would apply to the future construction and operation of the potable water system within the project area as this system is necessary for overall project construction. Project-level environmental review, at the time that specific development plans have been prepared will also be required.

James A. Musick Jail Facility (Portion of PA 35)

After annexation, the IRWD will continue to serve the Musick Jail facility at existing levels of service. Annexation of the jail facility will not result in the need to construct or expand potable water facilities, and no impact is anticipated.

According to EIR No. 564, in the event that the jail facility is expanded to the proposed 7,584 inmates, the existing potable water system has the capacity to service the jail. A third

connection is proposed in the jail expansion plan to provide additional reliability. No significant impacts were identified in EIR No. 564 related to potable water service. The future expansion of the jail is not a component of this project, and environmental review and mitigation for impacts from the expansion will be the responsibility of the County of Orange.

IRWD Parcel (Portion of PA 35)

No additional service will be required for this parcel, therefore annexation of the project will not result in a significant environmental impact related to construction or expansion of potable water facilities.

Threshold 2: *Would the project have sufficient water supplies available to serve the project from existing entitlements and resources, or are new or expanded entitlements needed?*

Base Plan and Overlay Plan

Former MCAS El Toro (PAs 51 and 30) ²

The proposed project's impact on water supply and the ability of the water provider to provide a water source to the project site has been assessed by the IRWD in accordance with the requirements of SB610 and SB221, both effective January 2, 2002, and the water supply assessment (WSA) contained in Appendix C complies with the most recent statutory requirements and concludes that adequate supplies are available to serve the proposed project. SB 901 requires an evaluation of the project's consistency with IRWD's most recent Urban Water Management Plan (UWMP), and an evaluation of supplies under normal, single, and multiple dry years within a 20-year projection.

On January 27, 2003 the Board of Directors of the Irvine Ranch Water District (IRWD) approved the assessment of water supply for the proposed project. The IRWD assessment of water supply is provided in Appendix C of this Final Program EIR. Based on the findings of the assessment, the IRWD has determined that a sufficient water supply is available to serve the project. The total water supplies available to IRWD during normal, single-dry and multiple-dry years within a 20-year projection will meet the project water demand of the project in addition to the demand of existing and other planned future uses, including, but not limited to, agricultural and manufacturing uses.

The status of a reliable water supply available to Southern California has recently come under question as a result of the failure to complete an agreement between MWD and the Imperial Irrigation District. This agreement would have allowed improved irrigation practices in the Imperial Valley and allowed the transfer of "saved" water from farms in the Imperial Irrigation District to other parts of Southern California. However, MWD has stated that the District will continue to meet all the region's demands for imported water in 2003, 2004, and beyond, primarily because of the investments urban Southern California has made over the past decade to conserve, diversify and stretch its portfolio of water resource options. Based on the water supply analysis prepared by IRWD, the district will have adequate water resources to meet future demand including the proposed project. IRWD has made a finding that it will have adequate water resources to meet the future water

demands of the project. No significant impact to water supply is anticipated. As a result, no significant impact resulting from the lack of availability of new water supplies is anticipated.

James A. Musick Jail Facility (Portion of PA 35)

After annexation, the IRWD will continue to serve the Musick Jail facility at existing levels of service. Annexation of the jail facility will not result in the need for additional potable water supplies, and no impact is anticipated.

According to EIR No. 564, in the event that the jail facility is expanded to the proposed 7,584 inmates, the existing potable water system has the capacity to service the jail. No significant impacts were identified in EIR No. 564 related to potable water service. The future expansion of the jail is not a component of this project, and environmental review and mitigation for impacts from the expansion will be the responsibility of the County of Orange.

IRWD Parcel (Portion of PA 35)

No additional service will be required for this parcel, therefore no additional water supplies will be required. As a result, no significant impact related to the need for additional water supply will occur.

5.15.1.4 Significant Impacts

Base Plan and Overlay Plan

The specific significant environmental impact of constructing new potable water facilities that will be needed to serve the proposed project cannot be determined at this General Plan level of analysis as specific site plans and locations have not been prepared. However, the general significant impacts associated with the construction and operation of public facilities has been addressed within this Final Program EIR, which would include the construction and operation of new potable water facilities.

5.15.1.5 Mitigation Measures

Base Plan and Overlay Plan

Mitigation Measures identified in other sections of this Final Program EIR (5.1 - 5.13) address the environmental impacts associated with the construction and operation of public utilities. These measures are applicable to the construction and operation of new potable water facilities identified in this section to serve new growth expected in the project area.

5.15.1.6 Significance of Impacts After Mitigation

Base Plan and Overlay Plan

The general environmental impacts associated with the construction and operation of public utilities have been addressed within the Final Program EIR, which would include the construction and operation of new potable water facilities identified in this section. Mitigation Measures required for any significant impacts identified in preceding sections of this Final Program EIR apply to the future construction and operation of potable water facilities within the project area. Project-level environmental review, at the time the specific plans for the potable water backbone system have been prepared, will also be required and project specific mitigation measures identified and implemented.

5.15.2 Recycled Water

5.15.2.1 Environmental Setting

IRWD is the jurisdictional agency responsible for providing plan approval and water service to the entire project area. The IRWD does not have any adopted expansion plans for the recycled water system within the project area.

Former MCAS El Toro (PAs 51 and 30)

A report, “The Orange County Great Park Program EIR Infrastructure Report” (Fusco Engineering, November, 21 2002) has been prepared for Orange County Great Park Plan. This report is provided in Appendix J of this Final Program EIR.

Recycled water is currently supplied to PAs 51 and 30 via a 12-inch IRWD Zone B pipeline that runs perpendicular to Technology Drive and connects to an eight-inch MCAS El Toro pipeline in the southwest corner of the base.

PAs 51 and 30 lies within three separate IRWD recycled water system pressure zones, Zone B East Irvine, Zone C East Irvine, and Zone D AMP East. Zone B East Irvine serves elevations from 114 to 300 feet, Zone C East Irvine serves elevations from 300 to 440, and Zone D AMP East serves elevations above 440 feet.

James A. Musick Jail Facility (Portion of PA 35)

Recycled water service to the Musick Jail is not available at this time. Historically, the Santiago Aqueduct Commission (SAC) pipeline supplied the Musick Jail facilities with untreated, imported water supply from the MWD. The untreated water was used primarily for agricultural applications. The untreated water service from the SAC pipeline has been abandoned due to pipeline damage. Repair of the pipeline damage is currently considered cost prohibitive. However, the IRWD staff has indicated that recycled water service to the Musick Jail has been considered and the IRWD Recycled Water System may be extended to

supply recycled water from the Michelson Water Reclamation Plant to the Irvine Industrial Complex and the Musick Jail in the future.

IRWD Parcel (Portion of PA 35)

The IRWD provides potable water to the parcel for use in irrigation.

City of Irvine

The IRWD provides recycled water service to the entire City of Irvine.

5.15.2.2 Threshold for Determining Significance

The CEQA Environmental Checklist, Appendix G outlines the thresholds for determining significance for recycled water.

Would the project:

1. *Require or result in the construction of new water treatment facilities or expansion of existing facilities, the construction of which could cause significant environmental effects?*

5.12.2.3 Environmental Impact

Threshold 1: Would the project require or result in the construction of new water treatment facilities or expansion of existing facilities, the construction of which could cause significant environmental effects?

Base Plan and Overlay Plan

Former MCAS El Toro (PAs 51 and 30)

The primary demand for recycled water within PAs 51 and 30 will be generated by the development of proposed land uses under the proposed project. The IRWD will continue to provide recycled water service, at existing levels of service, to PAs 51 and 30. IRWD has indicated in its Water Resources Master Plan that it will have sufficient capacity to meet the future recycled water requirements of Measure W Orange County Great Park Plan, which is similar to the proposed project.

On January 27, 2003 the Board of Directors of the Irvine Ranch Water District (IRWD) approved the assessment of water supply for the proposed project. The IRWD assessment of water supply is provided in Appendix C of this Final Program EIR. Based on the findings of the assessment, the IRWD has determined that a sufficient non-potable water supply is available to serve the project. The total non-potable water supplies available to IRWD during normal, single-dry and multiple-dry years within a 20-year projection will meet the project non-potable water demand of the project in addition to the demand of existing and other planned future uses, including, but not limited to, agricultural and manufacturing uses.

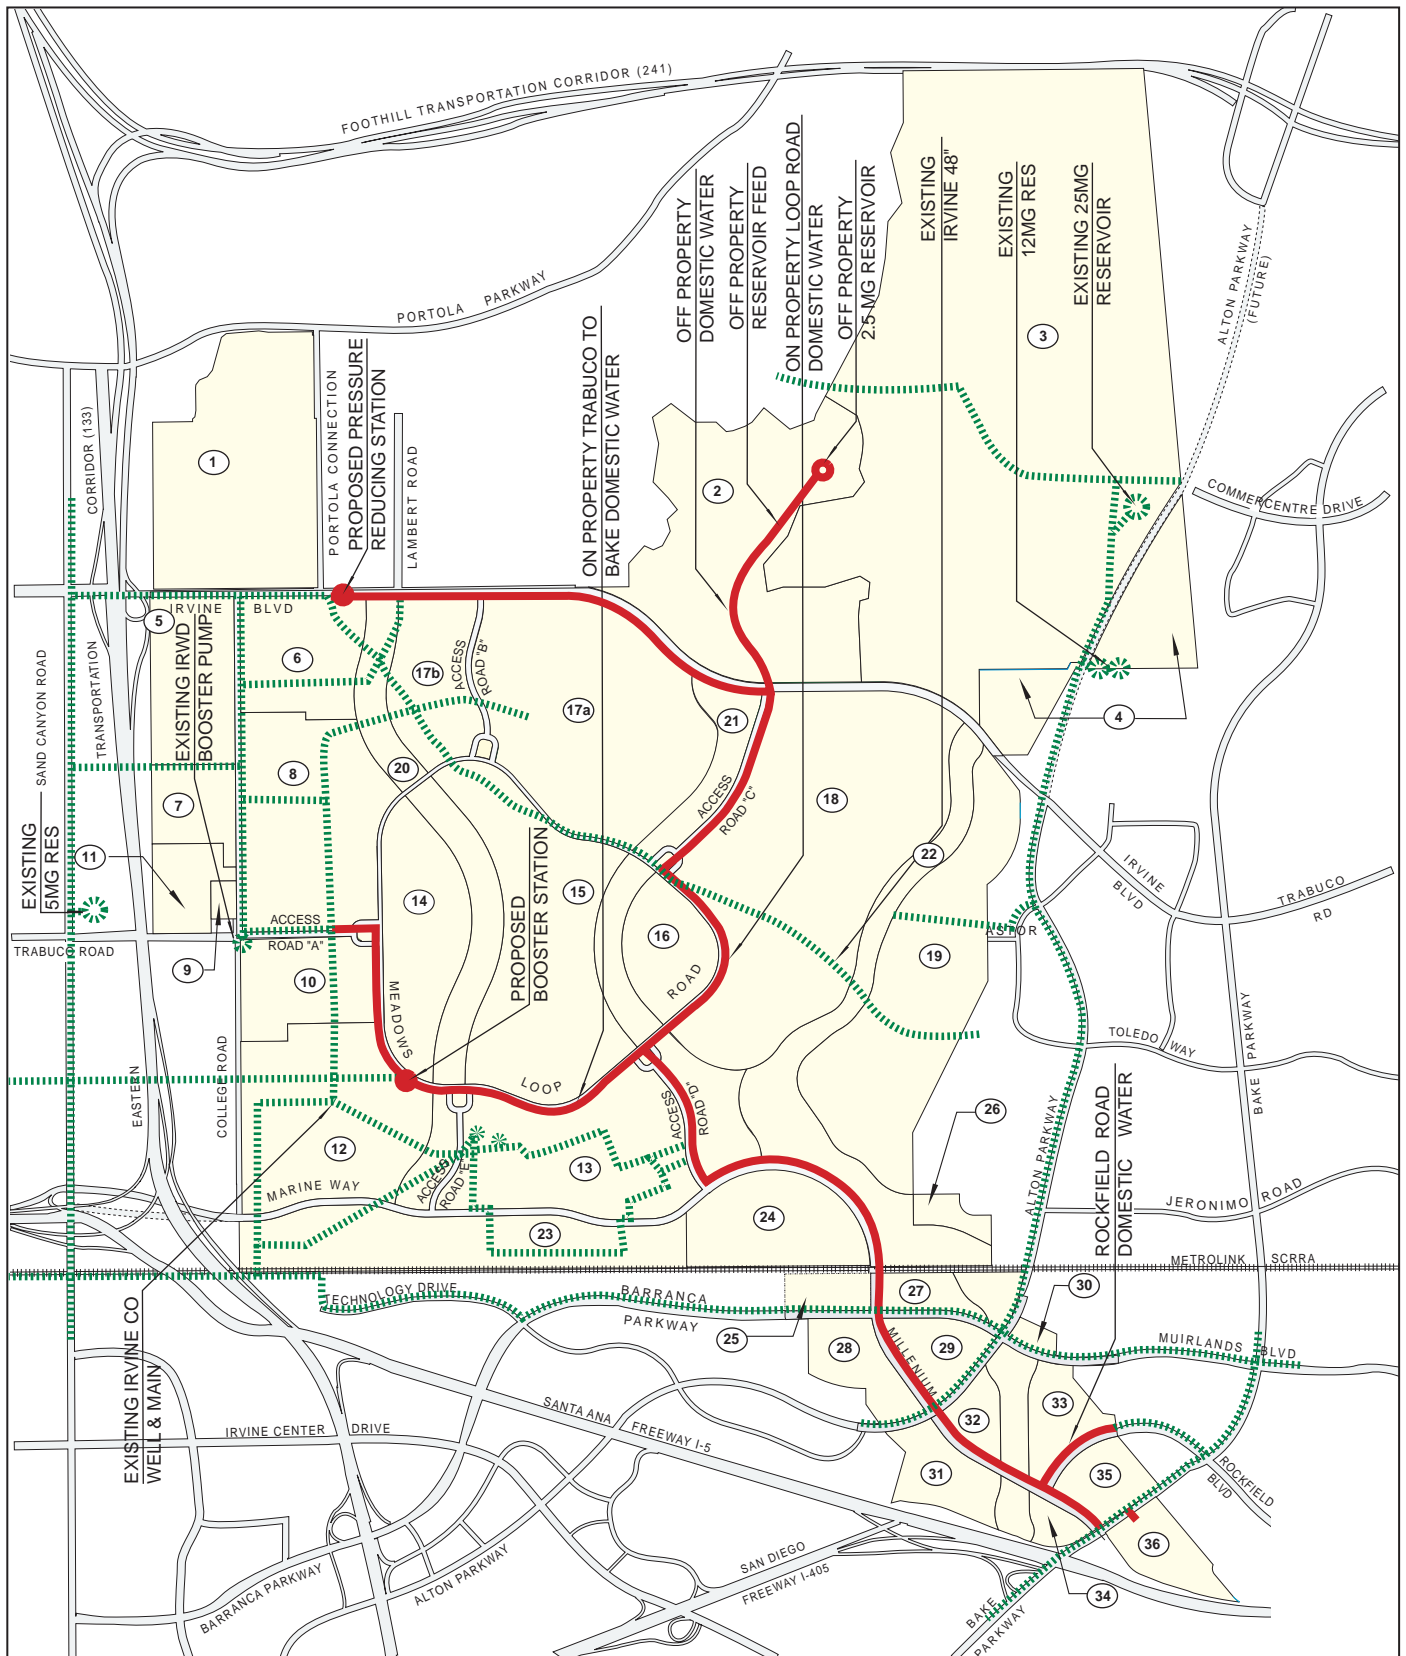

Projected average day water buildout demand for recycled water service based on the proposed land uses in PAs 51 and 30 under the Base Plan is expected to be less than the 5.6 million gallons per day (MGD) calculated for the Overlay Plan since the Base Plan is less intense. Appendix J of this Final Program EIR contains the generation assumptions that were completed to estimate the future demand for recycled water within PAs 51 and 30 under the Overlay Plan.

Implementation of the proposed project will require the expansion of recycled water transmission lines to serve the project. The recycled water system for the former MCAS El Toro property for the Base Plan and Overlay Plan is illustrated in Figure 5.15-2. The Base Plan and Overlay Plan recycled water system assumes that selected on-site facilities will be preserved in place and remain operational at buildout of the Plan. The Base Plan and Overlay Plan recycled water system design works to expand the limited existing MCAS El Toro system, fully integrating it into the IRWD system and providing backbone service to all user areas of the project site.

A looped system is the conventional and preferred method for delivery of recycled water supplies since multiple sources of supply make the system more reliable and flexible. The Base Plan and Overlay Plan recycled water system proposes an expansion of the facilities currently operated by IRWD. The proposed looped system features multiple connections to existing facilities with a network of 12-inch, 16-inch, and 24-inch diameter pipes that generally coincide with the routing of new and existing roadways circulating throughout the project. Two new booster stations will need to be constructed that will pump water through the network from Zone B through Zone C and Zone D. Conversely, pressure-reducing stations will return excess water from higher elevations to lower elevation zones as necessary in response to local demand by the project. Storage calculations using IRWD storage criteria reveal that a new Zone D reservoir measuring 2.0 million gallons will be needed to meet projected demand by the project. The reservoir is expected to be located in the vicinity of the existing potable water reservoir at the “Wherry” site. The balance of the projected demand will be met by drawing from the existing “Irvine Lake” system pipeline in the vicinity of the intersection of Irvine Boulevard and Lambert Road.

Additional IRWD maintenance personnel and equipment may be required to operate and maintain the proposed recycled water system. The project proponent(s) will be responsible for applicable costs associated with protection, relocation, repair, replacement, extension or expansion of recycled water facilities.

The specific environmental impact of constructing new recycled water facilities that will be needed to serve the proposed project cannot be determined at this program level of analysis as site specific plans for the installation of the recycled water backbone system

LEGEND

Existing Domestic Water

Proposed Domestic Water

Parcel Number (Typical)

0 1,500

Figure 5.15-2
Recycled Water System PAs 51 and 30

have not been prepared. However, the general impacts associated with the construction and operation of public utilities has been addressed within this Final Program EIR, which would include the construction and operation of the recycled water system. Mitigation measures required for any significant impacts identified in preceding sections of this Final Program EIR would apply to the future construction and operation of the recycled water system within the project area. Project-level environmental review, at the time that specific development plans have been prepared will also be required.

James A. Musick Jail Facility (Portion of PA 35)

IRWD will be the provider of recycled water to the jail in the event that a new recycled water connection is established. Annexation of the jail facility will not result in the need for the construction or expansion of recycled water facilities, and no impact is anticipated.

Repair of the SAC pipeline connection to provide untreated water service is not included in the proposed jail expansion plan due to the cost of repairing the pipeline connection. According to the IRWD, the property may be served with treated recycled water some time in the future. Currently recycled water is conveyed by the IRWD dual distribution system originating from the Michelson Water Reclamation Plant. IRWD is contemplating expanding this system into the Irvine Industrial Complex East area of the district in the future, which would increase the fiscal feasibility of providing recycled water to the jail facility. Similarly, with the proposed development of the PAs 51 and 30, the cost to install a new recycled water connection may decrease to a level that will allow new service to reach the jail facility.

IRWD Parcel (Portion of PA 35)

The IRWD parcel will not require additional recycled water service as a result of its annexation, therefore no significant impact related to the construction and or extension of recycled water service will occur.

5.15.2.4 Significant Impacts

Base Plan and Overlay Plan

The specific significant environmental impact of constructing new recycled water facilities that will be needed to serve the proposed project cannot be determined at this General Plan level of analysis as specific site plans and locations have not been prepared. However, the general significant impacts associated with the construction and operation of public facilities has been addressed within this Final Program EIR, which would include the construction and operation of new recycled water facilities.

5.15.2.5 Mitigation Measures

Base Plan and Overlay Plan

Mitigation Measures identified in other sections of this Final Program EIR (5.1 - 5.13) address the environmental impacts associated with the construction and operation of public utilities. These measures are applicable to the construction and operation of new recycled water facilities identified in this section to serve new growth expected in the project area.

5.15.2.6 Significance of Impacts After Mitigation

Base Plan and Overlay Plan

The general environmental impacts associated with the construction and operation of public facilities have been addressed within the Final Program EIR, which would include the construction and operation of new recycled water facilities identified in this section. Mitigation Measures required for any significant impacts identified in preceding sections of this Final Program EIR apply to the future construction and operation of recycled water facilities within the project area. Project-level environmental review, at the time the specific plans for the recycled water backbone system have been prepared, will also be required and project specific mitigation measures identified and implemented.

5.15.3 SEWER

5.15.3.1 Environmental Setting

The Irvine Ranch Water District (IRWD) is the jurisdictional agency responsible for providing plan approval and sewer service to the entire annexation area. The IRWD does not have any adopted expansion plans at this time for sewer services serving the proposed annexation area.

Former MCAS El Toro (PAs 51 and 30)

A report, "The Orange County Great Park Program EIR Infrastructure Report" (Fusco Engineering, November, 21 2002) has been prepared for Orange County Great Park Plan. This report is provided in Appendix J of this Final Program EIR.

The primary sewer collection system that serves PAs 51 and 30 is a two-branched system with flow, mainly by gravity, from the northeast to the southwest. One lift station with two pumps is located in the southwest portion of PA 51 in Building 375. The existing sewer infrastructure system on PAs 51 and 30 consists of a series of polyvinyl chloride (PVC) and vitrified clay pipes (VCP) ranging in size from 6-inches to 15-inches in diameter.

Sewer discharge exits PAs 51 and 30 via two 12-inch lines at the southwest boundary of the base into the IRWD sewer system. The two 12-inch lines cross under the SCRRA railroad

tracks and connect with IRWD manholes southwest of the tracks. The flows then combine and exit via an 18-inch VCP pipe. The design capacity of this 18-inch pipe is about 1,200 gallons per minute (GPM). The flow continues through the IRWD Alton-Bake Parkway Trunk Sewer System to the San Diego Creek Interceptor on the north side of the San Diego (I-405) Freeway. The sewage is treated at the Michelson Wastewater Reclamation Plant.

James A. Musick Jail (Portion of PA 35)

The existing sewer system that serves the Musick Jail consists of eight- and ten-inch pipelines that connect to the external IRWD sewer system through a single 10-inch trunk sewer connection located at the southern edge of the jail property. The wastewater is treated at the Michelson Wastewater Reclamation Plant³.

IRWD Parcel (Portion of PA 35)

The IRWD parcel contains a domestic water storage and pumping facility, and does not generate sewage.

City of Irvine

The IRWD provides sewer service to the entire City of Irvine.

5.15.3.2 Threshold for Determining Significance

The CEQA Environmental Checklist, Appendix G outlines the thresholds for determining significance for sewer services.

Would the project:

1. *Require or result in the construction of new wastewater treatment facilities or expansion of existing facilities, the construction of which could cause significant environmental effects?*
2. *Result in a determination by the wastewater treatment provider which serves or may serve the project that it has inadequate capacity to serve the project's projected demand in addition to the provider's existing commitments?*
3. *Exceed wastewater treatment requirements of the applicable Regional Water Quality Board?*

5.15.3.3 Environmental Impact

Threshold 1: *Would the project require or result in the construction of new wastewater treatment facilities or expansion of existing facilities, the construction of which could cause significant environmental effects?*

Base Plan and Overlay Plan

Former MCAS El Toro (PAs 51 and 30)

The primary demand for sewer within PAs 51 and 30 will be generated by the development of proposed land uses under the proposed project. The IRWD will continue to provide sewer service, at existing levels of service, to PAs 51 and 30. IRWD has indicated in the past that it will have sufficient capacity to meet the future sewer requirements of PAs 51 and 30 under more intense development plans (the Millennium Plan) than proposed development plan; therefore, IRWD would have adequate capacity to service the less intense Base Plan and Overlay Plan. However, additional wastewater treatment capacity may need to be purchased by the project proponents as specific development proposals come forward in PAs 51 and 30.

Projected buildout demand for sewer services based on the land uses proposed in the project is expected to be an average daily flow of 0.89 million gallons per day (MGD) calculated for the Overlay Plan and less than 0.89 MGD for the Base Plan, since the Base Plan is less intense. Appendix J of this Final Program EIR contains the generation assumptions that were completed to estimate the future demand for sewer within PAs 51 and 30 for the Overlay Plan.

The proposed project will require an increase of sewer transmission capacity in order to serve the project. The backbone sewer system for PAs 51 and 30 as proposed in the project is illustrated in Figure 5.15-3.

The proposed sewer system will preserve selected, existing on-site facilities in place and remain operational at plan build-out. The proposed Base Plan sewer system would expand rather than replace the existing MCAS El Toro system, fully integrating it into the IRWD system and providing backbone service to all user areas of the project. The proposed system would be transferred to IRWD control for operation and maintenance.

The new system includes extension of existing sewer lines with a series of eight-inch, ten-inch, and 12-inch diameter lines beneath the Metrolink Railroad. From there, separate flows will combine and continue to the IRWD Alton-Bake Trunk Sewer than to the San Diego Creek Interceptor Sewer on the north side of the San Diego Freeway in the vicinity of the I-5/I-405 interchange. Sewage effluent will be treated at the Michelson Wastewater Reclamation Plant.

Additional IRWD maintenance personnel and equipment may be required to operate and maintain the proposed sewer system. The project proponent(s) will be responsible for applicable costs associated with protection, relocation, repair, replacement, extension or expansion of wastewater facilities.

Source: Fuscoe Engineering, City of Irvine, 2002.

LEGEND

- Existing Sanitary Sewer
- Proposed Sanitary Sewer

① Parcel Number (Typical)

Figure 5.15-3
Sanitary Sewer System PAs 51 and 30

The specific environmental impact of constructing new sewer facilities that will be needed to serve the proposed project cannot be determined at this program level of analysis as site specific plans for the installation of the sewer backbone system have not been prepared. However, the general impacts associated with the construction and operation of public utilities has been addressed within this Final Program EIR, which would include the construction and operation of the sewer system. Mitigation Measures required for any significant impacts identified in preceding sections of this Final Program EIR would apply to the future construction and operation of the sewer system within the project area. Project-level environmental review, at the time that specific development plans have been prepared will also be required.

James A. Musick Jail Facility (Portion of PA 35)

After annexation, IRWD will continue to serve the Musick Jail facility at its existing level of service. Annexation of the jail facility will not result in the need for the construction or expansion of sewer facilities, and no impact is anticipated.

Should the jail be expanded in the future, an average demand of 0.99 cfs, with a peak hour demand of 1.89 cfs, is expected³. The existing sewer collection system will support 3,840 inmates. Any expansion of the jail facilities to provide space for more than 3,840 inmates will require system improvements to expand the capacity of the sewer collection system serving the jail. No significant impacts were identified in EIR No. 564 related to sewer service. The future expansion of the jail is not a component of this project, and environmental review and mitigation for impacts from the expansion will be the responsibility of the County of Orange.

IRWD Parcel (Portion of PA 35)

No sewer service is anticipated for this parcel since it does not generate sewage. As a result, no impact related to the construction or expansion of sewer facilities will occur.

Threshold 2: ***Result in a determination by the wastewater treatment provider which serves or may serve the project that it has inadequate capacity to serve the project's projected demand in addition to the provider's existing commitments?***

Base Plan and Overlay Plan

Former MCAS El Toro (PAs 51 and 30)

The IRWD will continue to provide sewer service, at existing levels of service, to PAs 51 and 30. IRWD has indicated in the past that it will have sufficient capacity to meet the future sewer requirements of PAs 51 and 30 under more intense development plans (the Millennium Plan) than proposed development plan; therefore, IRWD would have adequate capacity to service the less intense Base Plan and Overlay Plan. However, additional wastewater treatment capacity may need to be purchased by the project proponents as specific development proposals come forward in PAs 51 and 30. Since the IRWD will be able to adequately provide sewer service to PAs 51 and 30, no significant impact related to treatment capacity is anticipated.

James A. Musick Jail Facility (Portion of PA 35)

The IRWD will continue to provide sewer service, at existing levels of service, to the Musick Jail facility. Annexation of the jail facility will not result in the exceedance of IRWD's capacity for wastewater treatment and no significant impact is anticipated. IRWD has indicated that it will be able to meet the future sewer requirements of the proposed jail expansion plan, but the improvements to the system, as described above, may need to be completed by the County of Orange, as well as purchasing additional wastewater treatment capacity. No significant impacts were identified in EIR No. 564 related to sewer service. The future expansion of the jail is not a component of this project, and environmental review and mitigation for impacts from the expansion will be the responsibility of the County of Orange.

IRWD Parcel (Portion of PA 35)

As the IRWD parcel does not create a demand for sewer service and no future development is proposed for the parcel, annexation of the parcel will not result in a significant impact to the IRWD capacity for wastewater treatment.

Threshold 3: *Would the project exceed wastewater treatment requirements of the applicable Regional Water Quality Board?*

Base Plan and Overlay Plan

As discussed above, the proposed project will not result in the exceedance of the IRWD capacity to treat wastewater. IRWD is regulated by law to treat wastewater consistent with the requirements and standards of the Regional Water Quality Board. Since IRWD is required to treat wastewater at a standard consistent with the Regional Water Quality Board regulations, and the proposed project will not result in the exceedance IRWD's treatment capacity which would impede IRWD's ability to treat wastewater at a level consistent with the Regional Water Quality Board standards, no significant impact related to exceeding wastewater treatment standards is anticipated.

5.15.3.4 Significant Impacts

Base Plan and Overlay Plan

The specific significant environmental impact of constructing new wastewater facilities that will be needed to serve the proposed project cannot be determined at this General Plan level of analysis as specific site plans and locations have not been prepared. However, the general significant impacts associated with the construction and operation of public facilities has been addressed within this Final Program EIR, which would include the construction and operation of new wastewater facilities.

5.15.3.5 Mitigation Measures

Base Plan and Overlay Plan

Mitigation Measures identified in other sections of this Final Program EIR (5.1 - 5.13) address the environmental impacts associated with the construction and operation of public utilities. These measures are applicable to the construction and operation of new wastewater facilities identified in this section to serve new growth expected in the project area.

5.15.3.6 Significance of Impacts After Mitigation

Base Plan and Overlay Plan

The general environmental impacts associated with the construction and operation of public facilities have been addressed within the Final Program EIR, which include the construction and operation of new sewer facilities identified in this section. Mitigation Measures required for any significant impacts identified in preceding sections of this Final Program EIR apply to the future construction and operation of the sewer system within the project area. Project-level environmental review, at the time specific development plans for the sewer backbone system have been prepared, will also be required and project specific mitigation measures identified and implemented.

5.15.4 SOLID WASTE

5.15.4.1 Environmental Setting

Former MCAS El Toro (PAs 51 and 30)

Solid waste is collected by private waste haulers in unincorporated areas of the County. Solid waste generated at the former MCAS El Toro property is collected by Waste Management Inc., a private solid waste hauler. Waste Management Inc. is also one of the private hauling firms permitted to work within the City of Irvine.

Solid waste collected at the former MCAS El Toro property is currently disposed of at the Frank R. Bowerman Landfill. The Bowerman Landfill is located at 11002 Bee Canyon Access Road. The County of Orange Integrated Waste Management Department (IWMD) owns and operates the facility.

James A. Musick Jail

The James A. Musick Jail currently disposes of its solid waste at the Frank R. Bowerman Landfill. Solid waste is collected by Waste Management, Inc., a private solid waste hauler.

IRWD Parcel

Since the parcel generates a minimal amount of solid waste, the IRWD collects the solid waste from the IRWD parcel. The solid waste is then disposed of at an IWMD facility.

City of Irvine

The City of Irvine's residential and village commercial communities' solid waste and recyclables are collected by Waste Management of Orange County, a private waste hauler with an exclusive contract with the City.

Solid waste produced by non-village commercial and industrial businesses is collected by one of the Irvine permitted solid waste haulers. The individual property owners select which permitted hauler the property owner will contract.

The City also offers to its residents, through Waste Management of Orange County, a curbside recycling program for glass bottles and jars, household paper products, aluminum and other metal cans, and greenwaste. All other permitted waste haulers are required to offer recycling services to their commercial customers. Construction and demolition recycling is a standard condition placed on development projects in Irvine.

Integrated Waste Management Department (IWMD)

The County of Orange IWMD owns and operates three landfills to serve the solid waste disposal needs of the County. The City of Irvine disposes of the majority of its solid wastes at the Frank R. Bowerman Landfill. The City of Irvine has a contract with IWMD to commit all of its wastes to the County landfill system (not a particular facility) until 2007. The IWMD also accepts wastes from outside Orange County. When the daily tonnage limit of a landfill is exceeded, waste imported to that facility is reduced accordingly. Thus, adequate capacity is expected to be available to serve future development in the County.

The California Integrated Waste Management Board requires that all counties have an approved Countywide Integrated Waste Management Plan (CIWMP). The Orange County IWMD's CIWMP was approved in 1996 and shows that sufficient solid waste disposal capacity is available in the County for the next 30 years, based on population projections for the area. Under AB 939, each city and county is also required to reduce 50 percent of wastes going to landfills, based on 1990 levels. Waste haulers are working with various jurisdictions on recycling programs and other measures to comply with this mandate.

A County operated Regional Collection Center for household hazardous materials is located near the intersection of Sand Canyon Avenue and Laguna Canyon Road. This center serves Irvine and the surrounding area. Sunset Environmental Industries, located near the intersection of Harvard Avenue and Warner Avenue, provides a public disposal site for

bulky items and purchases recyclables. There are several certified used oil recycling centers located in Irvine.

5.15.4.2 Threshold for Determining Significance

The CEQA Environmental Checklist, Appendix G outlines the thresholds for determining significance for solid waste.

Would the project:

1. *Be served by a landfill with sufficient permitted capacity to accommodate the project's solid waste disposal needs?*
2. *Comply with federal, state, and local statutes and regulations related to solid waste?*

5.15.4.3 Environmental Impact

As defined by the thresholds for determining significance, impacts related to the disposal of solid waste are described below:

Threshold 1: Be served by a landfill with sufficient permitted capacity to accommodate the project's solid waste disposal needs?

Base Plan and Overlay Plan

Former MCAS El Toro (PAs 51 and 30)

Demolition activities, including the removal of existing runways and buildings, at PA 51 will generate debris materials that will need to be disposed at local landfills. Additionally, green waste will be produced as a result of on-going park and landscaping maintenance. As indicated earlier, the City requires construction and demolition debris recycling for new development projects in Irvine. This will allow the reuse of building materials and reduce waste volume requiring disposal. Also, California's Integrated Waste Management Act of 1989 (AB939) mandates that all cities in California divert from the landfill a minimum of 50 percent of the solid waste generated within their jurisdiction compared to base year levels. In addition, as part of AB939 compliance, a new state law (SB1374) requires that all cities implement ordinances or other measures that specifically require the diversion of 75 percent of all construction and demolition waste from landfills. Construction and demolition waste typically includes, but is not limited to, asphalt, brick, concrete, drywall, flooring, glass, gravel, metal, sand, soil, wood, and organics (greenwaste) and other landscaping debris. Therefore, to assure compliance with these statutes, it is necessary for the City to require appropriate and effective mitigation measures to limit the disposal and ensure significant recycling of solid waste from the demolition, dismantling, or other deconstruction of runways, buildings, structures, and other property at the former El Toro Marine Corps Air Station (MCAS) and the maintenance of parks and landscaping. This is considered a potentially significant impact.

Under the proposed project, PAs 51 and 30 will be served by a private solid waste hauler permitted by the City of Irvine. The level of service provided by the Irvine permitted hauler will be approximately the same as existing levels of service. For residential and City controlled land, Waste Management of Orange County will be responsible for the collection of solid wastes and recyclables. Those non-residential areas will be responsible for contracting with an Irvine permitted private waste hauler. Any County, State, or federally controlled lands within the area would be responsible for contracting with private waste haulers to collect their trash, and may be exempt from using a Irvine approved solid waste hauler.

Solid waste will continue to be disposed of in an IWMD facility. The IWMD has not adopted generation rates for solid waste. As shown in Table 5.15-1, using other generation rates, it is estimated that 12 tons per day of solid waste are anticipated to be generated within PAs 51 and 30 under the Base Plan. Table 5.15-2 shows that an estimated that 35 tons per day of solid waste are anticipated to be generated within PAs 51 and 30 under the Overlay Plan. Anticipated increases in solid waste generation resulting from the implementation of the proposed Base or Overlay Plans are not anticipated to exceed the capacity of IWMD facilities since the current capacity exceeds 30 years. Private solid waste hauling services will expand to meet the needs of the projected growth and development allowed under the proposed project.

**Table 5.15-1

Multi-family Residential	7	1,665 DU	11,655
Non-residential	6	6,586 KSF	39,516
Total			70,771

Source: Modified by CBA from Orange County Sanitation Department and National Solid Waste Management Association.

DU= dwelling units, KSF= thousand square feet, lbs=pounds

James A. Musick Jail Facility (Portion of PA 35)

The Musick Jail will continue to be served by a private solid waste hauler at existing levels of service. It is possible that the jail will be exempt from the requirement of using an Irvine permitted hauler since it is a County facility. In the event that the jail is not exempt, the jail will be required to use an Irvine permitted hauler for the collection of solid waste. Solid waste collected from the jail will continue to be disposed of in an IWMD facility. Annexation of the jail facility will not result in the exceedance of IWMD's capacity for solid waste and no significant impact is anticipated.

Anticipated increases in solid waste generation resulting from County expansion plans are not anticipated to exceed the capacity of the private haulers and IWMD facilities. No significant impacts were identified in EIR No. 564 related to solid waste. The future expansion of the jail is not a component of this project, and environmental review and mitigation for impacts from the expansion will be the responsibility of the County of Orange.

IRWD Parcel (Portion of PA 35)

Since no additional development is anticipated for the IRWD parcel, IRWD will continue to collect the small amount of solid waste generated on the IRWD parcel. This solid waste will continue to be disposed of at an IWMD facility. This small amount of solid waste generated at the IRWD parcel will not exceed the disposal capacity the IWMD. No impact related to exceeding the current landfill capacity will occur with the annexation of the IRWD parcel.

Threshold 2: Comply with federal, state, and local statutes and regulations related to solid waste?

Base Plan and Overlay Plan

Former MCAS El Toro (PAs 51 and 30)

Solid waste generated in PAs 51 and 30 by the Base or Overlay Plans will continue to be disposed of by permitted solid waste haulers to IWMD regulated sites that have adequate capacity and comply with federal, state and local statutes and regulations related to solid waste. In addition, the City of Irvine requires solid waste carriers to offer recycling disposal of solid waste generated in PAs 51 and 30 to help reduce the amount of solid waste disposed of in local landfills. The impact is potentially significant and mitigation is required.

James A. Musick Jail (Portion of PA 35)

Solid waste generated by the James A. Musick Jail will continue to be disposed of by a solid waste hauler to IWMD regulated sites that have adequate capacity and comply with federal, state and local statutes and regulations related to solid waste. As a result, no significant impact is anticipated.

IRWD Parcel (Portion of PA 35)

The small amount of solid waste generated by the IRWD parcel will continue to be disposed of at a IWMMD regulated site that has adequate capacity and comply with federal, state and local statutes and regulations related to solid waste. As a result, no significant impact is anticipated.

5.15.4.4 Significant Impacts

Base Plan and Overlay Plan

- SW1.** The project site may contain solid waste unsuitable for recycling or reuse. Also, the project will generate solid waste as result of demolition, operation of proposed land uses, and landscape maintenance.

5.15.4.5 Mitigation Measures

Base Plan and Overlay Plan

- SW1.** It is anticipated that much of the solid waste resulting from the demolition, dismantling, or other deconstruction of the aged structures and property, including but not limited to buildings and runways, at the former MCAS El Toro is contaminated with lead based paints, asbestos, or other materials that may render it unsuitable for recycling or reuse. At the sole cost and expense of the project applicant, in order to evaluate this condition and determine the feasibility of recycling of solid waste material from the former MCAS El Toro site by ordinary means, a technical evaluation by a qualified environmental consultant must be conducted. The technical evaluation shall include sufficient sample testing of all types of solid waste materials to be generated by the project to analyze its composition. A copy of the full technical evaluation and its findings must be submitted to the City of Irvine Community Development Department. The City of Irvine must confirm the adequacy of the technical evaluation prior to authorizing the demolition, dismantling, or deconstruction project to proceed.

If it is determined by the technical evaluation that the material is contaminated and prohibited from being recycled by ordinary means, a further evaluation must be conducted to identify and evaluate other feasible methods approved by state law to divert the material from landfills. This may include the delivery of the waste material to other appropriate non-disposal or transformation facilities, such as “waste-to-energy” (WTE) plants.

- SW2.** For that solid waste which is determined to be inappropriate for recycling (as that term is defined by California Public Resources Code Section 40180), the project applicant must submit a written plan to the City and implement such plan to ensure that 75 percent of the material, or the maximum amount feasible as determined by the technical evaluation, is diverted from the landfill through other methods that comply with state statutes and regulations.

- SW3.** For that solid waste which the technical study deems to be suitable for recycling the project applicant must submit a written plan to the City and implement such plan to ensure that solid waste material generated by the demolition, dismantling, or deconstruction project, land use operations and maintenance is collected by a City authorized solid waste hauler or recycling agent, and that a minimum of 75 percent of the solid waste from the project is diverted from landfills by recycling, as that term is defined by California Public Resources Code Section 40180. ("Recycling" does not include transformation, as defined in Public Resources Code Section 40201.)
- SW4.** To ensure ongoing compliance with these mitigation measures, the project applicant will be required to submit solid waste tonnage reports to the City of Irvine on City approved forms, accompanied by "weight ticket" receipts from state-certified disposal, nondisposal, or transformation facilities, on a quarterly basis to demonstrate that solid waste diversion has occurred in accordance with these required mitigation measures and in a manner that is consistent with, and not detrimental to, the efforts of the City of Irvine to comply with AB939.
- SW5.** For green waste, the project applicant must submit a written plan to the City and implement such plan to ensure that the green waste material generated by the landscape maintenance operations is collected by a City authorized waste hauler or recycling agent, that the maximum feasible amount of that collected green waste is recycled, and that a minimum of 50 percent of the green waste from the project is diverted from landfills by recycling, as that term is defined by California Public Resources Code Section 40180.

To assure compliance with applicable statutes related to the disposal of solid waste, it is necessary for the City to require appropriate and effective mitigation measures to limit the disposal and ensure significant recycling of solid waste on-site.

5.15.4.6 Significance of Impacts After Mitigation

Base Plan and Overlay Plan

Implementation of the proposed project will not result in a significant impact related to solid waste.

5.15.5 ENERGY AND COMMUNICATIONS

5.15.5.1 Environmental Setting

Electrical Facilities and Service

Former MCAS El Toro (PAs 51 and 30)

A report, "The Orange County Great Park Program EIR Infrastructure Report" (Fuscoe Engineering, November, 21 2002) has been prepared for Orange County Great Park Plan

was prepared to design the backbone infrastructure system. This report is provided in Appendix J of this Final Program EIR.

Southern California Edison (SCE) presently serves the former MCAS El Toro property via two primary substation sites. Historically the former MCAS El Toro has received power through the California ISO-controlled 220/66 kV Santiago Substation which is interconnected to the Irvine and Limestone Substations. The Santiago Substation, is south of Irvine Center Drive on Sand Canyon Avenue. The Irvine Substation is located next to the entry gate of MCAS El Toro, at the east end of Trabuco Road. The Limestone Substation is located near Peachwood Avenue and Trabuco Road.

Since MCAS El Toro's closure in July, 1999, the majority of facilities have been closed and or idled. The DON continues to provide caretaker responsibilities for the existing buildings, structures, ancillary facilities, runways, etc. Some existing facilities are leased for various interim land uses, such as the golf course, equestrian facilities, California State University - Fullerton Extension Campus, agricultural operations, and recreational vehicle storage.

These interim land uses reflect only a limited and temporary use of the former MCAS El Toro site. As the leases for the interim activities end, the DON may renew or not renew the respective leases. With limited current usage, interim electricity consumption can be considered minimal.

The James A. Musick Jail Facility (Portion of PA 35)

The Musick Jail facility is located within the service area of SCE, which provides service by utilizing existing 12kV underground facilities. These electrical facilities are located on the northerly and westerly boundaries of the jail facility¹.

IRWD Parcel (portion of PA 35)

The IRWD parcel is located within the SCE service area.

Natural Gas Facilities and Service

The Former MCAS El Toro Property (PAs 51 and 30)

A report, "The Orange County Great Park Program EIR Infrastructure Report" (Fuscoe Engineering, November, 21 2002) has been prepared for Orange County Great Park Plan was prepared to design the backbone infrastructure system. This report is provided in Appendix J of this Final Program EIR.

The Southern California Gas Company presently serves PAs 51 and 30. The former MCAS El Toro property is adjacent to a large diameter pipe. Along a portion of Irvine Boulevard, six-inch and eight-inch lines exist. The line in Irvine Boulevard and the adjacent parcel extends to the east of the former base and connects into existing two-inch, three-inch, and four-inch systems. The Gas Company has two-inch, four-inch, and six-inch lines located within the existing roads within the Irvine Spectrum area to the south.

The Southern California Gas Company has an option to utilize the existing 30-inch high pressure main that runs parallel to the railroad tracks between PA 51 and PA 30. This 30-inch line is rated at approximately 465 pounds per square inch (p.s.i.) and serves a portion of San Diego County.

James A. Musick Jail Facility (Portion of PA 35)

The James A. Musick Jail facility is located within The Southern California Gas Company service area.

IRWD Parcel (Portion of PA 35)

The IRWD parcel is within The Southern California Gas Company service area.

Communication Facilities and Services

Former MCAS El Toro (PAs 51 and 30)

A report, "The Orange County Great Park Program EIR Infrastructure Report" (Fusco Engineering, November, 21 2002) has been prepared for Orange County Great Park Plan was prepared to design the backbone infrastructure system. This report is provided in Appendix J of this Final Program EIR.

Pacific Bell is the present provider to PAs 51 and 30. Pacific Bell has service offices on Irvine Center Drive, south of Yale Avenue (Irvine office) and on Irvine Center Drive, west of Bake Parkway (Spectrum office). An exchange boundary runs the extent of the railroad tracks and separates the serving territory of these two offices. The Spectrum office would serve communications needs south of the tracks (the majority of PA 30), while the Irvine office would serve the majority of the former base (PA 51 and the remainder of PA 30). Fiber optic and copper lines are contained throughout the areas surrounding PAs 51 and 30.

James A. Musick Jail Facility (Portion of PA 35)

The Musick Jail is located within the service area of Pacific Bell, which provides service to the facility³.

IRWD Parcel

The IRWD parcel is within the Pacific Bell service area, but does not require service since the parcel does not contain any residential or business uses.

5.15.5.2 Threshold for Determining Significance

The CEQA Environmental Checklist, Appendix G outlines the thresholds for determining significance for energy.

Would the project:

1. *Result in substantial adverse physical impacts associated with the provision of new or physically altered energy and communications transmission facilities, need for new or physically altered energy and communications transmission facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable levels of service?*
2. *Result in the use of substantial amounts of fuel and/or energy?*

5.15.5.3 Environmental Impact

As defined by the thresholds for determining significance, impacts related to the provision of energy are described below:

Threshold 1: *Would the project result in substantial adverse physical impacts associated with the provision of new or physically altered energy and communication transmission facilities, need for new or physically altered energy and communications transmission facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable levels of service?*

Base Plan and Overlay Plan

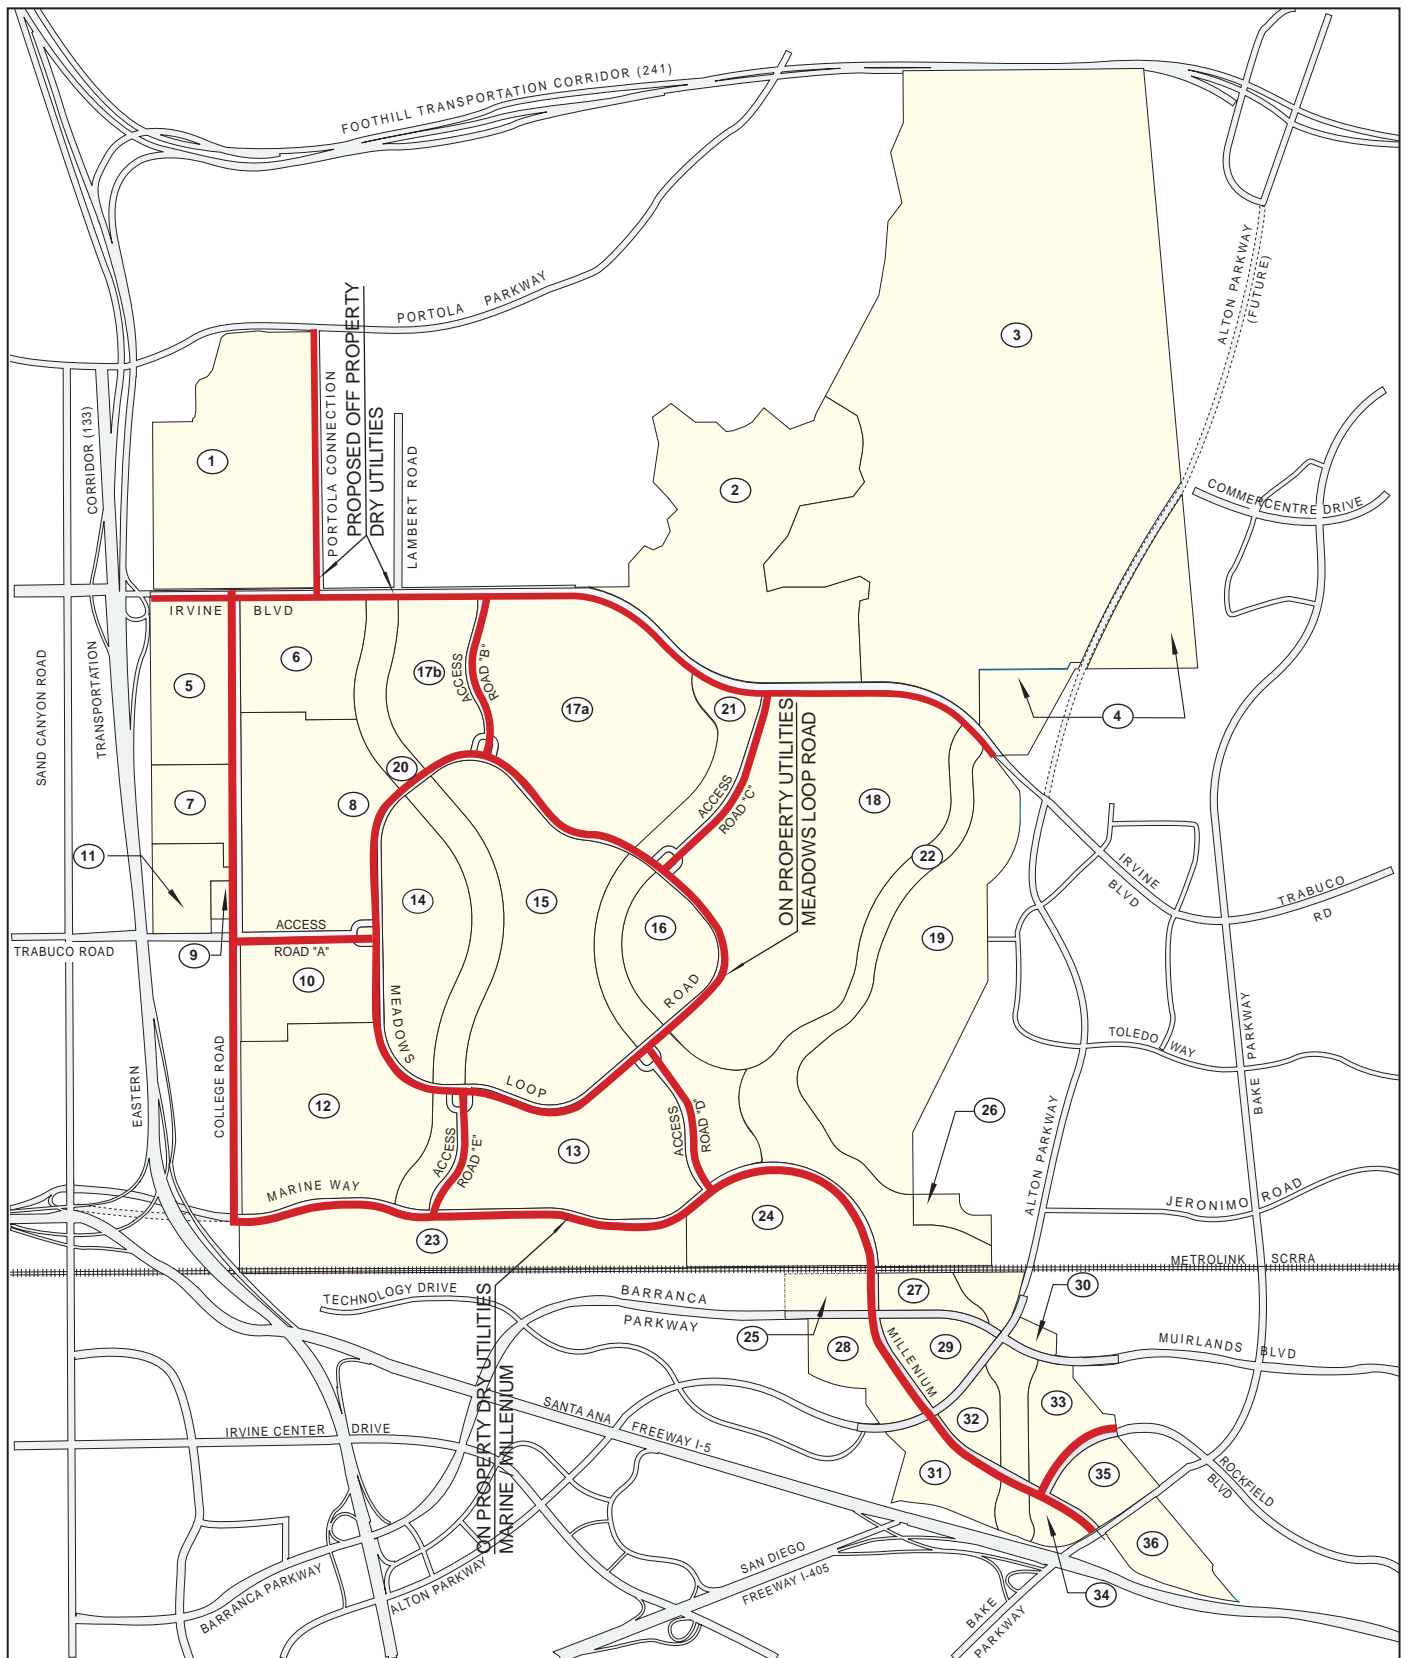

Former MCAS El Toro (PAs 51 and 30)

Proposed Electrical, Gas, and Communication System

The primary demand for electricity, gas, and communications within PAs 51 and 30 will be generated by the development of proposed land uses under the proposed project. Implementation of the proposed project will require the expansion of existing electrical, gas, and communications systems to serve the project. The proposed backbone electrical, gas, and communications system for PAs 51 and 30 is illustrated in Figure 5.15-4.

The Base Plan and Overlay Plan propose to replace the existing electrical, gas, and communication systems in their entirety. The new system will comply with modern design methods, performance standards and specifications that will make the Base Plan system compatible with its surroundings. The new system will be installed to generally coincide with the routing of new and existing roadways circulating throughout the project. Electrical lines will be required to be undergrounded pursuant to City standards.

The specific environmental impact of constructing new energy and communication transmission facilities that will be needed to serve the proposed project cannot be determined at this program level of analysis as site specific plans for the installation of the energy and communication transmission backbone system have not been prepared.

Source: Fuscoe Engineering, City of Irvine, 2002.

LEGEND

— Proposed Dry Utilities,
Power Gas and Communications

① Parcel Number (Typical)

Figure 5.15-4
Dry Utilities

However, the general impacts associated with the construction and operation of public facilities has been addressed within this Final Program EIR, which would include the construction and operation of the transmission system. Mitigation Measures required for any significant impacts identified in preceding sections of this Final Program EIR would apply to the future construction and operation of the energy and communication transmission system within the project area. Project-level environmental review, at the time that specific development plans have been prepared will also be required.

James A. Musick Jail Facility (Portion of PA 35)

After annexation, SCE, The Southern California Gas Company, and Pacific Bell will continue to serve the Musick Jail facility at existing levels of service. Annexation of the jail facility will not result in the need for the construction or expansion of additional energy or communication transmission facilities, and no impact is anticipated.

According to EIR No. 564, in the event that the jail facility is expanded to the proposed 7,584 inmates, SCE, The Southern California Gas Company, and Pacific Bell have the capacity to service the jail. No significant impacts were identified in EIR No. 564 related to energy or communication service. The future expansion of the jail is not a component of this project, and environmental review and mitigation for impacts from the expansion will be the responsibility of the County of Orange.

IRWD Parcel (Portion of PA 35)

As there is no expansion plan for the IRWD parcel that would generate a demand for energy or communication service requiring the construction or expansion of energy or communication transmission facilities, annexation of the IRWD parcel will not result in a need to construct or expand energy or communication facilities. As a result, no impact related to the construction and expansion of energy and communication transmission facilities will result from the annexation of the IRWD parcel.

Threshold 2: Result in the use of substantial amounts of fuel and/or energy?

Base Plan

The Former MCAS El Toro (PAs 51 and 30)

Electrical Usage

Using the planned land uses, the Proposed Project would consume 59.1 million kWh per year (Table 5.15-3). Rather than subtract existing electricity consumption from the Base Plan's electricity consumption to determine incremental or net electricity consumption, it has been assumed that existing electricity consumption to be zero. As such, all of the proposed project's electricity consumption is considered to be incremental. Therefore, total incremental electricity consumption would be approximately 59.1 million kWh (Table 5.15-3).

The proposed project would have a peak load of 14,771 kW (Table 5.15-3). Sufficient available capacity exists at the Irvine and Limestone Substations to serve the proposed project's load estimates. However, the existing overhead 4 kV distribution system currently serving the former MCAS El Toro would be replaced with an underground 12 kV distribution system.

To place the Base Plan's electricity consumption and demand in perspective, the total net energy load in the SCE transmission service area in 2000 was 98,269 million kWh and SCE area peak demand was 18,724,000 kW (California Energy Commission (CEC), California Energy Demand 2002-2012 Forecast, Table B-3 and Table D-3). The CEC is

**Table 5.15-3
Proposed Project Electricity Demand and Consumption for Base Plan**

Land Use Type	Acres	Dwelling Units	Square Feet	Peak Load (kW)	Energy Consumption (Million kWh/Year)

(a) Cultural/Institutional residential included in Residential
Source: ASTRUM Utility Services, 2003.

also predicting that net energy for load will grow annually at 2 percent and that the area peak demand will grow at 2.4 percent (CEC, California Energy Demand 2002-2012 Forecast, Table B-3 and D-3). For the year 2012, the CEC forecasts net energy for load and area peak demand in SCE's service area to be 125,224 million kWh and 24,960,000 kW respectively (CEC, California Energy Demand 2002-2012 Forecast, Table B-3 and D-3). The proposed project's consumption of electricity is 0.05 percent and peak demand is 0.06 percent of CEC's forecast for SCE in 2012.

SCE has indicated its ability to serve the projected project, in accordance with all applicable tariff schedules which are the effective rates and rules of the Southern California Edison Company on file with and approved by the Public Utilities Commission, State of California, and subject to the receipt of such permits or authorization from public agencies may be

required for such installation. Project-related electricity demand will not significantly impact SCE's current level of service.

California Assembly Bill 1890 (AB 1890) fundamentally changed the structure of the electric industry to increase the reliance on competitive market forces. Initially, the transition appeared to be consistent with its intended purpose. However, partial deregulation of electric utilities ultimately led to what many would term as an "energy crisis" in 2000.

The "energy crisis" resulted in escalating electricity rates, limited rotating blackouts, active State participation in power purchases, severe financial distress for investor-owned utilities, and Federal Government intervention. The events leading up to the "energy crisis" were economic rather than increasing demand for electricity or the capacity to generate and deliver power.

The economic factors that helped precipitate the "energy crisis" were in part due to the requirements of AB 1890. This law required that California's three largest investor-owned utilities ("IOUs") to: (i) divest much of their generation facilities; (ii) sell the electric output from their remaining facilities to the California Power Exchange ("PX"); (iii) buy electricity exclusively from the PX; (iv) limited their ability to enter into long term power supply contracts; and (v) freeze electric rates to retail customers. During 2000, the PX's cost of wholesale electricity costs more than tripled from \$7.4 billion in 1999 to \$27.1 billion (CEC, 2002-2012 Electricity Outlook Report, page 2). Unable to increase the rates to customers, the IOUs experienced severe financial difficulties (PG&E declared bankruptcy on April 6, 2001) and energy suppliers were reluctant to provide additional power resources without payment guarantees.

Faced with the "energy crisis", the State initiated a number of steps including: (i) authorized the California Department of Water Resources to execute long term power purchase contracts; (ii) increased electric rates in 2001; (iii) offered customers financial incentives to lower consumption; (iv) initiated a public-awareness campaign advising customers to conserve electricity or shift usage to non-peak hours; (v) accelerated the permitting for new generation facilities; and (vi) participated in regulatory and legal proceedings to determine if the wholesale electricity market had been manipulated. The Federal Energy Regulatory Commission ("FERC") also imposed several changes intended to mitigate price and reliability problems, including establishing a ceiling price for wholesale electric power.

Conservation programs and new interruptible power programs created permanent peak load reductions and averted the predicted outages during the summer of 2001 (CEC, California Energy Demand 2002-2012 Electricity Outlook Report). In 2001, Californians used 8 percent less energy during peak hours than the year before. In 2002, the peak load drop was 5.4 percent through August 2002, compared to the same period in 2000. (San Diego Union-Tribune, December 15, 2002).

As of December 12, 2002, the CEC predicted that in a 1-in-2 year "normal weather" scenario for 2004, the peak hour demand for electricity in California, including a 7 percent reserve would be 58,059 MW, and in a 1-in-10 year hotter-than-normal scenario, 61,436 MW. Based on the CEC's most likely estimate for generation, it projected a range of the state-wide peak load surpluses from 584 MW (8.0 percent reserve margin) to 3,961 MW (14.3 percent reserve margin). Generation includes existing generation sources, net new

generation additions, net firm imports and demand responsive programs. (Draft Report dated December 12, 2002, Energy Analysis Office, California Energy Commission).

Since 1999, the CEC has approved 18 power plants greater than 300 MW, representing a total capacity of 11,497 MW. As of October 17, 2002, six of the 18 plants are online (totaling 3,587 MW), seven are currently under construction (totaling 4,724 MW) and five plants have put construction on hold (totaling 3,186 MW). An additional 14 power plant applications were under review by the CEC as of December 3, 2002, representing an additional 8,827 MW. Taking into account the larger Western Electricity Coordinating Council (WECC) region (formerly the Western Systems Coordinating Council), which is the regional market for electricity production that includes California, as of November 13, 2002, there was a total of 20,753 MW of new generation capacity under construction, and another 39,950 MW in various in states of the regulatory approval process. (CEC website, Electricity in California, Power Plants & Infrastructure section)

The short-term disruption of electrical energy supply of 2000 and 2001 has largely passed, though the financial effects will be felt for years to come. The State and Federal Government will continue to take a proactive role in ensuring that California has a reliable supply of electricity and the capacity to meet peak load demand in the future. Along with the above measures, the State has passed several bills intended to assist the investor-owned utilities, promote renewable and conventional generation, and encourage energy conservation. Forecasted energy supply is expected to be sufficient to meet the development requirements of the proposed project and no significant impact is anticipated.

The additional electrical load imposed by the proposed project is within the capacity of SCE. However, SCE has indicated that an additional substation and circuits will be necessary to support future growth in the vicinity (Planning Areas 1, 2, 40 and Northern Sphere). In the interim, SCE's existing facilities have sufficient circuit capacity to supply the project area once the infrastructure for the development is installed. Additional circuits will be built on an as needed basis taking into account the development schedule of proposed project. All projects in the development area would be required to incorporate energy conservation measures into their design and function. Although electrical consumption will increase as a result of cumulative developments, SCE is expanding its facilities to accommodate this growth. Since SCE can meet the increased demand for electricity, the growth in consumption is not considered significant.

Natural Gas Usage

As shown in Table 5.15-4, the development of PAs 51 and 30 under the proposed Base Plan would consume 8,345,738 cubic feet per month.

Rather than subtract existing natural gas consumption from the proposed project's anticipated consumption to determine incremental or net natural gas consumption, it has been assumed that existing natural gas consumption is zero. As such, all of the proposed project's natural gas consumption is considered to be incremental. Therefore, total incremental gas consumption would be 8,345,738 cubic feet per month (Table 5.15-4).

The new on-site gas distribution infrastructure can be connected to and served from the existing SoCal Gas infrastructure mentioned previously. The existing SoCal Gas facilities are located within and adjacent to the proposed project. The new gas distribution facilities will

typically be installed in the right-of-ways of existing and proposed streets and will be located to efficiently meet the needs of the project. The new gas distribution systems will utilize current design, construction, and operating standards to meet the energy distribution needs of the proposed project.

To place this natural gas consumption in perspective, the total natural gas consumption in the SoCal Gas service area (core and noncore customers) in 2001 was 81,608 million cubic feet per month (Southern California Gas Company, 2002 California Gas Report, page 65). The project's consumption of natural gas is 0.010 percent of SoCal Gas's 2001 consumption.

**Table 5.15-4
Future Natural Gas Usage for Base Plan
Buildout Year 2025**

Land Use Type	Acres	Dwelling Units	Square Feet	Natural Gas Consumption (cu./ft./mo)

(a) Cultural/Institutional residential included in Residential

Long-range planning and oversight of the numerous regulatory agencies will continue to address future energy supply needs. Gas transmission projects both planned for the future and currently under construction by the energy companies will continue to ensure adequate supplies to California and the Southern California Region. Should the CPUC or another agency take an action that may affect gas supply or delivery, then gas distribution will be provided in accordance with the revised conditions.

Natural gas supplies are sufficient to serve the project at build-out. Even with a forecasted 41 percent increase in a natural gas demand in California from 1997-2012, the California Energy Commission anticipates natural gas supplies will be adequate to meet the demand requirements for the state (California Energy Commission, Natural Gas Supply and Infrastructure Assessment, December 2002). According to the Energy Information Administration of the US Department of Energy, technically recoverable natural gas resources in the nation are estimated to be 1,614 trillion cubic feet. This is approximately 82 times the 2001 natural gas production level. (Energy Information Administration, US Crude Oil, Natural Gas, and Natural Gas Liquids Reserves 2001 Annual Report, November 2002, page 128).

The existing utility infrastructure transporting natural gas to the area and site is adequate to meet the needs of the proposed project. Since 2000, SoCal Gas has increased its natural gas receiving capacity. Its firm receiving capacity has increased 10.7 percent to 3,875 MMcf/day. SoCal Gas's firm receiving capacity in excess of demand or slack capacity is forecasted to be 22 percent in 2012. SoCal Gas has increased its ability to meet peak day requirements by using a greater portion of the Aliso Canyon and La Goleta storage facilities. (California Energy Commission, Natural Gas Supply and Infrastructure Assessment, December 2002, page 43.)

Based on the above, implementation of the proposed project will not result in a significant energy level.

James A. Musick Jail Facility (Portion of PA 35)

According to EIR No. 564, in the event that the jail facility is expanded to the proposed 7,584 inmates, SCE and The Southern California Gas Company have the capacity to service the jail. No significant impacts were identified in EIR No. 564 related to energy service. The future expansion of the jail is not a component of this project, and environmental review and mitigation for impacts from the expansion will be the responsibility of the County of Orange.

IRWD Parcel (Portion of PA 35)

As there are no expansion plans for the IRWD parcel that would generate a demand for energy service, no substantial use of fuel and/or energy will occur on-site. As a result, no impact related to the substantial use of fuel and/or energy will result from the annexation of the IRWD parcel.

Overlay Plan

The Former MCAS El Toro (PAs 51 and 30)

Electrical Usage

Using the planned land uses, the Overlay Plan would consume 131.9 million kWh per year (Table 5.15-5). Rather than subtract existing electricity consumption from the Proposed Project's electricity consumption to determine incremental or net electricity consumption, it has been assumed that existing electricity consumption to be zero. As such, all of the proposed project's electricity consumption is considered to be incremental. Therefore, total incremental electricity consumption would be approximately 131.9 million kWh (Table 5.15-5).

The Overlay Plan would have a peak load of 34,978 kW (Table 5.15-5). Sufficient available capacity exists at the Irvine and Limestone Substations to serve the Proposed Project's load estimates. However, the existing overhead 4 kV distribution system currently serving the former MCAS El Toro would be replaced with an underground 12 kV distribution system.

**Table 5.15-5
Proposed Project Electricity Demand and Consumption for Overlay Plan**

Land Use Type	Acres	Dwelling Units	Square Feet	Peak Load (kW)	Energy Consumption (Million kWh/Year)
Residential	560	3,625	-	6,972	20.2
Education	273	-	1,492,594	7,096	23.9
Cultural/Institutional	256	-	1,031,000	2,900	13.2
Transportation Facilities	70	-	176,000	650	2.3
Research and Development	200	-	2,600,000	10,840	43.2

Roadways	185	-	-	-	-
Total	4,693	3,625	6,585,594	34,978	131.9

(a) Open & Recreational Space residential included in Residential
Source: Astrum Utility Services, 2003.

To place this electricity consumption and demand in perspective in 2000, the total net energy load in the SCE transmission service area was 98,269 million kWh and SCE area peak demand was 18,724,000 kW (California Energy Commission (CEC), California Energy Demand 2002-2012 Forecast, Table B-3 and Table D-3). The CEC is also predicting that net energy for load will grow annually at 2 percent and that the area peak demand will grow at 2.4 percent (CEC, California Energy Demand 2002-2012 Forecast, Table B-3 and D-3). For the year 2012, the CEC forecasts net energy for load and area peak demand in SCE's service area to be 125,224 million kWh and 24,960,000 kW respectively (CEC, California Energy Demand 2002-2012 Forecast, Table B-3 and D-3). The Overlay Plan consumption of electricity is 0.11 percent and peak demand is 0.14 percent of CEC's forecast for SCE in 2012.

SCE has indicated its ability to serve the projected project, in accordance with all applicable tariff schedules which are the effective rates and rules of the Southern California Edison Company on file with and approved by the Public Utilities Commission, State of California, and subject to the receipt of such permits or authorization from public agencies may be required for such installation. Project-related electricity demand will not significantly impact SCE's current level of service and no significant impact would occur.

The Base Plan provides a detailed discussion of the State's energy supply and is incorporated by reference.

The additional electrical load imposed by the Overlay Plan is within the capacity of SCE. However, SCE has indicated that an additional substation and circuits will be necessary to support future growth in the vicinity (Planning Areas 1, 2, 40 and Northern Sphere). In the interim, SCE's existing facilities have sufficient circuit capacity to supply the project area once the infrastructure for the development is installed. Additional circuits will be built on an as needed basis taking into account the development schedule of proposed project. All projects in the development area would be required to incorporate energy conservation

measures into their design and function. Although electrical consumption will increase as a result of cumulative developments, SCE is expanding its facilities to accommodate this growth. Since SCE can meet the increased demand for electricity, the growth in consumption is not considered significant.

Natural Gas Usage

Using the planned land uses, the Overlay Plan would consume 31,123,576 cubic feet per month (Table 5.15-6) of natural gas. Rather than subtract existing natural gas consumption from the Overlay Plan's anticipated consumption to determine incremental or net natural gas consumption, it has been assumed that existing natural gas consumption is zero. As such, all of the Overlay Plan's natural gas consumption is considered to be incremental. Therefore, total incremental natural gas consumption would be 31,123,576 cubic feet per month (Table 5.15-6).

**Table 5.15-6
Future Natural Gas Usage for Overlay Plan
Buildout Year 2025**

Land Use Type	Acres	Dwelling Units	Square Feet	Natural Gas Consumption (cu./ft./mo)

Source: Astrum Utility Services, 2003.

(a) Open & Recreational Space residential is included in Residential.

The new on-site gas distribution infrastructure can be connected to and served from the existing SoCal Gas infrastructure mentioned previously. The existing SoCal Gas facilities are located within and adjacent to the proposed project. The new gas distribution facilities will typically be installed in the right-of-ways of existing and proposed streets and will be located to efficiently meet the needs of the project. The new gas distribution systems will utilize current design, construction, and operating standards to meet the energy distribution needs of the proposed project. This would not create as significant impact on the environment.

To place this natural gas consumption in perspective, the total natural gas consumption in the SoCal Gas service area (core and noncore customers) in 2001 was 81,608 million cubic feet per month (Southern California Gas Company, 2002 California Gas Report, page 65).

The Overlay Plan's consumption of natural gas is 0.038 percent of Southern California Gas's 2001 total consumption.

James A. Musick Jail Facility (Portion of PA 35)

According to EIR No. 564, in the event that the jail facility is expanded to the proposed 7,584 inmates, SCE and The Southern California Gas Company have the capacity to service the jail. No significant impacts were identified in EIR No. 564 related to energy service. The future expansion of the jail is not a component of this project, and environmental review and mitigation for impacts from the expansion will be the responsibility of the County of Orange.

IRWD Parcel (Portion of PA 35)

As there are no expansion plans for the IRWD parcel that would generate a demand for energy service, no substantial use of fuel and/or energy will occur on-site. As a result, no impact related to the substantial use of fuel and/or energy will result from the annexation of the IRWD parcel.

5.15.5.4 Significant Impacts

Base Plan and Overlay Plan

The specific significant environmental impact of constructing new energy and communication facilities that will be needed to serve the proposed project cannot be determined at this General Plan level of analysis as specific site plans and locations have not been prepared. However, the general significant impacts associated with the construction and operation of public facilities has been addressed within this Final Program EIR, which would include the construction and operation of new energy and communication facilities.

No significant impact is anticipated related to substantial use of fuel and/or energy sources by the project was identified.

5.15.5.5 Mitigation Measures

Base Plan and Overlay Plan

Mitigation Measures identified in other sections of this Final Program EIR address the environmental impacts associated with the construction and operation of public utilities. These measures are applicable to the construction and operation of new energy and communication transmission facilities identified in this section to serve new growth expected in the project area.

5.15.5.6 Significance of Impact After Mitigation

Base Plan and Overlay Plan

The general environmental impacts associated with the construction and operation of public utilities have been addressed within the Final Program EIR, which would include the construction and operation of new energy and communication transmission facilities identified in this section. Mitigation Measures required for any significant impacts identified in preceding sections of this Final Program EIR apply to the future construction and operation of the energy and communication transmission system within the project area. Project-level environmental review, at the time specific development plans for the energy and communication transmission backbone system have been prepared, will also be required and project specific mitigation measures identified and implemented.

5.2 Traffic/Circulation

5.2.1 Environmental Setting

The following section is based on the following technical reports: Orange County Great Park Traffic Impact Analysis and the Orange County Great Park General Plan Amendment and Zone Change Traffic Impact Analysis, City of Irvine, California prepared by Urban Crossroads, Inc. (December 2002). These studies are contained in Volume II Appendix G and Volume III Appendices K, L, and M of this Final Program EIR.

Study Area

For analysis purposes, a traffic study area has been identified with respect to the potential traffic impacts of the proposed project. The study area and corresponding intersection analysis locations is the same for each of the time frames analyzed; however, the number of intersections studied varies. The analysis time frames include existing conditions, Year 2007, Year 2025, and Post 2025. Figure 5.2-1 depicts the 2007 study area and 145 intersection analysis locations. Figure 5.2-2 depicts the 2025 study area and 147 intersection analysis locations. Figure 5.2-3 depicts the Post 2025 study area and 156 intersection analysis locations. In addition to the City of Irvine, the analysis study area encompasses portions of several adjacent jurisdictions, including the City of Lake Forest, the City of Mission Viejo, the City of Laguna Hills, the City of Laguna Woods, the City of Aliso Viejo, the City of Laguna Beach, and areas located within the unincorporated County of Orange.

City of Irvine Traffic Performance Criteria

Roadway system performance is generally described in terms of level of service (LOS). LOS "A" represents the highest or best LOS, while LOS "F" represents the lowest or worst LOS. During peak hours, levels of service "A" to "D" are acceptable (at a minimum). Each LOS is briefly summarized in Table 5.2-1.

The performance criteria contained in the adopted City of Irvine General Plan state that roadway segments and intersections outside of the Irvine Business Complex (City of Irvine Planning Area 36) and the Irvine Center (City of Irvine Planning Area 33) should operate at LOS "D" or better for peak hour conditions except the intersection of Bake Parkway and the I-5 Northbound Ramps. However, as per current City criteria within PAs 33 and 36, roadway segments and intersections could operate at LOS "E" or better for peak hour conditions.¹ The City of Lake Forest has a similar rule that allows LOS E for roadways designated as Commercial Streets on the City of Lake Forest General Plan Arterial Highway Plan. The County of Orange Congestion Management Program (CMP) also allows LOS E on the CMP roadway system.

Figure 5.2-1

¹ Exhibit 2-1 of the traffic study, which is contained in Appendix K of this EIR, depicts the areas where LOS E is acceptable. Additionally, as part of the proposed General Plan Amendment, City of Irvine General Plan Amendment Policy B-1(C) will be amended to add that LOS "E" would be considered acceptable for application to intersections impacted in PAs 13, 31, 32, 34, 35, and 39.

City of Irvine

**TABLE 5.2-1
ROADWAY AND INTERSECTION LOS CRITERIA**

LOS	Description	V/C or ICU
LOS A	LOS "A" conditions are characterized by free flow operations. Vehicles are unimpeded in their ability to maneuver within the traffic stream, and stopped delay at intersections is minimal.	0-0.6
LOS B	LOS "B" conditions are characterized by travel speeds which are within 70% of free flow operational speeds. Vehicles are slightly restricted in their ability to maneuver within the traffic stream, and stopped delay at intersections is not bothersome to most drivers.	0.61-0.7
LOS C	LOS "C" conditions are characterized as stable operations. The ability to maneuver and change lanes may be somewhat restricted, and travel speeds may drop to 50% of free flow speeds. Some queuing typically occurs at signalized intersections, however all vehicles clear the intersection on all or nearly all cycles.	0.71-0.8
LOS D	LOS "D" conditions are characterized by high density traffic flows. Travel speeds may range as low as 40% of free flow operational speeds. Vehicles are restricted in their ability to maneuver within the traffic stream, and one or more vehicles may not clear the intersection within a single signal cycle on a regular basis.	0.81-0.9
LOS E	LOS "E" conditions are characterized as operations at or near capacity. There is little or no freedom to maneuver within the traffic stream. Comfort and convenience levels are low, and driver frustration is generally high. Operations at this level are generally unstable, with even minor disturbances or disruptions resulting in the breakdown of operations and substantially increased delays. The failure of vehicles to clear an intersection in a single cycle is a regular occurrence.	0.91-1.00
LOS F	LOS "F" conditions represent forced or breakdown flow. The traffic volume approaching location exceeds the capacity of the system at that location. Intersections often become the focal point for roadway system failure. Operations are characterized by extensive queues and long delays. Some or all vehicles fail to clear the intersection during every signal cycle.	> 1.00

Source: Urban Crossroads, December 2002.

The CMP criteria for deficiency (LOS F or worse) has also been accepted by Caltrans District 12 for freeway mainlines and ramps.

The City of Irvine traffic analysis performance criteria specify the same standards for daily roadway segments described previously for peak hour conditions. However, if a roadway does not meet the performance standard on a daily basis, a number of steps may be required to demonstrate acceptable conditions on such a roadway. These steps include the analysis of peak hour roadway segment operations and peak hour intersection operations as necessary to demonstrate acceptable traffic conditions during peak traffic conditions.

The City of Irvine performance criteria also include standards related to determining the significance of project impacts on the roadway system. For both roadways and intersections, improvements addressing deficiencies are required if the project causes an increase of 0.02 in either the roadway volume to capacity (V/C) ratio or the intersection capacity utilization (ICU). This criteria is consistent with the standards of the adjacent cities of Lake Forest, Mission Viejo, Laguna Hills, and Laguna Woods.

The City of Aliso Viejo does not have an adopted standard; therefore, this traffic analysis uses the 0.02 standard. Freeways/tollways (mainline segments) and CMP roadways and intersections (i.e., the adopted CMP roadway system) have been evaluated using the greater than 0.03 criteria specified in the CMP.

Analysis Methodologies

The overall approach to the traffic impact analysis is based on the evaluation of traffic conditions for existing conditions, 2007 conditions, 2025 conditions, and Post 2025 conditions. The specific roadway segment and intersection traffic operations analysis methodologies are discussed in further detail in Section 2.0 of Volume II Appendix G. The future traffic volume analysis for 2007, 2025 and Post 2025 is based on the Irvine Transportation Analysis Model (ITAM).

Existing and Planned Circulation System

Figure 5.2-4 depicts the existing number of through lanes for the traffic study area. As depicted, roadway cross-sections range from two lane undivided roadways up to eight lane divided arterials (such as Bake Parkway north of the I-5 Freeway).

The planned circulation system includes the planned system in accordance with both City of Irvine and Countywide planning efforts. The adopted City of Irvine Arterial Highway Designations are presented on Figure 5.2-5. Figure 5.2-6 depicts the overall study area planned system per the Orange County Master Plan of Arterial Highways (MPAH). The countywide MPAH is the responsibility of the Orange County Transportation Authority (OCTA). All local jurisdictions are required to maintain consistency with the MPAH. Several other cities are included within the overall study area. Their roadway infrastructure plans are generally consistent with the Orange County MPAH. The City of Aliso Viejo is newly incorporated and does not yet have an independent circulation plan. The City of Lake Forest Arterial Highway Plan is presented on Figure 5.2-7. The City of Laguna Hills General Plan Circulation Map is depicted on Figure 5.2-8.

Existing Roadway Segment Traffic

The existing average daily traffic (ADT) volumes are summarized on Figure 5.2-9. Existing ADT volumes range from less than 10,000 vehicles per day on some roadways to upwards of 65,000 vehicles per day (VPD) on some major arterials. The highest volume roadways under existing conditions include:

1. Bake Parkway (73,000 VPD north of I-5)
2. Alicia Parkway (65,000 VPD north of I-5)
3. Lake Forest Drive (57,000 VPD north of I-5)
4. El Toro Road (53,000 VPD north of I-5)
5. Culver Drive (45,000 VPD south of I-5)

Bake Parkway, in addition to carrying the highest overall daily traffic volume of any arterial in the study area, also carries volumes in excess of 46,000 VPD from the I-5 Freeway north of Trabuco Road.

Existing Daily Roadway/Freeway Segment Volume/Capacity Ratios

The existing roadway and freeway/tollway geometrics and the daily traffic volumes have been used to calculate existing daily roadway segment and freeway/tollway volume/capacity (V/C) ratios. Fifteen roadway segments and six freeway segments carry daily traffic volumes resulting in daily V/C ratios that indicate the need for further analysis of peak hour conditions.

Existing Peak Hour Roadway Segment Volume/Capacity Ratios

The peak hour roadway segment V/C ratio analysis indicates that no roadway segment within the study area experiences peak hour roadway segment deficiencies under existing conditions, except for freeway segments.

Existing conditions peak hour analysis has also been completed for the freeway ramps within the study area. Table 3-2 of the traffic report (Volume II Appendix G) summarizes the results of the freeway ramp peak hour analysis. The only freeway/tollway ramp experiencing deficient peak hour operations under existing conditions is the northbound direct on ramp at the I-5 Freeway/Bake Parkway interchange. At this location, the ramp currently experiences a V/C ratio in excess of 1.0.

Orange County Great Park
 Final EIR

Figure 5.2-9
 Existing Average Daily Traffic (ADT)

City of Irvine

Existing Peak Hour Intersection Operations Analysis

Existing peak hour intersection traffic conditions have been analyzed for all of the analysis locations (intersections) that currently exist in the study area. The vast majority of the intersections analyzed operate at acceptable levels of service. However, there are a number of intersections currently operating at LOS "E" or LOS "F". The following ten intersections currently experience deficient peak hour traffic operations:

1. Culver Drive and Walnut Avenue
2. Culver Drive and University Drive
3. Jeffrey Road and Alton Parkway
4. Jeffrey Road and I-405 Northbound Ramps
5. Bake Parkway and Irvine Boulevard
6. Bake Parkway and Jeronimo Road
7. El Toro Road and Aliso Creek Road
8. Los Alisos Boulevard and Jeronimo Road
9. Muirlands Boulevard and Los Alisos Boulevard
10. Trabuco Road and Alicia Parkway

Future Traffic Conditions without the Proposed Project

The following subsections identify the baseline traffic conditions expected in the future scenarios (Years 2007, 2025, and Post 2025) without the proposed project. These conditions are identified in order to illustrate the anticipated circulation system upon which traffic will be assigned and to provide a baseline for comparing the effects of the proposed project.

Year 2007

2007 Without Project Anticipated Roadway Improvements

Figure 5.2-10 depicts the number of lanes and median treatment for all of the roadways within the 2007 study area. Table 5.2-2 summarizes the anticipated roadway improvements that are already funded and are expected to be constructed by 2007.

2007 Without Project Traffic Volumes

The ITAM 2007 daily traffic volume conditions, including all of the updated input data, are summarized on Figure 5.2-11. Daily traffic volumes are generally expected to increase throughout the study area by 2007. Alton Parkway and Irvine Center Drive are the arterial roadways expected to experience the largest daily traffic increases in the study area under no project conditions. Peak hour (AM and PM) traffic volumes have also been estimated using the ITAM output. Volume II Appendix G of this Final Program EIR contains the peak hour intersection turning movement forecasts for 2007 without project conditions.

 Final EIR

Figure 5.2-11
 2007 Without Project
 Average Daily Traffic Volumes

City of Irvine

Year 2025

2025 Without Project Anticipated Roadway Improvements

Figure 5.2-12 depicts the number of through lanes for all the roadways within the 2025 study area. The funding cycle for roadway improvements generally encompasses a much shorter time frame than the 2025 horizon year studied. Most programmed/funded roadway improvements were identified as part of the 2007 improvements. The funded improvements anticipated to be completed by 2025 are identified in Table 5.2-3.

2025 Without Project Traffic Volumes

The ITAM 2025 daily traffic volume conditions, including all of the updated input data, are summarized on Figure 5.2-13. Daily traffic volumes are generally expected to increase throughout the study area from 2007 to 2025. Daily traffic volumes on I-5 north of the "Y" increase substantially. Irvine Center Drive, El Toro Road, Bake Parkway, Lake Forest Drive, and Culver Drive are expected to carry traffic volumes in excess of 50,000 vehicles per day (VPD). Peak hour (AM and PM) traffic volumes have also been estimated. Volume III of this EIR contains the peak hour intersection turning movement forecasts for 2025 without project conditions.

Buildout (Post 2025)

In accordance with City of Irvine General Plan policy, a General Plan buildout analysis has been completed as part of the traffic analysis contained in Volume III of this Final Program EIR. The City of Irvine General Plan Buildout study area and off-site analysis locations are similar to the 2007 analysis.

Post 2025 Without Project Anticipated Roadway Improvements

Figure 5.2-14 depicts the Year Post 2025 number of through lanes. This condition assumes planned roadways per the City of Irvine or MPAH. As discussed previously, the funding cycle for roadway improvements resulted in most funded improvements occurring within the first phase of development (by 2007). However, some additional improvements were identified for 2025 conditions. These unfunded buildout roadway segment improvements are summarized in Table 4-3 of Volume II Appendix G.

Post 2025 Without Project Traffic Volumes

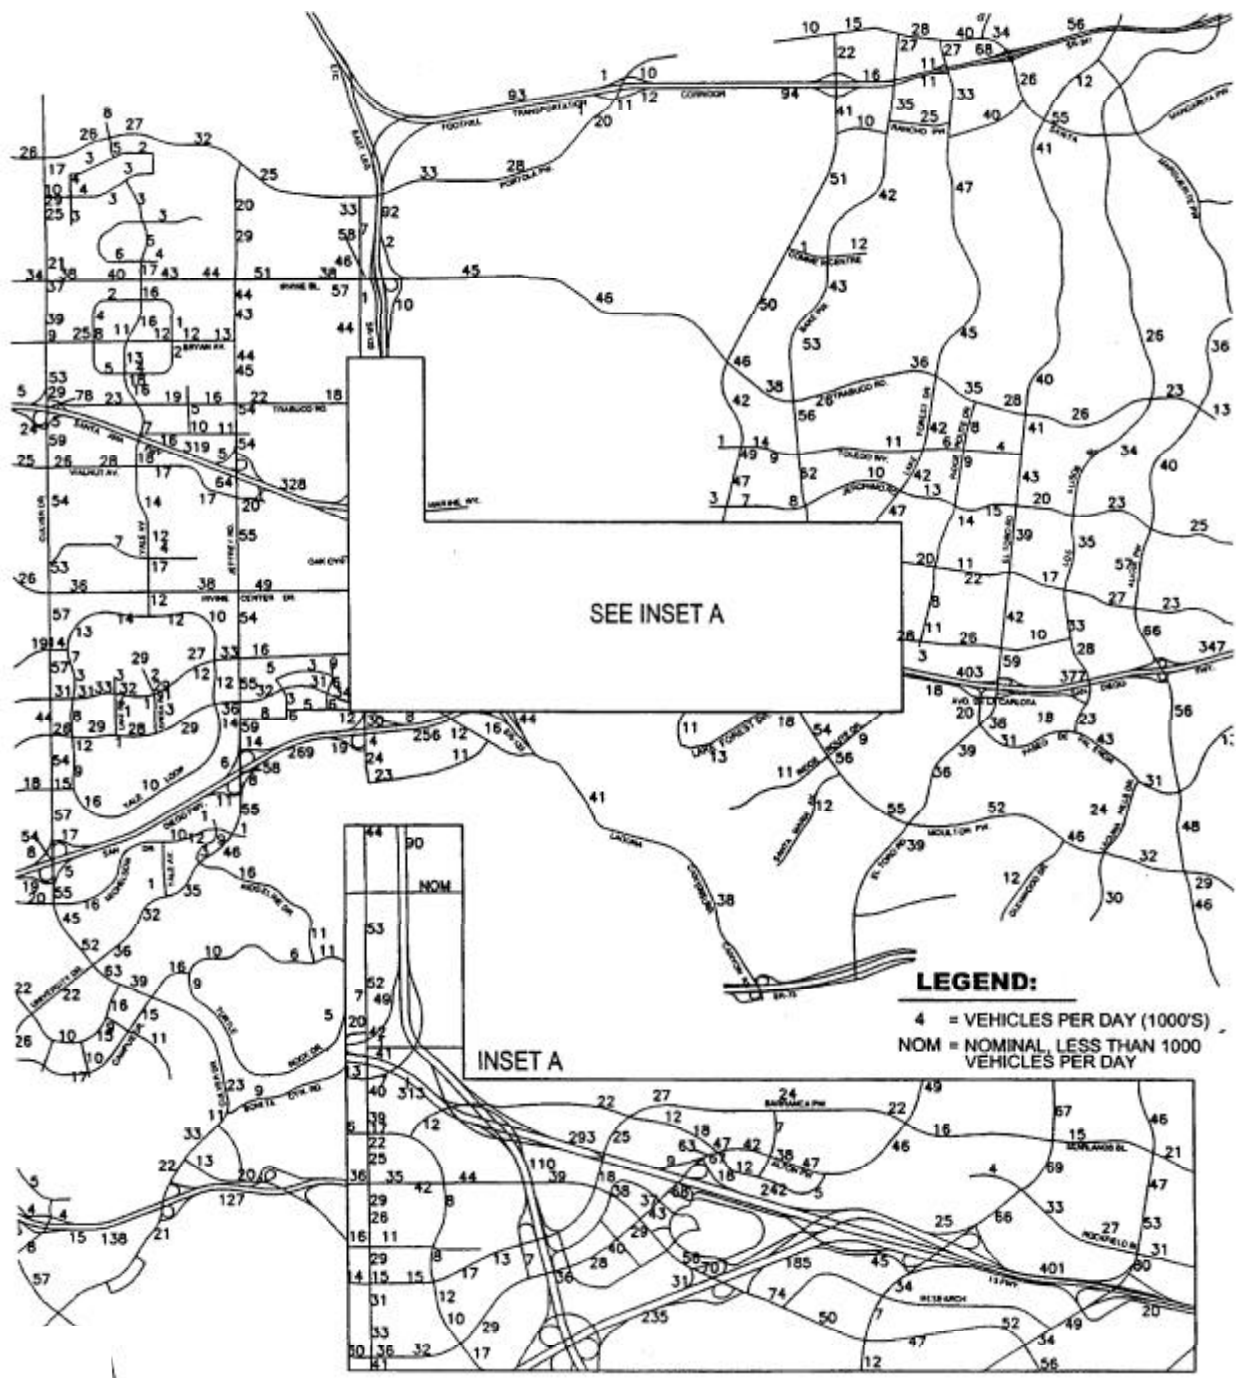

Figure 5.2-15 depicts the Year Post 2025 daily traffic volume conditions. The ITAM General Plan buildout conditions daily traffic volumes including all of the updated input data are summarized in Volume III Appendix K. Daily traffic volumes generally increase only slightly beyond 2025. General Plan buildout peak hour (AM and PM) traffic volumes have also been estimated by the ITAM. Volume III of this EIR contains the peak hour intersection turning movement forecasts for City of Irvine General Plan buildout without project conditions.

5.2.2 Threshold For Determining Significance

The CEQA Environmental Checklist, Appendix G outlines the thresholds for determining significance for traffic.

1. *Cause an increase in traffic which is substantial in relation to the existing traffic load and capacity of the street system (i.e., result in a substantial increase in either the number of vehicle trips, the volume to capacity ratio on road, or congestion at intersections)?*
2. *Exceed, either individually or cumulatively, a level of service standard established by the county congestion management agency for designated roads or highways?*
3. *Result in a change in air traffic patterns, including either an increase in traffic level or a change in location that results in substantial safety risks?*
4. *Substantially increase hazards due to design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment)?*
5. *Result in inadequate emergency access?*
6. *Result in inadequate parking capacity?*

The specific criteria for evaluation of project impacts to traffic circulation are discussed under "City of Irvine Traffic Performance Criteria" at the beginning of this section.

5.2.3 Environmental Impact

The following analysis focuses on the potential traffic and circulation impacts associated with implementation of the Base Plan and the Overlay Plan for the Former MCAS El Toro (PAs 51 and 30). The Musick Branch Jail and the IRWD parcels are a portion of the annexation component of the proposed project; however, no new development is proposed for these parcels under the proposed project. As a result, implementation of the proposed project will not result in a significant traffic and circulation impact associated with the annexation of the James A. Musick Jail Facility and the IRWD Parcel.

Threshold 1. Cause an increase in traffic which is substantial in relation to the existing traffic load and capacity of the street system (i.e., result in a substantial increase in either the number of vehicle trips, the volume to capacity ratio on road, or congestion at intersections)?

Base Plan

Project Roadway System

The proposed circulation system for the project will be constructed in conjunction with short range (2007) development. The 2007 project roadway system will include all of the proposed on-site roadway infrastructure. Figure 5.2-16 depicts the proposed 2007 on-site circulation system. A number of new roadways will be constructed in conjunction with project development. Marine Way will be constructed and realigned from the Bake Parkway/I-5.

Northbound Ramp through the project site until it joins with Sand Canyon Avenue at the I-5 Northbound Ramps. Trabuco Road will be extended from its current terminus east of the Eastern Transportation Corridor (ETC) across to Meadows Loop Road. "A" Drive and "B" Drive will be connected with Irvine Boulevard on-site to provide access to the central park loop road. "C" and "D" Drives will provide access between the central park area and Marine Way.

Interim Year 2007

2007 Base Project Land Use

The 2007 project land use associated with the Base Plan is summarized on Table 3-5 of the Project Description. Approximately 410 project dwelling units are anticipated for 2007 conditions under the Base Plan project. The most prevalent type of on-site development for 2007 conditions is open space/park. Other uses include warehousing, golf courses, community facilities and auto center uses, along with some research and development, transportation, sports park, and cultural/institutional uses.

2007 Base Project Trip Generation

Project trip generation estimates have been developed for 2007, 2025, and Post-2025 conditions based on currently adopted ITAM procedures. Land use is converted into socio-economic data (SED); the SED is used to generate trips using trip generation rates. The 2007 project trip generation by planning analysis zone (PAZ) and traffic analysis zone (TAZ) is summarized on Table 5.2-4. As shown on Table 5.2-4, the Base Plan project is expected to generate more than 45,000 daily vehicle trips in 2007. Table 5-11 of Volume II Appendix G depicts trip generation by land use type.

2007 Base Project Trip Distribution and Daily Traffic

The 2007 Base project trip distribution is presented in Volume II Appendix G. The roadways carrying the highest proportion of project traffic include Marine Way (20 percent) and Irvine Boulevard (20 percent). These percentages occur on-site. Off-site, Sand Canyon Avenue, Bake Parkway, and I-5 carry approximately ten percent or more of project traffic.

2007 With Base Project Traffic Projections

The ITAM 2007 with Base project conditions daily traffic volumes are summarized on Figure 5.2-17. Daily traffic volumes are generally similar to the 2007 no project scenario. There are minor daily volume increases in the area of the project, but no significant increases.

2007 with project peak hour (AM and PM) traffic volumes have also been estimated using the ITAM output. Volume III of this Final Program EIR contains the peak hour roadway segment and intersection turning movement forecasts.

 Average Daily Trips

City of Irvine

Year 2025

2025 Base Project Land Use

The 2025 Base project land uses are summarized in Table 3-3 of the Project Description. Under the Base Plan, 225 project dwelling units are anticipated for 2025 conditions. Land use is predominately open space. Developed uses include commercial, golf courses, community facilities, and auto center uses, along with office park and educational uses. The proposed development also includes active Sports Park uses.

2025 Base Project Trip Generation

The proposed 2025 Base project includes a number of unique land uses, including a proposed sports park, educational uses, etc. Table 5.2-5 summarizes the 2025 Base project vehicle trip generation per PAZ and TAZ. As shown on Table 5.2-5, the project is expected to generate about 91,000 daily vehicle trips.

2025 Base Project Trip Distribution and Daily Traffic

The 2025 Base project trip distribution is presented in Volume II Appendix G. The roadways carrying the highest proportion of project traffic are Irvine Boulevard (22 percent) and Marine Way (19 percent). Other roadways expected to carry 10% or more of project traffic include Trabuco Road, College Drive, and Barranca Parkway.

2025 With Base Project Traffic Projections

The 2025 with Base project conditions daily traffic volumes are illustrated on Figure 5.2-18. Daily traffic volumes exhibit increases primarily on roadways near the project site, notably on Irvine Boulevard, the I-5 Freeway, and the SR-133 Tollway. Marine Way is projected to carry daily traffic volumes ranging from 8,000 vehicles per day (VPD) north of Alton Parkway to 21,000 VPD north of Barranca Parkway. Peak hour (AM and PM) traffic volumes have also been estimated by the ITAM. Volume III contains the 2025 peak hour intersection turning movement forecasts for 2025 with Base Plan conditions.

(Buildout) Post 2025

Post 2025 Base Project Land Use

The Post 2025 Base project land uses are summarized in Table 3-3 of the Project Description. Under the Base Plan, 225 project dwelling units are anticipated for Post 2025 conditions. Land use is predominately open space. Developed uses include commercial, golf courses, community facilities, and auto center uses, along with office park and educational uses. The proposed development also includes active Sports Park uses.

Post 2025 Base Project Trip Generation

Because buildout of the Base project is expected by 2025, the Post 2025 project trip generation is the same as the 2025 condition. Table 5.2-5 above summarizes the Post 2025 Base project vehicle trip generation by PAZ and TAZ. As shown on Table 5.2-5, the project is anticipated to generate approximately 91,000 daily vehicle trips by 2025.

Post 2025 Base Project Trip Distribution and Daily Traffic

The Post 2025 Base project trip distribution is presented in Volume II Appendix G. The primary trip distribution pattern changes are attributed to the addition of the ETC East Leg interchange with Trabuco Road. Roadways projected to carry more than ten percent of the project traffic include Trabuco Road, Marine Way, ETC East Leg, and Irvine Boulevard.

Post 2025 With Base Project Traffic Projections

The Post 2025 with Base project conditions daily traffic volumes are summarized in Figure 5.2-19. Daily traffic volumes generally differ from the no project scenario near the project site. Differences from the 2025 volume with the Base project reflect network changes as well as additional growth. Peak hour (AM and PM) traffic volumes have also been estimated by the ITAM. Volume III Appendix L contains the Post 2025 peak hour intersection turning movement forecasts for Post 2025 with project conditions.

Base Plan Daily Roadway Segment Analysis

Table 7-1 contained in Volume II Appendix G presents the 2007 without project daily roadway segment analysis. Table 7-2 of Volume II Appendix G depicts the results of the 2007 with Base Plan daily roadway segment analysis. Table 7-4 of Volume II Appendix G presents the 2025 without project daily roadway segment analysis. The 2025 with Base Plan daily roadway segment analysis results are presented on Table 7-5 of Volume II Appendix G. The Post 2025 without project daily roadway segment analysis results are presented on Table 7-7 of Volume II Appendix G. The Post 2025 with Base Plan daily roadway segment analysis results are presented on Table 7-8 of Volume II Appendix G. The daily roadway segment volume/capacity ratio calculations have been used to determine where peak hour roadway segment analysis is required.

Final EIR

Figure 5.2-19
Post Year 2025
With Base Project
Average Daily Traffic (ADT)

City of Irvine

Year 2007 - Based on these calculations, six roadway segments experience daily deficiencies and meet the project impact significance threshold of exceeding 0.02 for all roadways except CMP roadways where the CMP criteria of an increase exceeding 0.03 has been applied in the 2007 with Base Plan condition. The roadway segments that require further peak hour analysis are:

1. Sand Canyon Avenue between the I-5 Freeway and Oak Canyon
2. Bake Parkway between Commercentre and Muirlands Boulevard
3. Lake Forest Drive between Trabuco Road and SR-241 Tollway
4. Lake Forest Drive between I-5 Freeway and Rockfield Boulevard
5. Alicia Parkway between I-5 Freeway and Jeronimo Road
6. Avenida de la Carlota between El Toro Road and Paseo de Valencia

Year 2025 – Based on the calculation presented in Table 7-5 of Volume II Appendix G, 60 roadway segments require the need for further analysis of peak hour conditions in the 2025 with Base Plan condition. Please refer to Table 7-5 for a complete list of these roadway segments.

Post 2025 - Based on the calculation presented in Table 7-8 of Volume II Appendix G, 57 roadway segments require the need for further analysis of peak hour conditions in the Post 2025 with Base Plan condition. Please refer to Table 7-8 for a complete list of these roadway segments.

Base Plan Peak Hour Roadway Segment Analysis

Peak hour roadway segment analysis has been performed wherever a daily roadway segment V/C ratio identified the need for such analysis with project conditions. Only if a peak hour deficiency is identified has further analysis been performed and possible mitigation required. For these cases (peak hour deficiency has been identified with project conditions), “no project” conditions peak hour analysis has also been performed. If a significant impact is identified (project contributes .02 or greater to the V/C ratios), then necessary improvements to provide acceptable peak hour operations have been determined.

Year 2007 – Table 7-10 of Volume II Appendix G summarizes the peak hour roadway segment analysis for the Year 2007 with Base Plan condition. No roadway segment deficiency has been identified for the Year 2007 with Base Plan conditions.

Table 7-13 of Volume II Appendix G summarizes the peak hour freeway/tollway mainline segment analysis for the Year 2007 with Base Plan condition. Although five freeway/tollway mainline segments are projected to experience deficient operations under these conditions, the Base Plan will not have a significant impact (increase in V/C ratio of greater than 0.03) on the mainline freeway/tollway system.

Table 7-16 summarizes the peak hour freeway/tollway ramp segment analysis for the Year 2007 with Base Plan conditions. Of the three ramps that experience deficient operations under these conditions, the Base Plan will have a significant impact (increase in V/C ratio of greater than 0.03) at the I-5 Freeway Southbound off ramp at Alton Parkway.

Year 2025 – Table 7-18 of Volume II Appendix G summarizes the 2025 with Base Plan peak hour roadway segment analysis. No 2025 peak hour roadway segment deficiencies have been identified.

Table 7-21 of Volume II Appendix G summarizes the peak hour freeway/tollway mainline segment analysis for the Year 2025 with Base Plan condition. Of the 11 freeway/tollway mainline segments anticipated to experience deficient operations under these conditions, the Base project will not have a significant impact at any location.

Table 7-24 of Volume II Appendix G summarizes the peak hour freeway/tollway ramp segment analysis for the Year 2025 with Base Plan conditions. Of the 16 ramp segments anticipated to experience deficient operations under these conditions, the project will have a significant impact at the following locations:

1. I-5 Freeway at Jeffrey Road – southbound on ramp (AM/PM)
2. I-5 Freeway at Sand Canyon Avenue – northbound on ramp (PM)
3. I-5 Freeway at Sand Canyon Avenue – southbound off ramp (AM)
4. I-5 Freeway at Bake Parkway – southbound off ramp (AM)
5. I-405 Freeway at Jeffrey Road – northbound off ramp (PM)
6. I-405 Freeway at Sand Canyon Avenue – northbound direct on ramp (PM)
7. I-405 Freeway at Sand Canyon Avenue – southbound off ramp (AM)
8. SR-241 Tollway at Lake Forest Drive – southbound off ramp (AM)

Post 2025 – Table 7-26 of Volume II Appendix G summarizes the peak hour roadway segment analysis for the Post 2025 with Base Plan condition. Based on the analysis, no peak hour roadway segment deficiency has been identified.

Table 7-29 of Volume II Appendix G summarizes the peak hour freeway/tollway mainline segment analysis for the Post 2025 with Base Plan condition. Of the eleven segments anticipated to experience deficient operations under these conditions, the project will have a significant impact at the following locations:

1. I-5 Freeway from Jeffrey Road to Sand Canyon Avenue- southbound (AM)
2. I-405 Freeway from Jeffrey Road to Sand Canyon Avenue- southbound (AM)

Table 7-32 of Volume II Appendix G summarizes the Post 2025 with Base Plan conditions peak hour freeway/tollway ramp segment analysis. Based upon the review of the increase in freeway/tollway ramp volume to capacity ratios, the Base Plan will have a significant impact under Post 2025 conditions at the following locations:

1. I-5 Freeway at Jeffrey Road – south bound on ramp (AM/ PM)
2. I-5 Freeway at Sand Canyon Avenue - north bound on ramp (PM)
3. I-5 Freeway at Sand Canyon Avenue - south bound off ramp (AM)
4. I-5 Freeway at Bake Parkway - south bound off ramp (AM)
5. I-405 Freeway at Sand Canyon Avenue - north bound direct on ramp (PM)
6. I-405 Freeway at Sand Canyon Avenue - south bound off ramp (AM)

Base Plan Peak Hour Intersection Operation Analysis

All of the peak hour intersection analysis which has been conducted as part of this analysis is based on the intersection geometric summarized in Volume III Appendix K of this EIR. Appendix K provides a summary of the geometric configuration for each analysis time frame at every intersection where analysis was performed for the time frame in question. This makes it possible for the reader to fully understand the phasing and nature of all baseline improvements prior to mitigation. At a minimum, mitigation analysis has been conducted wherever the project causes a 0.02 increase in intersection capacity utilization (ICU), and the "with project" ICU is deficient.

Year 2007 – Tables 7-34, 7-35, and 7-36 of Volume II Appendix G summarize the 2007 with project (both the Base Plan and Overlay Plan) intersection operation analysis. Of the 17 deficient intersections in 2007, the proposed Base Plan will impact the four intersections identified in Table 5.2-6. Table 5.2-6 summarizes the improvements needed to mitigate project impacts for 2007 conditions.

Year 2025 - Tables 7-37, 7-38, and 7-39 of Volume II Appendix G summarize the 2025 with project (both the Base Plan and Overlay Plan) intersection operation analysis. Of the 47 deficient intersections in 2025, the proposed Base Plan will impact the 16 intersections identified in Table 5.2-7. Table 5.2-7 summarizes the improvements needed to mitigate project impacts for 2025 conditions.

Post 2025 - Tables 7-40, 7-41, and 7-42 of Volume II Appendix G summarize the Post 2025 with project (both the Base Plan and Overlay Plan) intersection operation analysis. Of the 45 deficient intersections in Post-2025, the proposed Base Plan will impact the 18 intersections identified in Table 5.2-8. Table 5.2-8 summarizes the improvements needed to mitigate project impacts for Post-2025 conditions.

Master Plan of Arterial Highways Amendment

The MPAH establishes a countywide roadway network intended to ensure coordinated transportation system development among local jurisdictions in Orange County. The main purpose of the MPAH is to describe an arterial system that effectively serves existing and adopted future land uses in both incorporated and unincorporated areas of Orange County. Extensive coordination with the transportation and land use planning and implementation process carried on by the cities of Orange County, the County of Orange, and adjacent jurisdictions is essential for the MPAH to provide its intended service to County motorists.

Marine Way should be included on the MPAH. This is consistent with the character and role of Marine Way in the regional roadway system. Marine Way will be designated as a primary or secondary arterial per the City of Irvine and Orange County Transportation Authority (OCTA) adopted standards. It will also provide a logical terminus for the realigned Rockfield Boulevard. The preference of OCTA is for arterial roadways to end only at other arterial roadways (e.g., no “stub” links). This is another reason to recommend including Marine Way on the MPAH. Marine Way may also be impacted by regional through traffic, particularly if an accident should occur that affects operations on parallel segments of the I-5 Freeway.

“Y” Street should be designated as a Secondary Highway from Portola Parkway to Irvine Boulevard and Trabuco Road should be designated as a Primary Highway from the SR-133 Tollway to College Road.

Rockfield Boulevard is currently shown on the MPAH as extending from its current terminus west to connect to Alton Parkway between the I-5 Freeway and Barranca Parkway. The proposed amendment will extend Rockfield Boulevard from its current terminus to the southwest to connect to the proposed alignment of Marine Way. Rockfield Boulevard will be designated as a primary arterial per the City of Irvine and Orange County Transportation Authority (OCTA) adopted standards.

As part of the General Plan Amendment for the Orange County Great Park, the City of Irvine will amend both the Land Use Element and the Circulation Element contained in its General Plan. This is a necessary part of the development process. However, following City of Irvine annexation of the Orange County Great Park has been approved, the City will submit a request to the OCTA to initiate a cooperative study, involving the OCTA and other affected agencies, for the purpose of bringing the City’s Master Plan of Arterial Highways into conformity with the Orange County Master Plan of Arterial Highways.

The City understands that the cooperative study would typically occur prior to the City amending its General Plan circulation element. However, because OCTA cannot recognize the City jurisdiction within portions of the Orange County Great Park until the annexation occurs, and the annexation cannot occur without the City first adopting a General Plan Amendment that demonstrates consistency between the Land Use and Circulation Elements, the City intends to enter into the cooperative agreement with the OCTA as soon as possible once the annexation is complete.

Threshold 2. Exceed, either individually or cumulatively, a level of service standard established by the county congestion management agency for designated roads or highways?

Congestion Management Program (CMP) Consistency/Requirements

The Congestion Management Program (CMP) requires that potential impacts of project traffic on roadway facilities included in the CMP network be identified. Roadway facilities within the study area that are included in the CMP network are listed below. Figure 5.2-20 illustrates the CMP network components. Table 5.2-9 summarizes the roadway facilities included in the CMP network.

**TABLE 5.2-9
CMP FACILITIES**

Roadway Facility	Limits
Freeways and Transportation Corridors	
Interstate 5 (I-5)	Culver Drive to Alicia Parkway
Interstate 405 (I-405)	Culver Drive to I-5
State Route 133	I-5 to I-405
Foothill Transportation Corridor (FTC)	ETC to Los Alisos Boulevard
Eastern Transportation Corridor (ETC)	Northern study area boundary to I-5

Orange County Great Park
Final EIR

Figure 5.2-20
Study Area Congestion
Management Program Roadway System

City of Irvine

Using both daily and peak hour traffic volumes forecasts developed with the ITAM, conditions along CMP roadways within the study area were evaluated for 2007 and 2025 conditions with and without the proposed project. Chapters 7 and 9 of Appendix G show the results of the peak hour capacity review for arterial roadways, freeway segments, and freeway interchanges.

The following summarizes the detailed CMP analysis contained in Volume II Appendix G of the EIR:

Year 2007 – No freeway/tollway segment or ramp location is significantly impacted by the Base Plan project in 2007. No deficient CMP intersection is significantly impacted by the Base Plan in 2007.

Year 2025 - For 2025 conditions, the Base Plan will not have a significant impact on the deficient freeway/tollway locations.

The Base Plan will have a significant impact at the intersection of El Toro Road and Avenida de la Carlota.

In accordance with CMP requirements, it is necessary to determine the improvements needed to provide LOS E or better traffic operations. The needed improvements are identified on Tables 5.2-6 through 5.2-8.

Threshold 1. Cause an increase in traffic which is substantial in relation to the existing traffic load and capacity of the street system (i.e., result in a substantial increase in either the number of vehicle trips, the volume to capacity ratio on road, or congestion at intersections)?

Overlay Plan

Project Roadway System

The proposed circulation system for the project will be constructed in conjunction with short range (2007) development. The 2007 project roadway system will include all of the proposed on-site roadway infrastructure. Figure 5.2-16 provided earlier in this section depicts the proposed 2007 on-site circulation system. A number of new roadways will be constructed in conjunction with project development. Marine Way will be constructed and realigned from the Bake Parkway/I-5 Northbound Ramp through the project site until it joins with Sand Canyon Avenue at the I-5 Northbound Ramps. Trabuco Road will be extended from its current terminus east of the Eastern Transportation Corridor (ETC) across to Meadows Loop Road. "A" Drive and "B" Drive will be connected with Irvine Boulevard on-site to provide access to the central park loop road. "C" and "D" Drives will provide access between the central park area and Marine Way.

Interim Year 2007

2007 Overlay Project Land Use

The 2007 Overlay project land use is summarized on Table 3-5 of the Project Description. Approximately 2,260 project dwelling units are anticipated for 2007 conditions under the Overlay Plan project. The most prevalent type of on-site development for 2007 conditions is open space/park. Other uses include an elementary school, cemetery, and transit oriented development (TOD) retail uses. There will also be a substantial amount of research and development.

2007 Overlay Project Trip Generation

The 2007 Overlay project trip generation by planning analysis zone (PAZ) and traffic analysis zone (TAZ) is summarized on Table 5.2-10. As shown on Table 5.2-10, the Overlay Plan project is expected to generate almost 68,000 daily vehicle trips in 2007. Table 5-11 of Volume II Appendix G depicts trip generation by land use type.

2007 Overlay Project Trip Distribution and Daily Traffic

The 2007 Overlay project trip distribution is presented in Volume II Appendix G. The roadways carrying the highest proportion of project traffic include Irvine Boulevard (24 percent) and Marine Way (19 percent). Other roadways expected to carry ten percent or more of project traffic include Trabuco Road, College Drive, and Barranca Parkway.

2007 With Overlay Project Traffic Projections

The ITAM 2007 with project conditions daily traffic volumes are summarized on Figure 5.2-21. Daily traffic volumes are generally similar to the 2007 no project scenario. Additional traffic is projected, primarily on Irvine Boulevard and Marine Way.

2007 with Overlay project peak hour (AM and PM) traffic volumes have also been estimated using the ITAM output. Volume III of this EIR contains the peak hour roadway segment and intersection turning movement forecasts.

Year 2025

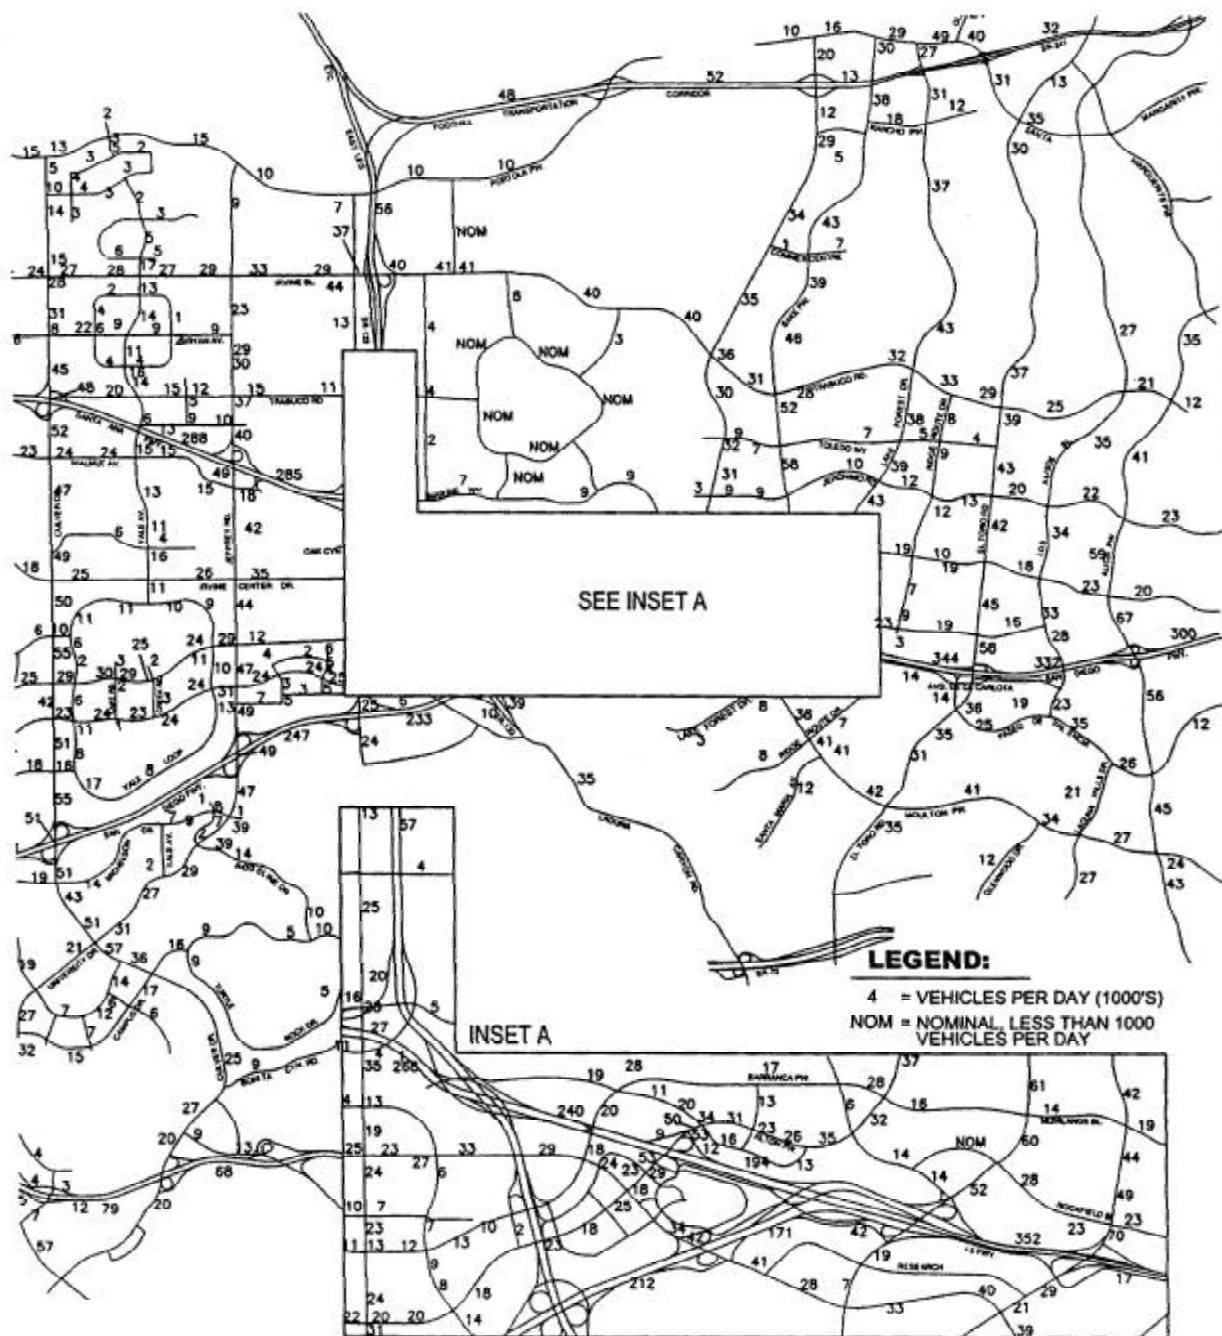

2025 Overlay Project Land Use

The 2025 Overlay project land uses are summarized in Table 3-4 of the Project Description. Land use is predominately open space. Other uses include: 3,625 project dwelling units; 2.6 million square feet of research and development; a 7,800 student college/university campus; and 375,000 square feet of retail and office uses. Other uses include natural and institutional, transportation facilities, and auto center.

Daily Traffic Volumes

City of Irvine

2025 Overlay Project Trip Generation

Since the Overlay project is proposed to be built out by 2025, trip generation for 2025 and Post 2025 are the same. Table 5.2-11 shows that by 2025 the Overlay Plan is anticipated to generate about 149,000 daily vehicle trips.

2025 Overlay Project Trip Distribution and Daily Traffic

The 2025 Overlay project trip distribution is presented in Appendix G. The roadways carrying the highest proportion of project traffic are Irvine Boulevard (22 percent) and Marine Way (19%). Other roadways expected to carry ten percent or more of project traffic include Trabuco Road and Barranca Parkway.

2025 With Overlay Project Traffic Projections

The 2025 with Overlay project conditions daily traffic volumes are illustrated on Figure 5.2-22. Additional traffic is present on Irvine Boulevard, with other minor increases in traffic on roadways near the project site.

(Buildout) Post 2025

Post 2025 Overlay Project Land Use

Because the project is anticipated to be fully developed by 2025, the Post 2025 land uses are the same as the 2025 land uses summarized above.

Post 2025 Overlay Project Trip Generation

Because buildout of the project is expected by 2025, the Post 2025 Overlay project trip generation is the same as the 2025 condition. Table 5.2-11 above summarizes the Post 2025 Overlay project vehicle trip generation by PAZ and TAZ. As shown on Table 5.2-11, the Overlay project is anticipated to generate approximately 149,000 daily vehicle trips by 2025.

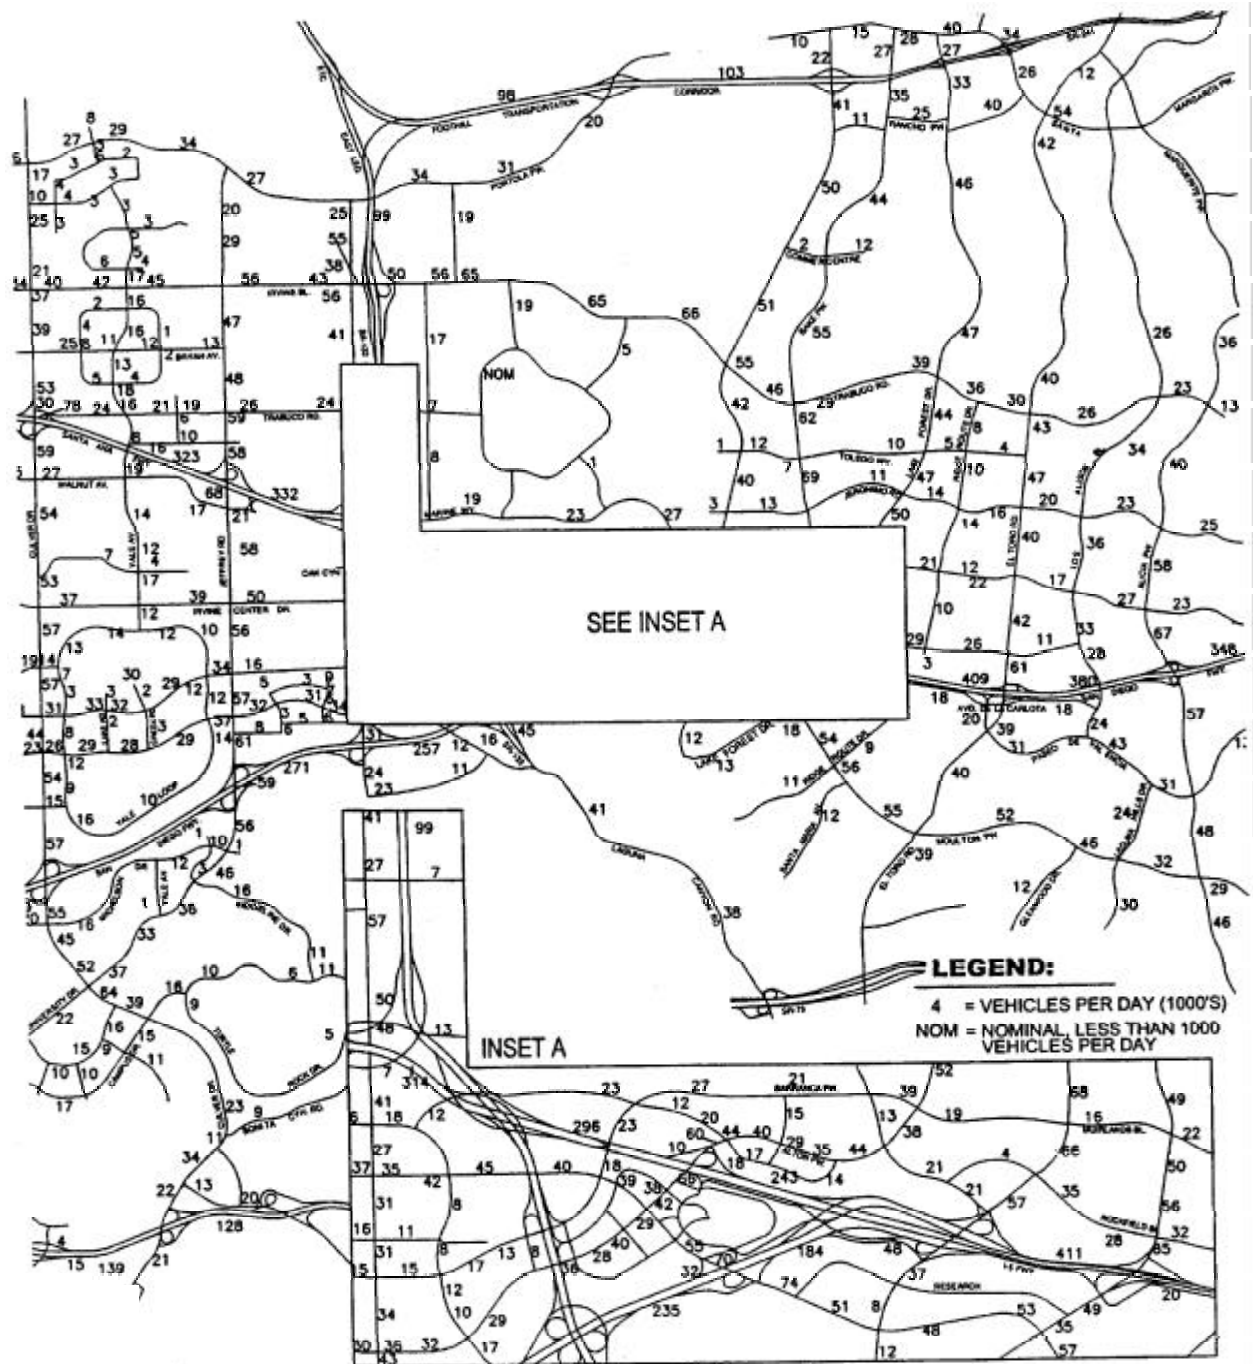

Post 2025 Overlay Project Trip Distribution and Daily Traffic

The Post 2025 Overlay project trip distribution is presented in Volume II Appendix G. The primary trip distribution pattern changes are attributed to the addition of the ETC East Leg interchange with Trabuco Road. Roadways project to carry more than ten percent of the project traffic include Trabuco Road, Marine Way, ETC East Leg, and Irvine Boulevard.

City of Irvine

Post 2025 With Overlay Project Traffic Projections

The Post 2025 with Overlay project conditions daily traffic volumes are summarized in Figure 5.2-23. Additional traffic is present primarily on Irvine Boulevard and Marine Way. Volume III contains the Post 2025 peak hour intersection turning movement forecasts for Post 2025 with Overlay project conditions.

Overlay Plan Daily Roadway Segment Analysis

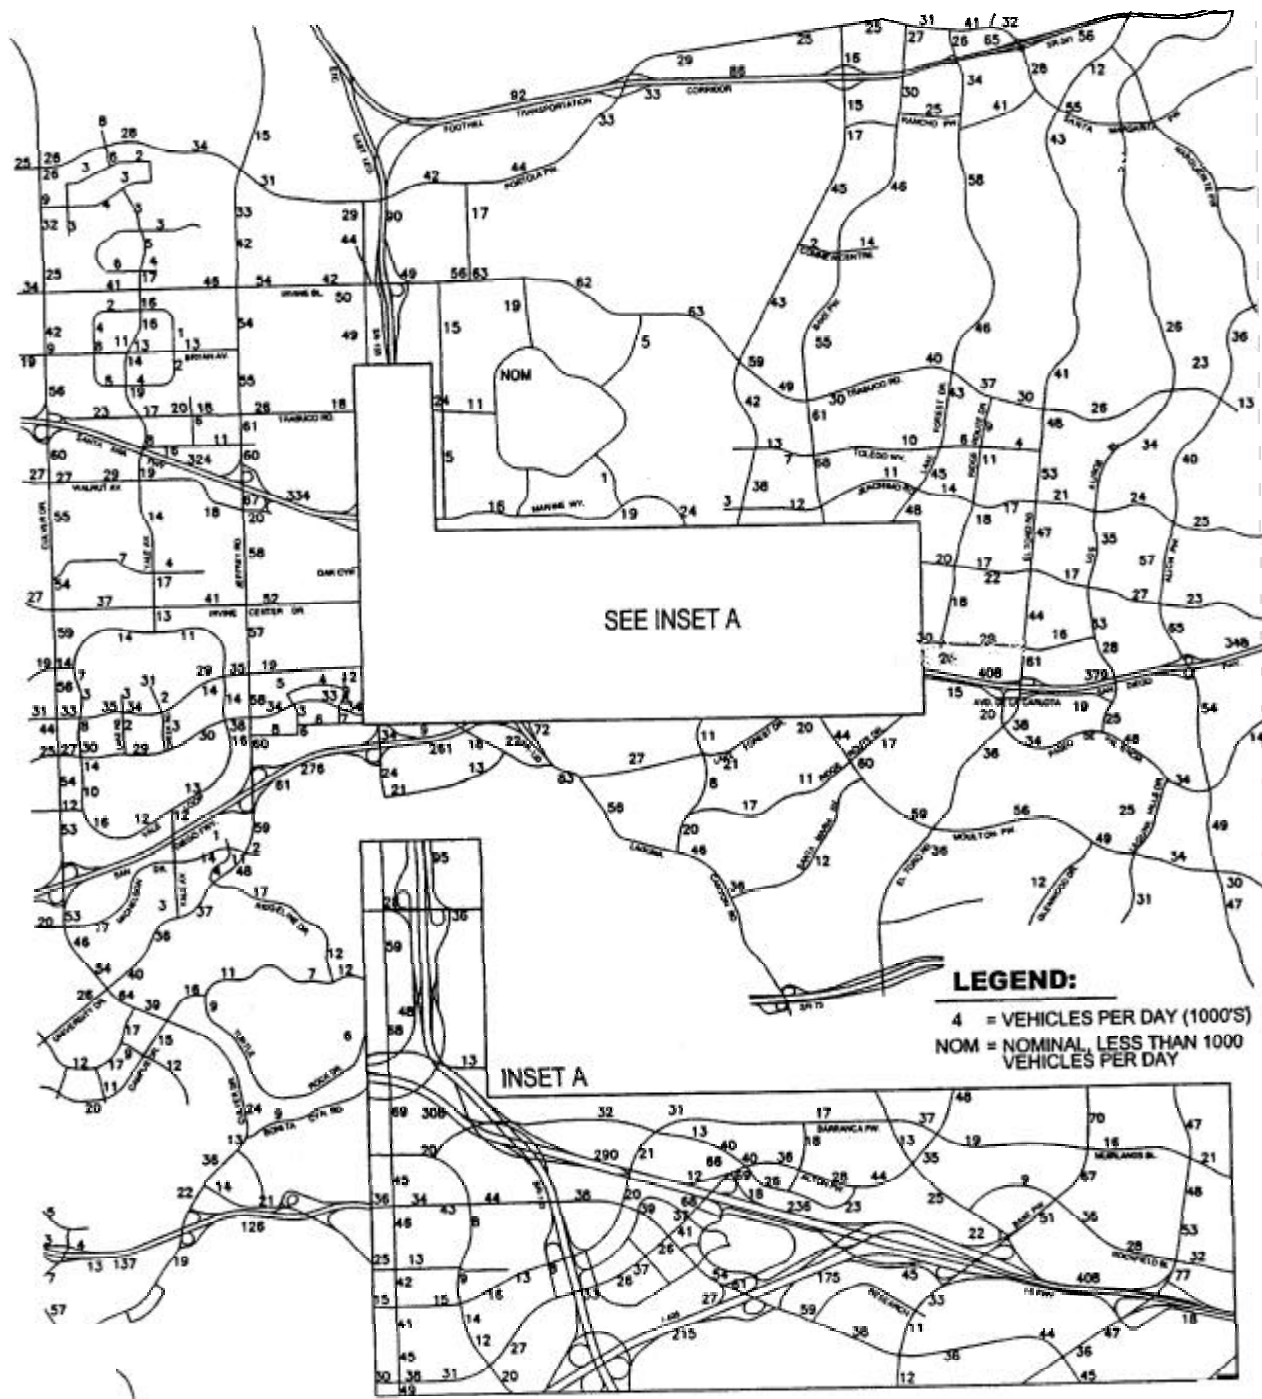

Table 7-1 contained in Volume II Appendix G presents the 2007 without project daily roadway segment analysis. Table 7-3 of Volume II Appendix G depicts the results of the 2007 with Overlay Plan daily roadway segment analysis. Table 7-4 of Volume II Appendix G presents the 2025 without project daily roadway segment analysis. The 2025 with Overlay Plan daily roadway segment analysis results are presented on Table 7-6 of Volume II Appendix G. The Post 2025 without project daily roadway segment analysis results are presented on Table 7-7 of Volume II Appendix G. The Post 2025 with Overlay Plan daily roadway segment analysis results are presented on Table 7-9 of Volume II Appendix G. The daily roadway segment volume/capacity ratio calculations have been used to determine where peak hour roadway segment analysis is required.

Year 2007 - Based on these calculations, six roadway segments experience daily deficiencies and meet the project impact significance threshold of exceeding 0.02 for all City of Irvine roadways except CMP roadways, where the CMP criteria of an impact exceeding 0.03 has been applied in the 2007 with Overlay Plan condition. The roadway segments that require further peak hour analysis are:

1. Sand Canyon Avenue between the I-5 and Oak Canyon
2. Bake Parkway between Commercentre and Muirlands Boulevard
3. Lake Forest Drive between Trabuco Road and SR-241 Tollway
4. Lake Forest Drive between I-5 and Rockfield Boulevard
5. Alicia Parkway between I-5 and Jeronimo Road
6. Avenida de la Carlota between El Toro Road and Paseo de Valencia

Year 2025 – Based on the calculation presented in Table 7-6 of Volume II Appendix G, 63 roadway segments require the need for further analysis of peak hour conditions in the 2025 with Base Plan condition. Please refer to Table 7-6 of Volume II Appendix G for a complete list of these roadway segments.

Post 2025 - Based on the calculation presented in Table 7-9 of Volume II Appendix G, 60 roadway segments require the need for further analysis of peak hour conditions in the Post 2025 with Base Plan condition. Please refer to Table 7-9 of Volume II Appendix G for a complete list of these roadway segments.

Overlay Plan Peak Hour Roadway Segment Analysis

Peak hour roadway segment analysis has been performed wherever a daily roadway segment V/C ratio identified the need for such analysis with project conditions. Only if a peak hour deficiency is identified has further analysis been performed and possible mitigation required. For these cases (peak hour deficiency has been identified with project conditions), "no project" conditions peak hour analysis has also been performed. If a significant impact is identified (project contributes .02 or greater to the V/C ratios), then necessary improvements to provide acceptable peak hour operations have been determined.

Year 2007 – Table 7-11 of Volume II Appendix G summarizes the peak hour roadway segment analysis for the Year 2007 with Overlay Plan condition. No roadway segment deficiency has been identified for the Year 2007 with Overlay Plan conditions.

Table 7-14 of Volume II Appendix G summarizes the peak hour freeway/tollway mainline segment analysis for the Year 2007 with Overlay Plan condition. Although four freeway/tollway mainline segments are projected to experience deficient operations under these conditions, the Overlay Plan will not have a significant impact (increase in V/C ratio of greater than 0.03) on the mainline freeway/tollway system.

Table 7-17 summarizes the peak hour freeway/tollway ramp segment analysis for the Year 2007 with Overlay Plan conditions. The Overlay Plan will have a significant impact at two of the three ramps that experience deficient operations, I-5 at Alton Parkway – southbound offramp (AM) and I-405 at Irvine Center Drive – southbound offramp (AM).

Year 2025 – Table 7-19 of Volume II Appendix G summarizes the 2025 with Overlay Plan peak hour roadway segment analysis. One 2025 peak hour roadway segment deficiency has been identified at University Drive from the I-405 Freeway to Michelson Drive. Improvements at this location would include widening of University Drive southbound from 2 to 3 lanes between I-405 southbound ramps and Michelson Drive.

Table 7-22 of Volume II Appendix G summarizes the peak hour freeway/tollway mainline segment analysis for the Year 2025 with Overlay Plan condition. Of the 12 freeway/tollway mainline segments anticipated to experience deficient operations under these conditions, the project will have a significant impact at the following locations:

1. I-5 Freeway from Sand Canyon Avenue to Jeffrey Road – northbound (PM)
2. I-5 Freeway from Jeffrey Road to Sand Canyon Avenue – southbound (AM)
3. I-405 Freeway from Jeffrey Road to Sand Canyon Avenue – southbound (AM)

Table 7-25 of Volume II Appendix G summarizes the peak hour freeway/tollway ramp segment analysis for the Year 2025 with Overlay Plan condition. Of the 13 ramp segments anticipated to experience deficient operations under these conditions, the project will have a significant impact at the following locations:

1. I-5 Freeway at Jeffrey Road – southbound on ramp (AM/PM)
2. I-5 Freeway at Sand Canyon Avenue – northbound on ramp (PM)
3. I-5 Freeway at Sand Canyon Avenue – southbound off ramp (AM)
4. I-5 Freeway at Alton Parkway - southbound off ramp (AM)
5. I-5 Freeway at Bake Parkway – southbound off ramp (AM)

6. I-405 Freeway at Sand Canyon Avenue – northbound direct on ramp (PM)
7. I-405 Freeway at Sand Canyon Avenue - southbound off ramp (AM)
8. I-405 Freeway at Irvine Center Drive - southbound off ramp (AM)
9. SR-241 Tollway at Lake Forest Drive – southbound off ramp (AM)

Post 2025 – Table 7-27 of Volume II Appendix G summarizes the peak hour roadway segment analysis for the Post 2025 with Overlay Plan condition. Based on the analysis, no peak hour roadway segment deficiency has been identified.

Table 7-30 of Volume II Appendix G summarizes the peak hour freeway/tollway mainline segment analysis for the Post 2025 with Overlay Plan condition. Of the 11 segments anticipated to experience deficient operations under these conditions, the project will have a significant impact at the following locations:

1. I-5 Freeway from Sand Canyon Avenue to Jeffrey Road – northbound (PM)
2. I-5 Freeway from Jeffrey Road to Sand Canyon Avenue – southbound (AM)
3. I-405 Freeway from Jeffrey Road to Sand Canyon Avenue – southbound (AM)

Table 7-33 of Volume II Appendix G summarizes the Post 2025 with Overlay Plan conditions peak hour freeway/tollway ramp segment analysis. Based upon the review of the increase in freeway/tollway ramp volume to capacity ratios, the Overlay Plan will have a significant impact under Post 2025 conditions at the following locations:

1. I-5 Freeway at Jeffrey Road – southbound on ramp (AM)
2. I-5 Freeway at Sand Canyon Avenue - northbound on ramp (PM)
3. I-5 Freeway at Sand Canyon Avenue - southbound off ramp (AM)
4. I-5 Freeway at Alton Parkway - southbound off ramp (AM)
5. I-5 Freeway at Bake Parkway - southbound off ramp (AM)
6. I-5 Freeway at El Toro Road – southbound off ramp (PM)
7. I-405 Freeway at Jeffrey Road – northbound off ramp (PM)
8. I-405 Freeway at Sand Canyon Avenue - northbound direct on ramp (AM/PM)
9. I-405 Freeway at Sand Canyon Avenue - southbound off ramp (AM)
10. I-405 Freeway at Irvine Center Drive – southbound off ramp (AM)

Overlay Plan Peak Hour Intersection Operation Analysis

All of the peak hour intersection analysis which has been conducted as part of this analysis is based on the intersection geometries summarized in the traffic report located in Volume II Appendix G and Volume III Appendix K of this Final Program EIR. Volume II Appendix G provides a summary of the geometric configuration for each analysis time frame at every intersection where analysis was performed for the time frame in question. This makes it possible for the reader to fully understand the phasing and nature of all baseline improvements prior to mitigation. At a minimum, mitigation analysis has been conducted wherever the project causes a 0.02 increase in intersection capacity utilization (ICU), and the “with project” ICU is deficient.

Year 2007 – Tables 7-34, 7-35, and 7-36 of Volume II Appendix G summarize the 2007 with project (both the Base Plan and Overlay Plan) intersection operation analysis. Of the 17 deficient intersections in 2007, the proposed Overlay Plan will impact the seven intersections

identified in Table 5.2-12. Table 5.2-12 summarizes the improvements needed to mitigate project impacts for 2007 conditions.

Year 2025 - Tables 7-37, 7-38, and 7-39 of Volume II Appendix G summarize the 2025 with project (both the Base Plan and Overlay Plan) intersection operation analysis. Of the 52 deficient intersections in 2025, the proposed Overlay Plan will impact the 25 intersections identified in Table 5.2-13. Table 5.2-13 summarizes the improvements needed to mitigate project impacts for 2025 conditions.

Post 2025 - Tables 7-40, 7-41, and 7-42 of Volume II Appendix G summarize the Post 2025 with project (both the Base Plan and Overlay Plan) intersection operation analysis. Of the 45 deficient intersections in 2025, the proposed Overlay Plan will impact the 22 intersections identified in Table 5.2-14. Table 5.2-14 summarizes the improvements needed to mitigate project impacts for 2025 conditions.

Master Plan of Arterial Highways Amendment

Refer to discussion under Base Plan.

Spectrum LOS "E" Level of Service Policy Analysis

An LOS "E" policy change would only result through participation in the City's Advanced Transportation Management System/Traffic Operations Systems. The effects of a change in acceptable Level of Service (LOS) from "D" to "E" have been evaluated in the Irvine Spectrum. Intersections in Planning Areas 13, 31, 32, 34, 35, 39, and the I-5 Freeway at Sand Canyon Avenue have been included in this analysis. Table 5.2-14 summarizes the results of this analysis for intersections identified as impacted in Volume II Appendix G that would be affected by the changed policy. All impacted intersections not included in the table below already experience LOS "F" for without project conditions and would therefore have no change in impact or mitigation with the policy change.

Intersections identified as affected by the potential policy change fall into 2 categories. Locations experiencing LOS "E" operations or "With Project" (whichever plan) conditions would no longer be considered deficient and no impact would be identified. Intersections that are no longer deficient if the LOS "E" policy is applied are:

- Laguna Canyon Road at Old Laguna Canyon Road
- Alton Parkway at Irvine Boulevard
- Lake Forest Drive at Avenida De La Carlota

**TABLE 5.2-12
YEAR 2007 OVERLAY PLAN INTERSECTION IMPACTS AND SUMMARY OF MITIGATION REQUIRED**

Intersection	2007 No Project				2007 with Overlay Plan						Mitigation

Table 5.2-14
Intersections Affected By Potential Level of Service “E” Policy Change

#	Intersection (NS) & (EW)	2007 with Base Plan	2007 with Overlay Plan	2025 with Base Plan	2025 with Overlay Plan	Post- 2025 with Base Plan	Post-2025 with Overlay Plan
321	Laguna Cyn. Rd. & Old Laguna Cyn. Rd.			X	X		
338	Alton Pkwy. & Irvine Bl.	X	X			X	X
341	Alton Pkwy. & Muirlands Bl. ¹				X		
362	Bake Pkwy. & Irvine Bl.			E	E		
366	Bake Pkwy. & Rockfield Bl.	E	E				
383	Lake Forest Dr. & Avenida de la Carlota	X	X				

Notes:

X = Impacted intersection would not be deficient/impacted with LOS “E” policy change.

E = Impacted intersection could be evaluated for less mitigation with LOS “E” policy change.

1 = If the LOS “E” policy includes PA30, then this intersection would no longer require mitigation.

In addition, if the LOS “E” Policy was extended to include PA30 (the southern portion of the project), then the intersection of Alton Parkway at Muirlands Boulevard would also be considered to operate at an acceptable level of service (LOS “E”) and would no longer require mitigation.

Two intersections (Bake Parkway at Irvine Boulevard and Bake Parkway at Rockfield Boulevard) are at LOS “E” for No Project conditions and LOS “F” for (certain) With Project Condition Conditions. Reduced mitigation may be possible at these two locations, however a review of the mitigation analysis indicates that no reduced physical mitigation is available. The Base Plan impacts at Bake Parkway and Rockfield Boulevard could be mitigated on the basis of ATMS credits. If the LOS “E” policy includes PA30, then this intersection would no longer require mitigation.

Threshold 2. Exceed, either individually or cumulatively, a level of service standard established by the county congestion management agency for designated roads or highways?

Congestion Management Program (CMP) Consistency/Requirements

The Congestion Management Program (CMP) requires that potential impacts of project traffic on roadway facilities included in the CMP network be identified. Roadway facilities within the study area that are included in the CMP network are listed below. Figure 5.2-21 illustrates the CMP network components. Table 5.2-9 summarizes the roadway facilities included in the CMP network.

Using both daily and peak hour traffic volumes forecasts developed with the ITAM, conditions along CMP roadways within the study area were evaluated for 2007 and 2025 conditions with

and without the proposed project. Volume II Appendix G show the results of the peak hour capacity review for arterial roadways, freeway segments, and freeway interchanges.

The following summarizes the detailed CMP analysis contained in Appendix K of the EIR:

Year 2007 – No freeway/tollway segment or ramp location is significantly impacted by the Overlay Plan project in 2007. Of the six deficient CMP intersections in 2007, the Overlay Plan will significantly impact El Toro Road/Avenida de Carlota. The mitigation identified in Table 5.2-15 for this intersection will reduce the impact to this intersection to a level less than significant.

Year 2025 - For 2025 conditions, the Overlay Plan will have a significant impact at the following freeway/tollway locations:

1. I-5 from Sand Canyon Avenue to Jeffrey Road – northbound (PM)
2. I-5 from Jeffrey Road to Sand Canyon Avenue – southbound (AM)
3. I-405 from Sand Canyon Avenue to Jeffrey Road - southbound (AM)

The Overlay Plan will also have a significant impact at the intersection of El Toro Road and Avenida de la Carlota. In accordance with CMP requirements, it is necessary to determine the improvements needed to provide LOS “E” or better traffic operations. The needed improvements are identified on Tables 5.2-12, 5.2-13 and 5.2-15.

Threshold 3. Result in a change in air traffic patterns, including either an increase in traffic level or a change in location that results in substantial safety risks?

Base Plan and Overlay Plan

The proposed project will not result in an impact to air traffic patterns associated with increased air traffic or the location of development. No impact associated with air traffic will occur.

Threshold 4. Substantially increase hazards due to design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment)?

Base Plan and Overlay Plan

The proposed project is intended to reduce incompatible uses and improve the street system in the area in accordance with local, regional, and State agency engineering requirements. No impact associated with increased hazards due to design features will occur.

Threshold 5. Result in inadequate emergency access?

Base Plan and Overlay Plan

The existing and proposed roadway system will provide adequate emergency access to all uses on-site during all phases of the project, and will not affect off-site emergency access.

Threshold 6. Result in inadequate parking capacity?

**TABLE 5.2-15

Base Plan and Overlay Plan

The Great Park Plan will not result in inadequate parking capacity as all new development will be required to provide parking in accordance with the City's parking requirements and standards.

Other special project issues have been analyzed in the traffic report provided in Volume II Appendix G of this EIR. These issues include analysis of probable future projects, year 2025 with SR-133 Freeway/Trabuco interchange, project site access and internal circulation analysis, pedestrian and bicycle circulation, and circulation phasing hot spots discussions.

The traffic analysis summarized in this EIR includes consideration of probable future projects. The probable future projects analysis provided in Section 8.0 of the traffic report (Volume II Appendix G) depicts the contribution of the probable future projects to impacted roadways. The results of the probable future projects analysis is summarized on Tables 8-2 through 8-10 of the traffic analysis provided in Volume II Appendix G of this EIR.

Additional analysis has also been performed for 2025 with the Overlay Plan conditions to evaluate the effects of a new interchange of Trabuco Road and the SR-133 Freeway being in place earlier than Buildout (Post 2025). Based on the analysis, project mitigation can be reduced if the interchange is completed by 2025.

Project site access and internal circulation analysis has also been performed and are included in preceding sections. Traffic signal warrants have been prepared for project intersections under the Base Plan and Overlay Plan for the 2007 and 2025 conditions. Under 2007 conditions traffic signals are warranted for the following:

1. Barranca Parkway at Marine Way
2. Alton Parkway at Marine Way
3. Irvine Boulevard at College Road
4. Irvine Boulevard at "A" Drive
5. Irvine Boulevard at "B" Drive

Under 2025 conditions traffic signals are warranted for the following:

1. Marine Way at Rockfield Boulevard
2. Marine Way at College Road
3. Trabuco Road at College Road
4. Portola Parkway at "Y" Street
5. Irvine Boulevard at "Y" Street

The project design has been developed in a manner that discourages through traffic through residential neighborhoods, pursuant to the city of Irvine General Plan Circulation Element Objective B-2, Policy (e). In some cases this is accomplished by the simple fact that there is no logical through connection from one arterial to another through the neighborhood. An example is the neighborhood located north of Irvine Boulevard. All access to the neighborhood is provided via Irvine Boulevard, resulting in no potential for through traffic. The residential uses located along the golf courses will also fall into this category.

The thruways, parkways, and community collectors are all being designed in accordance with City of Irvine standards and will therefore prohibit parking, consistent with General Plan Circulation Element Objective B-2, Policy (e). Similarly, the project roadway is being designed in accordance with City standards and will therefore serve to appropriately limit the routes, speeds, and operation types of buses and trucks.

The project should also comply with Objective B-2, Policy (h). This policy states that traffic signals should be properly spaced and interconnected to minimize the number of traffic signals, and the acceleration/deceleration that produces significantly higher levels of vehicular emissions and noise levels. The spacing of the project intersections with the arterial system have been designed with appropriate traffic signal spacing in mind. Specific examples include relocating Marine Way at Sand Canyon Avenue to reduce the number of signalized intersections as well as connecting Marine Way to Bake Parkway at the existing intersection of the I-5 Freeway Northbound Ramps.

Trails and Bikeways

Transit, bicycles, and pedestrian modes of transportation are important alternatives to the automobile. The design of the project, with a mix of complementary uses, lends itself to supporting Policies (a), (b), and (c) of Objective B-3 of the General Plan Circulation Element.

The public transit system is designed to serve regional and local travel needs. The Irvine Transportation Center is located adjacent to the project site and provides an excellent opportunity to encourage transit usage. The project accomplishes this by providing land designated for use in expanding the Irvine Transportation Center.

The project also encourages transit usage through the designation of transit oriented development areas nearby the Irvine Transportation Center. These areas consist of mixed use development opportunities located in close proximity to the primary transit center in the vicinity of the project.

Another on-site destination that is likely to attract high densities of transit users includes the educational area in the northwest part of the project. This area will include a high density of college students, a traditionally transit friendly group.

Pedestrian access will be provided as part of the project circulation system. Sidewalks and/or walking trails will be provided along all project roadways. Pedestrian access will be particularly important within and between areas designated as transit oriented development and the Irvine Transportation Center.

Policy B-4 of the General Plan Circulation Element deals with bicycle trails. The Great Park Plan (both alternatives) incorporates a trails system directly into the plan. The project will include internal Class II bicycle trails on the (non-local) roadway elements of the project. The project will also include Class I bicycle trails along the SCRRA right of way and within other areas of the Great Park. The trail system will be designed to accommodate cyclists of all levels of experience and provide for both recreation and transportation.

The trail system will provide opportunities for trail connections to the City of Irvine Trails Network. Connections should be considered to Portola Parkway and along Irvine Boulevard. These are all trails designated on the City of Irvine Trail Network.

Another policy that is particularly relevant to this project is Policy (f) of Objective B-4. This policy requires that all bicycle trip destinations should be equipped with bicycle facilities that include the provision of bike racks and showers. This policy should be considered in particular during design of the educational facilities (showers and racks) and the transit facilities (additional bike racks).

Additional trail opportunities for trails in areas identified as permanent open space, scenic highway corridors, agricultural edges, public utility rights of way and easement, flood control channels, and areas designated for rural and estate density residential development will also be encouraged, consistent with Objectives B-5, Policy (b). At the same time, such trails will be designed to minimize impacts on existing or planned development and wildlife preservation areas.

The phasing of the system will be consistent with the project's growth and development.

The traffic analysis specifically addresses project impacts to intersections identified in the Circulation Phasing Report (1998). Table 8-18 provided in the traffic report (Final Program EIR Appendix G) lists low, medium, and high priority intersections and shows project impacts. No impacts to Circulation Phasing "Hot Spot" locations are identified for 2007 conditions. Some locations are impacted for 2025 and/or Build (Post-2025) conditions. All impacts are fully mitigated.

5.2.4 Significant Impacts

Base Plan

Tran B1. Implementation of the Base Plan will cause an increase in traffic which is substantial in relation to the existing traffic load and capacity of the street system (i.e., result in a substantial increase in either the number of vehicle trips, the volume to capacity ratio on road, or congestion at intersections) in the 2007, 2025, and Post 2025 scenarios as follows:

ROADWAY/FREEWAY/TOLLWAY/RAMP SEGMENTS

Year 2007

I-5 Freeway Southbound off ramp at Alton Parkway

Year 2025

I-5 Freeway at Jeffrey Road – southbound on ramp (AM/PM)
 I-5 Freeway at Sand Canyon Avenue – northbound on ramp (PM)
 I-5 Freeway at Sand Canyon Avenue – southbound off ramp (AM)
 I-5 Freeway at Bake Parkway – southbound off ramp (AM)
 I-405 Freeway at Jeffrey Road – northbound off ramp (PM)
 I-405 Freeway at Sand Canyon Avenue – northbound direct on ramp (PM)
 I-405 Freeway at Sand Canyon Avenue – southbound off ramp (AM)

Post 2025

I-5 Freeway from Jeffrey Road to Sand Canyon Avenue- southbound (AM)
 I-405 Freeway from Jeffrey Road to Sand Canyon Avenue- southbound (AM)

I-5 Freeway at Jeffrey Road – southbound on ramp (AM/PM)
 I-5 Freeway at Sand Canyon Avenue – northbound on ramp (PM)
 I-5 Freeway at Sand Canyon Avenue – southbound off ramp (AM)
 I-5 Freeway at Bake Parkway – southbound off ramp (AM)
 I-405 Freeway at Sand Canyon Avenue – northbound direct on ramp (PM)
 I-405 Freeway at Sand Canyon Avenue – southbound off ramp (AM)

El Toro Road/Avenida de la Carlota

Year 2025

El Toro Road/Avenida de la Carlota

5.2.5 Mitigation Measures

Locations experiencing peak hour deficiencies and significantly impacted by the project have been evaluated to determine what improvements are necessary to provide acceptable levels of service in accordance with City of Irvine and adjacent jurisdiction standards. Project mitigation in the form of (1) constructing new on-site arterial highways, (2) constructing new off-site roadway improvements, and (3) participating on a fair share basis to needed off-site freeway/tollway ramp improvements, have all been determined as part of the traffic analysis.

The traffic impact study has presented a multi-phase analysis of the potential traffic related impacts that would be anticipated to occur under the Orange County Great Park proposed network and land use concepts. The following identifies the measures needed to mitigate the impacts that have been identified. As the planning process for the project proceeds, and the land use plan becomes more defined and refined, additional analyses will be required to determine the cost, assign responsibility and refine the phasing of mitigation measures.

Base Plan and Overlay Plan

Tran 1. Prior to the approval of any final map (other than a financing and conveyance map) within the Great Park project, and prior to issuances of any building permits for permanent improvements within the Great Park property, the landowner or subsequent project applicant shall apply for annexation of any areas within the final map to the Irvine Spectrum Transportation Management Association (TMA) ("Spectrumotion") in accordance with Article X of the recorded Declaration of Covenants, Conditions and Restrictions (CC&Rs) for the Irvine Spectrum TMA, including any supplementary or amended CC&Rs. The primary purpose of this mitigation measure is to reduce traffic, air quality and noise impacts. Should annexation into Spectrumotion not be approved, the landowner or subsequent project applicant shall develop and implement a similar transportation management plan containing the elements and meeting the criteria described below:

Transportation Management Plan (TMP)

The development and implementation of a Transportation Management Plan is an identified mitigation measure to manage transportation access for the Great Park Project. This document summarizes the key elements of the TMP.

1.0 Introduction

The purpose of this document is to provide an outline for a comprehensive TMP for the Great Park. This report is not intended to provide the specific details of the plan, but rather to highlight the key components and provide direction for subsequent detailed planning and implementation activities. When preparation of the TMP is undertaken, all of the agency and stakeholders will be invited to provide input.

It is the intent to annex Planning Area 51 and a portion of Planning Area 35 into the Irvine Spectrum Transportation Management Association (Spectrumotion). Spectrumotion is a private, non-profit Transportation Management Association (TMA) formed to reduce traffic congestion in Irvine Spectrum. Spectrumotion promotes, markets, and subsidizes alternatives to solo-commuting and assists the business community in complying with trip reduction related requirements. Membership is mandatory to property owners with deed restrictions requiring participation in the TMA. Membership dues provide the funding for the Association and its programs, which offer a variety of employer and commuter services focused on reducing vehicular trip generation.

In the event that annexation of PAs 51 and 35 into Spectrumotion is not approved, a TMP similar to that provided by Spectrumotion will be implemented. This document sets forth the components of the TMP should it be necessary.

2.0 Transportation Management Plan Framework

The key elements of the Great Park TMP are set forth below:

New Hire Orientation: Inform newly hired employees of commuting services available to them.

Public Transportation Pass Sales: Provide a central location for purchase of passes to available transit services ((i.e., OCTA buses, Metrolink, Amtrak, etc.).

Vanpool and Carpool Formation Assistance: Perform all of the administrative work necessary to establish van pools and car pools.

On-site Promotions: Hold rideshare promotions at work sites and assist in employer assistance promotions.

Telecommuting/Alternative Work Schedule Consulting: Assist employers in developing and implementing a telecommuting or alternative work schedule program.

Personalized Commute Consulting: Provide a personalized commute profile to any commuter, which includes carpool match list containing the names of other commuters in the North Irvine Sphere that live and work near each other.

Website: Maintain a website with all of their program information available.

Rideshare Promotions: Conduct high visibility rideshare promotions as a means to advertise its services.

Subsidies: To the extent financially feasible, offer subsidies to assist in the formation of vanpools, the formation of carpools, and to encourage the trying of transit services.

Public Agency Coordination: Work closely with various public and quasi-public agencies to improve bus and commuter rail service to the Spectrum and North Irvine Sphere areas.

3.0 Transportation Management Plan Implementation

As part of the TMP, a process will be established to monitor its effectiveness in reducing peak hour trip generation in the Great Park. Provision shall be made for the Plan to be modified as appropriate to enhance its effectiveness.

Tran 2. Prior to the issuance of the first building permit, City shall establish, and the landowner or subsequent project applicant shall commit to participate in, a transportation system/infrastructure fee program to fund improvements identified as mitigation measures listed in Tables 5.2-16 and 5.2-17 of this Final Program EIR.

Tran 3. Prior to issuance of any building permits for permanent improvements within the Great Park property, the landowner or subsequent project applicant shall implement or contribute its percentage funding responsibility for traffic improvements as identified in the project traffic study (Urban Crossroads, December 2002) to maintain satisfactory levels of service as defined by the City's General Plan, based on thresholds of significance, performance standards, and methodologies used in this Final Program EIR, Orange County Congestion Management Program, and

established in the transportation system/infrastructure fee program described in Mitigation Measure Tran 2 above.

Tran 4. Prior to approval of each Master Tentative Map or equivalent, the landowner or subsequent project applicant shall prepare, subject to City review and approval, an updated traffic study consistent with the City of Irvine Traffic Study Guidelines inclusive of a phasing plan for traffic improvements associated with the subject Master Tentative Map. The phasing plan will specify the timing, funding, construction, and responsibilities for all traffic improvements identified in the updated traffic study. The updated traffic study will determine whether any additional or alternative traffic improvements are necessary based on updated traffic forecasts. The updated traffic study will evaluate the cumulative impact of the subject map and all previously approved or concurrently submitted maps. The methodology for the study area, applicable land use and circulation modifications, and standards for assessing and mitigating impacts employed in the updated traffic study shall be consistent with a City approved traffic study scope of work. The landowner or subsequent project applicant shall construct, bond for, or enter into a funding agreement for necessary improvements identified in the updated traffic study and/or participate in the City fee program (Tran 2 above) to the extent that the improvements identified in the updated traffic study are listed in Tables 5.2-16 and 5.2-17 of this Final Program EIR.

Traffic signals that are on-site or directly related to the Great Park development will be installed as warranted through the mitigation implementation plan process.

Tran 5. In conjunction with the preparation of any updated traffic study as required in Mitigation Measure Tran 4 for each master tentative map or equivalent, and assuming that a regional transportation agency has not already programmed and funded the warranted improvements to the impacted freeway mainline or freeway/tollway ramp locations in conjunctions with fulfilling its regional role, the landowner or subsequent project applicant and the City will take the following actions:

1. The City shall ensure that the updated traffic study identifies the project's proportionate impact on the specific freeway mainline and/or freeway-tollway ramp locations and its percentage responsibility for mitigating these impacts (assuming tolled conditions on the Transportation Corridors) based on thresholds of significance, performance standards and methodologies used in this EIR and established in the Orange County Congestion Management Program and City of Irvine Traffic Study Guidelines.
2. The City shall estimate the cost of the project's percentage responsibility in cooperation with Caltrans and the Transportation Corridor Agency.
3. The landowner or subsequent project applicant shall enter into an agreement with the City prior to recordation of the first final map for each Master Tentative Map or equivalent to establish the method and timing of payment of the identified percentage responsibility.
4. The City shall allocate landowner or subsequent project applicant's percentage contribution to traffic improvements that result in improved traffic

flow on the impacted mainline and ramp locations, including but not limited to construction of physical or operational improvements, contributions to mandated trip reduction or transit programs, or funding participation in a regional transportation improvement fee program, if adopted.

- Tran 6.** The project shall mitigate to insignificant levels all project impacts at significantly impacted study area intersections. Tables 5.2-16 and 5.2-17 show the mitigation program for each phase. With regard to impacts that require improvements in other jurisdictions, the City of Irvine shall cooperate with the affected jurisdiction to ensure that the improvements are constructed in a timely manner.
- Tran 7.** Assuming that a regional transportation agency has not already programmed and funded the improvements, the City of Irvine shall coordinate with Caltrans and the Transportation Corridor Agencies, and submit for their approval, proposed plans for modifications to the state highway system and the transportation corridors, as required to provide ramp connections to Trabuco Road. If needed, the City shall prepare a Project Study Report, a New Connection Request, and a Detailed Traffic Revenue Study for review by Caltrans and the Transportation Corridor Agency for the proposed connection of Trabuco Road to the Eastern Transportation Corridor. The City shall perform toll and revenue impact studies for any mitigation measure (improvement) that may be impacted by the non-compete clause or any similar agreement restricting a public agency's authority to construct improvement.
- Tran 8.** Following adoption of a land use plan and circulation plan for the Great Park property and before the issuance of any building permits within the base property, the City of Irvine shall enter into a cooperative study with OCTA and other affected jurisdiction to amend the Orange County Master Plan of Arterial Highways. Marine Way, Trabuco Road from the SR-133 tollway to College Road, and Y Street should be included on the MPAH.

5.2.6 Significance of Impacts After Mitigation

While potential impacts to the freeway/tollway mainline segments and ramps have been evaluated, this analysis and mitigation assumes that implementation of freeway and ramp improvements, except for ramp intersections with arterial streets, will be the responsibility of the existing regional transportation agencies. A number of programs are in place in Orange County to improve and upgrade the regional transportation system. These include the Transportation Corridor Agencies (TCA) Corridor program, the State Transportation Improvement Program (STIP), Caltrans Traffic Operations Strategies (TOPS), and the Orange County Transportation Authority (OCTA) Measure M program.

The TCA has adopted a Major Thoroughfare and Bridge Fee Program in which new development is required to pay a corridor fee at issuance of building permits. The purpose of the fee program is to assure that new development pays its fair share cost toward construction of the ultimate Corridor improvements. The corridor fee revenue can be used to construct additional improvements to the existing transportation corridor system. Both the Base project and Overlay project would contribute Corridor fees. In addition, project traffic would increase the amount of toll revenue that the TCA obtains from operation of the Corridors.

The STIP is a four-year expenditure plan that defines how state transportation funds will be allocated. The source of these funds is primarily from state and federal gas taxes. The STIP funds are used for different projects ranging from road maintenance to new freeway construction. Each county is guaranteed a minimum amount of STIP funds.

Traffic Operations Strategies (TOPS) is a program recently implemented by Caltrans to maximize utilization of the existing freeway and tollway system through performance-based investment strategies. The Caltrans' April 2002 TOPS report defines different implementation strategies within the TOPS program including implementation of "intelligent infrastructure" improvements such as system-wide adaptive ramp metering, advanced traveler information systems and real-time performance measurement systems, and implementation of physical operational improvements such as the construction of freeway auxiliary lanes (merge lanes provided before and after on ramps), the modification of ramp/city street access and the addition of short passing lanes and truck climbing lanes.

Orange County has supplemented their transportation programs by implementing a county sales tax for transportation improvements through the Measure M program. Funds from this program are available for improvements to regional interchanges and arterial highways. The ramps on the I-5 and I-405 identified as impacted would be eligible for improvement and funding through the Measure M program.

To the extent that the non-compete clause interferes with implementation of mitigation measures proposed in this Final Program EIR, cumulative impacts would not be mitigated and thus remain significant and unavoidable. The conclusions below assume that the impact of project traffic along with other regional growth at the identified ramp locations will be mitigated through a combination of the above programs. However, if these programs are not implemented by the agencies with the responsibility to do so, the cumulative impacts would remain significant and unavoidable.

5.3 Air Quality

An air quality analysis to determine the potential air quality impacts of the proposed project, is incorporated into the following discussion. The Air Quality technical report prepared by Black & Veatch is provided in the Volume II Appendix I of this Final Program EIR. Guidance for this section is provided by the South Coast Air Quality Management District's *CEQA Air Quality Handbook and Update*.

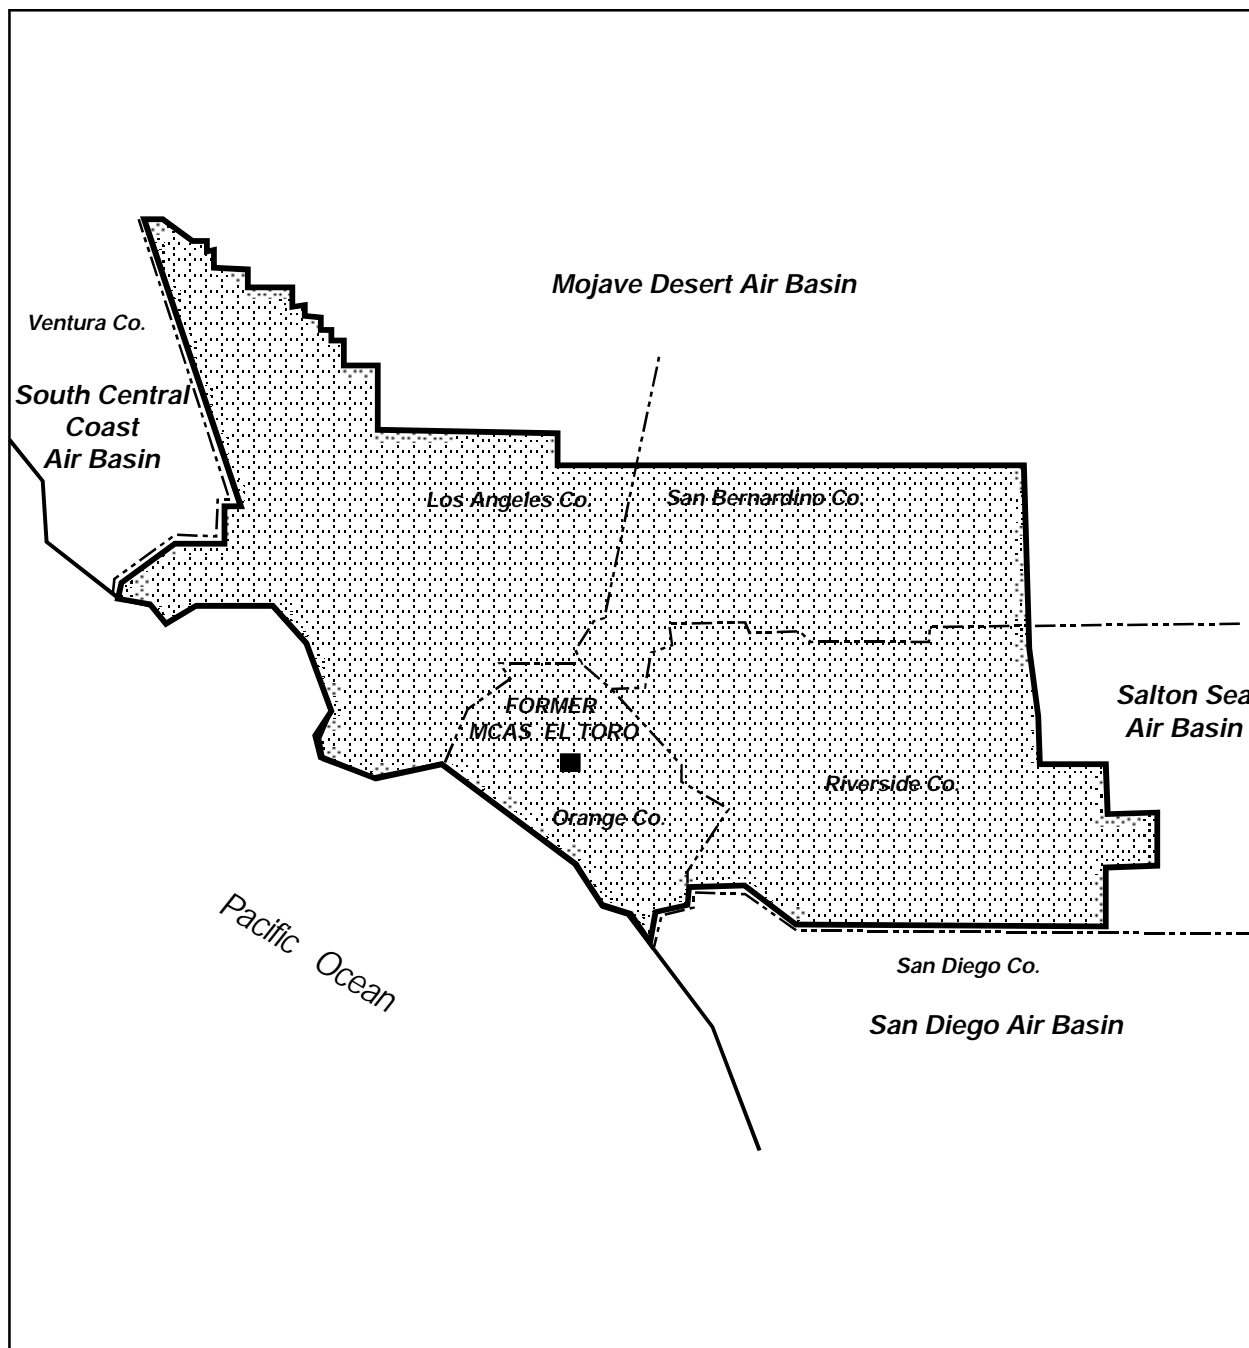

5.3.1 Environmental Setting

The proposed project site is located in the South Coast Air Basin (SCAB). The boundaries of the SCAB are shown in Figure 5.3-1. Air quality within the SCAB is monitored by the South Coast Air Quality Management District (SCAQMD). In general terms, air quality in the SCAB is considered one of the poorest in the United States.

Climate and Meteorological Conditions

The climate in Southern California is generally dominated by high-pressure systems over the Pacific Ocean. Moderate temperatures and comfortably low humidity are the predominant weather patterns in the region. Mild temperatures persist, except during summer months, when temperatures sometimes exceed 100 °F. The average summer and winter temperatures are approximately 75 °F and 50 °F, respectively. Heavy precipitation is limited to a few storms occurring normally from late November to April. The climate in Southern California is also frequented by temperature inversions that result in either ground based or elevated inversions that ultimately inhibit the dispersion of pollutants. Elevated inversions generally occur during the summer months where vertical mixing of pollutants is restricted, thereby resulting in accumulation of pollutants.

The climate in the SCAB is controlled largely by high-pressure systems over the Pacific Ocean, and is arid, with little rainfall and plentiful sunshine. During the summer months, light winds, high temperatures, and limited vertical mixing result in poor pollutant dispersion and in conjunction with abundant sunshine favor the formation of photochemical smog or ozone. Dominant wind patterns within the SCAB include the land/sea circulation system. On-shore breeze dominates daytime regional winds and the direction is usually reversed during nighttime. As such, calm winds (less than two miles per hour) usually occur less than ten percent of the time during the year. Based on the data available from the AQMD website [<http://www.aqmd.gov/metdata/>], the average wind speed measured at the MCAS El Toro meteorological station in 1981 is 1.57 meters per second (m/sec). However, the frequency of calm winds for 1981 measured at the site is 19.58 percent.

South Coast Air Basin

Effects of Pollutants on Health

Certain air pollutants have been recognized to cause notable health problems and consequential damage to the environment either directly or in reaction with other pollutants, due to their presence in elevated concentrations in the atmosphere. Such pollutants have been identified and regulated as part of the overall endeavor to prevent further deterioration and facilitate improvement in the prevalent air quality.

The following pollutants are regulated by the EPA and therefore are subject to emission reduction measures adopted by federal, state and other regulatory agencies.

Ozone (O₃)

Ozone is a secondary pollutant formed by the chemical reaction of volatile organic compounds and nitrogen oxides (NO_x) under favorable meteorological conditions such as high temperature and stagnation episodes. An elevated level of ozone irritates the lungs and breathing passages, causing coughing, and pain in the chest and throat thereby increasing susceptibility to respiratory infections and reducing the ability to exercise. Effects are more severe in people with asthma and other respiratory ailments. Long-term exposure may lead to scarring of lung tissue and may lower the lung efficiency.

Carbon Monoxide (CO)

Carbon monoxide is primarily emitted from combustion processes and motor vehicles because of incomplete combustion of fuel. Elevated concentrations of CO weaken the heart's contractions and lower the amount of oxygen carried by the blood. It is especially dangerous for people with chronic heart disease. Inhalation of moderate levels of carbon monoxide can cause nausea, dizziness, and headaches, and can be fatal at high concentrations.

Particulate Matter (PM₁₀)

The human body naturally prevents the entry of larger particles into the body. However, small particles, with an aerodynamic diameter equal to or less than ten microns (PM₁₀), are trapped in the nose, throat, and upper respiratory tract. These small particulates enter the body and could potentially aggravate existing heart and lung diseases, change the body's defenses against inhaled materials, and damage lung tissue. The elderly, children, and those with chronic lung or heart disease are most sensitive to PM₁₀. Lung impairment can persist for two to three weeks after exposure to high levels of particulate matter. Some types of particulate could become toxic after inhalation due to the presence of certain chemicals and their reaction with internal body fluids.

Nitrogen Oxides (NO_x)

Major sources of NO_x include power plants, large industrial facilities, and motor vehicles. Nitrogen oxides are emitted from combustion processes and irritate the nose and throat. It increases susceptibility to respiratory infections, especially in people with asthma. The principal concern of NO_x is as a precursor to the formation of ozone.

Sulfur Dioxide (SO₂)

Major sources of SO₂ include power plants, large industrial facilities, diesel vehicles, and oil-burning residential heaters. Emissions of sulfur dioxide aggravate lung diseases, especially bronchitis. It also constricts the breathing passages, especially in asthmatics and people involved in moderate to heavy exercise. Sulfur dioxide potentially causes wheezing, shortness of breath, and coughing. High levels of particulate appear to worsen the effect of sulfur dioxide, and long-term exposures to both pollutants leads to higher rates of respiratory illness.

Lead (Pb)

Lead is emitted from industrial facilities and from the sanding or removal of old lead-based paint. Smelting or processing the metal is the primary source of lead emissions, which is primarily a regional pollutant. Lead affects the brain and other parts of the body's nervous system. Exposure to lead in very young children impairs the development of the nervous system, kidneys, and blood forming processes in the body.

Volatile Organic Compounds (VOC)

Though VOCs are not directly a health hazard and are not considered a criteria pollutant, they react with NO_x in the presence of sunlight to produce ozone. Hence, VOC emissions are regulated as a precursor of ozone. However, some state and local agencies regulate VOCs as Reactive Organic Gases (ROGs) which possess similar characteristics as VOCs.

Air Quality Management

The project area is located in the SCAB and air emissions emanating from the project area are under the authority of the SCAQMD and the California Air Resources Board (CARB). The SCAQMD is primarily responsible for enforcing regulations for new and existing stationary sources within the SCAB and implementing appropriate transportation control measures. The CARB regulates and monitors mobile source emissions in conjunction with the SCAQMD. Other responsible agencies include the EPA and the Southern California Association of Governments (SCAG). The EPA is responsible for implementing the provisions of the federal Clean Air Act (CAA), the corresponding National Ambient Air Quality Standards (NAAQS), and ensuring the development of plans that are designed to meet the appropriate air quality standards. The SCAQMD and the SCAG are responsible for the development and implementation of the Air Quality Management Plan (AQMP) for the SCAB. The California Clean Air Act (CCAA) mandates implementation of a program that will achieve the California Ambient Air Quality Standards (CAAQS) and any new air quality performance standards. A listing of NAAQS and CAAQS is presented in Table 5.3-1. The most recent AQMP for the SCAB was developed in 1997. Preparation of a 2003 AQMP is underway and a draft is scheduled for release in early 2003.

Table 5.3-1
Applicable Federal and State Ambient Air Quality Standards

Air Pollutant	State Standard	Federal Primary Standard	Most Relevant Effects
	Concentration/ Averaging Time	Concentration/ Averaging Time	
Ozone	0.09 ppm, 1-hr. avg. >	0.12 ppm, 1-hr avg.> 0.08 ppm, 8-hr avg>	(a) Short-term exposures: (1) Pulmonary function decrements and localized lung edema in humans and animals. (2) Risk to public health implied by alterations in pulmonary morphology and host defense in animals; (b) Long-term exposures: Risk to public health implied by altered connective tissue metabolism and altered pulmonary morphology in animals after long-term exposures and pulmonary function decrements in chronically exposed humans; (c) Vegetation damage; (d) Property damage
Carbon Monoxide	9.0 ppm, 8-hr avg. > 20 ppm, 1-hr avg. >	9 ppm, 8-hr avg.> 35 ppm, 1-hr avg.>	(a) Aggravation of angina pectoris and other aspects of coronary heart disease; (b) Decreased exercise tolerance in persons with peripheral vascular disease and lung disease; (c) Impairment of central nervous system functions; (d) Possible increased risk to fetuses
Nitrogen Dioxide	0.25 ppm, 1-hr avg. >	0.053 ppm, ann. avg.>	(a) Potential to aggravate chronic respiratory disease and respiratory symptoms in sensitive groups; (b) Risk to public health implied by pulmonary and extra-pulmonary biochemical and cellular changes and pulmonary structural changes; (c) Contribution to atmospheric discoloration
Sulfur Dioxide	0.04 ppm, 24-hr avg.> 0.25 ppm, 1-hr. avg. >	0.03 ppm, ann. avg.> 0.14 ppm, 24-hr avg.>	(a) Bronchoconstriction accompanied by symptoms which may include wheezing, shortness of breath and chest tightness, during exercise or physical activity in persons with asthma
Suspended Particulate Matter (PM ₁₀)	30 µg/m ³ , ann. geometric mean > 50 µg/m ³ , 24-hr average>	50 µg/m ³ , annual arithmetic mean > 150 µg/m ³ , 24-hr avg.>	(a) Excess deaths from short-term exposures and exacerbation of symptoms in sensitive patients with respiratory disease; (b) Excess seasonal declines in pulmonary function, especially in children
Sulfates	25 µg/m ³ , 24-hr avg. >=		(a) Decrease in ventilatory function; (b) Aggravation of asthmatic symptoms; (c) Aggravation of cardio-pulmonary disease; (d) Vegetation damage; (e) Degradation of visibility; (f) Property damage
Lead	1.5 µg/m ³ , 30-day avg. >=	1.5 µg/m ³ , calendar quarter>	(a) Increased body burden; (b) Impairment of blood formation and nerve conduction
Visibility-Reducing Particles	In sufficient amount to reduce the visual range to less than 10 miles at relative humidity less than 70%, 8-hour average (10am - 6pm)		Visibility impairment on days when relative humidity is less than 70 percent

Source: AQMP 1997 available at <http://www.aqmd.gov/aqmp/97aqmp/chapters/m-chap2.html>.

On January 12, 1999, the EPA proposed partial approval/disapproval of the 1997 AQMP revisions to the 1994 California Ozone State Implementation Plan (SIP) (64 FR 1770). To address the issues raised by the EPA, the SCAQMD Governing Board adopted the 1999 amendment to the 1997 ozone SIP revision for the SCAB. The 1999 amendment provides additional short-term stationary source control measures that implement portions of the 1997 Ozone SIP's long-term stationary source control measures. In addition, the amendment revises the adoption and implementation schedule for the remaining 1997 ozone SIP short-term stationary source control measures that AQMD is responsible for implementing.

Federal Clean Air Act (CAA) Requirements

In November 1990, Congress enacted a series of amendments to the CAA intended to intensify air pollution control efforts across the nation. One of the primary goals of the 1990 CAA amendments was an overhaul of the planning provisions for those areas not currently meeting NAAQS. The CAA identifies specific emission reduction goals, requires both a demonstration of reasonable further progress and an attainment demonstration, and incorporates more stringent sanctions for failure to attain, or to meet interim milestones.

National Ambient Air Quality Standards (NAAQS)

The CAA established the NAAQS for six criteria pollutants. The NAAQS are divided into primary and secondary standards. These are risk-based, national ambient standards established to regulate, protect, and improve the overall quality of air. Primary NAAQS are intended to protect human health, while the secondary NAAQS protect against other adverse effects to the environment. Compliance with the NAAQS is measured at certain locations within each designated air basin. The NAAQS are not directly enforceable against an emitting source. Rather, the source's emission limitations (which are directly enforceable) are set at levels calculated to support attainment of the NAAQS either statewide or basinwide.

The EPA does not necessarily consider economic feasibility of meeting the NAAQS in setting these standards. The NAAQS are technology forcing standards, since the regulated industries are required to implement pollution control technologies to attain emission limitations based upon the NAAQS, or limit or cease operations. NAAQS are implemented by the states, through enforceable source-specific emission standards developed and adopted through the SIP. The SIPs are revised periodically to comply with federal regulatory changes and local air quality conditions.

The CAA identifies two types of sources; namely, stationary sources and mobile sources. Stationary sources are regulated for all of the criteria and non-criteria pollutants, including hazardous air pollutants. Pollutants that are directly emitted into the atmosphere are known as primary pollutants, while secondary pollutants are those that are formed by the reaction of other precursor pollutants.

In general, the CAA does not necessitate significant changes in attainment planning for the SCAB in 1997, except requiring an attainment plan for PM₁₀. The CAA requires plans to provide for the implementation of all reasonably available control measures, as expeditiously as practicable, including the adoption of reasonably available control technologies for

reducing emissions from existing sources. Emission control innovations in the form of market-based approaches are explicitly encouraged by the CAA. The SCAQMD is the first local agency in the country to adopt a market-based approach for controlling stationary source emissions of oxides of nitrogen and sulfur. The CAA also requires plans to include demonstrations for reasonable further progress, which is defined as annual incremental reductions in emissions of relevant air pollutants needed to ensure attainment of the NAAQS by the applicable date. A similar demonstration of progress was instituted in California with the passage of the CCAA in 1988.

On July 17, 1997, the EPA announced new national ambient air quality standards for ground-level ozone and particulate matter. Specifically, the EPA plans to phase out and replace the existing 1-hour ozone standard with a new eight-hour standard, specifically the fourth highest eight hour average concentration not to exceed 0.08 parts per million (ppm) more than three times in three years. Additionally, the EPA had also revised the particulate matter standard by the promulgating a new standard for fine particulate matter, which is defined as particulate matter less than 2.5 microns in diameter.

In the year 2000, the EPA planned to designate areas that do not meet the eight-hour ozone standard based on the most recent three years of ozone data available at that time (e.g., 1997-1999). In order to implement the PM_{2.5} standards, the EPA established a comprehensive monitoring network to determine ambient PM_{2.5} concentrations. The CAA requires that the EPA make designation determinations (i.e., attainment, nonattainment, or unclassifiable) within two to three years of revising a standard. However, due to litigation, the EPA has delayed designation determinations and the implementation of PM_{2.5} standards until further notice. The EPA is scheduled to promulgate air quality designations for the new eight-hour ozone standard by April 15, 2004. Currently, it is unknown when the EPA plans to begin implementation of the new PM_{2.5} standards.

California Clean Air Act (CCAA)

The CCAA established a legal mandate to achieve health-based state air quality standards at the earliest practicable date. The Lewis Presley Act provides that the plan must also contain deadlines for compliance with all state ambient air quality standards and the federally mandated primary ambient air quality standards [Health and Safety Code (H&SC) 40462(a)]. Through its many requirements, the CCAA serves as an important consideration in the SCAB's attainment planning efforts. Essential CCAA requirements include the application of best available retrofit control technology; and reduction of nonattainment pollutants and their precursors at a rate of five percent per year. If these measures cannot be implemented, each basin is required to include other feasible measures of emission reduction with an expeditious implementation schedule; reduction in population exposure to severe nonattainment pollutants (i.e., ozone, CO, and NO_x for the SCAB) according to the prescribed schedule; and ranking control measures by cost-effectiveness and implementation priority. Finally, state law requires the plan to provide for attainment of the federal and state ambient air quality standards at the earliest practicable date.

The CCAA serves as the centerpiece of the SCAB's attainment planning efforts, since it is generally more stringent than the CAA. Based on pollutant levels, the CCAA divides nonattainment areas into categories with progressively more stringent requirements. The state nonattainment designations are on a county basis. The entire SCAB is an extreme nonattainment area for ozone. Although PM₁₀ is not explicitly addressed in the CCAA, it is

governed by the Lewis Presley Act. The plan therefore provides achieving all federal ambient air quality standards by their applicable date and state ambient air quality standards as early as possible.

1997 Air Quality Management Plan (AQMP)

The 1997 AQMP focuses on PM_{10} , since this is the first plan required by federal law to demonstrate attainment of the federal PM_{10} ambient air quality standards. The AQMP also updates the demonstration of attainment for ozone and CO, and includes a maintenance plan for nitrogen dioxide (NO_2).

The 1997 AQMP proposes policies and measures to achieve federal and state standards for healthful air quality in the SCAB and those portions of the Mojave Desert and Salton Sea Air Basins (formerly named the Southeast Desert Air Basin) that are under SCAQMD jurisdiction (namely, Antelope Valley and Coachella Valley). The expected compliance deadlines with state and federal standards for four criteria pollutants within SCAB are presented in Table 5.3-2. The Plan also addresses several state and federal planning requirements and incorporates significant new scientific data, primarily in the form of updated emissions inventories, ambient measurements, and new models. The 1997 AQMP is consistent with the approaches taken in the 1994 AQMP for the attainment of the federal ozone air quality standard, and shows that with refinements to the 1994 AQMP control strategy, sufficient emission reductions are achieved to meet all federal criteria pollutant standards within the time frames allowed under the CAA. The new or amended rules which have been adopted since the release of the 1994 AQMP include the implementation of Phase II reformulated fuels (California Cleaner Burning Gasoline) in 1996; the replacement of the Regulation XV rideshare program with an equivalent emission reduction program under Rule 2202; and new incentive programs for generating emission credits.

Various measures are incorporated as overall control strategies within the AQMP to meet applicable state and federal standards. These measures include short and intermediate term measures, and long term measures. Short and intermediate measures include application of known, essential and available technologies and good management practices between 1995 and 2005. Long-term measures rely on future development of low to zero-emission control technology for all sources, and development of alternative technological solutions.

Sensitive Receptors

SCAQMD identifies sensitive receptors as populations that are more susceptible to the effects for air pollution than is the general population. Sensitive receptors located in or near the vicinity of known air emissions sources, including freeways and intersections, are of particular concern. Sensitive receptors include the following:

- health care facilities
- rehabilitation centers
- convalescent centers
- residences
- schools
- playgrounds
- child care centers
- athletic facilities

Table 5.3-2
Expected Year of Compliance with State and Federal Standards for Four
Criteria Pollutants (SCAB)

Pollutant	Standard	Threshold Concentration Level	Expected Compliance Year
Ozone	NAAQS 1-hour	12 pphm	2010
	CAAQS 1-hour	9 pphm	beyond 2010
PM ₁₀	NAAQS Annual	50 ug/m ³	2006
	NAAQS 24-hour	150 ug/m ³	2000 ¹
	CAAQS Annual	30 ug/m ³	beyond 2010
	CAAQS 24-hour	50 ug/m ³	beyond 2010
CO	NAAQS 8-hour	9 ppm	2000 ²
	NAAQS 1-hour	35 ppm	Achieved
	CAAQS 8-hour	9 ppm	2000 ²
	CAAQS 1-hour	20 ppm	Achieved
NO ₂	NAAQS Annual	5.34 pphm	Achieved
	CAAQS 1-hour	25 pphm	Achieved

pphm = Parts per hundred million parts of air, by volume

ug/m³ = micrograms per cubic meter

ppm = parts per million parts of air, by volume

¹Exceedances of the PM₁₀ 24-hour NAAQS were recorded in 2001

²No exceedances of the CO 8-hour NAAQS or CAAQS were recorded in 2001

Source: AQMP 1997 available at: [<http://www.aqmd.gov/aqmp/97aqmp/m-exec.html>]

Existing Environmental Conditions

In 2001, the annual maximum concentrations of ozone, and PM₁₀ exceeded both federal and state standards in some or all areas in the SCAB. However, standards for CO, NO₂, SO₂, lead and sulfate were not exceeded. Monitored data for the year 2001 is available for the monitoring locations in Orange County, but no official version of the trends incorporating the 2002 data is currently available. Therefore, air quality trends including 2001 are presented in the following section.

Maximum Pollutant Concentrations

Maximum recorded one-hour average and eight-hour average ozone concentrations in the SCAB for 2001 were 0.19 parts per million (ppm) and 0.144 ppm, which were 158 percent and 180 percent of the federal one-hour and eight-hour standards. Maximum recorded averages of 24-hour and annual PM₁₀ concentrations were 219 micrograms per cubic meter (ug/m³) and 63.1 ug/m³ and these values were 146 percent and 126 percent of the federal

24-hour and annual standards. A summary of measured pollutant concentrations within Orange County for the year 2001 is presented in Tables 5.3-3 to 5.3-8. The Saddleback Valley Site is the nearest to the project area.

In 2001, the federal NO₂ standard was not exceeded, with a maximum concentration of 0.0419 ppm, which was 79 percent of the standard. However, the one-hour average nitrogen dioxide concentration of 0.25 ppm was equal to the more stringent state standard. The highest eight-hour average CO concentration of the year was 7.71 ppm, which was less than both the federal and state standards. The maximum 24-hour concentration of sulfate was 20.6 µg/m³ and did not exceed the state standard. Sulfur dioxide and lead concentrations continued to remain well below the federal and state standards.

Air Quality Trends Through 2000

Historically, the SCAB has the highest number of exceedances of the federal air quality standards in the US. In 2001 alone, there were 36 days on which one or more federal standards were exceeded somewhere in the SCAB. However, air quality trends through 2001 reveal a continuation of a downward trend in concentrations and the number of exceedances in relation to preceding years. In the past few years, ozone levels in the SCAB have been markedly improving in terms of maximum concentration, the number of days exceeding the standards, and the severity of episode levels. In a continuing trend of improving air quality, the SCAB made it through a summer without experiencing a stage one episode for the third year in a row. While 1999 and 2000 were the first years in the history of ambient air monitoring that the SCAB was not the location of the highest recorded ozone concentration in the nation, once again in 2001 the highest one-hour ozone concentration in the nation was reported in the SCAB (SCAQMD website: [<http://www.aqmd.gov/smog/o3trend.html>]).

The SCAB's exceedances of the maximum three-year mean of the eight-hour average O₃ concentration decreased 48 percent between 1976-1978 and 1999-2001. The number of exceedances of the maximum one-hour O₃ concentration decreased 81 percent between 1976 and 2001. The SCAB is currently designated by the EPA as a non-attainment area for O₃, CO, and PM₁₀. Once an area has been designated as nonattainment, then the EPA requires the regulating authority to put in place a plan for planning and implementing a control strategy to achieve attainment. Some of the control strategies could include addressing emissions from existing sources and requiring more prescriptive control technology requirements and emission offsets for any new sources. According to the 1997 AQMP, attainment of all federal PM₁₀ standards is to occur no later than December 31, 2006, and O₃ standards are to be achieved by November 15, 2010. The eight-hour federal CO standard was to be attained no later than December 31, 2000; however, two exceedances were measured in the SCAB during 2000. There were no exceedances of the eight-hour federal CO standard in 2001 (AQMD website: [<http://ozone.aqmd.gov/smog/#aqdata>]).

**Table 5.3-3
Measured Ozone Concentrations in Orange County in 2001**

Monitoring Location	Station No.	Days of Data	1-hour Max (ppm)	8-hour Max (ppm)	Number of Days Standard Exceeded		
					Federal		State

The SCAB's exceedances of the maximum three-year mean of the eight-hour average ozone concentration decreased 48 percent between 1976-1978 and 1999-2001. The number of exceedances of the maximum one-hour ozone concentration decreased 81 percent between 1976 and 2001. The SCAB is currently designated by the EPA as a non-attainment area for ozone, CO, and PM_{10} . In 2000, the annual maximum concentrations of ozone (O_3), carbon monoxide (CO), particulate matter (PM_{10}), and sulfates (SO_x) exceeded both federal and state standards in some or all areas in the SCAB. However, standards for nitrogen dioxide (NO_2), sulfur dioxide (SO_2), and lead (Pb) were not exceeded. A summary of measured criteria pollutant concentrations at the Saddleback air quality monitoring station (located at the former MCAS El Toro) for selected years between 1995 and 2000 are shown

in Table 5.3-9. NO₂ concentrations are not measured at this station; however, no station in Orange County has recorded an exceedance of NO₂ standards since at least 1990. Although air quality tends to vary year to year due primarily to meteorological conditions, air quality at the Saddleback monitoring station appears to be improving (which generally has been the case throughout the SCAB).

**Table 5.3-9
Measured Criteria Pollutant Concentrations at Saddleback Monitoring Station
for 1995, 1997, 1998, and 2000**

Year	Carbon Monoxide (CO) ¹		Ozone (O ₃) ²		Suspended Particulate Matter (PM ₁₀) ³	
	Maximum 8-hour Concentration (ppm)	Days State Standard Exceeded	Maximum 1-hour Concentration (ppm)	Days State Standard Exceeded	Maximum 24-hour Concentration (ug/m ³)	Days (% of Samples) State Standard Exceeded
2000	2.3	0	0.13	3	60	1(3)
1998	3.1	0	0.16	15	70	6(10.2)
1997	3.6	0	0.13	8	86	4(7.1)
1995	4.0	0	0.15	18	122	11 (18.3)

Abbreviations: ppm = parts per million; ug/m³ = micrograms per cubic meter

1. State standard for carbon monoxide: 20 ppm 1-Hour; 9.0 ppm 8-Hour. Less than 12 months of data for some years.
 2. State standard for ozone: 0.09 ppm 1-Hour.
 3. State standard for PM₁₀: 50 ug/m³, 24 hour. Collected approximately every 6 days.
- * Less than twelve full months of data.

Note: Levels of nitrogen dioxide (NO₂) are not measured at the Saddleback station. For other nearby stations in Orange County, NO₂ levels have not exceeded the State standard since at least 1990.

Source: South Coast Air Quality Management District. *Air Quality Data*. 1995-2000.

According to the 1997 AQMP, attainment of all federal PM₁₀ standards is to occur no later than December 31, 2006, and ozone standards are to be achieved by November 15, 2010. The eight-hour federal CO standard was to be attained no later than December 31, 2000; however, two exceedances were measured in the SCAB during 2000. There were no exceedances of the eight-hour federal CO standard in 2001. A summary of the attainment/nonattainment status of the SCAB and attainment deadlines is presented in Table 5.3-2.

5.3.2 Threshold For Determining Significance

The CEQA Environmental Checklist, Appendix G outlines the thresholds for determining significance for air quality.

Would the project:

1. *Conflict with or obstruct implementation of any applicable air quality plan?*
2. *Violate any air quality standard or contributes substantially to an existing or projected air quality violation?*
3. *Result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard (including releasing emissions which exceed quantitative thresholds for ozone precursors)?*
4. *Expose sensitive receptors to substantial pollutant concentrations?*
5. *Create objectionable odors affecting a substantial number of people?*

The significance of the air quality impacts is determined by the criteria set forth in the SCAQMD's 1993 *CEQA Handbook and Update*. Air quality impacts are considered significant if operational emissions exceed the threshold criteria shown in Table 5.3-10.

Table 5.3-10
SCAQMD Thresholds for Significant Contribution to Regional Air Pollution

Pollutant	Threshold of Significant Effect	
	Operation Emissions	Construction Emissions
Reactive Organic Gases (ROG)	55 lbs/day, 0.03 tons/day	75 lbs/day, 0.03 tons/day, 2.5 tons/quarter
Oxides of Nitrogen (NO _x)	55 lbs/day, 0.03 tons/day	100 lbs/day, 0.03 tons/day, 2.5 tons/quarter
Carbon Monoxide (CO)	550 lbs/day, 0.28 tons/day	550 lbs/day, 0.28 tons/day 24.75 tons/quarter
Fine Particulate Matter (PM ₁₀)	150 lbs/day, 0.08 tons/day	150 lbs/day, 0.08 tons/day, 6.75 tons/quarter

Source: *CEQA Air Quality Handbook*. South Coast Air Quality Management District.

5.3.3 Environmental Impact

Musick Jail and IRWD Parcels

No land use change is proposed for these parcels as part of the proposed project. As such, the air quality impact is less than significant. The following analysis addresses Thresholds 2, 3 and 4, as identified below. Thresholds 1 and 5 are addressed later in this section.

Threshold 2: *Violate any air quality standard or contributes substantially to an existing or projected air quality violation?*

Threshold 3: *Result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard (including releasing emissions which exceed quantitative thresholds for ozone precursors)?*

Threshold 4: Expose sensitive receptors to substantial pollutant concentrations?**Base Plan and Overlay Plan**

The implementation of either the Base Plan or Overlay Plan for the development of the project area will result in additional amounts of air emissions. The overall air quality impacts due to the emissions generated by the project are classified into construction and post-construction impacts based on duration. In addition, based on the area of influence, they are divided into local and regional impacts. Construction-related impacts include impacts due to air emissions generated from activities such as grading and excavation. Post-construction impacts are predicted based on general operational emissions for the life of the project. The operational emissions include emissions due to energy consumption and motor vehicle trips.

The significance of the air quality impacts is determined by the criteria set forth in the SCAQMD's 1993 CEQA Handbook. Impacts are considered significant if net project emissions exceed the following threshold criteria:

<u>Pollutant</u>	<u>Emission Threshold</u>
ROG	55 lbs/day (0.0275 tons/day)
CO	550 lbs/day (0.275 tons/day)
PM ₁₀	150 lbs/day (0.075 tons/day)
NO _x	55 lbs/day (0.0275 tons/day)
SO _x	150 lbs/day (0.075 tons/day)

Other indicators that the project could be considered significant include interference with attainment of a national or state ambient air quality standard, or the generation of vehicle trips that create a CO hotspot.

Emission Estimation Procedure

Emissions from the Base Plan and Overlay Plan are estimated using the Urban Emissions (URBEMIS) 2001 Model developed and tested by CARB and approved for use by SCAQMD. The URBEMIS 2001 model is an emissions estimation tool for land use development projects, such as the reuse of the project area. The model has been modified and enhanced to estimate construction and area source emissions for various air districts in California. Specific emission factors for each air basin, including the SCAB, have been incorporated into the model that account for compliance with air basin specific requirements. Various default parameters specific to each region have been verified and approved by local regulatory agencies and are also included in the model. Additionally, the model includes the ability to selectively identify and account for various mitigation measures.

The URBEMIS 2001 model has been modified to estimate motor vehicle emissions using EMFAC7G, a motor vehicle emission factor model. Another significant feature of the model includes the ability to selectively identify and account for various mitigation measures.

Construction Emissions

Base Plan and Overlay Plan

Both the Base Plan and Overlay Plan propose the development of the entire 4,693-acre base within a 19-year (2007-2025) time frame. For estimation of air emissions, it was assumed that either plan is subdivided into two phases based on utility and extent of the development. For each of the two plans, the first phase is expected to last ten years (2007-2016) and the second phase will last the remaining nine years (2017-2025). For the estimation of air quality emissions from construction of the various facilities, construction activity is assumed to last for a period of three years during each phase. This assumption conservatively accounts for both demolition and grading/excavation activities as major sources of construction related emissions. The URBEMIS 2001 model is used for estimating construction emissions for all stages of development. Estimates of land use and acreage absorbed are obtained from the plan proposal and modification for the development.

According to the URBEMIS 2001 User's Guide, site grading emissions consist of two components: site grading equipment exhaust and grading-related fugitive PM₁₀ emissions. The procedure used to estimate site grading equipment exhaust emissions is based on emission factors developed by the EPA. The mobile construction equipment equations proposed for URBEMIS 2001 are based on the following equation:

$$\text{Emissions (pound per day)} = (\text{pounds of pollutant emitted per hour}) \times (\text{hours each equipment type operated})$$

URBEMIS 2001 estimates default acreage graded per day based on land use size specified by the user. The basis for site grading PM₁₀ fugitive emissions is the emission factor prepared by the CARB for construction activities:

$$\text{PM}_{10} \text{ (pounds per day)} = (220 \text{ pounds of PM}_{10} / \text{acre month}) \times (\text{month}/22 \text{ days}) \times \text{Acres graded per day}$$

The PM₁₀ emission factor of 220 pounds per acre-month is based on a report prepared for the SCAQMD (Midwest Research Institute 1996). A review of the report, entitled Improvement of Specific Emission Factors (BASCM Project No.1), indicates that this emission factor is an average emission factor for construction activities and was recommended by the Midwest Research Institute as a substitute for the EPA's AP-42 emission factor for construction activities. This average emission factor was based on construction activities (at four construction sites) for the following elements: limited-to-heavy trenching activities; limited-to-heavy earth moving activities by scrapers; road preparing activities; paving activities; road grading; scraper excavations; general construction (pads, framing, landscaping, etc.); drilling; blasting; compaction; and trucking of excavated and fill material.

Previous air quality analysis performed for the public release (draft) EIR for the Great Park Plan did not specifically estimate demolition emissions in the URBEMIS 2001 construction model. However, the air quality analysis did assume that fugitive particulate emissions would occur from land disturbance (i.e., site grading). Runway demolition will only occur in the first phase of construction; approximately 31.2 million cubic feet of concrete from

existing runways will be demolished. Table 5.3-11 provides emission estimates for the unmitigated phase one Base Plan scenario both with and without runway demolition. As shown in the table, the difference between the unmitigated PM₁₀ emissions for both scenarios is less than 6.6 tons per year; this figure is statistically insignificant.

Table 5.3-11
Initial URBEMIS 2001 Model Run (Without Runway Demolition)

Emission Source	Unmitigated PM₁₀ Emissions (Tons per Year)	Total Construction Emissions (Percent)
Demolition	0.00	0.00
Site Grading	445.69	98.76
Construction Worker Trips	3.47	0.77
Stationary Equipment	0.01	<0.01
Mobile Equipment (Diesel)	2.12	0.47
Total	451.29	100

Secondary URBEMIS 2001 Model Run (With Runway Demolition)

Emission Source	Unmitigated PM₁₀ Emissions (Tons per Year)	Total Construction Emissions (Percent)
Demolition	6.55	1.43
Site Grading	445.69	97.35
Construction Worker Trips	3.47	0.76
Stationary Equipment	0.01	<0.01
Mobile Equipment (Diesel)	2.12	0.46
Total	457.84	100

Source: Black and Veatch 2003

Other sources of construction related emissions include construction worker travel and asphaltting operations. A commonly accepted practice for reducing and suppressing dust emissions from construction activity is watering prior to and during the activity. Water application accounts for one of the mitigation measures assumed for estimating mitigated construction emissions. Probable mitigation measures and reduced impacts from their implementation are discussed in later in this report.

Unmitigated Construction Emission Estimates

Base Plan and Overlay Plan

Emissions from construction related activities for each phase are presented in Table 5.3-12 for both the Base Plan and Overlay Plan. These emissions are a result of unmitigated construction activity for the development in the project site. Emissions are presented in tons per day. It should be emphasized the emissions presented in the Table 5.3-12 are unmitigated emissions only. Once mitigation measures are implemented, a reduction in construction related emissions is anticipated. The estimates are based on URBEMIS 2001

defaults, as exact construction schedule and equipment specifications are currently not available.

Table 5.3-12
Unmitigated Construction Emissions for the Development of the Project Area

Construction Emission Estimates (tons/day)

Mitigated Construction Emission Estimates

Base Plan and Overlay Plan

Mitigation measures are implemented to minimize emissions and thereby reduce impacts of construction activity associated with the project. Various levels of mitigation measures can be adopted. The most common form of mitigation method applied to minimize fugitive dust emissions from construction activity is the application of water. This form of mitigation is effective, resulting in a reduction of fugitive dust emissions. The following are some of the mitigation measures assumed for estimating mitigated emissions due to construction activity.

- ◆ Replace ground cover in disturbed areas quickly.
- ◆ Maintain construction and mobile equipment properly.
- ◆ Apply water to haul roads and unpaved areas twice a day.
- ◆ Reduce speeds on unpaved roads.
- ◆ Use low emission fuel.
- ◆ Use low VOC asphalt for paving.
- ◆ Reduce equipment idling time.
- ◆ Use non-diesel equipment, wherever possible.
- ◆ Stagger use of equipment near sensitive receptors.

All the above measures result in a substantial reduction of total PM₁₀ emissions from construction related activities, but NO_x emissions are increased. Specific mitigation measures that will be implemented is varied; certain measures may not be feasible once actual development gets underway and selection of certain measures may not be desirable

due to NO_x emission increases. The probable implementation of these measures may be further modified based on future demand. The mitigated construction emissions for the Base Plan and the Overlay Plan are presented in Table 5.3-13. All construction related emissions from the project are considered temporary and therefore not expected to significantly contribute to post-construction air quality impacts. As shown in the Tables 5.3-12 and 5.3-13, the project is expected to exceed the SCAB significant emission thresholds for ROG, NO_x and PM₁₀. The project impact is, therefore, considered significant since the estimated potential construction emissions are expected to exceed the emission thresholds.

Operational Emissions

Base Plan and Overlay Plan

Operational emissions resulting from the implementation of either the Base Plan or Overlay Plan are divided into (i) area source emissions that include emissions from natural gas combustion, residential fireplaces, landscaping, consumer products, and (ii) motor vehicle operation emissions. The number of motor vehicles that will result from the either plan were estimated using the land use type and trip generation rates presented in the transportation study performed by Urban Crossroads, Inc. Area source emissions resulting from natural gas combustion for heating/cooling purposes, fireplaces and consumer products are estimated based on the area and size of various proposed land uses in the project area. Operational emissions estimates are based on the assumption that operational emissions begin in the third year of each phase, that emissions are 50 percent of full phase operational emissions in years three and four, and that full operational emissions begin by the 5th year of each phase. Table 5.3-14 summarizes this approach.

Area source and motor vehicular emissions are estimated using the URBEMIS 2001 model. The description of the model is presented in earlier in this section.

Table 5.3-14
Operational Levels by Year for the Development of the Project Area

Year	Operational Level (Phase 1)	Operational Level (Phase 2)
Initiation of Phase 1		
2007	0%	0%

Unmitigated Area Source Emissions Estimation

Base Plan and Overlay Plan

The emissions from area sources are estimated depending on the land uses presented in the Air Quality technical report (Appendix I of this Final Program EIR). The significant area sources of air emissions result from combustion of natural gas (space and water heating) and electrical usage, residential fireplaces, and consumer products. Emissions from water and space heating are measured using default emission factors built into the URBEMIS 2001 model for the SCAB. These emission factors estimate the amount of emissions based on the square footage and/or acreage of various land uses in the plan. Similarly, air emissions from residential fireplaces and consumer products are also measured using emission factors built into the model based on number and type of residential units within the plan. Air emissions from each of the sources are estimated for the two stages of development of the project area for the Base Plan and Overlay Plan. Area source emissions are estimated for the median year for each stage of development. For example, the Phase 1 development will occur between the years 2007 and 2016. Therefore, emissions for this stage are estimated for the median year of 2010. These estimates conservatively account for potential emissions resulting from the project area. Potential unmitigated air emissions from area sources for the development of the project area for the Base Plan and the Overlay Plan are presented in Table 5.3-15.

Table 5.3-15
Unmitigated Area Source Emissions for the Development of the Project Area

Area Source Emission Estimates (tons/day)					
	ROG	NO_x	CO	PM₁₀	SO_x
Phase 1 (Base)	0.08	0.02	0.16	0.02	0.00
Phase 2 (Base)	0.03	0.01	0.07	0.01	0.00

Mitigated Area Source Emissions Estimation

Base Plan and Overlay Plan

The mitigation of area source emissions cannot be completely quantified, as some of the applicable measures cannot be imposed on the proposed development at this time; but may be suggested for implementation later. The actual implementation of the mitigation measures depends on the type and degree of development activity, and the appropriate mitigation measures may not be proposed until the detailed planning of the various stages of development. However, for emission estimation, certain measures (defined below) have been assumed as mitigation measures that may be implemented during the planning and execution stages of the project. The implementation of the emission mitigation measures cannot be guaranteed at this stage of the project, because they may not be technically or economically feasible once actual development begins.

The mitigation measures that could be implemented for residential and commercial development include the siting of structures such that they orient either north or south to reduce the amount of energy consumed for heating and cooling purposes. Other assumed measures for residential and commercial development include the use of solar energy, and central heating and cooling systems. The mitigated emission estimates for the project area are presented in Table 5.3-16. As shown in Tables 5.3-15 and 5.3-16, the potential emissions resulting from the project are, whether unmitigated or mitigated, expected to be at or above the SCAB significant emission thresholds for all the pollutants for the Overlay Plan, except for SO_x. Only emissions of ROG are over the CEQA significant emission threshold for the Base Plan. The project area is, therefore, considered significant since the estimated potential emissions are expected to exceed the CEQA significant emission thresholds.

Table 5.3-16
Mitigated Area Source Emissions for the Development of the Project Area

Area Source Emission Estimates (tons/day)					
	ROG	NOx	CO	PM10	SOx

Unmitigated Motor Vehicle Emission Estimation

Base Plan and Overlay Plan

Motor vehicle emissions or mobile source emissions constitute a significant portion of the total emissions from the development of the Base Plan or Overlay Plan. According to the data provided by Urban Crossroads, Inc, the total estimated number of average daily trips (ADT) generated by the Base Plan and the Overlay Plan are 90,965 and 148,455, respectively. Motor vehicle emissions are estimated for each phase based on the type of development activity and projected number of ADTs for that phase. It should be noted however that the actual number of ADTs during each phase might be less than projected since the increase depends upon the gradual progress of the development. The unmitigated emission estimates based on the projected number of ADTs for the Base Plan and Overlay Plan in the project area are presented in Table 5.3-17.

Table 5.3-17
Unmitigated Mobile Source Emissions for the Development of the Project Area

Mobile Source Emission Estimates (tons/day)				
	ROG	NO_x	CO	PM₁₀
Phase 1 (Base)	0.22	0.22	2.07	0.14

Mitigated Motor Vehicle Emission Estimation

Base Plan and Overlay Plan

The most common suggested mitigation measures for mobile source emissions include proper design of roadway systems that include sidewalks, street lighting, traffic shelters, synchronization of traffic lights and providing bicycle trails. Certain measures specific to the commercial development include parking preference for carpools and vanpools, using low emission vehicle fleets, and programs such as satellite offices, home based telecommuting programs, and providing onsite facilities such as banks and cafeterias. However, these measures are not guaranteed for implementation, as they are specific to the businesses and residences that will be developed in the project area. The mitigated emission estimates for motor vehicle emissions are presented in Table 5.3-18.

Summary of Operational Emissions

Base Plan and Overlay Plan

Operational emissions last for the life of the project and consist of emissions from area sources and the operation of motor vehicles. As seen in Tables 5.3-15 through 5.3-19, the project area is expected to exceed the significance thresholds for one or more pollutants. The project is, therefore, considered significant since the estimated potential emissions are expected to exceed the significant emission thresholds for ROG, NO_x, CO and PM₁₀. Thus, a detailed assessment will be required to quantify the significance of the impacts from each of the pollutants. In the year 2025, after the project is completely implemented, only operational emissions (post-construction) will exist and the estimated average operational emissions resulting from the plan development are presented in Table 5.3-19. These estimates include all developed area sources and motor vehicle operations that occur during the two phases of the project area. A comparison of these estimates with the 1997 AQMP total projected SCAB emissions is presented later in this section.

Summary of Construction and Operation Emission Estimates

Base Plan and Overlay Plan

The total emission estimates from both construction and post-construction of the project are presented in Tables 5.3-20 and 5.3-21. The estimates are presented in tons per day. (These emissions are compared to projected total emissions in the SCAB later in this section). The projected SCAB emissions were extrapolated from the 1997 AQMP emission estimates for the years 2007 and 2025. As compared to the total projected emissions for the SCAB, the mitigated emissions after the Base Plan is completed constitutes from only 0.05 percent (for ROG) to 0.20 percent (for CO) of the total SCAB emissions. Similarly, the mitigated emissions after the Overlay Plan is completed constitutes from only 0.09 percent (for NO_x) to 0.39 percent (for CO) of the total SCAB emissions.

Extent of Change in Regional Emissions

The primary post-construction air quality impacts from the development of the project result from operational emissions from area sources and motor vehicles. A comparison of the projected emission estimates for the SCAB in the 1997 AQMP and the emission estimates from the development of the project help determine the extent of the air quality impacts that the project will have on the surrounding environment and existing air quality. Projected SCAB emission estimates for the year 2007 and 2025 are currently unavailable, but have been determined based on the 1997 AQMP estimates for years 2000, 2006, and 2010. Projected emissions for each pollutant in year 2007 were extrapolated from the 1997 AQMP based on the trend of each pollutant from 2000 to 2006. Projected emissions for each pollutant in year 2025 were extrapolated from the 1997 AQMP based on the trend of each pollutant from 2000 to 2010. The projected SCAB emission estimates for the years 2007 and 2025 and the estimated average unmitigated and mitigated operation emissions for the project for the same years are presented in Table 5.3-22. This information is also presented graphically in Figure 5.3-2. Tables 5.3-23 and 5.3-24 list the percent comparison of the project estimates with the projected SCAB estimates. From the estimates presented, it is evident that emissions from the project are less than one-half (0.5) percent of the total projected SCAB emissions. Therefore, though the development of the project will have a negligible impact on the overall air quality within the SCAB.

Local Air Quality Impacts

The air quality impacts of the development of the project area and the immediate vicinity are addressed in this section. Significant sources of air emissions quantified in the previous section will cause air quality impacts on the nearby area. The following sections examine the effect of such air emissions on the vicinity of the project qualitatively and/or quantitatively where sufficient data is available.

Local Air Quality Impacts Due to Construction

Construction activity associated with the project area will not cause long-term impacts on the surrounding environment or the air quality within the region. However, due to the extent and schedule of construction activities, short-term impacts will occur. The major emissions associated with construction activity are particulates and fugitive dust emissions. These emissions can be considerably reduced through the implementation of appropriate mitigation measures and proper planning of construction activity as discussed previously.

Local Air Quality Impacts Due to Motor Vehicles

The major impact of motor vehicle emissions is the potential increase in CO concentrations. The CO concentrations were predicted using the CALINE 4.0 model. The model is a line source air quality model developed by the CALTRANS and it is used to predict air quality impacts due to motor vehicles. The region identified for estimating emissions encompasses major intersections around the proposed project area. With representative site geometry, receptor location, and source characteristics, the model can reliably and conservatively predict pollutant concentrations.

Default options for the model are specified in the Air Quality technical report, Appendix I of this EIR of the CO protocol that is acceptable for project-level conformity analysis in the SCAB. The protocol was approved by the EPA in December 1998. The CALINE 4.0 model requires input of motor vehicle emission factors obtained from the EMFAC7F model. Emission factors for each scenario were generated using the EMFAC7F model. According to CALTRANS, the later version of the model EMFAC7G is not used for micro-scale analysis such as intersections. Default motor vehicle distribution values for the SCAB were obtained from the default assumptions in the URBEMIS 2001 model. Cold start percentages of 20 percent were assumed against a suggested default of 15 percent for the model. The emission factors thus obtained were input into the CALINE 4.0 model. The input assumptions and model outputs for the EMFAC7F modeling are presented in the Air Quality technical report, located in Appendix I of this Final Program EIR.

Worst-case meteorology with a wind speed of 1 mile per hour and a stability class G was used in the CALINE 4.0 modeling, as recommended in the CALTRANS air quality technical analysis notes (AQTAN) protocol. Default worst-case wind direction option was used. The fluctuation in wind direction is measured in terms of standard deviation (σ theta), and it was assigned a default value of ten degrees. A mixing height of 1,000 meters and surface roughness of 100 centimeters were used based on the AQTAN.

Existing and projected hourly peak traffic volumes were extracted from the Traffic Impact Analysis provided by Urban Crossroads. Default vehicle type distributions specific to the

SCAB specified in the URBEMIS 2001 model were used in the CALINE 4.0 modeling. The input assumptions and model outputs for the CALINE 4.0 modeling are presented in the Air Quality technical report, located in Appendix I of this Final Program EIR.

The link option was used within the CALINE 4.0 model as specific data regarding delay times at intersections and other required intersection-specific input data are not currently available. Link coordinates in terms of directional splits (separate links for opposite directions on each route) were used for each intersection. Receptors were placed at a distance of three meters (m) from the edge of each roadway and at a height of 1.8 m to reflect the concentration in the mixing zone as recommended by the CALINE 4.0 manual. Four years were analyzed: 2002 (existing), 2007, 2025 and post-2025. Because CO impacts are higher when traffic congestion exists, intersections with a Level of Service (LOS) "D" or higher at AM or PM peak hours, with available data and representative of traffic patterns, were identified for analysis. Average vehicular speeds of 40 mph, 30 mph and 20 mph were used for intersections with LOS designations D, E, and F, respectively.

One-hour concentrations of CO at each intersection with projected traffic volumes were assessed using the CALINE 4.0 model. Eight-hour concentrations were estimated using the procedure described in the AQTAN. A persistence factor of 0.83 was used which was calculated as the highest ratio of the highest eight hour maximum (2.38 ppm) to the highest one hour maximum (3.0 ppm) CO concentration measured during at the Saddleback Valley monitoring site in the SCAB in each of the past three years (1999, 2000, 2001). The monitored maximums at the monitoring location nearest to the MCAS El Toro (Saddleback Valley) for 2001 were used as the one-hour and the 8-hour background levels. These concentrations were added to the predicted concentrations obtained from the CALINE 4.0 modeling to determine projected total CO impacts. The model output and results are summarized in Table 5.3-25 through Table 5.3-30.

The 1993 CEQA Handbook defines a measurable increase as one ppm for one-hour concentration and 0.45 ppm for eight-hour concentration. For the Base Plan or Overlay Plan, impacts predicted by the model indicate a range of one-hour CO concentrations between 0.4 ppm and 2.9 ppm and an approximate maximum increase of 0.8 ppm. For either plan, predicted eight-hour concentrations ranged between 0.33 ppm and 2.41 ppm with an estimated maximum increase of 0.7 ppm. As shown in Table 5.3-25 through Table 5.3-30, the predicted air quality impacts from the CALINE 4.0 modeling demonstrate that no intersections in the traffic study area result in one-hour and eight-hour CO concentrations above the applicable state air quality standards of 20 ppm for one-hour concentrations and nine ppm for eight-hour concentrations. This is believed to be due to the interconnection of roadways through the project area and other traffic improvement programs planned for the area.

Local Air Quality Impacts Due to Area Sources (Operation)

The air quality impacts due to area sources such as commercial establishments and residential neighborhoods are not individually significant but cumulatively contribute to increased emissions within the region. Given the predominant use of natural gas as the primary fuel source for most combustion-related local sources, emission concentrations of pollutants should be very low. The development of new emerging technologies and the refinement of existing technologies may help mitigate a significant portion of these and

other emissions resulting from local sources. Considering this, local source emissions should have a negligible impact on local air quality

Threshold 5: Create objectionable odors affecting a substantial number of people.

Base Plan and Overlay Plan

No land used that handles large amounts of solid waste, chemicals associated with heavy industry, or other uses that may generate objectionable odors are known under the proposed project. Thus, no significant adverse impacts associated with odors are expected.

Consistency with Air Quality Planning Measures

The CEQA guidelines provide direction to determine consistency of any proposed development projects with the AQMP and other applicable regional plans. Any inconsistency of the development projects with the AQMP results from the increase in the severity or frequency of air quality standard exceedances and/or changing the assumptions in the AQMP.

Consistency with AQMP

Threshold 1: Conflicts with or obstructs implementation of any applicable air quality plan.

Base Plan and Overlay Plan

The most recent AQMP for the SCAB was developed by the SCAQMD in 1997 with the 1999 Ozone amendment and incorporates most of the provisions included in the 1994 AQMP. The overall control strategy for this plan, designed to meet applicable state and federal requirements, including attainment of ambient air quality standards, proposes two tiers of emission reduction measures. Short-term and intermediate-term measures propose the application of available technologies and management practices until the year 2005. Long-term additional emission reductions rely on the advancement of technologies and control methods that can reasonably be expected to occur between 2000 and 2010. These long-term measures rely on further development and refinement of currently available low- and zero-emission control technologies in addition to technological breakthroughs. The primary goal of these measures is to bring the area into attainment of the federal and state air quality standards, and the reduction in total vehicle miles traveled consistent with the AQMP. Another goal includes the mitigation of all possible emissions for overall reduction in potential emissions without prohibiting future growth within the region. The important criteria for determining consistency with the AQMP are jobs and housing balance, reduction in motor vehicle trips and improvement in overall air quality in the region.

Motor Vehicle Trip Reduction

In accordance with the requirements of the AQMP, the proposed project is required to demonstrate that vehicle trips and vehicle miles traveled will be reduced by its implementation. This may be accomplished through the implementation of a variety of transportation management strategies. Some of the major strategies that deserve consideration include increased utilization of public transportation, discouraging single occupant car use by increasing commuter parking fees, using parking fees as incentives for ride sharing, planning auto free land uses, and encouraging employer sponsored transit services.

The proposed project includes the construction of an Orange County Transportation Authority (OCTA) facility aimed at encouraging the use of alternative transportation such as buses, trains and bicycles and thus, reducing the overall motor vehicle trips generated by the proposed project.

Air Quality

The proposed project is also required to demonstrate that it does not have a long-term (post-construction) negative impact on the region's air quality. The major air quality impacts expected from the development of the proposed project include pollutant emissions due to construction (short-term), and emissions due to energy consumption and motor vehicle (mobile source) use. Construction impacts are considered short-term impacts though the complete development of the project is expected to last 19 years. These impacts will be mitigated using appropriate measures as required by the SCAQMD and local governing agencies. Energy consumption and motor vehicle impacts are long-term impacts that are considered to have localized air quality impacts above the SCAQMD significance thresholds, but they only constitute less than one-half (0.5) percent of projected SCAB basin wide emissions. Mitigation measures would be implemented that would further decrease these emissions, but the proposed project is not expected to significantly impact the overall air quality within the SCAB.

Unavoidable Adverse Impacts

Certain impacts that result from the development of the proposed project are termed "unavoidable" as these impacts cannot be completely mitigated and most of these changes are irreversible. Irreversible changes generally include a large commitment of nonrenewable resources, committing future generations to specific uses of the environment (e.g., converting undeveloped land to urban uses), or enduring environmental damage due to an accident.

Implementation of the proposed project is not anticipated to result in any significant irreversible adverse environmental changes. The proposed project would place only an incremental demand on nonrenewable and limited resources, such as energy, relative to the accelerated rate of use of these resources due to population growth and increased consumer demand. Construction related emissions are expected to cause unavoidable short term impacts and the implementation of mitigation measures will assist in minimizing these impacts. Operational emissions of the proposed project consist of area source and motor vehicle emissions, but the overall effect on air quality within the SCAB for the life of the proposed project is minimal.

5.3.4 Significant Impacts

Base Plan and Overlay Plan

- AQ1.** Implementation of the proposed project will result in a significant air quality impact associated with the fugitive dust emissions resulting from the demolition of existing structures, and land preparation and excavation for the construction of proposed structures. Additionally, the operation of the project will result in a significant impact associated with motor vehicle emissions.

5.3.5 Mitigation Measures

Base Plan and Overlay Plan

The following section provides a summary of the possible mitigation measures that could be implemented for the development of the former MCAS El Toro according to the proposed project. The limited availability of specific data to quantify air quality impacts for emission sources within the proposed project make it impossible to accurately quantify the effectiveness of each of the mitigation measures. However, these measures are identified as possibilities for the project, while some are recommended by the SCAQMD for all development projects within the SCAB. As expected, the implementation of some or all of the mitigation measures will result in an overall reduction in potential air emissions from the proposed project. However, the implementation of any of these emission mitigation measures cannot be guaranteed at this stage of the proposed project, because they may not be technically or economically feasible once actual development gets underway. Therefore, the emission mitigation measures discussed in the following sections are defined as alternate control measures that could be implemented for the proposed project.

Construction Emissions Mitigation

The major source of construction emissions are fugitive dust emissions resulting from the demolition of existing structures, and land preparation and excavation for the construction of proposed structures. Actual erection of structures is considered a minimal source of construction related dust emissions. The following mitigation measures are intended to effectively reduce pollutant emissions from construction activities. Some or all of the mentioned mitigation measures can be implemented as necessary, but quantification and application of these measures cannot be specified at this time.

- AQ1.** Prior to the start of demolition and construction within the project area, adjacent sensitive receptors shall be informed of the planned demolition and construction activities. Measures to avoid significantly impacting these receptors shall be developed and implemented by the project proponent in coordination with these uses. Other applicable mitigation measures such as erection of fences around construction areas; staggered use of equipment near sensitive receptors; diversion of truck trips away from receptors; etc.; shall be employed as necessary. Compliance with this measure shall be verified by the Director of Community Development.

- AQ2.** Prior to the commencement of construction activities required to demolish and/or remove existing DON structure, including, runways, the Director of Community

Development shall receive and approve a construction emissions mitigation plan from the chosen demolition contractor. Prior to the issuance of grading permits, the applicant of any future development project shall submit, and the Director of Community Development shall approve a construction emissions mitigation plan. The plans shall identify implementation procedures for each of the following emissions reduction measures and all feasible mitigation measures shall be implemented. If certain measures are determined infeasible, an explanation thereof shall be provided.

- Evaluate the availability and use, if available, of low-emission (i.e., methanol- or natural gas-powered) construction equipment instead of diesel for each construction phase.
- Water exposed soils at least twice daily and maintain equipment and vehicle engines in good condition and in proper tune.
- Wash off trucks leaving the site.
- Replace ground cover on construction sites when it is determined that the site will be undisturbed for lengthy periods.
- Reduce speeds on unpaved roads to less than 15 miles per hour.
- Halt all grading and excavation operations when wind speeds exceed 25 miles per hour.
- Suspend all emission generating activities during smog alerts.
- Use propane- or butane-powered on-site mobile equipment instead of diesel/gasoline, whenever feasible.
- Properly maintain diesel-powered on-site mobile equipment.
- Sweep streets at the end of the day if substantial visible soil material is carried over to the adjacent streets.
- Use electricity from power poles rather than temporary on-site diesel- or gasoline-powered generators, whenever feasible.
- Use of low-VOC asphalt.
- Cover all trucks hauling dirt, sand, soil or other loose material to and from the site.
- Provide temporary traffic controls (e.g., flag persons) during all phases of construction to ensure minimum disruption of traffic.
- Schedule construction activities that affect traffic flow on adjoining streets to off-peak hours to the extent possible.
- Reroute construction trucks away from congested streets, whenever feasible.
- Provide dedicated turn lanes for movement of construction trucks and equipment on- and off-site, whenever feasible.

AQ3. Prior to the issuance of building permits for any future development, the applicant shall submit, and the Director of Community Development shall have approved, an operation-emissions mitigation plan. The plan shall identify implementation procedures for each of the following emissions reduction measures and all feasible mitigation measures shall be implemented. If certain measures are determined infeasible, an explanation thereof shall be provided.

- Utilize built-in energy-efficient appliances to reduce energy consumption and emissions.
- Utilize energy-efficient and automated controls for air conditioners and lighting to reduce electricity consumption and associated emissions.

- Install special sunlight-filtering window coatings or double-paned windows to reduce thermal loss, whenever feasible.
- Utilize light-colored roofing materials as opposed to dark roofing materials to conserve electrical energy for air-conditioning.
- Provide shade trees in residential subdivisions as well as public areas, including parks, to reduce building heating and cooling needs, whenever feasible.
- Ensure that whenever feasible, commercial truck traffic is diverted from local roadways to off-peak periods.
- Centralize space heating and cooling for multiple-family dwelling units and commercial space.
- Orient buildings north/south for reducing energy-related combustion emissions.
- Use solar energy, when feasible.
- Use high rating insulation in walls and ceilings.

AQ4. Information on available housing and employment opportunities within the project area shall be provided to employees and residents of the project area, so as to encourage employees to live within the residential developments planned on-site and future residents to find employment nearby.

AQ5. Future employment generating non-residential development shall include measures to reduce vehicle trips including: the promotion of carpool incentives and alternative work schedules, easy access to public transit systems, trail linkages between uses, low-emissions vehicle fleets, and the provision of on-site facilities such as banking and food courts, and bicycle parking facilities, and other transportation demand management measures, as deemed appropriate.

5.3.6 Significance of Impacts After Mitigation

Base Plan and Overlay Plan

Due to the size of the project, certain impacts that result from development will be "unavoidable" as these impacts cannot be completely mitigated and most of these changes are irreversible. This is considered a significant unavoidable impact, although the overall effect on air quality within the Basin for the life of the proposed project is estimated at less than one half of one percent. Construction-related emissions are expected to result in unavoidable short-term impacts in terms of ROG and NO_x, although implementation of mitigation measures during construction will minimize these impacts to the extent feasible. Short-term impacts on sensitive receptors are expected to be mitigated during construction and no long-term CO hotspots will be created that may affect sensitive receptors. Operational emissions from future development under the proposed project will consist of area source and motor vehicle emissions, which will exceed SCAQMD thresholds. These air quality emissions from future development under the proposed project will remain significant, even after mitigation.

Area Source (Post-Construction) Emission Mitigation

Emissions resulting from the post-construction and routine operation of various sources within a development contribute to long term impacts on air quality throughout its life. Some of the mitigation measures that could reduce energy consumption within the proposed project and thus, reduce associated emissions should be considered for implementation and are listed below.

- ◆ Central residential space heating and cooling for multi-dwelling units.
- ◆ Orient buildings north/south for reducing energy-related combustion emissions.
- ◆ Central commercial space heating.

These measures could be accounted for in the planning process such that the overall impact of the proposed project on prevalent air quality in the SCAB is minimized.

Motor Vehicle (Operational) Emission Mitigation

Motor vehicle emissions form a large portion of the total operational emissions from the proposed project. These emissions can be mitigated by the use of fuel-efficient vehicles and a well designed transportation system. However, most of the measures will be ineffective unless the occupants of various commercial and residential establishments within the project contribute their share in the mitigation effort. The implementation of some of the measures cannot be stated with certainty, as they are owner and employer specific and related specific land use types within the proposed project. Development of the proposed project will identify motor vehicle mitigation measures that would result in reductions in emissions and thereby contribute to the overall improvement in air quality within the SCAB. The inclusion of the OCTA facility within the proposed project is aimed at encouraging the use of alternative transportation thereby reducing motor vehicle congestion and related air quality emissions and impacts. The implementation of an emission reduction program under SCAQMD Rule 2202 is also expected to result in reducing motor vehicle air quality emissions and impacts.

5.4 Noise

An environmental noise assessment to determine the potential noise impacts of the proposed project prepared by Black and Veatch Corporation is provided as Appendix H in Volume II of this Final Program EIR. The report is summarized below and provides the basis for determining projects impacts.

Acoustical Terminology

Definitions

Sound is generated by the propagation of energy in the form of pressure waves. Being a wave phenomenon, sound is characterized by amplitude (sound level) and frequency (pitch). Sound amplitude is measured in decibels (dB) and sound frequency is measured in hertz (Hz). The decibel is the logarithmic ratio of a sound pressure to a reference sound pressure. Typically, zero dB corresponds to the threshold of human hearing. For reference, the sound pressure levels associated with common noise sources are shown in Figure 5.4-1. The standard unit of measure for frequency is Hz (cycles per second). The typical human ear can hear frequencies ranging from 20 Hz to 20,000 Hz.

At typical sound pressure levels, the human ear is more sensitive to sounds in the middle and high frequencies (1,000 to 8,000 Hz) than sounds in the low frequencies. Various weighting networks have been developed to simulate the frequency response of the human ear. The A-weighting network was developed to simulate the frequency response of the human ear to sounds at typical environmental levels. The A-weighting network emphasizes sounds in the middle to high frequencies and de-emphasizes sounds in the low frequencies. Most sound level instruments can apply these weighting networks automatically. Any sound level to which the A-weighting network has been applied is expressed in A-weighted decibels (dBA) and most community noise standards are expressed in decibels on the dBA scale. Noise levels of common sounds in the environment include office background noise at about 50 dBA, human speech at 10 feet (ft) at about 60-70 dBA, cars driving by at 50 feet at 65-70 dBA, trucks at 50ft at 75-80 dBA, and aircraft overflights a mile from the approach at about 95-100 dBA. Table 5.4-1 shows typical sound levels according to the A-weighted decibel scale.

People are exposed to sound on a daily basis. Sound is perceived as a normal part of the natural environment. People quickly adapt to most everyday sounds and barely notice its presence. Other sounds can be annoying or disturbing. For purposes of environmental assessment, noise is defined as unwanted sound. Noise in the urban environment typically is produced by transportation activities and stationary activities. Transportation noise includes noise from automobile and truck traffic, trains and airplanes. Stationary noise sources typically include heating, ventilation and air conditioning systems, manufacturing activities, industrial equipment, entertainment activities, yard care equipment, and outdoor activities. Stationary sources of a temporary nature include construction activities and agricultural operations.

Sound Level Metrics

Community noise consists of a wide variety of sounds, some near and some far away, some of which are short and some of long duration, some constant and some infrequent, which vary over the 24-hour day. Scientists and planners have found that humans respond generally to the 24-hour variation in noise based on the total energy content of the sound over the day, with a greater sensitivity to noise at night.

Several noise metrics have been developed to quantify fluctuating noise levels. These metrics include the equivalent-continuous sound level, the day-night sound level, and the community noise equivalent sound level. California standards for community noise use the Community Noise Equivalent Level (CNEL), in which the energy is averaged over a 24-hour day with a five-decibel penalty from 7:00 pm to 10:00 pm and a ten-decibel penalty from 10:00 pm to 7:00 am. The EPA uses the Day-Night Noise Level (L_{dn}) measure, which is identical to the CNEL, but without the evening noise weighting.

The equivalent-continuous sound level (L_{eq}) is the level of a hypothetical steady sound that has the equivalent sound energy as the actual fluctuating sound over a given time duration. For example, $L_{eq(24h)}$ is the equivalent-continuous sound level measured over a 24-hour period. This sound level provides an indication of the overall sound level over a 24-hour period, but does not provide any indication as to the variability of the sound level, such as from daytime to nighttime.

The day-night sound level (L_{dn}) is the 24-hour average L_{eq} sound level with a ten dB penalty applied to nighttime sound levels (10:00 pm to 7:00 am) to account for increased sensitivity to nighttime noise.

The exceedance sound level, L_x , is the sound level exceeded “x” percent of the sampling period and is referred to as a statistical sound level. The most common L_x values are L_{90} , L_{50} , and L_{10} . L_{90} is the sound level exceeded 90 percent of the sampling period. L_{90} is often referred to as the residual sound level because it measures the background sound level without the influence of loud, transient noise sources. L_{50} is the sound level exceeded 50 percent of the sampling period or the median sound level. L_{10} is the sound level exceeded ten percent of the sampling period. L_{10} is often referred to as the intrusive sound level because it measures the occasional louder noises.

Human Response to Sound

Human response to sound is highly individualized. Annoyance is the most common issue regarding community noise. The percentage of people claiming to be annoyed by noise will generally increase with the environmental sound level. However, many other factors will also influence people’s response to noise. These factors can include the character of the noise, the variability of the sound level, the presence of tones or impulses, and the time of day of the occurrence. Additionally, non-acoustical factors, such as the person’s opinion of the noise source, the ability to adapt to the noise, the attitude towards the noise and those associated with it, and the predictability of the noise, will all also influence people’s response. As such, response to noise varies widely from one person to another and with any particular noise, individual responses will range from “highly annoyed” to “not annoyed.”

Applicable Laws, Ordinances, Regulations, and Standards

This section outlines the laws, ordinances, regulations, and standards that are applicable to mixed land use developments and the proposed project. Regulatory requirements related to environmental noise are typically promulgated at the local level. However, federal and state agencies provide standards and guidelines to the local jurisdictions.

Federal Agencies

A number of federal agencies have published standards and guidelines related to environmental noise. These agencies include the Environmental Protection Agency, the Federal Highway Administration, the Department of Housing and Urban Development, and the Occupational Safety and Health Administration.

Environmental Protection Agency

As mandated by the Noise Control Act of 1972, the EPA has identified yearly day-night average sound levels (L_{dn}) sufficient to protect public health and welfare from the effects of environmental noise. According to the EPA, outdoor yearly levels are sufficient to protect public health and welfare if they do not exceed an L_{dn} of 55 dBA in sensitive areas such as residences, schools, and hospitals. Similarly, indoor yearly levels are sufficient to protect public health and welfare if they do not exceed an L_{dn} of 45 dBA. Additionally, the EPA has established that the 24-hour equivalent sound level exposure, L_{eq} , at the ear should not exceed 70 dBA in order to protect against hearing damage. The EPA emphasizes that these levels were derived without concern for technical feasibility and contain a margin of safety to ensure their protective value. Therefore, the levels must not be viewed as standards, criteria, regulations, or goals; but rather they should be viewed as levels below which there are no reason to suspect that the general population will be at risk from the effects of noise.

Federal Highway Administration

The Federal Highway Administration (FHWA) has established a set of design goals for traffic noise exposure. FHWA has established that impacts occur when predicted traffic noise levels approach or exceed established Noise Abatement Criteria. FHWA defines four land use categories and assigns maximum hourly equivalent sound levels (L_{eq}) as listed in Table 5.4-2. Category B, defined as picnic and recreation areas, parks, residences, motels, hotels, schools, churches, libraries, and hospitals, has a corresponding maximum exterior L_{eq} of 67 dBA. Category E, defined as residences, motels, hotels, public meeting rooms, schools, churches, libraries, hospitals, and auditoriums, has a corresponding maximum interior L_{eq} of 52 dBA. All highway projects funded by FHWA are subject to these criteria. Additionally, FHWA considers these limits to be goals in the design and evaluation of highway facilities and to also be helpful for planning projects near existing or future highways.

**Table 5.4-2
Federal Highway Administration - Traffic Noise Abatement
Criteria**

Activity Category	Leq(h)	Description of Activity Category
A	57 (Exterior)	Lands on which serenity and quiet are of extraordinary significance and serve an important public need and where the preservation of those qualities is essential if the area is to continue to serve its intended purpose.
B	67 (Exterior)	Picnic areas, recreation areas, playgrounds, active sports areas, parks, residences, motels, hotels, schools, churches, libraries, and hospitals.
C	72 (Exterior)	Developed lands, properties or activities not included in Categories A or B.
D	–	Undeveloped lands.
E	52 (Interior)	Residences, motels, hotels, public meeting rooms, schools, churches, libraries, hospitals, and auditoriums.

Source: 23 CFR Part 772.

Department of Housing and Urban Development

The Department of Housing and Urban Development (HUD) has established environmental criteria and standards for interior and exterior noise impacting HUD assisted housing sites. These standards are based on day-night average sound levels (L_{dn}) and identify the need for noise abatement, either at the property boundary or in the building construction. HUD's Site Acceptability Noise Standards rank exterior environmental noise and consider housing sites exposed to exterior noise levels not exceeding an L_{dn} of 65 dBA as acceptable. Housing sites exposed to noise levels exceeding an L_{dn} of 65 dBA require additional noise attenuation other than that provided in customary building techniques.

HUD also specifies minimum sound isolation standards for wall and floor/ceiling constructions separating living units from other living units, common service areas, or public spaces. For example, HUD specifies a minimum Sound Transmission Class (STC) of 45 for walls and floor/ceiling constructions separating living units, and a minimum Impact Isolation Class (IIC) of 45 for floor/ceiling constructions separating living units. These standards must be met if HUD financing will be considered for the housing developments.

Occupational Safety and Health Administration

The Occupational Safety and Health Administration (OSHA) has established worker noise exposure limits. The OSHA worker noise exposure limits are based on a worker's noise exposure over a specific time period. Examples of these limits are outlined in Table 5.4-3.

Table 5.4-3
Occupational Safety and Health Administration - Permissible Daily Noise
Exposures

Duration per day in hours.	Sound Exposure Level, dBA.
8	90
6	92
4	95
3	97
2	100
1-1/2	102
1	105
1/2	110
1/4 or less	115

Source : 29 CFR Part 1910

When worker noise exposure exceeds the permissible noise exposure, feasible engineering or administrative controls must be implemented to reduce the noise exposure. When such controls fail to reduce the noise exposure, personal protective equipment must be provided and used to reduce the noise exposure to a permissible level. Although the permissible noise exposure over an 8-hour duration is shown as 90 dBA, OSHA has established a trigger level of 85 dBA over an 8-hour duration. When the trigger level is exceeded, the employer must provide the workers with hearing protection and establish an annual audiometric testing program.

All commercial and industrial uses developed within the project site must comply with the OSHA noise exposure limits.

State of California

California Environmental Quality Act

CEQA was enacted in 1970 and requires that all known environmental effects of a project be analyzed, including the environmental noise impacts. Under CEQA, a project has a potentially significant impact if the project exposes people to noise levels in excess of standards established in the local general plan or noise ordinance. Additionally, under CEQA, a project has a potentially significant impact if the project creates a substantial increase in the ambient noise levels in the project vicinity above levels existing without the project. If a project has a potentially significant impact, mitigation measures must be considered. If mitigation measures to reduce the impact to less than significant are not feasible due to economic, social, environmental, legal, or other conditions, the most feasible mitigation measures must be considered.

California Government Code

California Code Section 65302(f) mandates that the legislative body of each county and city adopt a noise element as part of their comprehensive general plan. The local noise element must recognize the land-use compatibility guidelines established by the State Department of Health Services as shown in Figure 5.4-2.

California Department of Transportation

The California Department of Transportation (CALTRANS) has established traffic noise policies for new construction or reconstruction transportation projects. These policies are also helpful in planning and evaluating non-transportation projects that are located near highways and roadways. CALTRANS has identified two conditions under which a traffic noise impact occurs. First, traffic noise impact occurs when the project creates a substantial increase in traffic noise. A substantial increase occurs when the predicted noise levels with the project exceed the existing noise levels by 12 dB, $L_{eq}(h)$. Second, a traffic noise impact also occurs when predicted noise levels with the project approach within one dB or exceed the Noise Abatement Criteria. The Noise Abatement Criteria is consistent with the FHWA criteria listed in Table 5.4-2. If traffic noise impacts are predicted, feasible and reasonable noise abatement measures must be evaluated and considered.

California Streets and Highways Code

The California Streets and Highways Code specify limits for noise within elementary or secondary schools produced by the traffic on a state freeway or by the construction of a state freeway. The interior noise level shall not exceed an hourly L_{eq} of 52 dBA or an L_{10} of 55 dBA due to the freeway traffic or construction. This requirement is consistent with the interior Noise Abatement Criteria for schools established by FHWA and CALTRANS.

This requirement applies to the construction or reconstruction of state transportation projects and does not specifically apply to this project. However, the criteria can be used as a guideline for the compatibility of new schools near roadways.

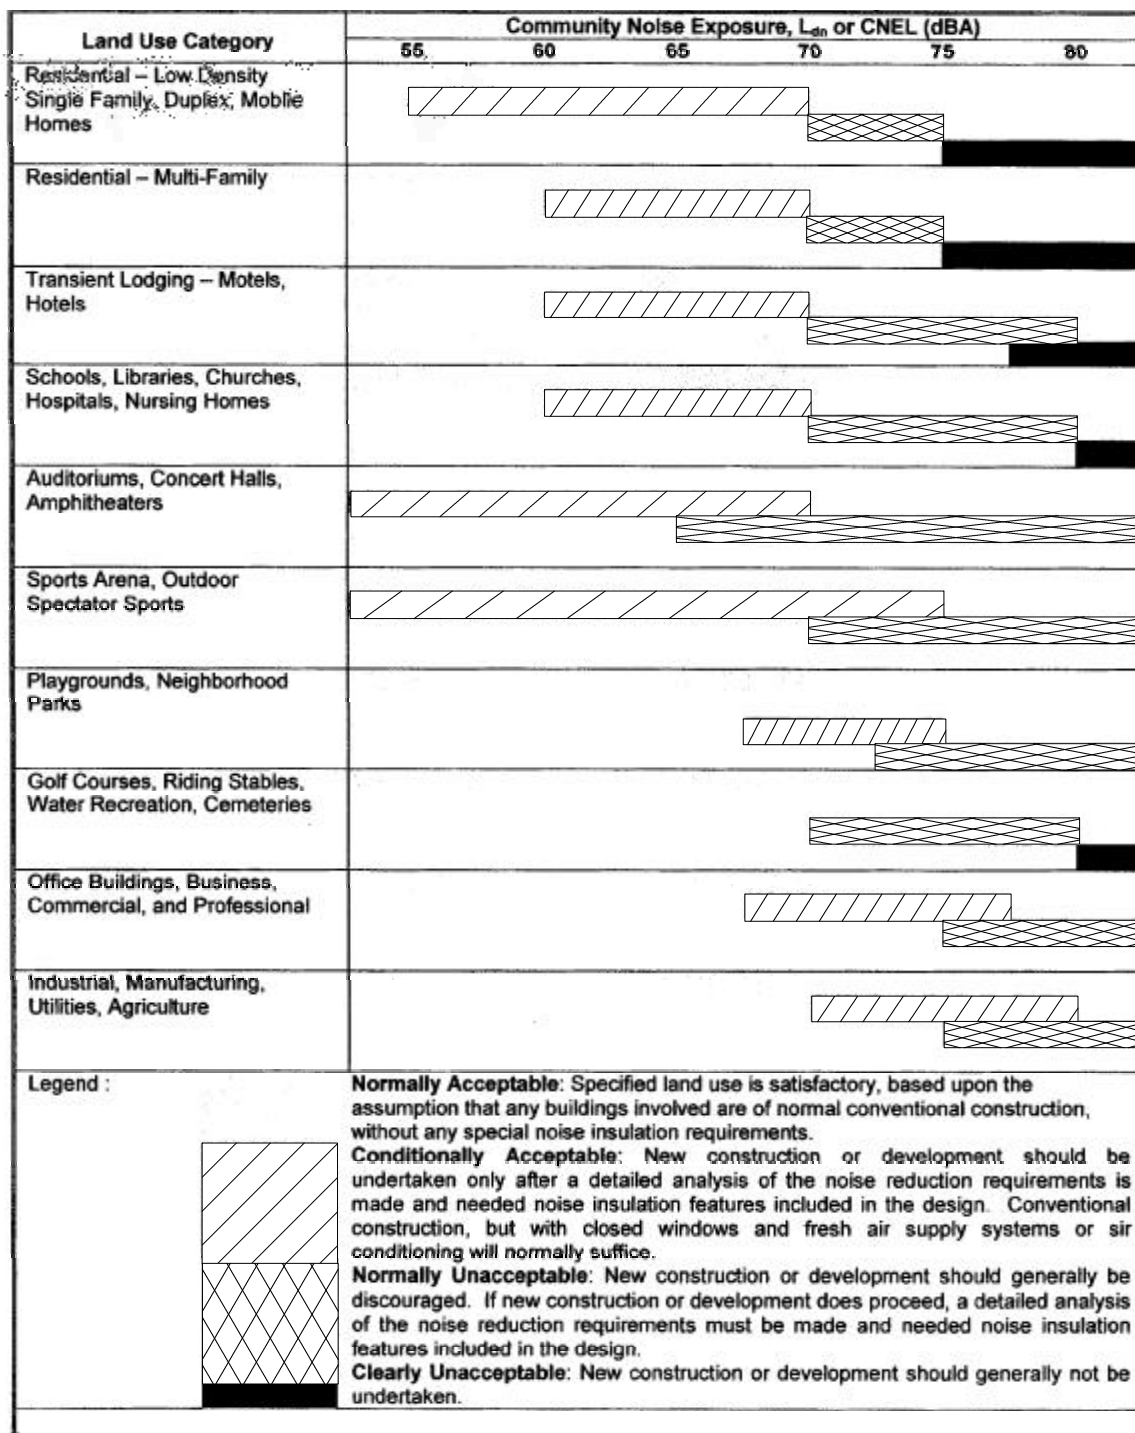

California Division of Occupational Safety and Health

The California Division of Occupational Safety and Health (CALOSHA) has established noise exposure limits to protect workers. The CALOSHA noise exposure limits are consistent with the OSHA worker noise exposure limits. All commercial and industrial uses developed within the project site must comply with the CALOSHA noise exposure limits.

California Building Standards

The California Building Standards establish uniform minimum noise insulation performance standards to protect persons within new hotels, motels, dormitories, long-term care facilities, apartment houses, and dwellings (other than detached single-family homes) from the effects of excessive noise. These standards specify minimum sound insulation requirements for interior and exterior sound transmission.

Wall and floor/ceiling assemblies separating habitable rooms from each other and from public or service areas such as interior corridors, garages, and mechanical spaces must provide airborne sound insulation. The airborne sound insulation must equal that required to meet a Sound Transmission Classification (STC) of 50 or a Noise Isolation

Source: General Plan Guidelines, Office of Planning and Research, California, November 1998, pg. 187.

Figure 5.4-2
California Department of Health Services
Land Use Compatibility Standards

Classification (NIC) of 45 if field tested. Additionally, floor/ceiling assemblies must provide impact sound insulation equal to that required to meet an Impact Insulation Classification (IIC) of 50 or a Field Impact Insulation Classification (FIIC) of 45 if field tested.

Interior noise levels attributable to exterior sources must not exceed 45 dBA in any habitable room. The noise metric should be either L_{dn} or CNEL; whichever is consistent with the noise element of the local general plan. When the exterior noise levels cause interior noise levels to exceed 45 dBA, the building must be designed to prevent the transmission of exterior noise. Proper acoustical design includes, but is not limited to, orientation of the structure, setbacks, shielding, and sound insulation of the building itself.

The California Building Standards will apply to all new hotels, motels, dormitories, long-term care facilities, apartment houses, and habitable dwellings other than detached single-family homes within the project site.

County of Orange

As mandated by the California Government Code, the County of Orange has adopted a noise element as a component of the Orange County General Plan. The Orange County Noise Element is administered by the Orange County Planning and Development Services Department and applies to all unincorporated portions of the County. The Noise Element establishes noise criteria to ensure that each county resident's quality of life is not affected adversely by high noise levels. The noise criteria are based on land use compatibility and are depicted in Table 5.4-4 and 5.4-5. In general, all outdoor living areas are compatible with noise levels less than CNEL 65 dBA. Outdoor living areas are defined in Figure 5.4-3. Similarly, indoor living spaces are compatible with interior noise levels less than CNEL 45 dBA. As mentioned, these standards only apply to unincorporated areas of the County. Therefore, these standards are only applicable to the project as guidelines for land use compatibility.

The County of Orange has also adopted a noise ordinance. The intent of the Orange County Noise Ordinance is to control unnecessary, excessive, and annoying sounds emanating from unincorporated areas of the County. Since the project site will be within the Irvine city boundaries, the ordinance is not applicable to the proposed project.

Local Jurisdictions

The local jurisdictions adjacent to the project area include the cities of Irvine and Lake Forest. Since Irvine intends to incorporate the project area in the Sphere of Influence, the project area and all future development of the area will be under the jurisdiction of Irvine.

City of Irvine

As mandated by the California Government Code, Irvine has adopted a noise element as a component of the Irvine Comprehensive General Plan. Irvine's interior and exterior noise standards are based on land use compatibility and are shown in Figure 5.4-4. Irvine has established a residential noise standard of CNEL 65 dBA for outdoor environments and CNEL 45 dBA for indoor environments. These standards are consistent with the noise

compatibility standards established by Orange County and are applicable to the project for evaluating land use compatibility within Irvine.

Note: See Table 5.4-5 for Explanations and Definitions

**Table 5.4-5
Explanation and Definitions of Table 5.4-4**

Action Required to Ensure Compatibility Between Land Use and Noise from External Sources

- 1 = Allowed if interior and exterior community noise can be mitigated.
 2 = Allowed if interior levels can be mitigated.
 3 = New residential uses are prohibited in areas within the 65-decibel CNEL contour from any airport or air station; allowed in other areas if interior and exterior community noise levels can be mitigated. The prohibition against new residential development excludes limited "infill" development within an established neighborhood.

Standards Required for Compatibility of Land Use and Noise

- a = Interior Standard: CNEL of less than 45 decibels (habitable rooms only).
 b = Exterior Standard: CNEL of less than 65 decibels in outdoor living areas.
 c = Interior Standard: Leq(h)=45-65 decibels interior noise level; depending on interior use.
 d = Exterior Standard: Leq(h) of less than 65 decibels in outdoor living areas.
 e = Interior Standard: As approved by the Board of Supervisors for sound events of short duration such as aircraft flyovers or individual passing railroad trains.

Key Definitions

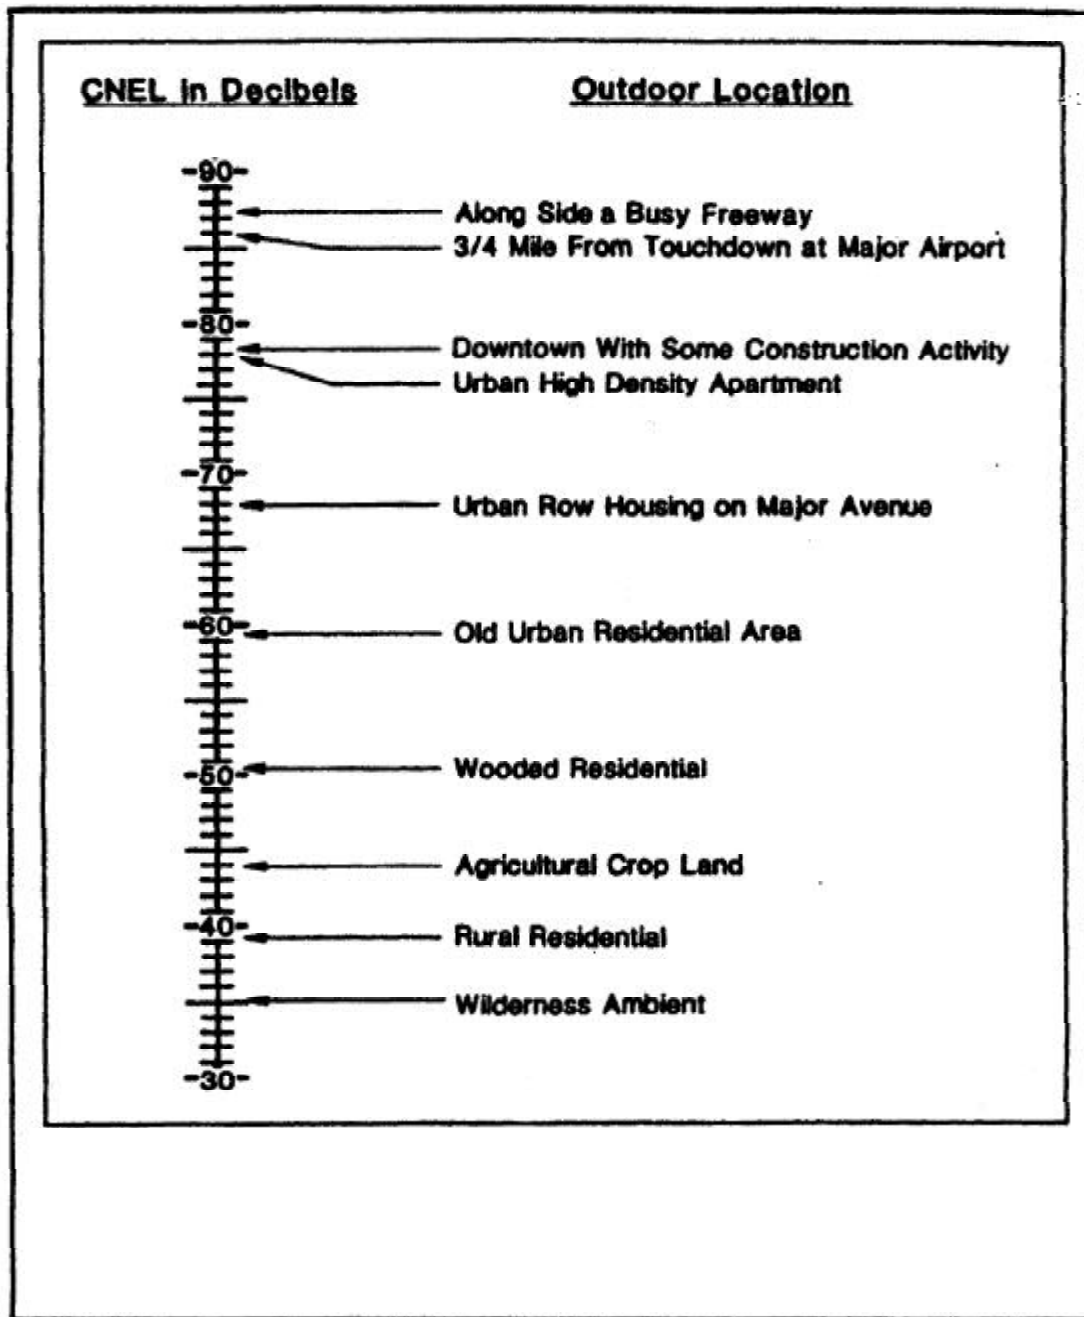

Habitable Room: Any room meeting the requirements of the Uniform Building Code or other applicable regulations which is intended to be used for sleeping, living, cooking, or dining purposes, excluding such enclosed spaces as closets, pantries, bath or toilet rooms, service rooms, connecting corridors, laundries, unfinished attics, foyers, storage spaces, cellars, utility rooms, and similar spaces.

Interior: Spaces that are covered and largely enclosed by walls.

Leq(h): The A-weighted equivalent sound level averaged over a period of "h" hours. An example would be Leq(12) where the equivalent sound level is the average over a specified 12-hour period (such as 7:00 am to 7:00 pm). Typically, time period "h" is defined to match the hours of operation of a given type of use.

Outdoor Living Area: Outdoor living areas is a term used by the County of Orange to define spaces that are associated with residential land uses typically used for passive private recreational activities or other noise-sensitive uses. Such space include patio areas, barbeque areas, Jacuzzi areas, etc. associated with residential uses; outdoor patient recovery or resting areas associated with hospitals, convalescent hospitals, or rest homes, outdoor areas associated with places of worship which have a significant role in services or other noise-sensitive activities; and outdoor school facilities routinely used for education purposes which may be adversely impacted by noise. Outdoor areas usually not included in this definition are: front yard areas, driveways, greenbelts, maintenance areas, and storage areas associated with residential land uses; exterior areas at hospitals that are not used for patient activities; outdoor areas associated with places of worship and principally used for short-term gatherings; and outdoor areas associated with school facilities that are not typically associated with educational uses prone to adverse noise impacts (for example, school play yard areas).

Interpretation

1. Indoor environment excluding bathrooms, toilets, closets and corridors.
2. Outdoor environment limited to private yard of single family; multi-family private patio or balcony which is served by a means of exit from inside; mobile home park; hospital patio; park's picnic area; school's playground; and hotel and motel recreation area.
3. Noise level requirement with closed windows. Mechanical ventilating system or other means of natural ventilation shall be provided as of Chapter 12, Section 1205 of UBC.
4. Noise level requirement with open windows, if they are used to meet natural ventilation requirement.
5. Exterior noise level should be such that interior noise level will not exceed 45 CNEL.
6. Except those areas affected by aircraft noise.

Source: City of Irvine Comprehensive General Plan Noise Element.

Figure 5.4-4
Interior and Exterior Noise Standards
Energy Average (CNEL)

Irvine has also adopted a noise ordinance. The intent of the Irvine Noise Ordinance is to control unnecessary, excessive, and annoying noise from stationary sources within the city limit. The noise level limits are based on the noise zone of the property receiving the noise and are outlined in Table 5.4-6.

**Table 5.4-6
City of Irvine Noise Ordinance Maximum Permissible Noise Levels**

Noise Zone		Period	Permissible Noise Level (dBA) (for a period not exceeding)				
			30 min	15 min	5 min	1 min	0 min
1	Exterior	7 am to 10 pm	55	60	65	70	75
		10 pm to 7 am	50	55	60	65	70
	Interior	7 am to 10 pm	-	-	55	60	65
		10 pm to 7 am	-	-	45	50	55
2	Exterior	Anytime	55	60	65	70	75
	Interior	Anytime	-	-	55	60	65
3	Exterior	Anytime	60	65	70	75	80
	Interior	Anytime	-	-	55	60	65
4	Exterior	Anytime	70	75	80	85	90
	Interior	Anytime	-	-	55	60	65

Noise Zone Designations:

- 1 All hospitals, libraries, churches, schools, and residential properties
- 2 All professional office and public institutional properties.
- 3 All commercial properties excluding professional office properties.
- 4 All industrial properties.

The Irvine Noise Ordinance also specifies construction activities and agricultural operations can only occur between 7:00 am and 7:00 pm Monday through Friday and between 9:00 am and 6:00 pm on Saturday. No construction activities or agricultural operations are permitted outside these hours or on Sundays or federal holidays unless a temporary waiver is requested and granted.

Following annexation to the City the Irvine Noise Ordinance is directly applicable to the project site. All future stationary noise sources associated with the various land use developments within the project site must comply with these regulations. Additionally, all construction activities associated with the development of the project must comply with these regulations.

City of Lake Forest

As mandated by the California Government Code, Lake Forest has adopted a noise element as a component of the Lake Forest General Plan. Lake Forest's interior and exterior noise standards are based on land use compatibility and are shown in Figure 5.4-5. Lake Forest has established a residential noise standard of CNEL 65 dBA for outdoor environments and CNEL 45 dBA for indoor environments. These standards are consistent

INTERIOR AND EXTERIOR NOISE STANDARDS

Land Use	Noise Standards ¹	
	Interior ^{2,3}	Exterior
Residential - Single family, multifamily, duplex, mobile home	CNEL 45 dB	CNEL 65 dB ⁴
Residential - Transient lodging, hotels, motels, nursing homes, hospitals	CNEL 45 dB	CNEL 65 dB ⁴
Private offices, church sanctuaries, libraries, board rooms, conference rooms, theaters, auditoriums, concert halls, meeting halls, etc.	Leq(12) 45 dB(A)	-
Schools	Leq(12) 45 dB(A)	Leq(12) 67 dB(A) ⁵
General offices, reception, clerical, etc.	Leq(12) 50 dB(A)	-
Bank lobby, retail store, restaurant, typing pool, etc.	Leq(12) 55 dB(A)	-
Manufacturing, kitchen, warehousing, etc.	Leq(12) 65 dB(A)	-
Parks, playgrounds	-	CNEL 65 dB ⁵
Golf courses, outdoor spectator sports, amusement parks	-	CNEL 70 dB ⁵

NOTES

1. CNEL: Community Noise Equivalent Level.
Leq(12): The A-weighted equivalent sound level averaged over a 12-hour period (usually the hours of operation).
2. Noise standard with windows closed. Mechanical ventilation shall be provided per UBC requirements to provide a habitable environment.
3. Indoor environment excluding bathrooms, toilets, closets and corridors.
4. Outdoor environment limited to rear yard of single family homes, multifamily patios and balconies (with a depth of 6' or more) and common recreation areas.
5. Outdoor environment limited to playground areas, picnic areas, and other areas of frequent human use.

Source: Lake Forest General Plan Safety and Noise Element.

Figure 5.4-5
Interior and Exterior Noise Standards

with the noise compatibility standards established by Orange County and are applicable to the project for evaluating land use compatibility within Lake Forest.

Lake Forest has also adopted a noise ordinance. The intent of the Lake Forest Noise Ordinance is to ensure that adjacent properties are not exposed to excessive noise from stationary sources (non-transportation) located within the city limits. The ordinance is not applicable to the proposed project.

5.4.1 Environmental Setting

Existing Noise Sources

The existing acoustical environment around the project area is typical of urban and suburban communities. The primary sources of noise throughout the community include both mobile and stationary sources. The mobile sources include the various modes of transportation such as automobiles, trucks, motorcycles, trains, and aircraft. The community locations directly adjacent to the roadways experience noise dominated by vehicles. The project area and locations immediately surrounding the project area currently experience noise from aircraft operations associated with John Wayne Airport and other outlying area airports. As the military mission at the former MCAS El Toro is terminated, no noise from military flight operations associated with the former air station is present.

The project area is dominated by mobile noise sources (i.e., traffic noise from roadways and freeways located near the project area). The project area is located north of the Santa Ana (I-5) Freeway, east of the Eastern Transportation Corridor (SR-133), and south of the Foothill Transportation Corridor (SR-241). Major roadways that border the project area include Barranca Parkway to the south, Sand Canyon Avenue to the west, Portola Parkway and Irvine Boulevard to the north, and Alton Parkway to the east. In addition, the Irvine Transportation Center, a major multi-modal transit center linking bus, commuter rail, and Amtrak rail services, is located along the southern edge of the project area, adjacent to the Southern California Regional Rail Authority (SCRRA) railroad. Passenger train operations at this facility generate noise along the tracks.

Noise emanating from the project area is limited to vehicle noise from security personnel and other limited activities. The Musick Branch Jail generates noise associated with vehicles trips to and from the jail and from stationary sources and activities associated with the jail. The IRWD parcel generates limited noise from the pump equipment. Land uses adjacent to the project area that generate vehicle noise include commercial business, light industry, and agricultural uses.

The stationary sources include the noise associated with the commercial and industrial land uses throughout the community. These stationary noise sources typically include building systems, manufacturing activities, industrial equipment, and entertainment activities. Specifically, the Irvine Spectrum business park and entertainment center is located to the south of the project area, industrial/business parks are located to the east, and agricultural land and a regional park are located to the north. Stationary sources of a temporary nature include construction activities and agricultural operations. Other community noise sources

include the noise from residential sources such as air conditioners, yard care equipment, and outdoor activities.

Ambient Noise Survey

A noise survey was conducted on December 10-12, 2002, to characterize the existing acoustical environment at nearby noise sensitive receptors. Noise measurements were conducted within the residential areas near the project area. Four representative residential locations were identified for long-term measurement and five additional locations were selected for short-term measurement. The locations selected are shown in Figure 5.4-6. Each location was selected to capture the acoustical environment within the residential community. Long-term noise measurements were conducted for a minimum duration of 46 hours and included the hourly equivalent-continuous sound level (L_{eq}); the 90-percentile exceedance sound level (L_{90}); the 50-percentile exceedance sound level (L_{50}); and the 10-percentile exceedance sound level (L_{10}). The short-term measurements were conducted for a minimum of 10 minutes to capture a typical spectrum that is experienced during the daytime. Weather conditions during the measurement period generally included clear skies, light winds, and temperatures ranging from approximately 47°F to 75°F.

The measurement results are detailed in Table 5.4-7 and Figure 5.4-7. Detailed survey results are included in the Noise Technical Report provided in Appendix H of this Final Program EIR. As indicated in Table 5.4-6, the CNEL sound levels at the surveyed residential locations ranged from 58 dBA to 65 dBA. The audible sources included typical suburban sources such as local traffic, distant traffic, birds, aircraft, and human voices. The measured sound levels are typical of suburban residential areas and are compatible with residential areas based on the local standards.

The additional survey results detailed in Figure 5.4-7 provide an indication of the variation in the daily sound levels at each location. As expected, the smallest variations occurred during the nighttime hours when local/neighborhood activities were minimal. During the nighttime hours, the L_{90} and L_{10} sound levels approached equivalent levels. These trends are typical of suburban areas.

Groundborne Noise and Vibration¹

Non-seismic groundborne vibration is generally a concern inside buildings and is rarely perceived as a problem outdoors. Groundborne vibration energy propagates from a source through intervening soil and rock layers to the foundations of nearby buildings, and then throughout the remainder of the structure. Building vibration may be perceived by occupants as motion of building surfaces, rattling of items on shelves or hanging on walls, or as a low-frequency rumbling noise. The rumble noise is caused by the vibrating walls, floors, and ceilings radiating sound waves. In most cases, groundborne noise and vibration is annoying but does not cause damage.

Typical sources of groundborne vibration are construction equipment, trains, and traffic on rough roads. Problems with groundborne vibration and noise from these sources are usually localized to areas within about 100 feet from the vibration source. When roadways are smooth, vibration from traffic, even heavy trucks, is rarely perceptible.

Figure 5.4-6
Measurement Locations for the Long-Term (A-D)
and Short-Term (E-I) Ambient Monitoring Locations
in Irvine and Lake Forest

Not to Scale

Table 5.4-7
Long-term and Short-term Ambient Noise Level Measurements

Noise Monitoring Location		L_{eq} dBA	L_{dn} dBA	L_{den} (CNEL) dBA	Audible Noise Sources
A	Orange Blossom and Tarocco (Irvine)	56 (46 hrs)	58	58	Local traffic, distant traffic, human voices, music from car stereo
B	Columbus and Eastwood (Irvine)	59 (47 hrs)	62	63	Local traffic, distant traffic, occasional small power tools
C	Teed and Roebuck (Lake Forest)	56 (49 hrs)	64	64	Distant traffic, local traffic, electric power tool, birds, distant aircraft, sprinklers
D	Paloma and Vallecito (Lake Forest)	60 (46 hrs)	64	65	Local traffic, distant traffic, barking dog, distant human voices, residential A/C unit
E	Portola east of Culver west of Jeffrey	61 / 63 (10 min)	n/a	n/a	Local traffic, birds
F	Trabuco at MCAS El Toro gate (Cal. St. Fullerton) at SR133	64 / 65 (10 min)	n/a	n/a	Local traffic, distant traffic, agricultural equipment
G	Barranca east of Technology in Irvine Spectrum Bus. Park	66 / 67 (10 min)	n/a	n/a	Local traffic, distant traffic
H	MCAS El Toro Gate 2; Irvine Blvd. west of Alton	58 / 59 (10 min)	n/a	n/a	Traffic, distant agricultural equipment
I	Corner of Alton and Morgan by Residence Inn	65 (10 min)	n/a	n/a	Traffic, small aircraft

Note:

1. Measured hourly L_{eq} , L_{90} , and L_{10} sound levels are shown in Figure 5.4-7 for A, B, C, and D
2. "n/a" denotes not applicable

Figure 5.4-7
Ambient Sound Level Measurements
within Nearby Residential Areas

Physical damage from groundborne vibration is generally limited to construction activities, except in rare cases. Groundborne noise is generally not a problem because noise arriving airborne usually is greater than the associated groundborne noise.

5.4.2 Threshold for Determining Significance

The CEQA Environmental Checklist, Appendix G, outlines the thresholds for determining significance for noise.

Would the project result in:

1. *Exposure of persons to or generation of noise levels in excess of standards established in the local general plan or noise ordinance, or applicable standards established in the local general plan or noise ordinance, or applicable standards of other agencies?*
2. *Exposure of persons to or generation of excessive groundborne vibration or groundborne noise levels?*
3. *Substantial permanent increase in ambient noise levels in the project vicinity above levels existing without the project?*
4. *A substantial temporary or periodic increase in ambient noise levels in the project vicinity above levels existing without the project?*
5. *For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project expose people residing or working in the project area to excessive noise levels?*
6. *For a project within the vicinity of a private airstrip, would the project expose people residing or working in the project area to excessive noise levels?*

5.4.3 Environmental Impact

The Musick Branch Jail and the IRWD parcel are a portion of the annexation component of the proposed project; however, no new development is proposed for these parcels under the proposed project. As a result, implementation of the proposed project will not result in a significant noise quality impact associated with the annexation of the Musick Branch Jail or the IRWD parcel.

Noise impacts on the surrounding areas due to the proposed project can be considered either short-term impacts or long-term impacts. Short-term impacts include those noise impacts due to the construction of the project from initial construction to final build-out. Long-term impacts include those post-construction noise impacts due to the operation and occupancy of the project area after its completion.

Construction Impacts

Threshold 1: Would the project cause exposure of persons to or generation of noise levels in excess of standards established in the local general plan or noise ordinance, or applicable standards established in the local general plan or noise ordinance, or applicable standards of other agencies?

Threshold 4: Would the project cause a substantial temporary or periodic increase in ambient noise levels in the project vicinity above levels existing without the project?

Base Plan and Overlay Plan

The construction phases are scheduled to correspond with the capacity and development of proposed roadways and growth of the surrounding community. Specific construction activities, level of activity, and the location of the construction will continually change throughout the course of project development. Development phasing will result in staggered noise impacts from demolition and construction activities and prevent extensive construction noise at any one time. Early construction will involve demolition and removal of portions of the existing infrastructure including the runways, and construction of the infrastructure backbone.

The proposed project has been designed so that noise-sensitive areas are buffered from noise sources that surround the project area and is compatible with the Irvine General Plan and zoning ordinance. Sensitive receptors are buffered from major transportation corridors and off-project area industrial land uses by areas of commercial land development and open space areas. Also, sensitive receptors will be located away from major noise sources such as the sports park and the OCTA facility, as well as the existing railroad line and the I-5 Freeway. New development under Overlay Plan will be required to comply with all applicable federal, state and local noise regulations as they relate to publicly funded roadway and housing projects, employee safety and noise compatibility. Also, HUD standards must be met if HUD financing is considered for the multi-family residential uses. All commercial uses developed within the project area must comply with the OSHA and CALOSHA noise exposure limits. California Building Standards related to noise will apply to all new hotels, motels, dormitories, long-term care facilities and multi-family housing associated with the Overlay Plan.

Total development of the project is expected to occur over approximately a 20-year period. The construction phases are scheduled to correspond with the capacity and development of the proposed roadways and growth of the community. The specific construction activities, the level of activity, and the location of the construction will continually change throughout the course of the project development. The phasing of development will stagger the noise impacts from demolition and construction activities and prevent extensive construction noise at any one time during the 20-year development period.

The removal of the existing runways will take place during the course of the project. The specific timing of the removal is dependent upon the availability of funding for park improvements as well as the market for the aggregate created. Demolition of the runways will involve breaking up the concrete using up to five tracked breakers, 15 wheel loaders,

and one or two portable on-site crushing plants. The temporary crushing plants will be located remote from the existing noise sensitive areas. Removal of the crushed concrete by heavy truck is anticipated, as the crushed concrete may be sold for use as aggregate for off-project area roadways and other uses. The runway demolition and crushing activities are anticipated to be the noisiest component of construction. The nearest residences are located more than 1 mile from the existing runways.

The construction of the infrastructure will also be scheduled to support the construction schedule for the various proposed developments. Construction of the infrastructure will involve the installation of major sewer lines, water lines, gas lines, and electrical/communication cables, as well as the grading, clearing, and preparing of land. Infrastructure construction will require a variety of large diesel equipment operating at various locations on the site. It is anticipated that four to 20 large pieces of mobile equipment will be operating at various locations on the site at any given time. The nearest off-site residences are located approximately 4,000 feet from the edge of the project area.

Estimated sound levels for typical construction equipment are shown in Table 5.4-8. The outlined sound levels are based on typical equipment sound levels at a distance of 50 feet from the equipment. The main noise producing activities are anticipated to occur primarily during the early phases of construction. Portions of the infrastructure construction activities and runway demolition may occur simultaneously. The sound levels associated with this worst case condition were evaluated at the nearest off-project area residences. The combined sound level was estimated for 20 pieces of large mobile equipment operating at a distance of 5,000 feet, five concrete breakers operating at a distance of 6,000 feet, and two crusher plants operating at a distance of 10,000 feet. These distances represent the closest possible location of the construction equipment to the nearest off-project area residences. Based on these equipment types and quantities, the combined effect of this equipment would result in a sound level of approximately 56 dBA at the nearest off-project area residential locations during a heavy construction period. The construction sound levels will be below this level during most of the construction period. During general project construction, noise emissions are anticipated to be less than the noise emissions from runway demolition and infrastructure construction.

Post-construction Project Impacts

Long-term impacts include those post-construction noise impacts due to the operation and occupancy of the various land uses proposed for the project area. Post-construction noise sources include vehicle traffic generated by the project and stationary sources associated with the project land uses, such as commercial uses, and transportation facility uses. Post-construction noise impacts due to traffic generated by the project can be evaluated quantitatively by utilizing traffic volume studies. However, since the exact type, amount, and location of the project stationary noise sources are undetermined at this time, long-term impacts due to stationary noise sources can only be evaluated qualitatively.

**Table 5.4-8
Typical Noise Levels for Construction Equipment¹**

Type of Equipment	Range of Measured Sound Levels, dBA at 50 feet	Suggested Sound Level for Analysis, dBA at 50 feet
Material-Handling and Transport Equipment: Concrete Batch Plants Vibratory Conveyors Concrete Vibrators Pavers	80 – 85 70 – 80 68 – 81 82 – 92	83 77 78 89
Impact Equipment: Pile Drivers 12000-18000 ft-lb/blow 20000-32000 ft-lb/blow Rock Drills Paving Breakers, Jack Hammers unquieted quieted Pneumatic Tools Temporary Crushing Plant	81 – 96 94 – 107 83 – 99 75 – 85 69 – 77 78 – 88	93 104 96 82 75 85 95 ⁽²⁾
Auxiliary Equipment: Pumps Chain Saws Electric Gas Electric Saws Welders Paging Systems Warning Horns	68 – 80 59 – 69 72 – 88 66 – 72 66 – 75 80 – 92 98 – 102	77 66 85 70 73 89 100

Notes:

1. Based on *Power Plant Construction Noise Guide*, Bolt Beranek and Newman Inc., 1977
2. Sound level based on similar construction equipment

Threshold 1: Would the project cause exposure of persons to or generation of noise levels in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?

Threshold 3: Would the project cause a substantial permanent increase in ambient noise levels in the project vicinity above levels existing without the project?

Base Plan and Overlay Plan

Traffic Noise Analysis Methodology

Under CEQA, consideration must be given to the magnitude of the increase and the existence of noise sensitive receptors in order to determine if the noise increase is a significant adverse environmental effect. Since CEQA does not define the magnitude of a significant increase, other applicable sources must be referenced. In general, a noise level increase of three dB is typically considered just barely perceptible while an increase of five dB is typically considered clearly noticeable. CALTRANS defines a noise increase as substantial when the predicted noise levels with the project exceed the existing noise levels by 12 dB. Additionally, CALTRANS has established a screening procedure that recommends further detailed traffic noise analysis when the ratio of the traffic volumes indicates a noise level increase equal to or greater than three dB. In addition, Lake Forest has recently developed a document titled *CEQA Significance Thresholds Guide* which provides guidance for the preparation of environmental documents. The guide specifies that traffic noise is significant if 1) the project causes a noise increase of three dB or more near a sensitive receptor and 2) the “future with project” noise level exceeds 65 dB CNEL. Therefore, to be conservative, this screening analysis includes further evaluation of any project-related traffic noise level increase greater than 1.5 dB within residential areas.

Base Plan

Traffic Noise Impacts

The Noise Technical Report is provided as Appendix H of this Final Program EIR and lists the changes in traffic noise for the with and without the project for interim years 2007 and 2025 and for build-out year post-2025 in Table B-2. The future traffic noise level change is represented as ten times the logarithm of the ratio of the future traffic volume to the existing traffic volume. The traffic noise change due solely to the project is the difference between the future change with and without the project. A negative change indicates a decrease in the traffic noise level and a positive change indicates an increase in the traffic noise level.

As shown in Table B-2 on the Noise Technical Report (Appendix H), the increase in the traffic noise levels due solely to the project-generated traffic ranges from -4.6 dB to 9.8 dB in the interim year 2007, -10.0 dB to 13.3 dB in the interim year 2025, and -1.7 dB to 13.1 dB in the build-out year post-2025. Specifically, eight roadway segments are predicted to experience a traffic noise level increase greater than 1.5 dB due to the project in either the

interim years 2007 and 2025 or in the build-out year post-2025. These roadway segments include the following.

Year 2007

- ◆ Trabuco Road from Jeffery Road to Sand Canyon Avenue
- ◆ Marine Way
- ◆ Jeronimo Road from Alton Parkway to Bake Parkway
- ◆ Barranca Parkway from Technology Drive to Alton Parkway
- ◆ Rockfield Boulevard from Bake Parkway to Lake Forest Drive
- ◆ Toledo Way from Alton Parkway to Bake Parkway

Year 2025

- ◆ Marine Way
- ◆ Jeronimo Road from Alton Parkway to Bake Parkway
- ◆ Barranca Parkway from Technology Drive to Alton Parkway
- ◆ Post-2025
- ◆ Irvine Boulevard west of Alton Parkway
- ◆ Toledo Way from Alton Parkway to Bake Parkway
- ◆ Barranca Parkway from Technology Drive to Alton Parkway
- ◆ Rockfield Boulevard from Alton Parkway to Bake Parkway
- ◆ Marine Way

Overlay Plan

The increase in the traffic noise levels due solely to the project-generated traffic ranges from -4.6 dB to 9.0 dB in the interim year 2007, -2.8 dB to 13.6 dB in the interim year 2025, and -1.4 dB to 13.4 dB in the build-out year post-2025. Specifically, eight roadway segments listed in Table B-2 are predicted to experience a traffic noise level increase greater than 1.5 dB due to the project in either 2007, 2025, or post-2025. These roadway segments include the following.

Year 2007

- ◆ Barranca Parkway from Technology Drive to Alton Parkway
- ◆ Jeronimo Road from Alton Parkway to Bake Parkway
- ◆ Marine Way
- ◆ Toledo Way from Alton Parkway to Bake Parkway
- ◆ Rockfield Boulevard from Bake Parkway to Lake Forest Drive
- ◆ Trabuco Road from Jeffery Road to Sand Canyon Avenue

Year 2025

Barranca Parkway from Technology Drive to Alton Parkway

- ◆ Marine Way
- ◆ Jeronimo Road from Alton Parkway to Bake Parkway
- ◆ Irvine Boulevard from Research Drive to Alton Parkway

Post-2025

- ◆ Barranca Parkway from Technology Drive to Alton Parkway
- ◆ Marine Way
- ◆ Toledo Way from Alton Parkway to Bake Parkway
- ◆ Irvine Boulevard from Research Drive to Alton Parkway
- ◆ Jeronimo Road from Alton Parkway to Bake Parkway
- ◆ Rockfield Boulevard from Alton Parkway to Bake Parkway

The land uses along these specific roadway segments are identified and listed in Table B-1 based on available land use and zoning maps. As shown, the land uses along all of these roadway segments consist of agricultural, commercial, or industrial uses. In general, most of the operations in these land uses are conducted indoors, and employees and occupants at these sites would not be exposed to traffic noise levels that could pose a nuisance. Agricultural, commercial, and industrial land uses are typically not considered noise sensitive land uses under the local noise elements.

Project Land Uses

Activities associated with the operation and occupancy of the land uses proposed for the project may emit noise to the existing surrounding land uses. The existing surrounding land uses consist of a mixture of commercial, agricultural, and open space. The nearest residential neighborhoods are located approximately one mile west and southwest of the site and approximately one mile east and southeast of the site.

Commercial Uses

Interim and future commercial land uses are anticipated to include retail stores, business offices, entertainment facilities, hotel/overnight accommodations, and other supporting services. Interim industrial uses are anticipated to include warehousing, materials recovery, light manufacturing facilities such as communication equipment manufacturing, electronics manufacturing, furniture manufacturing, and pharmaceutical manufacturing; motion picture studios; printing and publishing businesses. The primary stationary noise sources associated with these uses will be noise from the specific on-site equipment, loading/unloading operations (delivery and shipment of goods), and the operation of HVAC equipment.

Noise from specific HVAC and other equipment will be highly variable and can only be evaluated as individual projects and land uses are developed. Individual commercial and industrial developments must be designed in accordance with the compatibility guidelines set forth in the City of Irvine Noise Element and the regulations set forth in the City of Irvine Noise Ordinance. Noise associated with the commercial and industrial land uses will be less than significant provided appropriate acoustical design features are incorporated to comply with the local regulations. Acoustical design features may include effective sound insulating construction, perimeter barrier walls, acoustical equipment enclosures, and operational restrictions. Additionally, commercial and industrial land uses within the project must comply with the OSHA and CALOSHA worker noise exposure limits in order to protect all workers from hearing damage. Noise mitigation measures required to ensure compliance with OSHA and CALOSHA must be evaluated on a case-by-case basis as each proposed land-use occupies existing spaces or is developed. In general, mitigation measures may

include equipment enclosures, barrier walls, low-noise equipment, hearing-protection devices, or limited worker access.

Cultural/Institutional/Educational Uses

The cultural, institutional, and educational land uses may emit noise to the surrounding community during their use. The noise associated with these uses will vary depending on the specific use, but are likely to include building equipment noise and activity noise. While the cultural/institutional/educational land use areas have been identified for the project, the specific uses and locations will not be known until the properties are purchased and developed. As such, noise from the cultural/institutional/educational uses must be evaluated as the individual properties are developed. Nonetheless, the individual developments must be designed in accordance with the compatibility guidelines set forth in the City of Irvine Noise Element and the regulations set forth in the City of Irvine Noise Ordinance.

Transportation Facilities

The transportation facilities will be constructed along the existing Southern California Regional Rail Authority (SCRAA) corridor in the southern portion of the site and will be integrated with the existing Irvine Transportation Center. The transportation center will include a maintenance center and will serve as a transit hub for bus, rail, and shuttle transportation. The facility will be located along the existing rail line within a light industrial area or transit-oriented development remote from off-site residences. Noise sources associated with the facility will be similar to those currently experienced at the existing Irvine Transportation Center and will include rail traffic, vehicle traffic, and bus traffic. Other sources may include the noise from any stationary equipment associated with the operation of the facility. The actual sound levels from the various facilities will depend on the specific activities and equipment. As such, noise from the proposed transportation facilities must be evaluated as each specific facility is developed. Nonetheless, the facilities must be designed in accordance with the compatibility guidelines set forth in the Irvine Noise Element and the regulations set forth in the Irvine Noise Ordinance.

Threshold 2: Would the project result in exposure of persons to or generation of excessive groundborne vibration or groundborne noise levels?

Base Plan and Overlay Plan

Short-term construction activities may result in groundborne noise and vibration. Since groundborne noise from construction will be less than airborne noise generated from that same construction, mitigation measures to limit construction noise will work to ensure a less-than-significant impact. Furthermore, groundborne noise from construction will be temporary, will cease with construction, and is not expected to be discernable from airborne noise. The impact related to groundborne noise will be less than significant.

Groundborne vibration from construction may in some cases be noticeable and perhaps even result in damage if structures are located adjacent. However, for damage to occur, the source of the vibration will need to be extremely close and powerful. For example, bulldozers and other heavy earth-moving equipment may result in groundborne-vibration-

induced cosmetic damage (e.g. plaster cracks) to sensitive structures (for example, historic buildings) between 25 feet and 50 feet away. No sensitive structures are located at the former MCAS El Toro (refer to Section 5.11), and heavy construction equipment is not expected to be concentrated for longer periods of time within close proximity to structures.

Extremely close blasting and impact pile driving are the primary sources of damage from groundborne vibration. In this case, such activities may occur during the demolition of runways. These operations will take place far from any habitable structure, and impact will be less than significant. Nuisance vibration from other construction-related groundborne vibration will be temporary, and therefore, less than significant.

Post-construction (long term) groundborne noise and vibration results primarily from trains and vehicular traffic (and in particular, truck traffic) on uneven roads. Annoyance and damage from these sources is very rare, except at extremely close distances. Again, groundborne noise is almost always drowned out by the corresponding airborne noise, and impact will be less than significant. All roads on the project site will be constructed and maintained to acceptable standards such that the impact of groundborne vibration from traffic on adjacent streets will be less than significant.

The proposed project site is located adjacent to the SCRRA railroad tracks. Vibration from trains can result in annoyance at sensitive uses, such as residences, within approximately 50ft to 100ft of the track. Groundborne vibration increases if the tracks are not maintained adequately or there is extensive switching infrastructure imbedded in the track. Structural damage from train-induced groundborne vibration is rare, except at extremely close distances to the track (substantially closer than 25 feet). Groundborne vibration will be limited adjacent to these tracks because they are relatively straight in this stretch and switching equipment is rare. Irvine and the SCRRA require setbacks to its tracks to ensure that, among other things, groundborne vibration-induced damage is limited. The impact will be less than significant.

Threshold 5: For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project expose people residing or working in the project area to excessive noise levels?

Base Plan and Overlay Plan

The proposed project is a non-aviation alternative for the former MCAS El Toro site. Flight activities on the site have ceased. No public airport, public use airport, or airport land use plan is located in the vicinity. No impact will result.

Threshold 6: For a project within the vicinity of a private airstrip, would the project expose people residing or working in the project area to excessive noise levels?

Base Plan and Overlay Plan

The project is not in the vicinity of any private airstrip. No impact will result.

Off-Project Area Noise Impacts

Noise impacts on the proposed project site can be considered either short-term impacts or long-term impacts. Short-term impacts include those noise impacts due to the construction of the project from initial construction to final build-out. Long-term impacts include those noise impacts on the project itself due to the surrounding community and the proposed project land uses.

Construction Project Impacts

Short-term impacts include those noise impacts due to the construction of the project from initial construction to final build-out.

Base Plan and Overlay Plan

Project Construction

The noisiest construction activities will include demolition of the existing runways and construction of the infrastructure. Project site construction will continue throughout the development of the overall project area. The construction activities of the on-going development may cause some short-term noise within the residential areas.

In the Overlay Plan, the residential areas are proposed just south of the intersection of College Road and Irvine Boulevard as well as along the east side of Irvine Boulevard just west of the Habitat Preserve. The specific construction equipment, the level of activity, and the location of the construction activities are not known at this time. However, the cumulative construction sound level was conservatively estimated for the worst possible case where approximately 20 pieces of large mobile equipment, five concrete breakers, and two crusher plants are operating at a distance of approximately 600 feet from the nearest residential area. This represents the demolition of the north end of the runways. Based on these equipment types and quantities, the combined effect of this equipment would result in a sound level of approximately 70 dBA at the nearest on-site residential locations during a typical heavy construction period. As mentioned, this applies to a situation that includes residential occupancy of the project site during heavy construction (i.e., runway demolition). During the general construction periods that are anticipated to follow the initial heavy construction period, the construction sound levels are anticipated to be below this level and of short-term duration.

Construction activities must be conducted in accordance with the Irvine Noise Ordinance. The Irvine Noise Ordinance does not specify a limit on construction noise levels but does specify that construction activities only occur between 7:00 am and 7:00 pm Monday through Friday and between 9:00 am and 6:00 pm on Saturday. No construction activities are permitted outside these hours or on Sundays or federal holidays unless a temporary waiver is requested and granted.

Post-construction Project Impacts

Long-term impacts include those noise impacts due to the operation and occupancy of the various land uses proposed for the project site. Long-term noise sources include vehicle traffic within the project and stationary sources associated with the land uses within and surrounding the project.

Base Plan and Overlay Plan

Traffic Noise

The proposed land uses within the project site will be exposed to noise from project generated traffic and non-project related traffic. As discussed, the Base Plan does not include any noise sensitive receptors, such as residences. Therefore, the traffic noise associated with the Base Plan would not impact any on-site noise sensitive receptors. The Overlay Plan, however, includes limited low-density and medium density residential areas along Irvine Boulevard and College Road. The traffic noise impact on the residences within the project should be evaluated during the detailed design of the residential areas to determine the specific required setback or mitigation necessary to comply with the local limit of CNEL 65 dBA. However, for preliminary purposes, the traffic noise impacts on the residences within the project were evaluated to determine an estimated setback necessary to comply with the local limit. The methodology used to estimate the traffic noise levels is based on the FHWA Highway Traffic Noise Prediction Model. The model uses traffic volume, vehicle mix, vehicle speed, and roadway geometry to estimate traffic noise level. The California reference energy mean emission levels were used for each vehicle type as required by CALTRANS. Urban Crossroads, Inc. provided the traffic volumes. The mix and hourly traffic flow distribution were based on those specified by the Orange County Environmental Management Agency. The roadway geometries were based on preliminary roadway information detailed in previous reuse plans due to the lack of roadway information in the current Great Park Plan.

Preliminary estimates indicate that the residences along Irvine Boulevard must include a setback of approximately 1540 feet from the edge of the road right-of-way (ROW) in order to comply with the local compatibility standard of maximum allowable CNEL 65 dBA. This setback is based on an estimated ROW width of 160 feet, a vehicle speed of 65 mph, flat terrain, and no roadside barrier walls. It is anticipated that this setback distance is prohibitive with respect to economical development of the residential areas. Therefore, if residences will be located closer than this distance, measures to reduce traffic noise would need to be implemented, which would occur through compliance with existing City regulations in the City's noise ordinance.

Preliminary estimates also indicate that the residences along College Road must include a setback of approximately 110 feet from the ROW in order to comply with the local compatibility standard of maximum allowable CNEL 65 dBA. This setback based on an estimated ROW width of 120 feet, a vehicle speed of 45 mph, flat terrain, and no roadside barrier walls. If residences will be located closer than this distance, measures to reduce traffic noise would need to be implemented which would occur through compliance with existing City regulations in the City's noise ordinance.

Surrounding Land Uses

Noise from land uses within and surrounding the project site may cause impacts on noise sensitive land uses within the project site. Noise sensitive land uses within the project include low and medium density residences (proposed in the Overlay Plan only). The project site has been arranged such that residential areas within the project are buffered from noise producing areas within the project. In addition, the residential areas within the project are located remotely from the off-site commercial and industrial areas that would be considered incompatible with the residential areas.

All land uses within the project must be designed and developed in accordance with the compatibility guidelines set forth in the Irvine Noise Element and the regulations set forth in the Irvine Noise Ordinance. Additionally, the noise sensitive land uses may be subject to the Noise Insulation Standards in the California Building Standards.

Project Land Uses

Noise from land uses within the project site may cause impacts on noise sensitive land uses within the project site. Noise sensitive land uses within the project include low and medium density residences. The commercial developments within the project may impact noise sensitive land uses within the project site.

Aircraft Noise

The project site is located approximately 7 miles from the John Wayne Airport. The project site is well outside the current and future CNEL 60 dBA contour associated with the aircraft operations at John Wayne Airport. Although distant aircraft operations may, on occasion, be discernible on-site, the noise impact due to aircraft associated with John Wayne Airport will not exceed the local noise compatibility standards for residential land uses and will be less than significant.

The project site is also located approximately seven miles from the MCAS Tustin. There will be no impacts on the project due to the fact that aircraft operations at the former MCAS Tustin ceased with base closure as of July 1999.

5.4.4 Significant Impacts

Base Plan and Overlay Plan

No significant noise impact has been identified.

5.4.5 Mitigation Measures

Base Plan and Overlay Plan

No mitigation measure is proposed, as no significant noise impact has been identified.

5.4.6 Significance of Impacts After Mitigation

Base Plan and Overlay Plan

Not applicable.

5.5 Public Health and Safety

5.5.1 Environmental Setting

Hazardous Materials and Wastes

Former MCAS El Toro (PAs 51 and 30)

The operation of facilities located in PA 51 (the former MCAS El Toro) historically included many involving the use, storage, transfer, and disposal of hazardous materials. The following discussion summarizes information from the Base Realignment and Closure Business Plan for MCAS El Toro dated May 2002 and other relevant sources. This information is subject to periodic change as additional information is generated from cleanup programs and activities that are being planned for or are in progress. This information may be found at the MCAS El Toro Information Repository Collection located both at the Heritage Park Regional Library in Irvine, California and at the former MCAS El Toro in the Administrative Record.

The military mission at the MCAS El Toro commenced towards the end of World War II and concluded with the closure of the air station in 1999. During the approximate 55 years of military operation, air station activities, the operation and maintenance of military aircraft and automotive vehicles, required the use of a large variety of hazardous materials. These hazardous materials consisted of petroleum-based products such as aviation and vehicular fuels, engine and lubricating oils, solvents, cleaners, paints, thinners, pesticides and herbicides; chlorinated/halogenated compounds, including trichloroethylene (TCE) and polychlorinated biphenyls (PCB); some radioactive materials; ordnance munitions; and propellants. Use of these materials typically involves the generation of hazardous byproducts and waste. A risk of explosion is associated with some of these materials. Oil-water separators (OWS) were located throughout the former air station at various facility locations. Wastewater from aircraft wash areas and vehicle wash racks passed through OWSs to the sanitary sewer and storm drainage systems. Materials recovered from the OWSs were handled as hazardous wastes. Fuel storage areas also generated hazardous wastes when fuel storage tanks were cleaned and sludge pumped out or when fueling/de-fueling or loading/unloading operations resulted in spills. Storage areas were located throughout the former air station and held hazardous, flammable, and unused chemical material and wastes. Ordnance munitions were used, handled, stored, and disposed of in PA 51. Pesticides and herbicides historically were used at the former air station to control rodents, vectors, and weeds as well as on agricultural parcels leased to farming operations. PCB transformers were in use throughout the former air station.

Many of the existing buildings and facilities may contain hazardous building materials such as asbestos-containing building materials (ACM) and lead-based paint (LBP). Asbestos is associated with respiratory ailments, including cancer, caused by inhaled asbestos fibers and gastro-intestinal disease associated with ingestion. Friable (brittle or readily crumbled) ACM is more readily released into the air than non-friable ACM. These hazardous building materials were in common use prior to 1980 when many of the structures were built on PA

51. Lead is known to have adverse effects on the human body, particularly in children. Exposure is usually through ingestion and inhalation.

Prior to the transfer or sale of any portion of the former MCAS El Toro site containing ACM, the DON must document all available information concerning ACMs, including the following:

- The type, location and condition of ACMs
- The results of any asbestos testing
- Description of asbestos control measures taken, if any
- The costs or time necessary to remove existing ACMs
- The results of any site-specific asbestos inventory updates

Existing source of ACMs are not required to be remediated unless they present an immediate threat to human health or are otherwise not in compliance with applicable regulations at the time of transfer. This is generally limited to friable asbestos in accessible locations. The DON policy is to not remove or otherwise abate asbestos hazards if remediation is otherwise required when all of the following conditions are met:

- The building is scheduled for demolition by the transferee
- The transfer documents specifically prohibit use and occupation of the building prior to demolition
- The transferee has assumed the responsibility to manage the ACMs in accordance with all applicable regulatory requirements

Certain LBP abatement and hazard disclosure requirements must be complied with prior to the transfer of the former MCAS El Toro site from federal responsibility. Housing units constructed prior to 1960 must be abated of LBP and LBP hazards. The presence of LBP and LBP hazards must be disclosed for housing units constructed between 1960 and 1978. Occupation of housing units scheduled for demolition due to the presence of LBP or LBP hazards is prohibited. Post-demolition sampling and response actions for any hazards due to lead in soil shall be conducted, consistent with regulatory requirements, prior to the occupancy of any newly constructed housing units to ensure public health and safety. Remediation of existing sources of LBPs is not required in certain circumstances:

- The building is scheduled for demolition by the transferee and the property transfer document specifically prohibits occupation of the units
- The building is scheduled for non-residential use
- The building is scheduled for residential use and the transferee agrees to comply with all LBP hazard abatement activities in accordance with applicable regulatory requirements

Many of the existing public streets in the project vicinity were probably used by vehicles transporting hazardous materials and wastes to and from PA 51 and the region resulting in the potential for hazardous spills. Rail cars on the railroad tracks may also have transported hazardous materials. Hazardous materials were also transported on-site by pipeline (jet fuel and natural gas). There is an existing fuel pipeline in the railroad right-of-way along the southern boundary of the site. A preliminary investigation into the potential presence of hazardous materials associated with the railroad is being conducted.

Environmental Regulations Affecting MCAS El Toro

In 1975, the DOD initiated a pilot program to investigate past disposal sites at military installations. In 1980, the Installation Restoration Program (IRP) was established to identify and remediate hazardous contamination sites that originated at military installations. IRP sites are sources of environmental contamination that are either within the boundaries of the installation or originated on the installation and subsequently migrated off-site. The IRP has three phases. The first phase was an Initial Assessment Study (IAS) to identify disposal sites and contaminated areas through record searches, on-site surveys, and employee interviews. The second phase consisted of a confirmation study to verify and characterize contamination and rank sites for priority of cleanup. The last phase was the identification, development and implementation of remedial measures to remove the contamination and/or restore the sites to acceptable conditions. The intent of these IRP actions was to protect human health and safety, and the environment. The IRP is an “in-house” program managed by DOD with the participation of state regulatory agencies as appropriate.

As the IRP only addresses contaminated sites that are within federal jurisdiction, it does not include a public review and comment process or independent third party review. At the former MCAS El Toro, the IRP sites are those covered by the Comprehensive Environmental Response, Liability and Cleanup Act (CERCLA). The 1980 “Superfund” legislation and subsequent amendments to CERCLA created a national framework for the identification and cleanup of contaminated sites, provided standards and financial assistance for site cleanups and imposed liability on parties responsible for such contamination.

The Resource Conservation and Recovery Act (RCRA), adopted in 1976, provides the basic framework for federal regulation of hazardous waste. The California Department of Toxic Substances Control (DTSC) is authorized to implement the State hazardous waste program in lieu of federal RCRA regulations. RCRA provides for “cradle-to-grave” regulation of hazardous wastes including generation, treatment, transportation, and disposal. RCRA sites at the project area consist of temporary accumulation areas (TAA) and solid waste management units (SWMU). Sites that are contaminated with petroleum products, which are not federally regulated, are not covered by the IRP or RCRA, but are managed by state agencies.

On the former MCAS El Toro, RCRA addresses existing and former hazardous waste storage and management facilities, while CERCLA addresses the release of hazardous materials and hazardous waste. There are both RCRA and CERCLA sites located on the project area. The DTSC manages implementation of RCRA, while the EPA manages the implementation of CERCLA. Sites are ranked using a Hazard Ranking System (HRS). Under CERCLA the EPA established a National Priorities List (NPL) for the expenditure of cleanup funds for contaminated sites ranked most hazardous by the HRS. The former MCAS El Toro was officially placed on the NPL Federal Section in February 1990.

Site Evaluation and Risk Assessment Methods

The site evaluation and cleanup method(s) selection under CERCLA is generally referred to as the Remedial Investigation and Feasibility Study process (RI/FS). The RI covers site assessment activities under which lead agencies evaluate the nature and extent of site contamination, general site conditions, and begin to identify possible cleanup methods. Considerations for remedial action objectives are provided in 40 Code of Federal

Regulations section 300.430(e)(2)(i), and states that remedial actions selected must attain a degree of cleanup and control further releases which, at a minimum, assures protection of human health and the environment. In the FS process, comprehensive cleanup options are developed and evaluated to select alternatives. Permanent solutions are preferred as opposed to mere containment or re-disposal of contaminated materials. The EPA and individual states approve cleanup plans, including cleanup standards, in a formal document called the Record of Decision (ROD). Final cleanups should reduce contamination to levels that meet Clean Water Act and Safe Drinking Water Act standards as well as potentially more stringent Applicable or Relevant and Appropriate Requirements (ARAR) standards.

All IRP sites on military installations follow the comprehensive, step-by-step CERCLA RI/FS process. Although some sites may require interim remedial actions, permanent cleanup follows the signing of a ROD. For evaluated sites that are determined to not have any contamination or have insignificant levels of contamination, no feasibility study is conducted and the process is completed with a No Further Action ROD. Some sites may require the implementation of interim remedial actions.

As lead agency, the DON is responsible for the establishment of cleanup goals. The DON's approach to the project site has been to evaluate and identify remediation strategies that allow for unrestricted use of as much of the land and resources as possible. The City of Irvine requested and received from the DON its policy regarding potential land-use control strategies that may be employed on specific IRP sites; this policy is outlined in a letter from the DON to the City of Irvine dated November 29, 2000 and is kept on file with the City of Irvine and the DON's Administrative Record. During the initial screening process for potential environmental contamination the DON may make use of the EPA's preliminary remediation goals (PRG) to protect human health. However, PRGs are not always applicable to a particular site and do not address non-human health endpoints such as ecological impacts (e.g., impacts to groundwater resources).

Base Realignment and Closure Cleanup Plan

In March 1993, the former MCAS El Toro was listed for closure by the Base Realignment and Closure Act (BRAC III). DON established a BRAC Cleanup Team (BCT) to manage and coordinate closure activities and to prepare a BRAC Cleanup Plan (BCP) for the former MCAS El Toro. The BCT is also the decision-making body for the level and methodology of remediation. The BCT includes representatives from DON, EPA, DTSC, and the Santa Ana Regional Water Quality Control Board.

The scope of the BCP considers the following regulatory mechanisms:

- BRAC III
- National Environmental Policy Act
- RCRA
- CERCLA, as amended by the Superfund Amendments and Reauthorization Act (SARA), and the Community Environmental Response Facilitation Act (CERFA)
- Other applicable state and local laws

The BCP objectives of the environmental restoration program for MCAS El Toro are as follows:

- Expedite and improve environmental response actions to facilitate the disposal and reuse of the site
- Protect human health and the environment
- Comply with existing federal, state, and local statutes and regulations
- Conduct IRP activities in a manner consistent with Section 120 of CERCLA as amended by SARA
- Meet the provisions of the Federal Facilities Agreement (FFA)
- Continue efforts to identify potentially contaminated areas
- Establish priorities for environmental restoration-related compliance activities so that property disposal and reuse goals can be met
- Design schedules and cost estimate costs for performing remedial activities for IRP sites and compliance program issues
- Identify and map area suitable for transfer by deed/lease and areas unsuitable for transfer by deed

The BCP for the former MCAS El Toro describes the current status of environmental restoration and compliance programs. The first BCP was issued in 1994 and is updated annually with the latest version being released in May 2002. The current BCP outlines 866 locations of concern, including IRP sites, TAAs, SWMUs, underground storage tanks (UST), and aboveground storage tanks (AST), targeted for remediation. The programs outlined in the BCP support the environmental restoration of the site and its disposal and reuse. The BCP describes active remediation sites, the status of other studies and assessments being conducted, and other on-going compliance-related programs. Remediation is on-going and required by the DON even though the military mission at the former MCAS El Toro has been terminated. The BCP emphasizes expedited remedial actions rather than lengthy site characterization studies and prolonged RI/FS activities. Several methods are used to streamline and accelerate cleanup of the former MCAS El Toro. Presumptive remedies use preferred technologies developed for common categories of waste sites to ensure consistency in remedy selection and reduce time and cleanup costs at appropriate sites. Currently accepted presumptive remedies exist for volatile organic compounds (VOC) and municipal and military landfills. Other strategies for streamlining cleanup include overlapping phases and a commitment to partnership amongst the BCT.

Environmental Restoration Programs at MCAS El Toro

An environmental baseline survey (EBS) was conducted in 1995 for the purpose of identifying which properties on the former MCAS El Toro were eligible for transfer or sale as uncontaminated. This study also provided information regarding the general environmental status of other structures, facilities and other properties on the former MCAS El Toro site. In preparation for transfer of available land, the DON has updated its 1995 EBS with an April 2003 Draft Final EBS. The April 2003 Draft Final EBS represents the most relevant evaluation of continuing remediation efforts undertaken by the DON. The updated EBS has identified 76 new potential release locations, all of which require further evaluation for potential releases to the environment and subsequent remediation, if required. The April 2003 Draft Final EBS catalogs the types of sites and distinguishes between those that require no further action, those that require further evaluation, those that require implementation of response actions, and those that require completion of on-going response actions. The DON will not transfer fee title to the property of the former MCAS El Toro until the parcels have been remediated to acceptable exposure levels; property not meeting acceptable exposure levels will not transfer or may be transferred to private control through a lease in furtherance of conveyance until remediation is complete. The April 2003 Draft Final EBS

concludes that of the 3,738-acres of former MCAS El Toro property expected to become available for transfer, approximately 84 percent are environmentally suitable for transfer of fee title at the present time. The DON evaluated potential soil contamination adjacent to and underneath certain runway extensions; no evidence of significant levels of contamination exists in these areas. The updated EBS also concludes that widespread unidentified contamination is not likely to exist at the former MCAS El Toro.

The DON is required to complete all necessary remedial actions before the fee title to the former MCAS El Toro is transferred from federal ownership. However, even after the title is transferred the federal government is required to conduct further remediation if additional contamination caused by DON actions is discovered or of a remedy fails to perform adequately. Federal law also provides that the DON may be required to indemnify the new owners or certain other parties for liabilities arising from claims of personal injury or property damage resulting from the release or threatened release of any hazardous substances, pollutants or contaminants, or petroleum or petroleum derivatives attributable to DON actions on military installations.

Installation Restoration Program

The IRP was authorized in 1984 for the former MCAS El Toro and the Initial Report was completed in 1986 outlining hazardous remediation needs. The IRP identified 24 sites (Sites 1-22, 24, and 25) for investigation at the former MCAS El Toro. The IRP sites are now divided into two categories: No Further Action sites and Action Required sites. As of September 1997, ten No Further Action sites were identified, following EPA guidance. These sites are 4, 6, 7, 9, 10, 13, 14, 15, 19, 20, 21, 22 and 25. The Action Required sites are shown on Figure 5.5-1, Installation Restoration Program Sites.

A number of IRP sites are under various stages of remedial investigation and/or cleanup. The six IRP sites that have the highest priority are Sites 18 and 24 (VOC groundwater and soil contamination) and landfill Sites 2, 3, 5, and 17. A presumptive remedy is being used for the vadose zone of the VOC source area (Site 24). Presumptive remedies are being considered for the landfill sites (Sites 2, 3, 5, and 17).

VOC Sites 24 (Soil-Source) and 18 (Groundwater-Regional). The two most wide spread contamination problems are Sites 18 and 24. Aircraft and support vehicle maintenance utilizing industrial solvents was conducted at Site 24 (potential VOC source area) from the mid-1940s to the mid-1970s. Solvents, including trichloroethylene, (TCE) and other VOCs were used for degreasing parts, painting, stripping, and aircraft and vehicular washing. Site 18 is a VOC plume caused by VOC contaminants leaching from Site 24 through the subsurface soils (vadose zone) into the shallow aquifer and then to the deeper aquifer, which flows generally to the northwest. Site 18 currently extends roughly from Site 24 down-gradient approximately three miles (west and northwest) into the City of Irvine.

Remediation for the sites is a two-step process. Soil remediation of Site 24 by soil vapor extraction (SVE) was planned to prevent or significantly minimize further impact to the

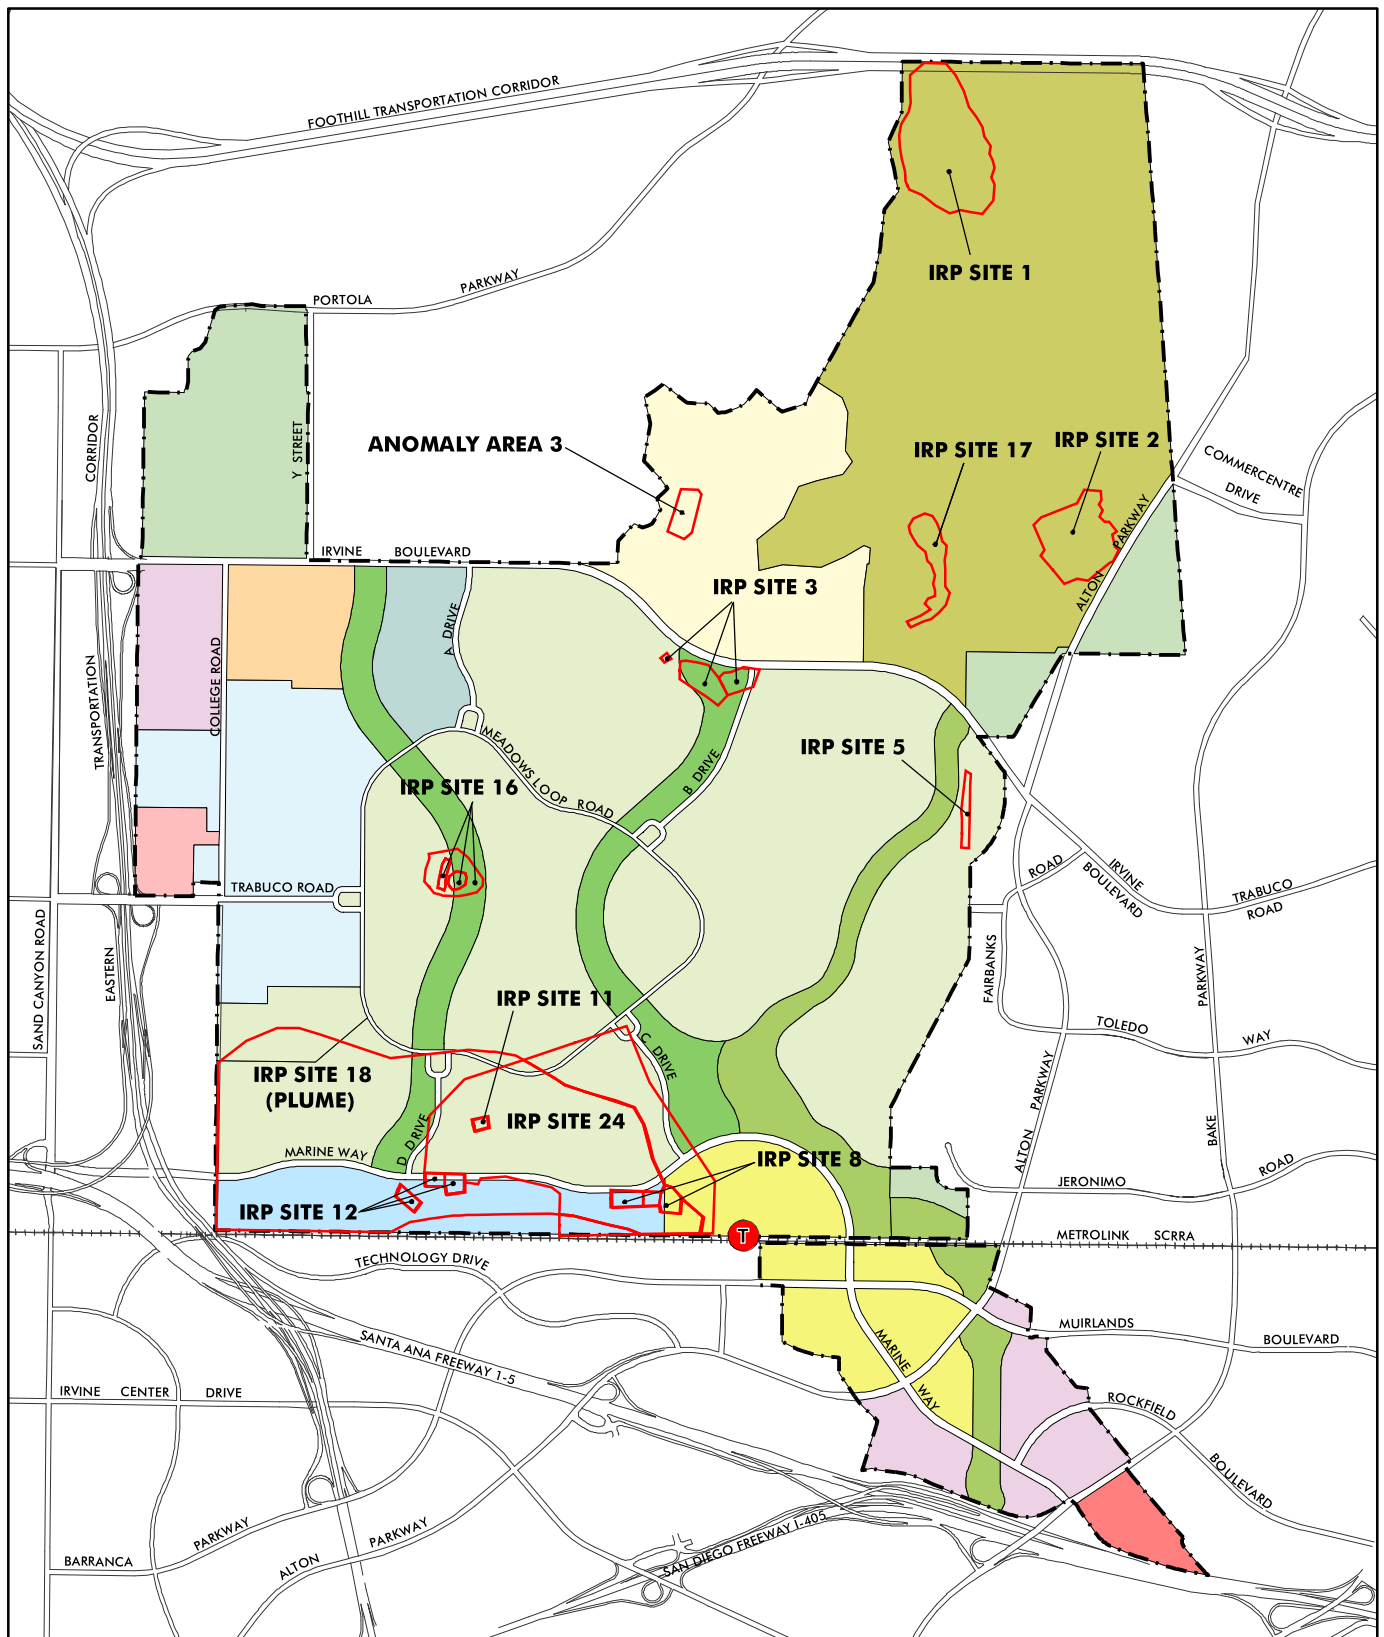

Figure 5.5-1
Installation Restoration
Program Sites

groundwater. Following the signing of the interim ROD for Site 24 in 1997, SVE treatment commenced in 1999. Testing of the vadose zone was completed in 2000 and a draft closure report was issued in 2001. For Site 18, the DON, the Orange County Water District (OCWD), and the Irvine Ranch Water District (IRWD) negotiated an agreement to construct and operate a joint water supply treatment project to remove contaminants from the groundwater to levels acceptable to the regulatory agencies (the Irvine Desalter Project).

In addition to the interim ROD for the contaminated soil of Site 24, a final ROD for groundwater contamination at Sites 18 and 24 was signed in June 2002. Please refer to the *Final Record of Decision, Operable Unit 1, Site 18 – Regional Volatile Organic Compound Groundwater Plume, Operable Unit 2A, Site 24 – VOC Source Area, Former MCAS El Toro, California* (Bechtel National, Inc. 2002a) for additional information. The draft ROD for Sites 3 and 5 was issued in March 1999. The draft final ROD will be issued following evaluation of the results from radiological survey/sampling. Please refer to the *Draft ROD, Operable Unit 2C, Landfill Sites 3 and 5, MCAS El Toro, California* (Bechtel National, Inc. 1999) for additional information.

Landfill Sites 2, 3, 5, and 17. IRP Site 2 (Magazine Road Landfill) operated between 1950 and 1980. It is believed to contain inert solid waste, municipal solid waste, unspecified industrial wastes, lead batteries, transformers, household refuse, hydraulic fluid, unspecified waste fuels, crankcase oil, lead-based paint residues, and scrap metal. IRP Site 3 (Original Landfill) covers approximately 20 acres and operated between 1943 and 1955. It is believed to contain municipal solid waste, scrap metal, incinerator ash, construction debris, paint residues, unspecified oily wastes, industrial solvents, hydraulic fluid and engine coolants. IRP Site 5 (Perimeter Landfill) operated between 1955 and the late-1960s, covers approximately 1.5 acres, and contains municipal solid waste, solvents and cleaning fluids, scrap metals, paint residues, and unspecified oil and fuel wastes. The draft version of the ROD for Sites 3 and 5 was issued in March 1999. The draft final ROD will be issued following evaluation of the results from radiological survey/sampling. Please refer to the *Draft ROD, Operable Unit 2C, Landfill Sites 3 and 5, MCAS El Toro, California* (Bechtel National, Inc. 1999) for additional information.

Site 17 (Communication Station Landfill) operated between 1981 and 1993. It contains cooking grease, oils, fuels, and municipal debris. Initially, the presumptive remedy for these landfill sites of capping with a soil cover (and a flexible membrane for several of the landfills) plus institutional controls and long-term groundwater monitoring was proposed by the DON and taken into consideration by CALEPA and EPA. Recently, the issue of potential presence of radioactive materials in the landfills resulting from the disposal of radium paint residues was identified in the Historical Radiological Assessment (HRA) report. As a result, the DON conducted site specific radiological investigations for the presence of radioactive materials. A final report is expected in 2003. Until this issue is appropriately resolved, the proposed remedy and the associated ROD are held in abeyance until the presence or non-presence of these materials can be confirmed. An interim ROD was signed in July 2000 for Sites 2 and 17 to allow for the design of the landfill caps to proceed. However, construction of the landfill caps will not proceed until radiological survey/sampling is complete and the data have been evaluated to determine potential impact on the remedial design. Please refer to the *Final Interim ROD, Operable Unit 2B, Landfill Sites 2 and 17, MCAS El Toro, California* (Bechtel National, Inc. 2000) for additional information.

Sites 8, 11, and 12. IRP Site 8 is the Defense Reutilization and Marketing Office (DRMO) Storage Yard where PCB-containing transformer fluids were released. It operated from the

mid-1970s to early 1999. PCB-containing transformers were stored at IRP Site 11 (the Transformer Storage Area) between 1968 and 1983. Wastewater sludge was spread on land at two locations adjacent to IRP Site 12 (Sludge Drying Beds) from 1943 to 1972. Site 12 also includes former sewage and industrial wastewater treatment plant sites. The HRA Report also identified IRP Sites 8 and 12 as potentially associated with the storage or disposal of radium paint residues. According to information in the HRA Report, IRP Site 8 may have received empty radium paint containers and debris from the demolition of the Radium Paint Shop at Building 296 for temporary storage waiting for disposal. IRP Site 12 may have received sludge contaminated with Radium 226 from the sanitary sewage treatment plant as resulting from the disposal of radium paint to the sanitary sewer system. Originally, the draft proposed plan for remediation of these sites recommended remedial actions for excavation of shallow soil contamination. This plan is now in abeyance until the issue is resolved by a radiological investigation to be conducted by DON.

Sites 7, 14, and 16. Kerosene-based jet fuel (JP-5) and lubrication oils were rinsed from aircraft drop tanks at IRP Site 7 (Drop tank Drainage Area No. 2) from 1969 to 1983. IRP Site 14 (Battery Acid Disposal Area) was used for disposal of vehicle battery acid, lubrication oils and paint residue between 1977 and 1983. Aviation fuels (JP-5, AVGAS), chlorinated solvents, hydraulic fluid, crankcase oil, white phosphorus, magnesium phosphate, and napalm were burned in unlined pits for fire training at IRP Site 16 (Crash Crew Pit No. 2) from 1972 to 1985. A Phase I Remedial Investigation was conducted for these three sites. A No Action ROD was signed for Sites 7 and 14 in 2001. Due to TCE contamination in groundwater at Site 16, the DON is completing a RI/FS to determine the appropriate remedial action that will likely include multi-phase extraction to remove contaminants from soil and groundwater simultaneously.

Site 7, Drop Tank Drainage Area No.2, and Site 14, Battery Acid Disposal Area, received concurrence for no further action in the final ROD signed in June 2001. Please refer to the *Final ROD, Operable Unit 3B, No Action Sites 7 and 14, MCAS El Toro, California* (Bechtel National, Inc. 2001) for additional information. Monitored natural attenuation is the selected remediation procedure for Site 16. A ROD is being prepared to document the selected remediation process. Please refer to the *Proposed Plan for Site 16, Crash Crew Training Pit No.2 at MCAS El Toro* (Bechtel National, Inc 2002b) for additional information.

Site 1 – Explosive Ordnance Disposal Range. The Explosive Ordnance Disposal (EOD) Range, located in the habitat preserve area, is currently inactive. The site was used for the disposal of excess and/or defective ordnance. Hazardous materials including sulfur trioxide, chlorosulfonic acid, and perchlorate, have been associated with the site. Post closure status of the range has not yet been determined. It may be closed by the DON under CERCLA, transferred to another federal, state, or local agency, or continue to be used as an EOD facility by law enforcement agency(s). The DON operations at the site were terminated by the DTSC in mid-1999 for operating a non-permitted disposal facility. As such, formal closures activities conducted by the DON are anticipated to begin in the near future. Currently, if a public agency desires to re-open the site as an EOD facility, then that agency will be required to prepare an application for and receive a Part B Permit from the DTSC to operate it as a treatment, storage and disposal facility. The Department of Justice is considering retaining this site as an EOD range. The DON is in the process of completing a remedial investigation to determine the nature and extent of contamination at Site 1. Please refer to the *Final Work Plan, Phase II Remedial Investigation, IRP Site 1, Explosive Ordnance Disposal Range, MCAS El Toro, California* (Earth Tech, Inc. 2001) for additional information.

Resource Conservation and Recovery Act Facility Assessment

A RCRA Facility Assessment (RFA) was conducted for the former MCAS El Toro between 1990 and 1993. The purpose of the RFA was to identify SWMUs and TAAs where there was an actual, or potential for, release of hazardous waste into the environment, and whether further actions might be required. The RFA was finalized on May 31, 1996. It presents results, recommendations and closure strategies for SWMUs and TAAs. Some of these sites are incorporated in the IRP; others are handled under alternative regulatory procedures. The RCRA sites must meet current environmental compliance requirements. The State of California considers any site from which hazardous constituents may migrate to be a SWMU, but corrective action can be addressed through the Federal Facilities Agreement for the former MCAS El Toro or responses to petroleum releases with oversight provided by the Regional Water Quality Control Board.

Compliance Program Sites and Other Locations of Concern

A number of compliance programs are in effect at the former MCAS El Toro that involve different types of locations of concern including USTs, less-than 90-day accumulation areas, PCB transformers, and OWSs. Many of these facilities were used to support current operations on the former air station.

A storage tank assessment was conducted at former MCAS El Toro to address compliance and closure issues related to UST/AST. The April 2003 Draft Final EBS provides the most recent and comprehensive assessment of the status of storage tanks at the former MCAS El Toro. The Orange County Health Care Agency (OCHCA) oversees tank closure and ensures that the proper locations are sampled when tanks are removed. The Santa Ana Regional Water Quality Control Board (SARWQCB) oversees site assessments, site remediation, and groundwater remediation associated with releases of hazardous substances from USTs. Based on the April 2003 Draft Final EBS, a total of 404 USTs were in use at the former air station. Of these USTs, 357 have been remediated and have received findings of “no further action” from the appropriate regulatory authority. Of a total of 39 ASTs used in support of the military mission at the former MCAS El Toro, 36 have been remediated and received “findings of no further action.”

The DTSC states that the former MCAS El Toro contains two hazardous waste management units (HWMU). The HWMUs include a hazardous waste container storage area and open burn/open detonation (OB/OD) hazardous waste treatment unit. A hazardous waste facility permit (a RCRA-equivalent permit) to operate the hazardous waste container storage area designated as Building 673-T3 was issued in August 1993 by the DTSC. The permit allowed the storage of hazardous wastes for longer than 90-days in Building 673-T3. In March 1996, the closure certification report was accepted by the DTSC and the container storage area was considered closed.

James A. Musick Jail Facility (Portion of PA 35)

Existing environmental issues consist of transformers installed prior to 1978 which may contain PCBs, soils containing agricultural pesticides, buildings containing ACMs, an underground storage tank, six 55-gallon drums, a small oil pump, and the storage and use of solvents on-site. EIR 654 concludes that there are no hazardous materials issues on-site.

IRWD Parcel (Portion of PA 35)

No significant hazardous material has been identified on this parcel.

Emergency Plans

The former MCAS El Toro (PA 51 and 30) is a potential emergency response staging area in the event of a large regional catastrophe such as a severe earthquake because of its capacity for processing and storing large quantities of cargo. The County of Orange, in coordination with all other local jurisdictions and emergency service providers in the County, is responsible for the preparation, maintenance, and implementation of emergency response plans and emergency evacuation plans for the County. The “Orange County Emergency Plan” is the official emergency plan for the County. The Plan is a basic reference and training document for emergency preparedness, response, recovery, mitigation, and provides the authority and basis for the development of more detailed departmental and functional standard operating procedures. This plan was recently revised to incorporate the standardized emergency management system (SEMS) established by the Governor’s Office of Emergency Services (OES). The SEMS standardizes the response to emergencies involving multiple jurisdictions or agencies.

Wildland Fires

Former MCAS El Toro (PAs 51 and 30)

The former MCAS El Toro is not identified as a high or very high fire hazard zone in the Safety Element of the Orange County General Plan. However, the area northeast of the project area is identified as a high fire hazard area in the Orange County’s Safety Element. This area is adjacent to the proposed habitat preserve and has the same coastal sage scrub plant community and topography as the habitat preserve. The habitat preserve has the same high fire hazard level. The existing housing in the northeastern part of PA 51 has a higher fire hazard risk than other portions of the former air station because of the numerous eucalyptus trees which increase the fire hazard and the potential for wildland fires associated with the adjacent coastal sage scrub plant community adjacent to the housing area.

James A. Musick Jail Facility (Portion of PA 35)

The jail facility is not identified as a high fire severity zone in the Safety Element of the City of Irvine General Plan.

IRWD Parcel (Portion of PA 35)

The IRWD parcel is not identified as a high fire severity zone in the Safety Element of the City of Irvine General Plan.

5.5.2 Threshold For Determining Significance

The CEQA Environmental Checklist, Appendix G outlines the thresholds for determining significance for public health and safety.

Would the project:

1. *Create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials?*
2. *Create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment?*
3. *Emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school?*
4. *Be located on a site, which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, create a significant hazard to the public or the environment?*
5. *For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, result in a safety hazard for people residing or working in the project area?*
6. *For a project within the vicinity of a private airstrip, result in a safety hazard for people residing or working in the project area?*
7. *Impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan?*
8. *Expose people or structures to a significant risk of loss, injury or death involving wildland fires, including where wildlands are adjacent to urbanized areas or where residences are intermixed with wildlands?*

5.5.3 Environmental Impact

The following analysis focuses on the potential public health and safety impacts associated with implementation of the Base Plan and the Overlay Plan for the former MCAS El Toro (PAS 51 and 30). The Musick Branch Jail and the IRWD parcels are a portion of the annexation component of the proposed project; however, no new development is proposed for these parcels under the proposed project. As a result, implementation of the proposed project will not result in a significant public health and safety impact associated with the annexation of the James A. Musick Jail Facility and the IRWD Parcel.

The potential for adverse impacts in the form of human exposure to unsafe levels of hazardous contaminants may occur if cleanup standards applied to site remediation activities are not appropriate for the proposed land uses. These impacts are most likely to occur in areas where recreational, or mixed land uses are proposed. Under CERCLA, contaminated federal property cannot be transferred until all necessary remedial actions have been taken or a remediation system is operating properly and successfully. Cleanup responsibility remains with the DOD until the property is fully remediated. Therefore, some of the former air station property cannot be transferred immediately.

There are 9 recommended federal conveyances for the former air station property at this time. The proposed project accommodates the transfer of the 995-acre Habitat Preserve to the Federal Aviation Administration (FAA). Other conveyances, such as property transfers for transitional housing or warehouse facilities, may not be implemented until appropriate remediation has been completed. The construction and operation of the proposed project could result in an impact related to public health and safety as described below. Any reuse of the former MCAS El Toro may involve the use, storage, handling and/or disposal of hazardous materials or waste, all of which will be subject to all applicable federal, state, and local environmental regulations.

Threshold 1. Would the project create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials?

Base Plan and Overlay Plan

There is a potential project impact resulting from the routine transport of hazardous materials on the proposed streets in the project area. This same potential impact exists for all freeways, local streets, and railroad tracks in the project vicinity, surrounding areas, and the region. However, federal and state regulations strictly control the design and size of transport vehicles, the training of vehicle operators, the types and quantities of materials that can be transported, the documentation of the material from its source to its destination, and procedures in the event of an accidental spill. In addition, California Department of Transportation, the California Highway Patrol, and local law enforcement and fire authorities are trained in emergency response procedures for safely responding to accidental spills of hazardous and toxic substances.

Many of the proposed land uses such as the recreational/cultural/open spaces, and sports park are not likely to use and store substantial quantities of hazardous materials other than typical materials such as cleaners and relatively small amounts of paints and thinners, fuels and oil, pesticide and other chemicals used for building and/or grounds maintenance. Other proposed uses such as golf courses, agriculture, auto center parking, educational, and research and development may store, handle and use hazardous materials and generate hazardous waste. However, business activities or facilities will be required to comply with all regulatory requirements and permit conditions administered by applicable federal, state and local regulatory agencies with jurisdiction over hazardous material storage and use and hazardous waste management.

The proposed project is not expected to result in a significant adverse impact related to the transport, use, or disposal of hazardous materials on or through the project area. Therefore, no mitigation is required.

Threshold 2. Would the project create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment?

Base Plan and Overlay Plan

Asbestos-Containing Building Materials and Lead-Based Paint

Prior to the transfer or sale of any portion of the former MCAS El Toro site containing ACMs, the DON must document all available information concerning ACMs, including the following:

- The type, location and condition of ACMs
- The results of any asbestos testing
- Description of asbestos control measures taken, if any
- The costs or time necessary to remove existing ACMs
- The results of any site-specific asbestos inventory updates

Existing source of ACMs are not required to be remediated unless they present an immediate threat to human health or are otherwise not in compliance with applicable regulations at the time of transfer. Where remediation may otherwise be required, it is the DON policy to not remediate asbestos if all of the following conditions are met:

- The building is scheduled for demolition by the transferee
- The transfer documents specifically prohibit use and occupation of the building prior to demolition
- The transferee has assumed the responsibility to manage the ACMs in accordance with all applicable regulatory requirements

Certain LBP abatement and hazard disclosure requirements must be complied with prior to the transfer of the former MCAS El Toro site from federal responsibility. Housing units constructed prior to 1960 must be abated of LBP and LBP hazards. The presence of LBP and LBP hazards must be disclosed for housing units constructed between 1960 and 1978. Occupation of housing units scheduled for demolition due to the presence of LBP or LBP hazards is prohibited. Post-demolition sampling and response actions for any hazards due to lead in soil shall be conducted, consistent with regulatory requirements, prior to the occupancy of any newly constructed housing units to ensure public health and safety. Remediation of existing sources of LBPs is not required if the following conditions are met:

- The building is scheduled for demolition by the transferee and the property transfer document specifically prohibits occupation of the units
- The building is scheduled for non-residential use
- The building is scheduled for residential use and the transferee agrees to comply with all LBP hazard abatement activities in accordance with applicable regulatory requirements

Construction activities involving demolition and possible substantial remodeling of existing structures in the project area as the project area develops could result in the disturbance of structures and/or soils containing ACMs or LBPs. This is considered a significant impact. A total of 161 non-residential buildings on the site are known to contain ACMs, 52 of which have friable ACMs. There are 233 non-residential buildings that have not been surveyed for the presence of ACMs. Some residential units were also found to contain ACMs.

The DON policy states that any facility on the former MCAS El Toro site constructed, repaired or maintained prior to 1980 is assumed to contain LBP. Approximately 670 units on the former air station in three residential communities have “high” LBP levels according to hazardous risk assessment criteria. They are the Moffet Meadows/Saddleback Terrace housing built in 1964, the Wherry Housing built in 1954, and the Saddleback Terrace/Vista Terrace housing built in 1947. In addition, there are 450 non-residential structures constructed prior to 1980 that are assumed to have LBP.

All non-residential construction projects of five or more acres require the project proponent to seek coverage under the National Pollutant Discharge Elimination System (NPDES) General Construction Storm Water Discharge Permit. This coverage requires a Storm Water Pollution Prevention Plan (SWPPP), which identifies all materials storage areas and construction vehicle/equipment staging areas and any other areas where hazardous materials are used and stored. The SWPPP must include Best Management Practices (BMP) to ensure that unauthorized discharges of hazardous materials do not drain into stormdrains or natural drainages during construction.

Major grading and/or land altering actions may result in the disturbance of previously unidentified contaminated soils that could expose construction workers to contamination. Proper management actions and regulatory compliance, including implementing a hazardous materials management plan for construction activities, testing if soils are suspected of containing contaminants, and reporting findings to regulatory agencies, will minimize potential impact from such occurrences.

There is also a potential impact associated with accidental releases of stored hazardous materials such as fuels and paint and potential leakage associated with construction equipment parking and staging areas. However, construction activities are also required to comply with all regulatory requirements and permit conditions administered by appropriate federal, state, and local regulatory agencies.

Remediation efforts at IRP Sites 18 and 24 could result in some releases of VOCs into the environment. According to the South Coast Air Quality Management District (SCAQMD), air emissions from vapor extraction activities typically generate one to two percent (by weight) of the volatile constituent after controls such as oxidation and carbon adsorption. The individual VOC emissions from the site remediation activities do not pose a significant impact on the air quality of the region. Implementation of mitigation measures such as site watering to control fugitive dust emissions during construction as described in Section 5.3 of this Final Program EIR will reduce the potential impacts of construction-related releases to below a level of significance. No significant long-term impacts associated with the release of hazardous materials into the environment are anticipated as a result of the proposed project.

Threshold 3. *Would the project emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school?*

Base Plan and Overlay Plan

A regional educational campus is planned on the west side of the former MCAS El Toro site. The campus could support both corporate and public educational and training facilities (research and development) with ancillary retail, lodging and housing uses. These facilities will likely store, use and transport some hazardous materials as well as generate some hazardous waste. Typical hazardous materials/waste will likely consist of, but not be limited: oils and petroleum products, paints, solvents, pesticides and herbicides, and VOC air emissions. These substances are regulated and controlled through federal, state and local regulations governing the storage, handling, transportation and manifesting of hazardous materials and wastes. None of these hazardous materials are considered atypical for research and development purposes, and should not represent a significant risk to people residing and working within one-quarter mile of the proposed project area. Therefore, the proposed project is not anticipated to result in a significant impact related to hazardous emissions or materials within one-quarter mile of a proposed school. This issue is not considered a significant impact.

Threshold 4. *Would the project be located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, create a significant hazard to the public or the environment?*

Base Plan

The proposed project will result in substantial changes to the existing land uses on the project area. While much of the air station contamination was evaluated and assessed prior to the advent of the current proposed project, adopted cleanup standards contemplated a wide variety of uses for IRP sites. Some contaminated sites are located in areas proposed for land uses including recreational, research and development, transportation, and open space/park.

Under CERCLA, contaminated federal property cannot be transferred until all necessary remedial actions have been initiated or a remediation system is operating properly and successfully. Remediation efforts have been ongoing since 1985. As established by BRAC III, the DON will continue its environmental restoration activities after installation disposal. Sites that require continuing monitoring and remediation will receive continuing investigation/remediation beyond installation closure, which occurred in July 1999.

The DON considered the “No Further Action” IRP Sites 4, 6, 9, 10, 13, 19, and 22 to be available for unrestricted uses, which would include the proposed recreational and multi-use activities. No significant impacts are associated with these sites.

The “Action Required” IRP sites are superimposed on Figure 5.5-1. Zoning districts of the Base Plan in relation to “Action Required” IRP sites are shown in Table 5.5-2. The environmental impacts of these sites are analyzed in the following sections.

Sites 18 and 24 (VOC Contamination)

Remediation of contaminated soils at IRP Site 24, the VOC Source Area, began in spring 1999 and was completed in 2001. IRP Site 24 is located in zoning districts categorized as 6.1 Institutional and 1.5 Recreation. The DON's human health risk assessment for Site 24 indicates that neither a recreational or institutional land use of the proposed site would result in a higher than acceptable risk. The DON, however, intends to remediate the existing contamination of the shallow groundwater at Site 24 to an unrestricted standard. This remediation process will likely take multiple years to complete and during this time the DON is likely to implement various institutional controls that will limit access to groundwater and related activities to portions of Site 24. Consequently, the temporary restricted use/access of Site 24 due to institutional controls (not contamination) is considered a significant impact.

IRP Site 18, VOC Groundwater Contamination Plume, is a plume of TCE extending below the ground surface into the aquifer system off-site of the former air station. This contamination does not impact the existing and proposed land uses on the project area.

Sites 2, 3, 5, and 17 (Landfills)

All of the landfill sites will be managed with institutional controls that prevent unauthorized access, degradation, access to groundwater, and irrigation of the site. The controls may also limit use and access by providing a buffer zone around the landfills. Issues relating specifically to IRP Sites 2, 3, 5, and 17 (landfills), including settling, are not expected to constrain proposed land uses within the project area. Possible exposure issues in regard to the potential presence of radioactive materials in the landfills resulting from the disposal of radium paint residues were identified in the HRA report. As a result, the DON is conducting site specific radiological investigations for the presence of radioactive materials. Until this issue is appropriately resolved, the proposed remedy and the associated RODs are held in abeyance by the regulatory agencies until the presence or non-presence of these materials can be confirmed.

IRP Sites 2 (Magazine Road Landfill) and 17 (Communications Station Landfills) are located in the proposed zoning district designated as 1.4 Preservation. Notwithstanding any potential changes resulting from the above mentioned radiological investigation, the proposed presumptive remedy for landfills at the former MCAS El Toro is the installation of an impermeable layer with a soil cap. This remedy will not result in any impact to the habitat preserve and is not considered a significant impact.

Table 5.5-1
Zoning Districts of No Further Action IRP Sites – Base Plan

IRP Site	IRP Site Description	Zoning District
4	Ferrocene Spill Area	1.5 Recreation
6	Drop Tank Drainage Area No. 1	1.5 Recreation
9	Crash Crew Pit No. 1	1.5 Recreation
10	Petroleum Disposal Area	1.5 Recreation
13	Oil Change Area	1.5 Recreation
15	Suspended Fuel Tanks	1.5 Recreation
19	Aircraft Expeditionary Refueling	1.5 Recreation
20	Hobby Shop	1.5 Recreation
21	Materials Management Group	6.1 Institutional
22	Tactical Air Fuel Dispensing System	1.5 Recreational

Sources: Cotton/Bridges/Associates 2002.

Table 5.5-2
Zoning Districts of Action Required IRP Sites – Base Plan

IRP Site	IRP Site Description	Zoning District
1	EOD Range	1.4 Preservation
2	Magazine Road landfill	1.4 Preservation
3	Original Landfill	1.5 Recreation
5	Perimeter Road Landfill	1.5 Recreation
7	Drop Tank Drainage Area No. 2	1.5 Recreation
8	DRMO Storage Yard	6.1 Institutional
11	Transformer Storage Area	1.5 Recreation
12	Sludge Drying Beds	6.1 Institutional
14	Battery Acid Disposal Area	1.5 Recreation
16	Crash Crew Pit No. 2	1.5 Recreation
17	Communications Station Landfill	1.4 Preservation
24	VOC Source Area	6.1 Institutional/ 1.5 Recreation

Source: Cotton/Bridges/Associates 2002.

IRP Site 3 (Original Landfill) is located in the proposed zoning district designated as 1.5 Recreation. As stated above, notwithstanding any potential changes resulting from the above radiological investigation, the proposed presumptive remedy for landfills at former MCAS El Toro is the installation of an impermeable flexible membrane with a soil cap. Due to the use of institutional controls, Site 3 and a possible buffer site surrounding it will not be available for immediate reuse activity. Apart from restricted access to the site by unauthorized parties, no impacts from contamination following implementation of the proposed remediation are likely to occur. The restricted use of Site 3 due to institutional controls (not contamination) is considered a significant impact.

IRP Site 5 (Perimeter Road Landfill) is located in the proposed zoning district designated as 1.5 Recreation. Notwithstanding any potential changes resulting from the radiological investigation, the proposed presumptive remedy for landfills at former MCAS El Toro is the installation of an impermeable flexible membrane with a soil cap. It is likely that this issue will not result in a significant impact to the habitat preserve/wildlife corridor.

Site 8

IRP Site 8 is located in zoning district designations 6.1 Institutional. As mentioned previously, information in the HRA Report indicates that IRP Site 8 may have received empty radium paint containers and debris from the demolition of the Radium Paint Shop at Building 296 for temporary storage awaiting disposal. The draft proposed plan for remediation of this site recommended excavation and proper disposal of shallow soil contamination. This plan is now in abeyance until the radiological issue is successfully resolved following completion of the radiological investigation that will be conducted by the DON. The DON intends to convey the site as suitable for unrestricted use. Therefore, no significant impacts are associated with this site.

Sites 11 and 12

IRP Site 11 (Transformer Storage Area) is located in a zoning district designation 1.5 Recreation and Site 12 (Sludge Drying beds) is located in a zoning district designation 6.1 Institutional. Site 12 may have received sludge contaminated with Radium 226 from the sanitary sewage treatment plant resulting from the disposal of radium paint to the sanitary sewer system. The draft proposed plan for remediation of these sites recommended excavation and proper disposal of shallow soil contamination. This plan is also in abeyance until the radiological issue is successfully resolved following completion of the radiological investigation that will be conducted by the DON. No significant impact is expected to result from remediation activities on Site 12, withstanding any potential changes that may result from the radiological investigation. Site 11 is located in 1.5 Recreation. The DON intends to convey the site as suitable for unrestricted use. Therefore, no significant impacts are associated with this site.

Sites 7, 14, and 16

IRP Site 7 (Drop Tank Drainage) is located in zoning district designations 1.5 Recreation. The DON intends to convey the site as suitable for unrestricted use. Therefore, no significant impacts are associated with this site.

IRP Site 14 (Battery Acid Disposal Area) is located in zoning district designation 1.5 Recreation. The DON intends to convey the site as suitable for unrestricted use. Therefore, no significant impacts are associated with this site.

IRP Site 16 (Crash Crew Pit No. 2) is located in zoning district designation 1.5 Recreation. Because of the potential risks associated with the existing groundwater contamination, the DON may restrict use of the site until the groundwater is remediated to an appropriate risk level, at which time the site would be released for unrestricted use. This remediation process will likely take multiple years to complete, and during this time various institutional controls will be implemented to limit certain activities and unauthorized access to the site.

Consequently, the temporary restricted use/access of Site 16 due to institutional controls (not contamination) is considered a significant impact.

Site 1

IRP Site 1 (EOD Range) is located in zoning district designation 1.4 Preservation. Post closure status of the EOD Range has not been determined. It could be closed by the DON under CERCLA, transferred to another federal, state or local agency, or continue to be used as an EOD facility. If a government agency desires to use the site as an EOD facility, then a RCRA Part B Permit would be required from CALEPA and the DTSC. In this circumstance, an independent remedial investigation outside of the current CERCLA program would be required as well as an independent cleanup, as appropriate. If this circumstance does not materialize, then remediation of the site will remain within current CERCLA program requirements. No significant impact is expected from the remediation of Site 1.

Anomaly Area 3

Anomaly Area 3 is an approximately 9-acre site located in the northwest section of the project area near Pusan Way and adjacent to Agua Chinon wash in zoning district designation 1.5 Recreation. This site is considered a former refuse disposal area for construction debris. To date, the DON has conducted a geophysical investigation, exploratory trenching, radiological screening, and installed monitoring wells and vadose zone wells. Preliminary results indicate buried metallic and construction debris, along with plastics, asbestos, pipes, wood and concrete. Radiological readings in the soil were at or below background levels. Some groundwater samples exceeded the maximum contaminant levels and are subject to further investigation. Soil levels for arsenic, total petroleum hydrocarbons, lead, and benzopyrene exceed industrial and residential PRGs. Investigation of the site is ongoing and no decisions about remediation have been made to date. If the DON remediates consistent with unrestricted use there will be no significant impacts. Otherwise, if the DON adopts a remediation strategy that includes institution controls, there would be a significant impact.

Due to the use of institutional controls, Anomaly Area 3 and a possible buffer site surrounding it will not be available for immediate reuse activity. Apart from restricted access to the site by unauthorized parties, no impacts from contamination following implementation of the proposed remediation are likely to occur. The restricted use of Anomaly Area 3 due to institutional controls (not contamination) is considered a significant impact.

Jet Fuel Distribution System

The Norwalk Pipeline was used as a jet fuel distribution system in support of the military mission at the former MCAS El Toro. The pipeline originates in Norwalk, California, enters the project area near the existing commissary located adjacent to Irvine Boulevard, and runs through the former air station housing to the former storage tank facilities. In May 1999, all the jet fuel was purged from the pipeline from Norwalk to the installation using a pigging process and replaced with an inert gas (nitrogen). The Defense Energy Support Center (DESC) currently maintains the pipeline. The presence of the pipeline containing inert material is considered a less than significant impact.

Overlay Plan

“Further Action” IRP sites are superimposed on the Figure 5.5-1. Zoning districts of the Overlay Plan in relation to “No Further Action” IRP sites are shown in Table 5.5-3. The DON intends to convey the “No Further Action” IRP Sites 4, 6, 9, 10, 13, 19, and 22 as suitable for unrestricted use. Therefore, there are no significant impacts associated with these sites.

Table 5.5-3
Zoning Districts of No Further Action IRP Sites – Overlay Plan

IRP Site	IRP Site Description	Zoning District
4	Ferrocene Spill Area	4.4 Commercial Recreation
6	Drop Tank Drainage Area No. 1	2.2 Low-Density Residential with 1.8 Golf Course Overlay
9	Crash Crew Pit No. 1	1.5 Recreation
10	Petroleum Disposal Area	1.5 Recreation
13	Oil Change Area	1.5 Recreation
15	Suspended Fuel Tanks	1.5 Recreation
19	Aircraft Expeditionary Refueling	2.2 Low-Density Residential with 1.8 Golf Course Overlay
20	Hobby Shop	2.3 Medium Density Residential
21	Materials Management Group	6.1 Institutional
22	Tactical Air Fuel Dispensing System	1.5 Recreational

Sources: Cotton/Bridges/Associates 2002.

The “Action Required” IRP sites are superimposed on Figure 5.5-1. Zoning districts of the Overlay Plan in relation to “Action Required” IRP sites are shown in Table 5.5-4.

Table 5.5-4
Zoning Districts of Action Required IRP Sites – Overlay Plan

IRP Site	IRP Site Description	Zoning District
1	EOD Range	1.4 Preservation
2	Magazine Road landfill	1.4 Preservation
3	Original Landfill	1.5 Recreation/ 2.2 Low-Density Residential with 1.8 Golf Course Overlay
5	Perimeter Road Landfill	1.5 Recreation
7	Drop Tank Drainage Area No. 2	1.5 Recreation
8	DRMO Storage Yard	6.1 Institutional/ 3.2 Transit Oriented Development
11	Transformer Storage Area	1.5 Recreation
12	Sludge Drying Beds	6.1 Institutional
14	Battery Acid Disposal Area	1.5 Recreation
16	Crash Crew Pit No. 2	1.5 Recreation
17	Communications Station Landfill	1.4 Preservation
24	VOC Source Area	6.1 Institutional/ 1.5 Recreation/ 3.2 Transit Oriented Development

Source: Cotton/Bridges/Associates 2002.

The environmental impacts of the “Action Required” sites are analyzed in the sections that follow.

Sites 18 and 24 (VOC Contamination)

Remediation of contaminated soils at IRP Site 24, the VOC Source Area, began in spring 1999 and was completed in 2001. IRP Site 24 is located in zoning districts categorized as 6.1 Institutional and 1.5 Recreation. The DON’s human health risk assessment for Site 24 indicates that neither a recreational or institutional land use of the proposed site would result in a higher than acceptable risk. The DON, however, intends to remediate the existing contamination of the shallow groundwater at Site 24 to an unrestricted standard. This remediation process will likely take a period of years to complete and during this time the DON is likely to implement institutional controls that will limit access to groundwater and related activities to portions of Site 24. Consequently, the temporary restrictions on Site 24 due to institutional controls (not contamination) are considered a significant impact.

IRP Site 18, VOC Groundwater Contamination Plume, is a plume of TCE extending below the ground surface into the aquifer system off-site of the former air station. This contamination does not impact the existing and proposed land uses on the project area.

Sites 2, 3, 5, and 17 (Landfills)

Issues relating to IRP Sites 2, 3, 5, and 17 (landfills), including settling are not expected to constrain proposed land uses within the project area. Possible exposure issues in regard to the potential presence of radioactive materials in the landfills resulting from the disposal of radium paint residues were identified in the HRA report. As a result, the DON is conducting

site specific radiological investigations for the presence of radioactive materials. Until this issue is appropriately resolved, the proposed remedy and the associated RODs are held in abeyance by the regulatory agencies until the presence or non-presence of these materials can be confirmed.

IRP Sites 2 (Magazine Road Landfill) and 17 (Communications Station Landfills) are located in the proposed zoning district designated as 1.4 Preservation. Notwithstanding any potential changes resulting from the above mentioned radiological investigation, the proposed presumptive remedy for landfills at the former MCAS El Toro is the installation of an impermeable layer with a soil cap with the use of institutional controls. This remedy will not result in any impact to the habitat preserve and is not considered a significant impact.

IRP Site 3 (Original Landfill) is located in the proposed zoning district designated as 1.5 Recreation. As stated above, notwithstanding any potential changes resulting from the above radiological investigation, the proposed presumptive remedy for landfills at former MCAS El Toro is the installation of an impermeable flexible membrane with a soil cap. Due to the use of institutional controls, Site 3 and a possible buffer site surrounding it will not be available for immediate reuse activity. Apart from restricted access to the site by unauthorized parties, no impacts from contamination following implementation of the proposed remediation are likely to occur. The restricted use of Site 3 due to institutional controls (not contamination) is considered a significant impact.

IRP Site 5 (Perimeter Road Landfill) is located in the proposed zoning district designated as 1.5 Recreation. Notwithstanding any potential changes resulting from the radiological investigation, the proposed remedy for landfills at former MCAS El Toro is the installation of an impermeable flexible membrane with a soil cap, along with institutional controls. It is likely that this issue will not result in a significant impact to the habitat preserve/wildlife corridor.

Site 8

IRP Site 8 is located in zoning district designations 6.1 Institutional and 3.2 Transit Oriented Development. As mentioned previously, information in the HRA Report indicates that IRP Site 8 may have received empty radium paint containers and debris from the demolition of the Radium Paint Shop at Building 296 for temporary storage awaiting disposal. The draft proposed plan for remediation of this site recommended the excavation and proper disposal of shallow soil contamination. This plan is now in abeyance until the radiological issue is successfully resolved following completion of the radiological investigation that will be conducted by the DON. Withstanding any potential changes resulting from the radiological investigation, the proposed presumptive remedy for Site 8 is excavation and removal of the contaminated soil. As the DON intends to convey the suit as suitable for unrestricted use, there would be no significant impact associated with this site.

Sites 11 and 12

IRP Site 11 (Transformer Storage Area) is located in a zoning district designation 1.5 Recreation and Site 12 (Sludge Drying beds) is located in a zoning district designation 6.1 Institutional. Site 12 may have received sludge contaminated with Radium 226 from the sanitary sewage treatment plant resulting from the disposal of radium paint to the sanitary sewer system. The draft proposed plan for remediation of these sites recommended the

excavation and proper disposal of shallow soil contamination. This plan is also in abeyance until the radiological issue is successfully resolved following completion of the radiological investigation that will be conducted by the DON. No significant impact is expected to result from remediation activities on Site 12 because industrial standards are adequate for this land use, withstanding any potential changes that may result from the radiological investigation. Site 11 is located in 1.5 Recreation. As the DON intends to convey the site as suitable for unrestricted use, there is no significant impact associated with this site.

Sites 7, 14, and 16

IRP Site 7 (Drop Tank Drainage) is located in zoning district designations 1.5 Recreation. As the DON intends to convey the site as suitable for unrestricted use, there is no significant impact associated with the site.

IRP Site 14 (Battery Acid Disposal Area) is located in zoning district designation 1.5 Recreation. As the DON intends to convey the site as suitable for unrestricted use, there is no significant impact associated with the site.

IRP Site 16 (Crash Crew Pit No. 2) is located in zoning district designation 1.5 Recreation. Because of the potential risks associated with the existing groundwater contamination, the DON may restrict use of the site until the groundwater is remediated to an appropriate risk level, at which time the site would be released for unrestricted use. This remediation process will likely take multiple years to complete, and during this time various institutional controls will be implemented to limit certain activities and unauthorized access to the site. Consequently, the temporary restricted use/access of Site 16 due to institutional controls (not contamination) is considered a significant impact.

Site 1

IRP Site 1 (EOD Range) is located in zoning district designation 1.4 Preservation. Post closure status of the EOD Range has not been determined, although it is intended to be retained by the Federal government. It could be closed by the DON under CERCLA, transferred to another agency, or continue to be used as an EOD facility. If a government agency desires to use the site as an EOD facility, then a RCRA Part B Permit would be required from CALEPA and the DTSC. In this circumstance, an independent remedial investigation outside of the current CERCLA program would be required as well as an independent cleanup, as appropriate. If this circumstance does not materialize, then remediation of the site will remain within current CERCLA program requirements. The DON's remedial investigation and feasibility studies are ongoing. Pending resolution of the site status and the outcome of the RI/FS process, remediation is expected to be consistent with the land use designation and the potential reuse activities. Therefore, no significant impact is expected.

Anomaly Area 3

Anomaly Area 3 is an approximately 9-acre site located in the northwest section of the project area near Pusan Way and adjacent to Agua Chinon wash in zoning district designation 2.2 Low Density Residential. This site is considered a former refuse disposal area for construction debris. To date, the DON has conducted a geophysical investigation, exploratory trenching, radiological screening, and installed monitoring wells and vadose

zone wells. Preliminary results indicate buried metallic and construction debris, along with plastics, asbestos, pipes, wood and concrete. Radiological readings in the soil were at or below background levels. Some groundwater samples exceeded the maximum contaminant levels and are subject to further investigation. Soil levels for arsenic, total petroleum hydrocarbons, lead, and benzopyrene exceed industrial and residential PRG standards. Investigation of the site is ongoing and no decisions about remediation have been made to date. Due to the use of institutional controls, Anomaly Area 3 and a possible buffer site surrounding it will not be available for immediate reuse activity. Apart from restricted access to the site by unauthorized parties, no impacts from contamination following implementation of the proposed remediation are likely to occur. The restricted use of Anomaly Area 3 due to institutional controls (no contamination) is considered a significant impact.

Jet Fuel Distribution System

The Norwalk Pipeline was used as a jet fuel distribution system in support of the military mission at the former MCAS El Toro. The pipeline originates in Norwalk, California, enters the project area near the existing commissary located adjacent to Irvine Boulevard, and runs through the former air station housing to the former storage tank facilities. In May 1999, all the jet fuel was purged from the pipeline from Norwalk to the installation using a pigging process and replaced with an inert gas (nitrogen). The pipeline is currently maintained by the DESC. The presence of the pipeline containing inert material is considered a less than significant impact.

Threshold 5. For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project result in a safety hazard for people residing or working in the project area?

Base Plan and Overlay Plan

The proposed project is a non-aviation plan for the former MCAS El Toro site. Absence of aviation uses on the site would eliminate the risk of aircraft accidents. This is not considered a significant impact.

Threshold 6. For a project within the vicinity of a private airstrip, would the project result in a safety hazard for people residing or working in the project area?

Base Plan and Overlay Plan

The project is not in the vicinity of a private airstrip. This is not considered a significant impact.

Threshold 7. Would the project impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan?

Base Plan and Overlay Plan

There is a minimal impact as a result of changes that would be necessary to current emergency response and evacuation plans. Following annexation, the City of Irvine would

assume responsibility for the project area and would need to revise its existing emergency response and evacuation plans. The land use changes associated with the proposed project will also require revisions to the Orange County Emergency Plan. Currently, former MCAS El Toro is designated a potential emergency response staging area for fixed-wing aircraft and emergency response equipment. The implementation of a non-aviation plan for the project area will remove the site as a potential emergency response staging area for fixed-wing aircraft. Two other sites in the County, the Los Alamitos Armed Forces Reserve Center in Los Alamitos and Mile Square Regional Park in Fountain Valley, will remain designated emergency staging areas. Portions of the proposed project area could remain available to non-aviation emergency response equipment. Therefore, the proposed project is not expected to interfere with emergency response and evacuation plans once they are revised and would not result in a significant impact related to emergency response and evacuation plans.

Threshold 8. *Would the project expose people or structures to a significant risk of loss, injury or death involving wildland fires, including where wildlands are adjacent to urbanized areas or where residences are intermixed with wildlands?*

Base Plan and Overlay Plan

There is an impact resulting from exposure of people and structures to wildland fires. The Habitat Preserve, Wildlife Corridor, and Recreational areas in the northeastern portion of PA 51 will be exposed to the highest level of fire risk from wildfires because these areas and adjacent areas are currently defined as having high risk for wildland fires. The proposed project will result in an increase in both population and structures adjacent to this high fire risk area and the impact is considered significant. Additionally, the City has no record of construction of existing structures on the site. Reuse of existing structures will require the City to inspect the building for conformance to fire life safety code requirements. This is a potentially significant impact.

5.5.4 Significant Impacts

Base Plan and Overlay Plan

HH 1. Construction activities involving demolition and possible substantial remodeling of existing structures in the project area as the project area develops could result in the disturbance of structures and soils containing ACMs or LBP. This is considered a significant impact.

The presence of ACMs and LBP in structures and soils of properties conveyed by the DON may pose a future hazard to the public if the materials degrade or are otherwise disturbed. This is considered a significant impact.

HH 2. IRP Site 24 is located in zoning districts categorized as 6.1 Institutional and 1.5 Recreation. The site may be conveyed with temporary restrictions on use that are not appropriate for transportation facility use. This is considered a significant impact.

Future uses of IRP Site 3 may be potentially constrained by the implementation of institutional controls. This is considered a significant impact.

IRP Site 16 (Crash Crew Pit No. 2) is located in zoning district designation 1.5 Recreation. The site may be conveyed with temporary restrictions on use that are not appropriate for recreational land uses. This issue is considered a significant impact.

- HH 3.** The Habitat Preserve, Wildlife Corridor, and Recreational areas in the northeastern portion of PA 51 will be exposed to the highest level of fire risk from wildfires because these areas and adjacent areas are currently defined as having high risk for wildland fires. The proposed project will result in an increase in both population and structures adjacent to this high fire risk area and the impact is considered significant. Additionally, existing structures may not meet City fire safety requirements.

5.5.5 Mitigation Measures

Base Plan and Overlay Plan

HH 1.

- a. Prior to the conveyance of the property and issuance of subsequent grading permits, where the presence of ACMs is identified, the DON or its transferee shall ensure that all available information concerning ACMs has been provided to the City of Irvine, and the purchasers of the property, including:
 - The type, location and condition of ACMs
 - The results of any asbestos testing
 - Description of asbestos control measures taken, if any
 - The costs or time necessary to remove existing ACMs
 - The results of any site-specific asbestos inventory updates
- b. For any structures known to contain ACMs that will be renovated and/or demolished prior to transfer, the DON shall ensure that all asbestos is removed and disposed of in accordance with applicable federal, state and local regulatory requirements.
- c. Prior to transfer of any structure constructed before October 1988, scheduled for renovation and/or demolition, and in which the presence of ACMs is unknown, an asbestos survey shall be conducted by the DON. This requirement can be waived if an architect or project engineer responsible for the construction of the structure or an accredited asbestos inspector signs a statement that no ACM was specified as a building material, and to the best of their knowledge, no ACMs were used as a building material.

- d. Any existing structures in which ACMs have been identified and which will remain in use shall be addressed in an Operation and Maintenance Plan and must be managed in accordance with applicable laws.
- e. Any renovation and/or LBP abatement activities on residential units at former MCAS El Toro, shall be conducted in accordance with all applicable federal, state and local regulatory requirements.

HH 2.

- a. Prior to transfer, the City of Irvine shall receive from the DON, with the concurrence of the appropriate regulatory agencies, a statement that the "Action Required" IRP Site 3 is to be conveyed for restricted use and that all institutional controls have been identified and implemented. The City of Irvine will adopt appropriate rules, policies, and regulations necessary to avoid actions that compromise the integrity of the remediated sites and that uphold the institutional controls. The actions of the City of Irvine shall be in accordance with the General Development Standards for the zone, which requires the Planning Commission to approve a master plan for the entire Planning Area indicating location, acreage, and types of land use within the Planning Area. As stated under Sec. 9-51-5 General Development Standards, boundaries and acreages are approximate and shall be established by master plan approval.
- b. Prior to transfer, if the DON chooses to impose temporary restrictions on the use of Sites 16 and 24 pending adequate remediation of groundwater, the City of Irvine shall receive from the DON a statement of temporary restrictions on the use of the sites and the release of the sites for unrestricted use following implementation of adequate remediation of groundwater. The City of Irvine shall adopt appropriate rules, policies, and regulations necessary to avoid actions that compromise the integrity of the remediated sites and that uphold the institutional controls. The actions of the City of Irvine shall be in accordance with the General Development Standards for the zone, which requires the Planning Commission to approve a master plan for the entire Planning Area indicating location, acreage, and types of land use within the Planning Area. As stated under Sec. 9-51-5 General Development Standards, boundaries and acreages are approximate and shall be established by master plan approval.

- HH 3.** The Community Development Department, in coordination with the Orange County Fire Authority (OCFA), will be responsible for review of all development plans, which would include evaluation of very high fire severity zones, special fire protection plans, and any requirements for fuel modification zones. Projects potentially impacted by wildland fire hazards will be subject to OCFA Guidelines for "Development Within and Exclusion from Very High Fire Severity Zones" and "Fuel Modification Plans and Maintenance." Additionally, all demolition, renovation, and construction activities in the project area will be subject to review by OCFA to ensure adequate fire protection, water flow, emergency access, design features, etc., according to the standards of the Uniform Fire Code and the California Fire Code. Due to the implementation of these standard fire protection procedures, the proposed project is not anticipated to result in significant short- or long-term adverse impacts related to fire hazards.

- HH 4.** Prior to issuance of occupancy permits of any existing structure at the former MCAS El Toro, a fire life-safety evaluation of the structure including recommendations for improvements required for compliance with current Building Codes for use of existing structures adopted by the City of Irvine and plans for any required improvements shall be submitted to the Chief Building Official for review and approval.
- HH 5.** Prior to the issuance of a grading permit, the applicant shall prepare and the Director of Community Development shall approve a protocol plan (including but not limited to worker training, health and safety precautions, additional testing requirements, and emergency notification procedures) in the event of unknown hazardous materials are discovered during grading, construction, and/or related development activities. Additionally, said protocol plan will be revised should the discovery of previously unknown hazardous materials be made during any of the above mentioned development activities. The applicant and/or property owner that discovers contamination due to past military operations not previously identified by the DON shall be responsible for notifying the DON, appropriate regulatory agencies, and the Director of Community Development of the City of Irvine in a timely manner.
- HH 6.** The City of Irvine shall develop and maintain the location and status, as well as other pertinent information, of all monitoring wells located on the former MCAS El Toro in a geographic information systems database (GIS). The City will review all permit applications on the former air station for monitoring well locations that may be affected by a permit, and require applicants to maintain appropriate access. Access to monitoring wells will be limited to authorized personnel.

5.5.6 Significance of Impact After Mitigation

Base Plan

Less than Significant.

Overlay Plan

Less than Significant.

5.6 Geology and Seismicity

5.6.1 Environmental Setting

Former MCAS El Toro (PAs 51 and 30)

Geology/Soils

Planning Areas 51, 35, and 30 (PAs 51, 35, and 30) extend from the southern margin of the foothills of the Santa Ana Mountains to the southeastern edge of the alluvial Tustin Plain. The Santa Ana foothills are underlain by a tilted sequence of stratified sedimentary bedrock units which make up the hills and ridges. The Tustin Plain is a gently sloping alluvial plain underlain by alluvial fan sediments consisting of sand, silt, and clayey silty sand.

PA 51 and PA 35 are situated within both the Santa Ana foothills and alluvial plain areas of the subject site. Foothill elevations range from approximately 450 feet above mean sea level (MSL) to about 750 feet above MSL. Some slopes of the foothills exceed 20 percent in gradient. The topography of the Tustin Plain portion of PA 51 is nearly flat and slopes gently down to the west to southwest with elevations ranging from approximately 450 feet above MSL to 200 feet above MSL. Slope gradients within this area of the Tustin Plain range from 2.5 percent in the northeast to 1.5 percent in the southwest. PA 30 is located at the southeast margin of the Tustin Plain, bordered on the west by the San Joaquin Hills. Elevations within PA 30 range from roughly 260 to 300 feet above MSL, with a gentle slope upward from the northwest to the southwest.

The foothill portions of the project area are underlain by sedimentary bedrock units, mantled by only a thin soil cover. Within PA 51 and PA 35, the Tustin Plain contains alluvial soils of six major soil associations, consisting predominantly of varying sands, silts, and clayey silty sands. The surface and near-surface soils underlying PA 30 are composed of terrace deposits, old alluvium, and unconsolidated recent alluvium of the Myford and Sorrento series. Both the Myford and Sorrento soils are comprised of sand, silt, and clay mixtures. The northern one-quarter of PA 30 is underlain by clayey loam alluvial material.

The historic uses of PAs 51 and 30 (the former MCAS El Toro) for natural resources has been restricted to limited sand and gravel borrow sites in the foothill areas and agricultural uses such as citrus and field crops within the alluvial plain. Several small landslides have been documented in the undeveloped northeastern portions of PA 51; however, due to the relatively flat topography of the remainder of the site, the landslide potential outside of the Santa Ana foothills is considered very low. No known mudflows have occurred in the project area, and there are no unusual or unique topographic features on the site. No oil, gas or mineral extraction has occurred on the site and these resources are not anticipated based on the known geologic conditions.

Seismicity

The project area is located in the seismically active Southern California region. There is no known active or potentially active fault crossing or projecting into the project area. Ground shaking has been experienced in the past and may occur in the future. The site has a low susceptibility for liquefaction because the alluvial sediments are relatively coarse and the water table is generally more than 80 feet below the ground surface. Figures 5.6-1 and 5.6-2, Regional Geology and Inactive Fault Locations, depict the location of major fault and fault zones, and inactive fault zones in relation to the project site. The Elsinore Fault, located approximately 14 miles northeast of the site, and the Newport-Inglewood Fault have the greatest potential for seismic ground shaking on the site. The recently discovered San Joaquin Hills fault is also located to the west of the site. The status of the newly discovered San Joaquin fault is being researched by the geologic community. The fault runs roughly along the coastline south of Huntington Beach and north of Dana Point; however, its precise location is unknown. The fault geologic community is researching whether the fault is considered active or inactive, and the potential earthquake magnitude.

In order to assess the geologic/seismic risk associated with potential development, the City evaluates five general types of geologic conditions through Seismic Response Areas (SRA). SRAs describe the different types and magnitudes of potential seismic hazards, making it possible to evaluate the risks of property damage, personal injury, and loss of vital services which may result from an earthquake. The majority of the project area, including most of PA 51 and all of PAs 30 and 35, is located within SRA-2. SRA-2 consists of denser soils/deeper ground water. The primary potential seismic hazard in this area is ground motion. The majority of the project area is within SRA-2 and is considered suitable for development. The northeastern portion of the project area is located within SRA-3 and SRA-4. SRA-3 consists of shallow alluvium over and abutting bedrock. In this area, the primary potential seismic hazard is ground motion. Figure 5.6-3 depicts Seismic Response Areas from the City's General Plan.

Many of the existing buildings on the former MCAS El Toro do not meet current seismic codes. Many are older structures that were constructed prior to seismic codes being in place or were constructed to federal military standards, not California Seismic Code standards.

James A. Musick Jail Facility (Portion of PA 35)

The Musick Jail site is relatively flat, with a localized highland in the northeastern portion of the site. Throughout the site, total relief is approximately 82 feet. Borrego Wash lies to the west/northwest of the property and will ultimately be separated from the jail facility by the future extension of Alton Parkway. Groundwater was not encountered on the site within 45 feet of the ground surface. The Musick Jail occupies portions of both SRA-2 (denser soils/deeper groundwater) and SRA-3 (alluvium/shallow bedrock).

|  | SRA-1: Soft soils/high groundwater |  | SRA-4: Highlands over 20% slope |
|  | SRA-2: Denser soils/deeper groundwater |  | SRA-5: Less stable geologic formations |
|  | SRA-3: Alluvium/shallow bedrock | | |

*Figure 5.6-3
Seismic Response Areas*

IRWD Parcel (Portion of PA 35)

The IRWD parcel is relatively flat, with a localized highland in the northeastern portion of the site. The types of soils that underlie the site are mainly alluvial and terrace deposits, with some clay content. The IRWD parcel occupies portions of both SRA-2 (denser soils/deeper groundwater) and SRA-3 (alluvium/shallow bedrock).

5.6.2 Threshold for Determining Significance

The CEQA Environmental Checklist, Appendix G outlines the thresholds for determining significance for geology and seismicity.

Would the project:

1. *Expose people or structures to potential substantial adverse effects, including the risk of loss, injury or death involving:*
 - *Rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known fault?*
 - *Strong seismic ground shaking?*
 - *Seismic-related ground failure, including liquefaction?*
 - *Landslides?*
2. *Result in substantial soil erosion or the loss of topsoil?*
3. *Be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on- or off-site landslide, lateral spreading, subsidence, liquefaction or collapse?*
4. *Be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial risks to life or property?*
5. *Have soils incapable of adequately supporting the use of septic tanks or alternative wastewater disposal systems where sewers are not available for the disposal of wastewater?*
6. *Result in the loss of availability of a known mineral resource that would be of value to the region and the residents of the state?*
7. *Result in the loss of availability of a locally important mineral resource recovery site delineated on a local general plan, specific plan or other land use plan?*

5.6.3 Environmental Impact

The following analysis focuses on the potential geology and seismic impacts associated with implementation of the Base Plan and the Overlay Plan for the former MCAS El Toro (PAs 51

and 30). The Musick Branch Jail and the IRWD parcels are a portion of the annexation component of the proposed project; however, no new development is proposed for these parcels under the proposed project. As a result, implementation of the proposed project will not result in a significant geology and seismicity impact associated with the annexation of the James A. Musick Jail Facility and the IRWD Parcel.

Threshold 1: Expose people or structures to potential substantial adverse effects, including the risk of loss, injury or death involving:

- ***Rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known fault?***

Base Plan and Overlay Plan

The potential for fault rupture in the project area is extremely low, whether the project site is developed according to the land uses identified in the Base Plan or the Overlay Plan. According to the City of Irvine General Plan, Figure D-1 (see Figures 5.6-1 and 5.6-2) there are no known active or potentially active faults crossing or projecting into the project area. No significant impact is anticipated through the post 2025 level of development.

Threshold 1: Expose people or structures to potential substantial adverse effects, including the risk of loss, injury or death involving:

- ***Strong seismic ground shaking?***

Base Plan and Overlay Plan

Whether the project site is developed according to Base Plan land uses or Overlay Plan land uses, future development of the project area has the potential to result in the exposure of people or structures to strong seismic ground shaking in the event a major earthquake occurs along any one of the active faults in the region. This is considered a significant impact. Severe ground shaking can cause damage to poorly designed or constructed buildings. The level of seismic activity expected in the project area is similar to the County as a whole, and other areas of Southern California. As such, the risk of loss, injury or death involving strong seismic ground shaking is similar to the risk associated with other regions within Southern California. New development in the project area will need to be constructed according to the latest adopted building codes, which address construction practices related to seismic safety.

PA 30 is located in that portion of the Coastal Plain that is bounded by the Santa Ana Mountains on its southern and eastern borders and the San Joaquin Hills on its western border. The surface and near surface soils of the site are composed of Terrace deposits, old alluvium, and unconsolidated alluvium of the Myford and Sorrento series. Both the Myford and Sorrento soils are composed of sand, silt, and clay mixtures. The northern one-quarter of the site is underlain with clayey loam alluvial material. Due to the topography of the site, landslide potential is considered very low. In addition, PA 30 is located in SRA-2, which is comprised of denser soils and deeper groundwater. PA 30 has a low potential for

seismically induced liquefaction due to the dense soils and deep groundwater which underlie the area.

Many of the existing buildings on the former MCAS El Toro site do not meet current seismic codes. The City has no record of how the existing structures were constructed; whether they were constructed to seismic codes in effect at the time; whether they were field inspected, and if so, what type of field inspection and quality control existed; and whether they are still being utilized for their originally intended use. The reuse of existing development would need to meet a level of life safety protection that is appropriate for that use. The City would need to assess the building condition, compliance with codes, and suitability of the current intended reuse. As such, temporary or permanent reuse of these facilities could expose people to a greater seismic risk than buildings that are constructed to applicable seismic codes. This is considered a significant impact.

Threshold 1: Expose people or structures to potential substantial adverse effects, including the risk of loss, injury or death involving:

- ***Seismic-related ground failure, including liquefaction?***

Base Plan and Overlay Plan

The potential for seismically induced liquefaction resulting from severe ground shaking is considered low based on the characteristics of the existing soils in the project area. No significant impact to this issue is anticipated. However, the potential for liquefaction will be analyzed by site-specific geological investigations prior to grading and construction of individual projects in the project area.

Threshold 1: Expose people or structures to potential substantial adverse effects, including the risk of loss, injury or death involving:

- ***Landslides?***

Base Plan

The only documented landslides are located in the undeveloped northeastern foothills area of the project area within PA 51. The land use designation for this portion of the project area is proposed as OCGP Habitat Preserve (Hab) and OCGP Cemetery/OCGP Low Density Residential (Cem/Ldr). Under the Base Plan this area is planned as Habitat Preserve and Open Space and will be used as natural open space to protect significant wildlife habitat. No intensive development is proposed in this area and no significant impact to this issue is anticipated.

Overlay Plan

The only documented landslides are located in the undeveloped northeastern foothills area of the project area within PA 51. The land use designation for this portion of the project area is proposed as OCGP Habitat Preserve (Hab) and OCGP Cemetery/OCGP Low Density Residential (Cem/Ldr). Under the Overlay Plan, this area is planned as Habitat Preserve and Low Density Residential. Because development of habitable structures would

be allowed under the Overlay Plan, the project would result in a significant impact associated with landslides.

Threshold 2: Result in substantial soil erosion or the loss of topsoil?

Base Plan and Overlay Plan

Grading associated with future development in any portion of the project area will involve the removal of soils, compaction, and possible import or export of fill material. Grading will include the renewal of the existing runways. These activities will expose soil surfaces to increased wind and water erosion. Future development of the project area has the potential for impacts resulting from soil erosion or the loss of topsoil. This impact is considered significant.

Threshold 3: Be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on- or off-site landslide, lateral spreading, subsidence, liquefaction or collapse?

Base Plan and Overlay Plan

The majority of the soil material in the project area is identified as well suited for grading and construction. No significant impact to this issue is anticipated.

Threshold 4: Be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial risk to life or property?

Base Plan and Overlay Plan

Some expansive soils may be present in localized areas within the project area. The presence of expansive soils could create risks to life or property. This issue is considered a significant impact.

Threshold 5: Have soils incapable of adequately supporting the use of septic tanks or alternative wastewater disposal systems where sewers are not available for the disposal of wastewater?

Base Plan and Overlay Plan

Sewers will be available to serve all future development for the disposal of wastewater. No significant impact to this issue is anticipated.

Threshold 6: Result in the loss of availability of a known mineral resource that would be of value to the region and the residents of the state?

Base Plan and Overlay Plan

There are no known mineral resources on the site. No significant impact to this issue is anticipated.

Threshold 7: *Result in the loss of availability of a locally important mineral resource recovery site delineated on a local general plan, specific plan or other land use plan?*

Base Plan and Overlay Plan

There is no known mineral resource on the site. No significant impact regarding this issue is anticipated.

5.6.4 Significant Impacts

Base Plan and Overlay Plan

- GS 1.** Future development of the project area has the potential to result in the exposure of people or structures to strong seismic ground shaking in the event a major earthquake occurs along any one of the active faults in the region. This is considered a significant impact.
- GS 2.** The level of seismic activity expected in the project area is similar to the County as a whole, and other areas of Southern California. As such, the risk of loss, injury or death involving strong seismic ground shaking is similar to the risk associated with other regions within Southern California.
- GS 3.** Some expansive soils may be present in localized areas within the project area. The presence of expansive soils could create risks to life or property through the post 2025 development levels. This impact is considered significant.
- GS 4.** Many of the existing buildings on the former MCAS El Toro site may not have been constructed in a manner that is acceptable for its intended use. Temporary or permanent reuse of these facilities could expose people to a greater seismic risk than buildings that are constructed to applicable seismic codes. This is considered a significant impact.
- GS 5.** Future development of the project area has the potential for impacts resulting from soil erosion or the loss of topsoil. This impact is considered significant through the post 2025 development levels.
- GS 6.** Some expansive soils may be present in localized areas within the project area. The presence of expansive soils could create risks to life or property. This is considered a significant impact.

5.6.5 Mitigation Measures

Base Plan and Overlay Plan

- GS 1.** Prior to issuance of a building permit, the City of Irvine shall require that all development be designed in accordance with the seismic design provisions outlined in future proposed development geotechnical reports and specified in the latest Building Codes adopted by the City of Irvine. Compliance with this measure shall be verified by the Community Development Department.
- GS 2.** Prior to issuance of a building permit, as per existing City policies, geotechnical studies shall be prepared at the time specific development projects are proposed to address site specific geotechnical considerations. The scope of each geotechnical study is based on the underlying geotechnical conditions of the individual site. These reports will provide measures to prevent settlement.
1. Prior to design and construction of any future developments within the project area, a comprehensive geotechnical evaluation, including development-specific subsurface exploration and laboratory testing, shall be conducted. The purpose of the subsurface evaluation is to:
 - a. Further evaluate the subsurface conditions in the area of the proposed structures.
 - b. Provide specific data on potential geologic and geotechnical hazards.
 - c. Provide information pertaining to the engineering characteristics of earth materials in the project area.

From this data, recommendations for grading/earthwork, surface, and subsurface drainage, temporary and/or permanent dewatering, foundations, pavement structural sections, and other pertinent geotechnical design considerations may be formulated and shall be included in the grading and building plans for individual developments. General recommendations are as follows:

- C Seismic Ground Shaking - Measures to prevent risk of loss, injury or death involving seismic ground shaking include constructing new development to the latest adopted building codes. In addition, new development should not be located near active earthquake faults.
- C Erosion or Loss of Topsoil – Erosion and sediment control measures shall be implemented as required by the City's Grading and Water Quality ordinances.
- C Where Expansive Soils Exist – Measures for the design of foundations, slabs, flatwork and other improvements subject to drainage from expansive soils.

Compliance with this measure shall be verified by the Community Development Department.

- GS 3.** Prior to issuance of building permits for the occupancy of any existing structure at the former MCAS El Toro, or occupancy of any existing structure if a building permit is not issued, a seismic evaluation of the structure including recommendations for seismic improvements required for compliance with current Building Codes for use of existing structures adopted by the City of Irvine and plans for any required seismic improvements shall be submitted to the Chief Building Official for review and approval.
- GS 4.** Prior to issuance of a grading permit, detailed geotechnical and hydrology reports shall be prepared prior to any development approval or grading activities. These reports shall specifically address erosion control and surface runoff for both construction and long-term operations on the site. Recommendations contained in these reports to prevent soil erosion, siltation, and debris influx into the drainage system shall be implemented. Compliance with this measure shall be verified by the Community Development Department.

5.6.6 Significance of Impacts After Mitigation

Base Plan and Overlay Plan

Less than significant.

5.7 Hydrology/Water Quality

5.7.1 Environmental Setting

Hydrologic Setting

Former MCAS El Toro (PAs 51 and 30)

The project area lies within the San Diego Creek watershed, which is 105 square miles and encompasses portions of the cities of Irvine and Tustin, Santa Ana, Costa Mesa, Lake Forest, Laguna Hills, Orange and Newport Beach, as well as unincorporated Orange County. The watershed includes the San Diego Creek along with Peters Canyon channel and their tributaries. Natural watercourses, agricultural channels, storm drain systems, and flood control channels transport runoff from the proposed annexation area and surrounding lands in the watershed to Upper Newport Bay.

The former MCAS El Toro property is traversed by six drainage channels flowing generally from the northeast to the southwest. Headwaters originate off-site in the Santa Ana Mountains, collect in the various upstream canyons and flow downstream into four improved channels that cross the former base property from Irvine Boulevard to the SCRRA railroad tracks. These are referred to as the “Marshburn”, “Bee Canyon”, “Agua Chino”, and the “Borrego” Channels (see more detailed discussion below). South of the Metrolink railroad (i.e. within PA 30) two other facilities cross the property. These facilities are the “Serrano Creek” channel and the Upper San Diego Creek channel. Each channel connects and discharges to existing County of Orange regional facilities.

James A. Musick Jail Facility (Portion of PA 35)

James A. Musick Branch Jail is a relatively small portion of PA 35. The Jail facility lies within the San Diego Creek drainage basin. Approximately 20 acres of the existing 100-acre Musick Jail site is covered by impervious surface. Approximately 36 acres of the site are tributary to a storm drain at the southerly corner of the site, which flows into a drain in Parker Avenue and eventually into Serrano Creek. The remaining 64 acres of the site are tributary to Borrego Canyon Wash.¹ Both Serrano Creek and Borrego Canyon Wash are tributaries of San Diego Creek.

IRWD Parcel (Portion of PA 35)

The Irvine Ranch Water District (IRWD) parcel is also a relatively small portion of PA 35. The IRWD parcel also lies within the San Diego Creek drainage basin. The parcel drains into the Borrego Canyon Wash.

Storm Drain System

Former MCAS El Toro (PAs 51 and 30)

Figure 5.7-1 illustrates the drainage areas and topographic conditions present in the project area. The following provides a description of the major drainage channels and the Marshburn Retarding Basin located in the project area.

Marshburn Channel: Tributary drainage areas upstream of Irvine Boulevard drain into the Marshburn retarding basin located just north of Irvine Boulevard between the Eastern Transportation Corridor and Lambert Road. An interim 48-inch diameter Spiral Rib Pipe in Irvine Boulevard delivers flows northwesterly toward the Marshburn Channel from the retarding basin. This channel runs along the southeasterly side of the Eastern Transportation Corridor. The channel reach between Irvine Boulevard and Trabuco Road is a trapezoidal concrete lined channel with a bottom that varies from eight-feet to 10-feet in width and ranges from five-feet to seven-feet in depth. South of Trabuco Road to Interstate 5, Marshburn Channel is a concrete rectangular channel with the bottom of the channel varying from 14-feet to 15-feet and ranging from nine-feet to 10.5 feet in depth.

Bee Canyon Channel: The Bee Canyon Channel drainage system consists of reinforced concrete boxes ten feet by six feet and 3.5 feet by 4.5 feet under the runways and open channels outside the runway areas. The capacity of the boxes is 680 cubic feet per second (cfs) and 630 cfs, respectively. Upstream of the box underneath Irvine Boulevard is a transition structure with a weir structure routing excess flows into the Marshburn retarding basin. The channel reach south of the SCRRA railway tracks to Interstate 5 is a 12-foot wide by nine feet in depth double reinforced concrete box. The Bee Canyon and Round Canyon retarding basins have been constructed in conjunction with the Foothill Transportation Corridor.

Agua Chinon Channel: The Agua Chinon Channel begins at the northeasterly limits of the Wherry housing area. Similar to the Bee Canyon Channel system, this system consists of a series of boxes under the existing runways and open channels outside the runways. The drainage facility south of the railroad tracks is a combination of 10-foot wide by 7.5-foot high with a 2:1 slope, rock lined trapezoidal channel, 12-foot by 12-foot triple reinforced concrete box, and six 10-foot by 10-foot reinforced concrete box underneath Interstate 5. In addition, the Agua Chinon retarding basin has been constructed just south of the Foothill Transportation Corridor.

Borrego Canyon Channel: The Borrego Canyon Channel runs along the southern boundary of the base. Its headwaters begin in the Santa Ana Mountains to the east. The facility is a natural bottom channel upstream of Irvine Boulevard. Downstream of this point, for a distance of about 2,900 feet, the channel is a 25-foot wide by 9.5-foot high reinforced concrete channel. This concrete channel is outside the former base. Downstream of this point, the channel enters the base property and becomes a soft bottom channel.

- Existing Drainage Channels
- - - Proposed Project Area
- Drainage Area Boundary
- Basin
- 300' — Topographic Lines

Figure 5.7-1
Drainage Areas and Topography

Serrano Creek: Serrano Creek is a drainage system located in the southern tip of the former base. It consists of a 30-foot-wide by 10-foot-high rectangular concrete channel upstream of Muirlands Boulevard and an earthen channel downstream of Muirlands Boulevard to Interstate 5. The creek crosses the intersection of Alton Parkway and Muirlands Boulevard in a triple 10-foot by 10-foot reinforced concrete box.

Upper San Diego Creek Channel: At the southerly most point of PA 30 is the Upper San Diego Creek Channel, which is an unimproved earthen berm.

Marshburn Retarding Basin: The Marshburn Retarding Basin was constructed as part of the Eastern Transportation Corridor (SR-133) improvements. The basin is located north of Irvine Boulevard, approximately 2,500 feet east of Sand Canyon Avenue. The basin is designed to accommodate the future ultimate condition drainage/runoff; however, the interim condition configuration for the basin was designed so that the interim discharge from the basin would not exceed the capacity of the Marshburn Channel. Reconstruction of the collector system and outflow lines will be required to accommodate ultimate development of the watershed.

James A. Musick Jail Facility (Portion of PA 35)

The Musick Jail is located within the Borrego Canyon drainage system. Approximately 69 acres of the site drain into the Borrego Canyon Wash, and the remaining 36 acres drain into a storm drain located at the southern corner of the site which connects to the Serrano Creek facility.

IRWD Parcel (Portion of PA 35)

The IRWD parcel is located within the Borrego Canyon drainage system, and drains into the Borrego Canyon Wash.

Flood Conditions and System Deficiencies

The “Flood Control Master Plan for San Diego Creek” (John M. Tettemer and Associates, 1989) analyzed the existing tributary drainage areas of San Diego Creek from its headwaters to I-405 downstream of the confluence with Peters Canyon Channel. The Flood Control Master Plan identified a range of flood control improvements for the San Diego Creek watershed that would control flood peaks based on a 100-year flood. The Flood Control Master Plan was adopted by the City of Irvine, the City of Tustin, the Irvine Company, and the Orange County Environmental Management Agency and is currently being implemented in phases by these agencies.

The Orange County Flood Control District (OCFCD) is the agency responsible for regional channel reaches where it has right-of-way (either fee title or easements). Local facilities are the responsibility of the County of Orange in unincorporated areas and the City of Irvine within its city limits.

PAs 51 and 30 (Former MCAS El Toro)

Final EIR 563 and the Draft Supplemental Analysis indicated that a variety of flood control facility deficiencies existed in PAs 51 and 30 as of 1995. Likewise, the U.S. Army Corps of Engineers had previously reported that about 40 percent of PAs 51 and 30 would be flooded during a 100-year storm. The recent construction of transportation corridors and freeway improvements adjacent to the site has included installation of drainage improvements and retarding basins (Bee Canyon, Round Canyon, Aqua Chinon, and Marshburn) that have significantly reduced, but not entirely eliminated, the flooding problems previously identified. The Federal Emergency Management Agency (FEMA) identified two modifications (associated with the Eastern Transportation Corridor (SR-133) improvements) to the flood plain maps. The changes will show that the 100-year flood zone north and west of the project area has been reduced due to the development of drainage improvements described above. The extent of that reduction is discussed in the following sections. There are no improvements to existing flood control systems currently adopted for the annexation area.

James A. Musick Jail Facility (Portion of PA 35)

The Musick Jail is located within the Borrego Canyon drainage system. The improvements related to the expansion of Alton Parkway will assist in alleviating flooding problems on-site.

IRWD Parcel (Portion of PA 35)

The IRWD parcel is located within the Borrego Canyon drainage system, and drains into the Borrego Canyon Wash.

Water Quality

Regulatory Background

For the purposes of regional administration of California's water quality control program, the State is divided into nine regions, each having its own Regional Water Quality Control Board (RWQCB). The City of Irvine is in the Santa Ana Region (Region 8). The Santa Ana RWQCB has adopted a Water Quality Control Plan (WQCP) or Basin Plan, which outlines Board responsibilities for adoption and implementation of water quality control plans, issuance of waste discharge requirements, and performance of other functions concerning water quality control. This document is called the "Water Quality Control Plan - Santa Ana Basin (8)". Specifically, the Basin Plan: (1) designates beneficial uses for surface and ground waters; (2) sets narrative and numerical objectives that must be attained or maintained to protect the designated beneficial uses and conform to the State's antidegradation policy; (3) describes implementation programs to protect the beneficial uses of all waters in the Region; and (4) describes surveillance and monitoring activities to evaluate the effectiveness of the Basin Plan [California Water Code §§13240 - 13244, and §13050(j)]. The Basin Plan incorporates by reference all applicable State and Regional Board plans and policies.

California Water Code Section 13050(h) defines “water quality objectives” as “the limits or levels of water quality constituents or characteristics which are established for the reasonable protection of beneficial uses of water or the prevention of nuisance within a specific area.”

By definition, water quality objectives must protect the most sensitive of the beneficial uses, which have been designated for a water body. Water quality objectives may be numerical values for water quality constituents or narrative descriptions.

Surface Waters

The Basin Plan states that point sources and nonpoint sources of pollution shall be controlled to protect designated beneficial uses of water. Beneficial uses are defined as the uses of water necessary for the survival or well being of humans, plants, and wildlife. Examples include drinking, swimming, industrial, and agricultural water supply, and the support of fresh and saline aquatic habitats. Inland surface waters of the San Diego Creek drainage basin have been exempted by the Regional Board from the municipal use designation under the terms and conditions of State Board Resolution No. 88-63, Sources of Drinking Water Policy. Surface waters in the project area discharge directly into water bodies with beneficial uses. Runoff water from the proposed project will also discharge into the municipal storm drain system that eventually drains into the San Diego Creek. The San Diego Creek, in turn, drains into Upper Newport Bay. Beneficial uses, as identified by the Regional Board are depicted in Table 5.7-1.

Coastal Receiving Waters

The coastal waters of the Pacific Ocean are defined in the Basin Plan as waters subject to tidal action. Beneficial uses of receiving coastal waters (i.e., Upper and Lower Newport Bay) generally include REC-1, REC-2, EST (estuarine habitat), WILD, RARE (habitat support for rare, threatened or endangered species), MAR (marine habitat), and NAV (navigation).

Groundwater

The Basin Plan indicates that the Irvine Forebay I and II groundwater subbasins generally encompass the proposed project area. Groundwaters that meet the criteria mandated by the Sources of Drinking Water Policy are designated MUN (municipal and domestic water supply). The Basin Plan currently designates the project area groundwater subbasins for municipal and domestic supply, agricultural supply, and industrial process and service supply. A large plume of groundwater contaminated by organic compounds including trichloroethylene (TCE) as a result of the historical use of solvents and fuels, is present beneath the project area.

Table 5.7-1
Beneficial Uses of Upper Newport Bay, San Diego Creek, and Tributaries

Beneficial Use	Other Tributaries	San Diego Creek (below Jeffery Road)	San Diego Creek (above Jeffery Road)	Upper Newport Bay
Groundwater Recharge	X		X	
Water Contact Recreation	X	X	X	X
Non-Contact Water Recreation	X	X	X	X
Commercial and Sport Fishing				X
Warm Freshwater Habitat	X	X	X	
Preservation of Biological Habitats of Special Significance				X
Wildlife Habitat	X	X	X	X
Rare, Threatened, or Endangered Species				X
Spawning, Reproduction, and Development				X
Marine Habitat				X
Shellfish Harvesting				X
Estuarine Habitat				X
1 For areas of San Diego Creek upstream of Jeffery Road, the Agua Chinon Wash, and other tributaries, applicable beneficial uses are intermittent only, meaning that water conditions do not allow the beneficial use to exist year-round.				

Existing Permits and Water Quality Management Plans

Surface water quality is regulated by the U.S. Environmental Protection Agency (EPA), the California State Water Resources Control Board, the California Regional Water Quality Control Board, the Santa Ana Region Water Quality Control Board, the County of Orange (for unincorporated areas), and the City of Irvine.

The federal Clean Water Act and the State Porter Cologne Act are the principal statutes governing water quality. The laws are similar in many ways. The fundamental purpose of both laws is to protect the beneficial uses of water. An important distinction between the two is that the Porter Cologne Water Quality Control Act addresses both ground and surface waters while the Clean Water Act addresses surface water only. The Clean Water Act requires the State to adopt water quality standards for water bodies subject to the review and approval of the EPA. Direct discharges of pollutants into waters of the United States are not allowed, except in accordance with the permitting program of the Clean

Water Act, the National Pollutant Discharge Elimination System. The County of Orange and the City of Irvine hold a NPDES permit governing the storm drain systems. Additionally, the State has issued a NPDES general permit relating to construction activities on sites over five acres in area. In March 2003, this provision will apply to residential construction sites that result in the disturbance of one acre or more.

Where water quality standards are not being achieved, the Clean Water Act requires the identification and listing of that water body as “impaired” under Section 303(d). Once a water body has been deemed “impaired” a Total Maximum Daily Load (TMDL) for the pollutant that has impaired the water body must be developed for that water body. A TMDL is an estimate of the total load of pollutants that a water body may receive without exceeding applicable water quality standards. Once established, the TMDL is allocated among current and future dischargers into the water body. Impaired waters relevant to the project are the San Diego Creek and Upper Newport Bay. TMDLs have been established for these water bodies and are shown on Table 5.7-2

The State Water Resources Control Board adopted the “Nonpoint Source Management Plan” (NPSMP) in 1988. In that plan, San Diego Creek was designated as the region's pilot watershed project since the Creek's water quality has been impaired by excessive sedimentation, nitrates, pesticides, and metals originating from point and nonpoint sources.

In 1982, the Southern California Association of Governments (SCAG) completed the “San Diego Creek Comprehensive Stormwater Sedimentation Control Plan” as part of an areawide planning process conducted pursuant to Section 208 of the Clean Water Act (The Flood Control Master Plan for San Diego Creek also includes the “208 Plan” for watershed sedimentation control). This Plan recommends management of the erosion-siltation problem through agricultural and construction Best Management Practices (BMPs) and Resource Conservation Plans (RCPs). The recommendations of the 208 Plan have been and are being implemented by the State, local agencies and The Irvine Company, the largest private landowner in the watershed. To minimize sediment transport to Newport Bay, programs have been implemented to control erosion resulting from grading operations at construction sites and to prevent erosion of agricultural lands. The cities of Irvine, Costa Mesa, Santa Ana, and Newport Beach have grading ordinances that require erosion/siltation control plans for construction projects within their boundaries. The focus of these plans is on the implementation of BMPs. Permit actions by the RWCQB (the areawide stormwater permit for Orange County) and the State Water Resources Control Board (the general construction activity stormwater permit) will necessitate additional coordinated efforts between the two agencies to control sediment inputs from construction activities. With technical assistance from the RWCQB, Orange County oversees a program to ensure development and implementation of RCPs by agricultural landowners, principally The Irvine Company.

Table 5.7-2
TMDLs Applicable to Newport Bay and San Diego Creek

	Sediment	Nutrients	Pathogens	Toxics (future)
General Info & Reduction	1998 estimate: 250,000 tons deposited/yr. Reduction: 50% (to 125,000 tons/yr) within ten years.	1998 estimate: 1,087,000 lbs/yr. Predominant sources: commercial nursery and agricultural land tailwaters. Reduction: 50% by 2012.	Fecal coliform bacteria used as indicator. Reduction: less than 200 organisms/100 ml. No more than 10% of samples to exceed 400 organisms/100 ml for any 30-day period.	San Diego Creek and Newport Bay are "impaired" water bodies for toxic substances. Problem toxic substances: PCBs, DDT, diazinon, chlorpyrifos, toxaphene, copper and selenium (may occur naturally).
Allocation	62,500 tons to Newport Bay. 62,500 tons to rest of the watershed. Load allocations (total 10 yr. running annual avg. (in tons/yr): open space = 28,000; agriculture = 19,000; construction = 13,000; urban = 2,500.	Loading targets for seasonal and annual amounts of total nitrogen and phosphorus, with 5, 10, and 15-year target dates. Waste & load allocations for total nitrogen (5-year target) (in lbs/season): nursery = 67,344; Silverado Constr. = 25,671; urban = 20,785; agricultural = 22,963; open space & natural = 63,334. Waste & load allocations for total phosphorous (5-year target) (in lbs/yr): urban = 4,102; construction = 17,947; agricultural = 26,196; open space = 38,640.	Waste & load allocations (14 yr. target date): urban runoff (incl. storm water), agricultural runoff (incl. storm water), and natural sources = 5-day sample/30-day geometric means of less than 200 organisms/100 ml, no more than 10% of samples to exceed 400 organisms/100 ml for any 30-day period; vessel waste = 0.	282.1 g/yr PCB to San Diego Creek, 432.6 g/yr DDT to San Diego Creek, Diazinon: acute 80 ng/L; chronic 50 ng/L, chlorpyrifos: acute 20 ng/L; chronic 14 ng/L, toxaphene 8.9 g/yr, copper to Newport Bay 11,646 lbs/yr, selenium to San Diego Creek 891.4 ug/L.
Implementation	Monitoring and surveys conducted by the County, and cities of Irvine, Tustin, Lake Forest, Costa Mesa, Santa Ana, and Newport Beach with the financial participation of The Irvine Company. Maintenance of basins to performance standards and other requirements.	Agricultural Nutrient Management approved by Regional Board identifies management measures and guidance practices. Based upon monitoring studies, Regional Board will review and may revise the current nitrogen objective for San Diego Creek in the Basin Plan.	Monitoring plans resulting from studies conducted by County Health Care Agency. Monitoring study to determine appropriateness of current bacteria objectives and reduction target.	Phase out household use of diazinon and chlorpyrifos. DDT and PCBs – State conduct investigations or potential spill sites to identify hotspots and remedial action. Selenium – monitor flow, discharge management practices. Copper – reduce through five areas of action.

National Pollutant Discharge Elimination System MS 4 Permit

The City of Irvine is a co-permittee under the National Pollutant Discharge Elimination System (NPDES) program. A co-permittee is a permittee to an NPDES permit (i.e., Areawide Municipal Storm Water Permit) that is responsible for permit conditions relating to the discharge for which it is operator. As used in the Storm Water Permit Implementation Agreement, co-permittees are the County of Orange, its incorporated cities, and OCFCDD.

General Permits are issued administratively to a discharger after a completed Notice of Intent (NOI) or appropriate application has been filed and, if necessary, the Regional Board Executive Officer has determined that the discharger meets the conditions specified in the Permit. The Areawide and general NPDES permits contain waste discharge requirements for storm water and urban runoff from the County of Orange, the Orange County Flood Control District, and the incorporated cities of Orange County.

The Regional Board has issued a MSW (MS4) Permit to the County, the County Flood Control District, and most of the incorporated cities in the County, including the City of Irvine for their storm drain systems. (Regional Board Order 96-31) The Drainage Area Management Plan (DAMP) is a document required under the MSW permit granted to the co-permittees by the Santa Ana RWQCB. The DAMP contains required and recommended BMPs aimed at alleviating pollutant levels in stormwater runoff. BMPs are defined as "schedules of activity, prohibitions of practices, maintenance procedures and other management practices to prevent or reduce the pollution of 'waters of the United States'." BMPs also include treatment requirements, operating procedures, and practices to control plant site runoff, spillage or leaks, sludge or waste disposal, or drainage from raw material storage. A Revised DAMP is currently being prepared by the County with input from all Co-permittees. The proposed project will be required to comply with any new requirements or BMPs that are adopted as part of the revised DAMP.

The current DAMP established by the County and City pursuant to the Municipal Stormwater Permit relies upon BMPs instead of numeric effluent limitations to comply with the Basin Plan. The original DAMP was prepared in 1993 and has been revised several times, with the most recent revision in September 2000. The DAMP specifically addresses BMPs for new development. It describes the range of structural controls, such as filtration, and non-structural controls, such as education programs. The DAMP also includes other programs and requires the preparation of a Water Quality Management Plan to address post-construction water quality. The DAMP does not specify a minimum development size to be considered for BMP applications, nor does it specify which land uses should receive the most attention. In general, BMPs are required on a variety of land uses, both residential and non-residential.

Although the provisions of the draft MSW permit may still be modified prior to final vote on the permit, the current draft MSW permit contains the following requirements:

- Pollution in discharges from the Municipal Separate Storm Sewer System (MS4) must be reduced to the maximum extent practicable;
- Certain non-storm water discharges are conditionally allowed (such as irrigation return flows, non-commercial car wash water, fire fighting flows) but other non-storm water discharges to the MS4 are prohibited;

- Local governments must inspect and report upon certain commercial, industrial, and construction facilities on a specified schedule;
- Local governments are given specific guidance regarding the elimination of illicit and illegal connections to the MS4, regarding the repair of leaking sanitary sewer and septic lines that might discharge into the MS4, regarding water quality from municipally-owned construction and industrial properties, regarding mandatory citizen education programs, and regarding regional monitoring of water quality;
- Local governments must review their project approval process to focus upon specified water quality improvement goals;
- In lieu of an approved water quality management plan, or equivalent or alternative regional water quality controls, new development projects that have not received tentative tract map approval by July 1, 2003 must implement structural best management practices meeting a specific design standard (treatment, infiltration, or filtration of specified volumes or flow rates associated with a design storm event);
- By October 1, 2003, the permittees must review and revise the DAMP to reflect specific water quality goals set for new development and significant redevelopment and to make any other revisions to the document annually necessary to comply with the permit; during the revision process; the permittees must implement their existing requirements for new development;
- Discharges from the MS4 are subject to relevant waste load allocations established in the TMDLs for the area.

As indicated in Final EIR 563 and the Draft Supplemental Analysis, PA 51 and 30 have a current industrial site NPDES permit for stormwater runoff. At the time of base closure, numerous structural BMP controls were employed in PA 51 due to the high propensity for pollutant runoff from a variety of sources, including aircraft and vehicle fluids and the accidental release of hazardous materials and wastes into off-site water courses. Oil and water separators, properly permitted hazardous materials storage and use facilities, routine sweeping, and a Spill Prevention Countermeasure and Control (SPCC) Plan are among the BMPs implemented at the facility.

Additional BMPs suited for various types of development include first flush diversion, detention/retention basins, infiltration trenches/basins, porous pavement, grass swales, swirl concentrators, and engineering and design modification of existing structures. Non-structural BMPs include programs to educate the public on proper disposal of hazardous/toxic wastes, regulatory approaches, street sweeping and facility maintenance, and detection and elimination of illicit connections and illegal discharges. Prior to the issuance of a precise grading permit, each new development is required to submit a Water Quality Management Plan (WQMP) and implement appropriate non-structural and structural BMPs, in keeping with the size and type of development, to minimize the introduction of pollutants into the drainage system.

Surface Water Quality

The San Diego Creek and its tributaries ultimately flow to the Upper and Lower Newport Bay. Any water quality deficiencies upstream of Newport Bay are compounded when they reach the Bay and contribute to water quality problems. Urban and agricultural runoff are the primary constituents of storm water and pollutants conveyed to Newport Bay. As indicated in EIR 563 and in the Basin Plan, although BMP implementation in PA 51 (former

MCAS El Toro) and surrounding sites has been effective at reducing the discharge of contaminated water to flood control facilities, the entire Newport Bay watershed is characterized by relatively high levels of various pollutants.

The Water Quality Control Plan notes that San Diego Creek and certain portions of Newport Bay have shown high levels of trace metals and organics, thus the Bay's inclusion in the State Toxic Substances Monitoring Program and the Bay Protection and Toxic Cleanup Program. Additionally, the Basin Plan notes that nutrient loading to the Bay is high, particularly from the San Diego Creek watershed, as a result of nutrient-laden runoff from agricultural crops and nurseries. Such pollutants contribute to seasonal algal blooms, which can adversely affect recreational, aesthetic, and habitat beneficial uses of Newport Bay.

The EIR 563 Draft Supplemental Analysis recognized several water quality deficiencies of the project area flood control system. Those deficiencies related to the inability of the existing system (as of 1995) to minimize sediment loading and transport within the project area drainage facilities. High sedimentation levels in stormwater runoff were deemed indicative of reduced surface water quality, particularly during 100-year storm events. The specific facility deficiencies are described in detail in the EIR 563 Draft Supplemental Analysis. Additionally, the Basin Plan notes that erosion in the watershed and the resulting siltation in the Bay are a continual threat to the Bay's designated beneficial uses.

San Diego Creek, which is the largest drainage system in the watershed, accounts for approximately 94 percent of the sediment delivered to Newport Bay. Sediment loads result from erosion of open space lands in foothill areas and from urban activity in the watershed, including: extensive grading for development; increased runoff and channel erosion due to urbanization; and erosion of agricultural lands and unprotected channel embankments. Most deposition occurs during major storm events, although low-level transport occurs year-round. However, recent construction of and/or improvements to the Marshburn, Bee Canyon, Round Canyon, and Agua Chinon detention basins have reduced many of the identified capacity deficiencies, thereby improving sedimentation levels accordingly. Additionally, project-related detention and conveyance facility improvements are proposed as part of the proposed project, as discussed in following sections.

Groundwater Quality

Although most ground waters in the Region are considered suitable or potentially suitable as sources of drinking water, EIR 563 and the Basin Plan have documented the contamination of groundwater in the Irvine Forebay. Constituents include a variety of volatile organic compounds (VOCs) historically used in PA 51 (former MCAS El Toro), as well as contaminants related to past agricultural activities in PAs 51 and 30. Section 5.5 (Public Health and Safety) contains information about groundwater pollutant levels and the status of groundwater remediation activities.

5.7.2 Threshold For Determining Significance

The CEQA Environmental Checklist, Appendix G outlines the thresholds for determining significance for hydrology and water quality.

Would the project:

1. *Violate any water quality standards or waste discharge requirements?*
2. *Substantially deplete groundwater supplies or interfere substantially with groundwater recharge such that there would be a net deficit in aquifer volume or a lowering of the local groundwater table level (e.g., the production rate of pre-existing nearby wells would drop to a level which would not support existing land uses or planned uses for which permits have been granted)?*
3. *Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, in a manner which would result in substantial erosion or siltation on- or off-site?*
4. *Would the project substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, or substantially increase the rate or amount of surface runoff in a manner which would result in flooding on- or off-site?*
5. *Create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff?*
6. *Otherwise substantially degrade water quality?*
7. *Place housing within a 100-year flood hazard area as mapped on a federal Flood Hazard Boundary or Flood Insurance Rate Map or other flood hazard delineation map?*
8. *Place within a 100-year flood hazards area structures which would impede or redirect flood flows?*
9. *Expose people or structures to a significant risk of loss, injury or death involving flooding, including flooding as a result of the failure of a levee or dam?*
10. *Cause inundation by seiche, tsunami or mudflow?*

As per the criteria provided in the WQCP for the Santa Ana River Basin, failure to implement the Plan would also result in a significant adverse environmental impact. Water quality would not be protected, thereby resulting in an adverse impact to the public and wildlife. An adverse impact on a beneficial use would also occur where there is an actual or threatened loss or impairment of that beneficial use.

Additionally, violations of waste discharge requirements (WDRs) or applicable statutory or regulatory requirements, as defined in the State Water Resources Control Board Water Quality Enforcement Policy (Resolution No. 96-030, as amended by Resolution No. 97-085), would result in a significant environmental impact.

5.7.3 Environmental Impact

The following analysis focuses on the potential hydrology and water quality impacts associated with implementation of the Base Plan and the Overlay Plan for the former MCAS El Toro (PAs 51 and 30). The Musick Branch Jail and the IRWD parcels are a portion of the annexation component of the proposed project; however, no new development is proposed for these parcels under the proposed project. As a result, implementation of the proposed project will not result in a significant hydrology or water quality impact associated with the annexation of the James A. Musick Jail Facility and the IRWD Parcel.

Threshold 1: Violate any water quality standards or waste discharge requirements?

Base Plan and Overlay Plan

Grading and excavation activities required for future development could result in the exposure of bare soils which could result in both wind and water-related erosion, and a significant water quality impact if not properly treated. Through buildout of the proposed project, wind and water related erosion has the potential to violate water quality standards or waste discharge requirements. This is considered a significant impact.

Threshold 2: Substantially deplete groundwater supplies or interfere substantially with groundwater recharge such that there would be a net deficit in aquifer volume or a lowering of the local groundwater table level (e.g., the production rate of pre-existing nearby wells would drop to a level which would not support existing land uses or planned uses for which permits have been granted)?

Base Plan and Overlay Plan

Previous analyses, including Final EIR 563 and the EIR 563 Draft Supplemental Analysis, indicate that proposed development in the project area will not substantially deplete groundwater supplies or interfere substantially with groundwater recharge such that there would be a net deficit in aquifer volume or a lowering of the local groundwater table level. This issue is not considered a significant impact. Groundwater quality and ongoing military base remediation activities are discussed in detail in Section 5.5 (Public Health and Safety).

Threshold 3: Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, in a manner which would result in substantial erosion or siltation on- or off-site?

Base Plan and Overlay Plan

The project will not substantially alter the existing drainage patterns of the site or area, including through the alteration of the course of a stream or river, in a manner which would result in substantial erosion or siltation on- or off-site. No significant impact to this issue is anticipated. All proposed stormwater conveyance and detention facilities are intended to reduce siltation in area flood control facilities, including San Diego Creek and in the receiving waters of Newport Bay. As flood control improvements are implemented, they will augment capacity within existing channels and facilities but will not substantially alter the existing drainage pattern of the site or area in a way that would result in substantial erosion or siltation on- or off-site. Future development will be planned and phased in accordance with the capacities of existing or planned stormwater drainage systems and pollutant reduction programs.

Threshold 4: Would the project substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, or substantially increase the rate or amount of surface runoff in a manner which would result in flooding on- or off-site?

Base Plan and Overlay Plan

The existing drainage patterns of the project site will not be substantially altered nor will stream courses or rivers be substantially altered. With recent improvements to upstream flood control facilities, the floodplain area has likely decreased and fewer areas of the project area are subject to inundation. The phasing of the flood control system improvements in PAs 51 and 30 will be coordinated with the street-phasing schedule so that the storm drains are installed prior to or in concert with road construction. Improvements to the flood control system shall be evenly scheduled during the various phases of development. The City's DAMP requires that increased surface flow due to increased impervious surfaces be minimized. The DAMP requires that BMPs be implemented in order to reduce increased runoff to stormdrains. The project proposed flood control facilities that will control runoff on-site. However, without proposed project drainage improvements a substantial increase in the rate or amount of surface runoff due to new development in localized areas may occur, resulting in flooding on- or off-site depending on the future proposed development, and it must be assured that proposed flood control facilities are implemented. The potential for flooding to occur on- or off-site as a result of future development of the project area is considered a significant impact.

Threshold 5: Create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff?

Base Plan and Overlay Plan

The "Regional Flood Control Master Plan for San Diego Creek" (John M. Tettner and Associates, April 1989) analyzed various drainage areas within the San Diego Creek watershed and provides a summary of proposed improvements within the watershed to accommodate the 100-year storm. Various components of the Master Plan have been implemented as projects within the drainage basin have been constructed. Construction of

the Foothill Transportation Corridor in the 1990's included construction of Bee Canyon Retarding Basin as well as the Round Canyon Retarding Basin. The Agua Chinon and Marshburn Retarding Basins have also been built. Improvements to the Marshburn Channel downstream of Trabuco Road to the I-5 Freeway were done in conjunction with the construction of the Eastern Transportation Corridor. These improvements were built on the basis of the 1989 Master Plan recommendations. The four retarding basins, located upstream of the El Toro Marine Base site, have dramatically restricted storm flows entering on to the base property.

As part of site planning for the reuse of the former MCAS El Toro, a hydrology study for the 100-year storm was prepared based on the Orange County Hydrology Manual (BV Engineering, March 2002). Design discharges were developed and compared against values found in the 1989 Master Plan report. The Orange County Unit Hydrograph method was used to generate peak flows for the sub-drainage areas. Table 5.7-3 provides a summary of the peak flows:

**Table 5.7-3
Summary of Peak Flows**

Channel	Subareas Designation	1989 Master Plan Report Peak Flows (cfs)
Marshburn	C30A	902
	C30C	168
	C30B	1084
	C31A	592
	C31B	480
Bee Canyon	L24A	1850
Chinon Channel	B19A	3076
Borrego Canyon	B14	5592

Source: BV Engineering, March 2002.

In order to address stormwater flows on the project site, a drainage concept plan has been prepared for the proposed project. Pipe locations and sizing, and proposed drainage channels were developed based upon anticipated runoff from various land uses so as to maintain and improve the existing level of flood control service. The proposed systems all drain into existing County of Orange regional facilities.

The backbone flood control system for the PA 51 and PA 30 components of the project area is based on proposed land uses and subsequent development potential. The proposed storm drain system is shown in Figure 5.7-2. The proposed storm drain system calculations were prepared assuming 25-year flows would be conveyed in the pipe with the streets carrying the incremental difference during a 100-year occurrence. The Orange County Hydrology Manual Rational Method was used to estimate peak runoffs in the systems. Storm runoff was estimated by applying appropriate runoff values for the various land uses in the site. The conceptual storm drain system, shown in Figure 5.7-2, takes into consideration and implements improvements identified in the Flood Control Master Plan for San Diego Creek. The drainage boundaries for each drainage facility identified in that master plan was maintained when the proposed system was analyzed.

Proposed Drainage System

The Orange County Flood Control District (OCFD) is the local governmental body with jurisdiction for flood protection in the San Diego Creek watershed. In 1989, flood control consultants John Tettemer and Associates produced a study of the San Diego Creek watershed areas that was converted into a Flood Control Master Plan (FCMP) and subsequently adopted by the Orange County Public Facilities and Resources Department (formerly the Orange County Environmental Management Agency), the Irvine Company, and the cities of Irvine and Tustin. The OCFD maintains the FCMP which specifies comprehensive flood control measures designed to protect the basin from a 100-year return interval storm event by identifying specific flood control improvements for the San Diego Creek watershed drainage channels and devices. The FCMP is currently being implemented in phases as development occurs in the watershed.

The proposed drainage plan for the project is based on an earthen open channel and landscaped drainage corridor (corridor) method. A typical "corridor" consists of a trapezoidal channel cross-section that is four to six feet deep and up to 500 feet wide with side slopes climbing at a rate of five to ten percent, depending on the location. A "strip" approximately 100 feet in width containing the streamline and the lowest portion of the side slopes is proposed to be protected by natural riparian plant types. Adjacent to the riparian strip, the corridor is proposed to be planted to the edges with a conventional landscaping palette.

The proposed improvements for each of the major drainage areas are described below:

Marshburn Channel. Under the proposed plan, the Marshburn Channel detention basin and Marshburn Channel will remain substantially unchanged and will continue to be owned and operated by the OCFCD. Under this arrangement, proposed on-site improvements will be restricted only to the extension of an existing 66" diameter pipe branch departing the main channel. Connecting to the Marshburn Channel in the southwest corner of the site, the new storm drain installation would capture runoff from the westerly most portion of the former base for conveyance to the main channel. In the future, off-site FCMP facilities may be constructed separately by other projects, however, off-site improvements are not proposed as part of this project. These improvements include 2,000 lineal feet of concrete box channel measuring nine feet wide by ten feet high serving as an inlet to the existing detention basin, 3,200 lineal feet of spiral ring pipe, measuring 120 inches in diameter used to supplement a similar pipe inlet to the existing detention basin, 1,400 lineal feet of reinforced concrete pipe measuring 96 inches in diameter to replace the existing collector channel adjacent to Irvine Boulevard, and 2,000 lineal feet of concrete box channel measuring 14 feet wide by six feet high to replace the existing trapezoidal section main channel adjacent to the Eastern Transportation Corridor between Irvine Boulevard and Trabuco Road. No additional downstream improvements are necessary since the existing channel discharge capacity is adequate to transmit tributary flow.

Bee Canyon Channel. Under the proposed plan, the Bee Canyon Channel, upstream of Irvine Boulevard, would remain substantially unchanged and would continue to be maintained by the present owner. Downstream (south) of Irvine Boulevard, in selected locations, the existing concrete box culverts and open channels would be demolished and replaced with the corridor cross-section and supporting internal culvert crossings, and storm drain laterals. The corridor measures approximately 10,200 feet in length. Further downstream, in the vicinity of the SCRRA railroad tracks, the new drainage corridor would reconnect to the existing Bee Canyon Channel. Continuing downstream, the channel would

cross the railroad and depart the project site via a reinforced concrete box measuring 12 feet wide by nine feet high that will be protected in place. No additional downstream improvements are necessary since the existing channel discharge capacity is adequate to transmit the tributary flow from the project.

Agua Chinon Channel. Under the proposed plan, the Agua Chinon Channel, upstream of Irvine Boulevard, would remain substantially unchanged and would continue to be maintained by the present owner. At Irvine Boulevard, the existing concrete box culvert crossing will be protected in place. Immediately upstream and downstream of the culvert location, the existing earthen channel will be improved with a riprap lining. Downstream from that location, the plan proposes selected demolition of the existing concrete box culverts and open channels and replacement with the corridor cross-section; and supporting internal culvert crossings and storm drain laterals. The corridor is approximately 8,000 feet in length. Further downstream, in the vicinity of the SCCRA railroad tracks, the new drainage corridor would reconnect to the existing Agua Chinon Channel. Continuing downstream, the channel would cross the railroad tracks and depart the project site via a reinforced concrete box measuring 12 feet wide by ten feet high that is proposed to be protected in place. No additional downstream improvements are necessary since the existing channel discharge capacity is adequate to transmit tributary flow.

Borrego Channel, Wildlife Corridor and Serrano Creek. The upstream reach of Borrego Channel east of Irvine Boulevard currently consists of a natural wash flowing down from the Santa Ana Mountains. Runoff flows beneath the intersection of Irvine Boulevard and Alton Parkway in a dual barrel culvert crossing which outlets to a trapezoidal section channel measuring 25 feet wide by six feet high, traveling 2,800 feet to the southwest. At the end of the trap channel section, the channel transitions into a vertical wall-reinforced concrete section measuring 25 feet wide by nine feet high. From there, the channel continues for approximately 4,000 lineal feet into the vicinity of the SCRRRA railroad tracks, where it curves to the northwest and transitions into a rock lined earthen channel. This rock-lined channel travels about 600 lineal feet to a point where it crosses the railroad tracks, ultimately discharging runoff downstream into an OCFCD regional drainage facility. No additional downstream improvements are necessary since the existing channel discharge capacity is adequate to transmit tributary flow.

Under the proposed project, the Borrego Channel would be modified to initially release upstream and later recapture downstream, low flow water rerouted out of the existing wash and into a new Wildlife Corridor (as described in Section 5.9 Biological Resources of this Final Program EIR). East of Irvine Boulevard, in the upstream reach of Borrego Wash, a concrete structure will be constructed to divert flow out of the wash streamline. From that point, a shallow channel would be constructed to convey the flow toward and through the existing Magazine Road tunnel below Irvine Boulevard to the entrance of the proposed Wildlife Corridor. Diverted flow will travel in the new corridor streamline to a downstream location in the vicinity of the SCRRRA railroad tracks near the Borrego Channel. At this location, Borrego Channel will be covered with a reinforced concrete roof span and buried below the earthen fill. Low flow runoff that is diverted from Borrego Wash into the wildlife corridor will arrive at this location, will cross over the buried Borrego Channel and flow toward a new catch basin inlet where it is recaptured and returned northwesterly to the rock lined section of the Borrego Channel via a storm drain lateral.

From the Magazine Road tunnel to the recapture inlet, the proposed wildlife corridor will be approximately 9,000 lineal feet and generally parallels Borrego Channel. It has a cross section and landscaping matching the descriptions previously given for depth, side slope, and ground cover. At the recapture inlet, intercepted low flow will be redirected to the northwest, while the wildlife corridor will continue southeasterly toward a connection to Serrano Creek. Along the southeasterly route, wildlife movement will be channeled through a proposed 15 foot wide by 12 foot high corrugated metal arch tunnel crossing below the SCRRA railroad. The tunnel will emerge on the southerly side of the railroad, where the corridor continues uncovered for 700 lineal feet to a second arch tunnel of a similar configuration. The second tunnel will be built to permit wildlife movement into the existing Serrano Creek Channel at the intersection of Barranca Parkway and Alton Parkway. Below the Barranca-Alton intersection, a triple ten foot high by ten foot wide reinforced concrete box culvert will allow wildlife movement to proceed south in Serrano Creek to the project boundary at the I-5 Freeway.

San Diego Creek. At the southerly most point of PA 30 is the San Diego Creek. It is an unimproved earthen channel that will be replaced with 1,000 lineal feet of buried storm drain conduit measuring 96 inches in diameter.

With recent improvements to upstream flood control facilities, the floodplain area has likely decreased and fewer areas of the project area are subject to inundation. The phasing of the flood control system improvements in PAs 51 and 30 will be coordinated with the street-phasing schedule so that the storm drains are installed prior to or in concert with road construction. Improvements to the flood control system shall be evenly scheduled during the various phases of development. However, without proposed project drainage improvements a substantial increase in the rate or amount of surface runoff due to new development in localized areas may occur, resulting in flooding on- or off-site depending on the future proposed development. This is considered a significant impact.

Threshold 6: Otherwise substantially degrade water quality?

Base Plan and Overlay Plan

Flood control conveyance and detention facilities that are proposed to be implemented during project buildout will comply with the requirements of the Basin Plan and decrease the project area contribution to sediment loading and toxic pollutants in downstream facilities and the receiving waters of Newport Bay.

The Irvine Ranch Water District (IRWD) is proposing installation of “natural treatment system” (NTS) basins that will capture and treat dry weather flow. The proposed system consists of NTS detention basins of varying dimension and capacity, selectively situated throughout the watershed. The basins will cleanse surface water by impounding low flow. As the impounded water in the basin accumulates, the “natural ecosystem process” works to remove sediments, nutrients, pathogens, and other contaminants from impounded flow. To address potential water quality issues as a result of proposed development under the plan, NTS basins (or equivalent) will be placed in or adjacent to the stream paths of the Bee Canyon, Agua Chinon, Serrano and San Diego Creek Channels and Marshburn Basin. The basins or equivalent will mitigate regional water quality impacts. Additionally, mitigation of on-site water quality impacts will be provided on the project site in accordance with the requirements of the NPDES program.

As per the requirements of the Regional Water Quality Control Board, proposed projects occurring upstream of or discharging into impaired waterbodies listed on the Clean Water Act Section 303(D) list may be subject to additional controls (specifically Total Maximum Daily Loads or TMDLs) pursuant to that regulation. Depending on the specific type of project proposed, these controls could include discharge prohibitions, revisions to discharge permits, or management plans to address water quality impacts. This is especially important in the Newport Bay watershed. At this program level of planning, the potential to degrade surface water quality is considered a significant impact.

Threshold 7: Would the project place housing within a 100-year flood hazard area as mapped on a federal Flood Hazard Boundary of Flood Insurance Rate Map or other flood hazard delineation map?

Base Plan and Overlay Plan

With recent improvements to upstream flood control facilities, the floodplain area has likely decreased and fewer areas of the project are subject to inundation. The exact boundaries of the 100-year floodplain in PA 51 and 30 is unknown at this time. The entire County of Orange Flood Insurance Rate Maps (FIRMs) are being revised by the Federal Emergency Management Agency (FEMA). At the request of the City of Irvine, the revisions will add the former MCAS El Toro to the FIRMs. When the FIRMs were originally prepared, Federal lands were not included, but are now being added as those lands change into non-Federal ownership. The revised FIRMs are due to be completed in the spring of 2003. Developers with property located in the newly delineated 100-year floodplain will be required to construct such improvements as necessary to remove the property from the 100-year floodplain and to prepare a Letter of Map Revision (LOMR) request to have the FIRMs revised to remove the development areas from the 100-year floodplain upon completion of the approved flood control facilities. The LOMR request is filed upon completion of design of the flood control improvements to contain or redirect the 100-year flood flows away from property. After the improvements are constructed, Record Drawings and a maintenance agreement with, or letter from, a public agency shall be submitted to FEMA to complete the LOMR process. The potential for placement of housing within a 100-year floodplain is low; however, at this program level of environmental review, this issue is considered significant. FEMA maps, or Flood Insurance Rate Maps (FIRMs) have not been prepared for the project area as the area is still currently federal property.

Project development is proposed in areas of PAs 51 and 30. Existing and proposed development within these areas could be subject to potential flooding associated with a 100-year frequency storm. This is considered a significant impact.

Threshold 8: Would the project place within a 100-year flood hazard area structures which would impede or redirect flood flows?

Base Plan and Overlay Plan

With recent improvements to upstream flood control facilities, the floodplain area has likely decreased and fewer areas of the project are subject to inundation. The exact location of the 100-year floodplain in PAs 51 and 30 is unknown at this time. During the site planning process for the project area the 100-year floodplain boundary shall be delineated in order to

accurately ascertain flood-prone areas and development constraints. The potential for the placement of structures within a 100-year floodplain is considered a significant impact. Updates to existing Federal Emergency Management Agency (FEMA) flood hazard maps may already have been processed as flood control improvements have been completed and will be reflected in future site plans. The City will coordinate floodplain delineation efforts with the Orange County Flood Control District and FEMA.

Project development is proposed in areas of PAs 51 and 30. Existing and proposed development within these areas could be subject to potential flooding associated with a 100-year frequency storm. This is considered a significant impact.

Threshold 9: Would the project expose people or structures to a significant risk of loss, injury or death involving flooding, including flooding as a result of the failure of a levee or dam?

Base Plan and Overlay Plan

The proposed project would not expose people or structures to a significant risk of loss, injury or death involving flooding, including flooding as a result of the failure of a levee or dam because there is not a levee or a dam in the vicinity of the project area. The impact to this issue is not considered significant.

Threshold 10: Would the project result in inundation by seiche, tsunami or mudflow?

Base Plan and Overlay Plan

The proposed project would not place people or structures in a location that would be adversely affected by a seiche, tsunami or mudflow. There is not a dam or levee in the vicinity of the project site that could result in a potentially harmful seiche or mudflow resulting from an earthquake. The project site is located far enough from the shoreline as to avoid the adverse affects of a tsunami. The impact to this issue is not considered significant.

5.7.4 Significant Impacts

Base Plan and Overlay Plan

H/WQ 1. Grading and excavation activities required for future development could result in the exposure of bare soils which could result in both wind and water-related erosion, and a significant water quality impact if not properly treated. Through buildout of the proposed project, wind and water related erosion has the potential to violate water quality standards or waste discharge requirements. This is considered a significant impact. Implementation of Mitigation Measures HW1 and HW2 will reduce the impact associated with the potential to violate water quality standards and waste discharge requirements to a level less than significant.

Additionally, a Storm Water Pollution Prevention Plan (SWPPP), Water Quality Management Plan (WQMP) will be prepared. A Notice of Intent (NOIs) for coverage of projects under the General Construction Activity Storm Water Runoff Permit will be submitted to the State Water Resources Control Board prior to issuance of grading permits in the project area. This requirement will be met to the satisfaction of the City Engineer for: a) any disturbance of one acre or more of soil in the project area; b) General Dewatering NPDES Permit of the Santa Ana RWQCB; and c) provisions of the Countywide Permit.

These measures will be implemented in accordance with local and State regulatory requirements. As future projects are planned, designed, and constructed in the project area, specific BMPs and other water quality control methods will be utilized to reduce water quality degradation in the Newport Bay watershed. Future projects in the proposed project area will acknowledge and implement those additional requirements that may be imposed by RWQCB in the future.

- H/WQ 2.** Improvements to the flood control system shall be evenly scheduled during the various phases of development. However, a substantial increase in the rate or amount of surface runoff due to new development may occur, resulting in flooding on- or off-site depending on the future proposed development. The potential for flooding to occur on-or off-site as a result of future development of the project area is considered a significant impact. Implementation of Mitigation Measure HW3 will reduce this impact to a level less than significant.
- H/WQ 3.** With recent improvements to upstream flood control facilities, the floodplain area has likely decreased and fewer areas of the project area are subject to inundation. The phasing of the flood control system improvements in PAs 51 and 30 will be coordinated with the street-phasing schedule so that the storm drains are installed prior to or in concert with road construction. Improvements to the flood control system shall be evenly scheduled during the various phases of development. However, a substantial increase in the rate or amount of surface runoff due to new development may occur, resulting in flooding on- or off-site depending on the future proposed development. This is considered a significant impact. Implementation of Mitigation Measure HW3 will reduce on- or off-site flooding due to surface runoff to a level less than significant.
- H/WQ 4.** As per the requirements of the Regional Water Quality Control Board, proposed projects occurring upstream of or discharging into impaired waterbodies listed on the Clean Water Act Section 303(D) list may be subject to additional controls (specifically Total Maximum Daily Loads or TMDLs) pursuant to that regulation. Depending on the specific type of project proposed, these controls could include discharge prohibitions, revisions to discharge permits or management plans to address water quality impacts. This is especially important in the Newport Bay watershed. At this program level of planning, the potential to degrade surface water quality is considered a significant impact. Implementation of Mitigation Measure

HW1 will reduce the impact of future development on surface water quality to a level less than significant.

Additionally, a Storm Water Pollution Prevention Plan (SWPPP), Water Quality Management Plan (WQMP), Notice of Intent (NOIs) for coverage of projects under the General Construction Activity Storm Water Runoff Permit will be submitted to the State Water Resources Control Board prior to issuance of grading permits in the project area. This requirement will be met to the satisfaction of the City Engineer for: a) any disturbance of one acre or more of soil in the project area; b) General Dewatering NPDES Permit of the Santa Ana RWQCB; and c) provisions of the Countywide Permit.

The Mitigation Measures will be implemented in accordance with local and State regulatory requirements. As future projects are planned and designed in the project area, specific BMPs and other water quality control methods will be utilized to reduce water quality degradation in the Newport Bay watershed. Grading or building permit applicants will be required to submit and obtain approval of a Water Quality Management Plan (WQMP) from the City of Irvine prior to issuance of the permits. The WQMP will specifically identify BMPs that will be used on-site to control predictable pollutant runoff. This WQMP shall identify, at a minimum, the routine, structural, and non-structural measures specified in the Countywide NPDES DAMP Appendix which details implementation of BMPs whenever they are applicable to a project, the assignment of long-term maintenance responsibilities (specifying the developer, parcel owner, maintenance association, leasee, etc.), and shall reference the location(s) of structural BMPs.

Future projects in the proposed project area will acknowledge and implement those additional requirements that may be imposed by RWQCB in the future. Compliance with these measures shall be verified by the Community Development Department.

- H/WQ 5.** Project development is proposed in areas of PAs 51 and 30. Existing and proposed development within these areas could be subject to potential flooding associated with a 100-year frequency storm. Mitigation Measure HW4 will reduce the impact of exposure of future residential development in the project area to a level less than significant.

5.7.5 Mitigation Measures

Base Plan and Overlay Plan

- H/WQ 1.** Prior to issuance of a grading permit, the applicant shall provide evidence that the development of the project area shall comply with City of Irvine adopted Grading and Water Quality Ordinances to ensure that the potential for soil erosion is minimized on a project-by-project basis. Specifically, the NPDES discharge permitting requirements to which the City is obligated will

ensure that construction activities reduce, to the maximum extent feasible, the water quality impacts of construction activities. The NPDES permit guidance states that "industrial/commercial construction operations that result in a disturbance of one acre or more of total land area . . . and residential construction sites that result in the disturbance of five acres or more . . . shall be required to develop and implement BMPs . . . to control erosion and siltation and contaminated runoff from the construction sites." Note: In March 2003 this provision will apply to residential construction sites that result in the disturbance of one acre or more.

The City's standard conditions of approval indicate that a Storm Water Pollution Prevention Plan (SWPPP) shall be prepared prior to the approval of grading permits for any project site in order to reduce sedimentation and erosion. The SWPPP shall include the adoption of erosion and sediment control practices such as desilting basins and construction site chemical control management measures.

Additionally, prior to the issuance of a grading permit, project applicants must submit, and the Director of Community Development or designee must have approved, a Water Quality Management Plan (WQMP). The WQMP must identify the Best Management Practices (BMPs) that will be used on the site to control predictable pollutant runoff after the site is occupied. Ongoing operations after construction would be subject to the Countywide Municipal NPDES Stormwater Permit, for which the City is a Co-Permittee. This WQMP shall identify, at a minimum, the routine, structural, and non-structural measures specified in the Countywide NPDES DAMP Appendix which details implementation of BMPs whenever they are applicable to a project, the assignment of long-term maintenance responsibilities (specifying the developer, parcel owner, maintenance association, leasee, etc.), and shall reference the location(s) of structural BMPs.

Also in accordance with standard City project permitting and approval procedures, Notices of Intent (NOIs) for coverage of projects under the General Construction Activity Storm Water Runoff Permit will be submitted to the State Water Resources Control Board prior to issuance of grading permits in the project area. This requirement will be met to the satisfaction of the Director of Community Development for any disturbance of one acre or more of soil in the project area. Also in force during the period of construction would be the General Dewatering NPDES Permit of the Santa Ana RWQCB, as well as the provisions of the Countywide Permit.

The Mitigation Measures will be implemented in accordance with local and State regulatory requirements. As future projects are planned and designed in the project area, specific BMPs and other water quality control methods will be utilized to reduce water quality degradation in the Newport Bay watershed. Future projects in the proposed project area will acknowledge and implement those additional requirements that may be imposed by RWQCB in the future. Compliance with these measures shall be verified by the Community Development Department.

- H/WQ 2.** Prior to issuance of a grading permit, evidence (e.g., in the form of a construction management plan) shall be provided that demonstrates that all stormwater runoff and dewatering discharges from the project area shall be managed to the maximum extent practicable or treated as appropriate to comply with water quality requirements identified in the Santa Ana Regional Water Quality Control Board Basin Plan, including Total Maximum Daily Load (TDML) Implementation Plan adopted for this watershed.
- H/WQ 3.** Prior to approval of the first tentative tract or parcel map in the project area, detailed hydrology studies and hydraulic analysis shall be conducted. Studies and analysis shall be prepared in accordance with OCFCD methodologies and standards and the Flood Control Master Plan for San Diego Creek, as well as any additional guidelines in effect at the time of project design. Recommendations contained in the hydrology studies and/or hydraulic analysis to address drainage/flooding issues related to proposed development shall be implemented. Compliance with this measure shall be verified by the Community Development Department.
- H/WQ 4.** Prior to issuance of a building permit, developers with property located in the newly delineated 100-year floodplain shall be required to construct such improvements as necessary to remove the property from the 100-year floodplain. Additionally, the developer shall prepare a Letter of Map Revision (LOMR) request to have the FIRMs revised to remove the development areas from the 100-year floodplain upon completion of the approved flood control facilities. The LOMR request shall be filed upon completion of design of the flood control improvements to contain or redirect the 100-year flood flows away from the property.
- After the improvements are constructed, Record Drawings and a maintenance agreement with, or letter from, a public agency shall be submitted to FEMA to complete the LOMR process.

5.7.6 Significance of Impacts After Mitigation

Base Plan and Overlay Plan

Less than significant.

5.8 Agricultural Resources

5.8.1 Environmental Setting

To assess potential impacts to agricultural resources, lands classified as agricultural land by the California Department of Conservation and any land in the project area that is currently used for agricultural production, zoned for agricultural use, or within a Williamson Act contract, must be identified.

Agricultural Classifications Within the Project Area

The California Department of Conservation, through the Farmland Mapping and Monitoring Program (FMMP) of the Division of Land Resource Protection defines classifications of agricultural lands as follows:

Prime Farmland: Land which has the best combination of physical and chemical features able to sustain long-term production of agricultural crops. This land has the soil quality, growing season, and moisture supply needed to produce sustained high yields. Land must have been used for production of irrigated crops at some time during the previous two map updates.

Farmland of Statewide Importance: Similar to Prime Farmland that has a good combination of physical and chemical features able to sustain long-term production of agricultural crops. This land has minor shortcomings, such as greater slopes or less ability to store soil moisture than Prime Farmland. Land must have been used for production of irrigated crops at some time during the two previous map updates.

Unique Farmland: Lesser quality soils used for the production of the state's leading agricultural crops. This land is usually irrigated, but may include non-irrigated orchards or vineyards as found in some climatic zones in California. This land is used for the production of specific high economic value crops such as oranges, olives, avocados, rice, grapes, or cut flowers. Land must have been cropped at some time during the two previous map updates.

Farmland of Local Importance: Land of importance to the local agricultural economy as determined by each county's board of supervisors and a local advisory committee.

The Orange County Board of Supervisors has not designated any farmland as being of "Local Importance." Table 5.8-1 shows the approximate acreages of the different FMMP agricultural classifications within the project area. The location of these farmland classifications is depicted in Figure 5.8-1.

Source: California Department of Conservation, Farmland Mapping and Monitoring Program, 2000.

* includes 55 acres on the Musick Jail Facility

Surrounding Agricultural Classifications

The project area is adjacent to unincorporated land within the City of Irvine's Sphere of Influence and incorporated areas of Irvine and Lake Forest. As shown in Figure 5.8-1, land to the north and west of the project area is identified as Prime Farmland, Farmland of Statewide Importance, and Unique Farmland by the FMMP. The remainder of existing agricultural land within the City of Irvine (including all of the existing agricultural land within the project site) is designated for urban uses, and agriculture is only designated as an interim use until the land is developed.

Orange County Agriculture Conversion

Table 5.8-2 depicts the conversion of agricultural land to non-agricultural uses within Orange County from 1998-2000. As depicted in this table, 10,127 acres of Prime Farmland, 763 acres of Farmland of Statewide Importance and 6,063 acres of Unique Farmland were inventoried in Orange County in 2000. Based on the County's total acreage, the lands identified by the FMMP for the project site as Prime Farmland, Farmland of Statewide Importance, and Unique Farmland comprise seven, 13, and one percent of the County's total acreage of these categories, respectively.

As can be seen in Table 5.8-2, a net loss of agricultural lands within Orange County occurred from 1998 to 2000. This trend is expected to continue as the increase in population continues to create pressure for new housing and employment opportunities.

Lands in Agricultural Production

Portions of the project area are within agricultural production. Specifically, portions of PAs 51 and 30 are currently leased for agricultural uses, and approximately 55 acres of PA 35 are used for agricultural production associated with the James A. Musick Jail operation. No agriculture is contained on the IRWD parcel.

Table 5.8-2
Orange County
Change In Land Use Summary

Land Use Category	Total Acreage Inventoried		1998-00 Acreage Changes			
	1998	2000	Acres Lost (-)	Acres Gained (+)	Total Acreage Changed	Net Acreage Changed
Prime Farmland	11,099	10,127	985	13	998	-972
Farmland of Statewide Importance	842	763	83	4	87	-79
Unique Farmland	6,259	6,063	264	68	332	-196
Farmland of Local Importance	0	0	0	0	0	0
Important Farmland Subtotal	18,200	16,953	1,332	85	1,417	-1,247
Grazing Land	38,518	37,964	660	106	766	-554
Agricultural Land Subtotal	56,718	54,917	1,992	191	2,183	-1,801
Urban and Built-Up Land	269,986	273,383	592	3,989	4,581	3,397
Other Land	181,770	180,174	2,351	755	3,106	-1,596

(1) Total area inventoried differs from previously reported acreage due to adoption of 1:24,000 digital county boundary file and conversion to Albers Equal Area Projection.

Williamson Act

All of the identified agricultural land within PAs 51 and 30 is currently in governmental ownership and is exempt from taxes; no agricultural land within the project area is currently covered by Williamson Act contracts. Williamson Act contracts with private landowners in the vicinity of the project area have been noticed for non-renewal by the landowners and all contracts have terminated as of July 1999.

City of Irvine Policies and Programs

Build-out of the City of Irvine and its Sphere of Influence in accordance with the General Plan would result in the conversion of open space, including agricultural land, to urban use. In the City of Irvine Comprehensive General Plan Update – Phase 2 and Zoning Ordinance Update – Phase VI Master EIR (State Clearinghouse #93-111034), this was considered a potentially significant impact.

In accordance with the policies and programs of the Conservation and Open Space Element, the General Plan Land Use Diagram designates large areas in the City and Sphere of Influence for permanent open space. Over time, as build-out of the City occurs, these lands will all be dedicated and placed in public ownership through the City's Phased Dedication and Compensating Development Program.

The City of Irvine General Plan includes as a stated objective the protection and preservation of agriculture in undeveloped areas until the areas are ready for development, or if the areas are not available for development (Objective L-10). In June 2002, the City of

Irvine amended General Plan Objective L-10 regarding the City's policies related to agriculture. The purpose of this amendment was to address the cumulative loss of agricultural resources in Irvine and Orange County as a whole. The revised amendment, as follows, shifted the emphasis from retention of agriculture for open space relief (which the community achieves through its Phased Dedication and Compensating Development Program) to a retention of smaller scale agricultural operations for heritage value.

Objective L-10: Agriculture

"Encourage the maintenance of agriculture in undeveloped areas of the City until the time of development, and in areas not available for development. "

Policy (a): Provide for farming opportunities in the community, where feasible and appropriate, through an Agricultural Legacy Program facilitating limited scale agricultural operations and programs on public lands. The program may include components such as edible landscape, metro-farming, heritage farming, model farming, education and community service farming and other farm or farm market programs. Locations for implementation of the Agricultural Legacy Program to be considered should, at a minimum, include:

- C Designated open space spine network
- C Designated open space areas not subject to the Natural Community Conservation Plan (NCCP)
- C Other appropriate publicly owned lands

Policy (b): Consider creating a "working model" farm to act as a center for education and enjoyment of all age groups pursuant to the Agricultural Legacy Program in conjunction with the City's planning efforts concerning the reuse of MCAS El Toro, or with the Couth Coast Research Extension owned by UC Regents.

Policy (c): Permit agricultural use of land which is unsuitable for building because it is within flood plains, or is subject to hazards to public health, safety, and welfare or similar constraints precluding development. Conversion from agricultural use may be allowed where the identified hazard conditions have been eliminated.

Policy (d): Permit agriculture uses, on an interim bases, on land designated for development, and consider agricultural uses as part of the City's planning efforts for the re-use of MCAS El Toro.

Policy (e): Encourage and support federal and state legislation proposed for the purpose of preservation of agricultural lands which are compatible with the City's goals and objectives.

Policy (f): Allow for conversion of interim and permanent agricultural uses to development to provide land for the construction of housing units consistent with the Land Use and Housing Elements, and the development of commercial and industrial buildings consistent with the provision of job opportunities as described in

the Land Use Element, where such conversion does not conflict with other L-10 policies.

Policy (g): Pursue the open space policies contained in the Conservation and Open Space Element and address any open space or aesthetic impacts from the conversion of interim and permanent agricultural uses to development as part of the City's existing policies for the preservation of open space and existing policies for mitigation of views and aesthetic impacts under the policies in the Conservation and Open Space Element.

PAs 51 and 30 are currently designated for a variety of urban uses in the City of Irvine General Plan. The jail and IRWD parcels are designated for Public Facilities. No portion of the project area is presently designated agriculture on the City's Conservation and Open Space or Land Use Element diagrams. However, this does not preclude agricultural use. In keeping with the policies above, the project encourages agriculture as an interim land use prior to development of the land.

Agricultural Legacy Program

The purpose of the Agricultural Legacy Program outlined in Policy L-10 is to facilitate limited scale agricultural operations and programs on public lands within Irvine. As part of the Agricultural Legacy Program, specific sites in Irvine will be made available for metro farming within the next five years. Metro farming generally includes small scale agricultural operations and activities that can be accommodated in an urban environment. Such activities could include, but not be limited to, small-scale specialty farming, model farming, heritage farming, and community service/educational farming. One example of a metro-farming operation is an Edible Landscape Program, a heritage farming operation involving Southern California Edison easements, where produce is grown within the public easements and sold by the farmer.

The City identified the following areas as having the soils and other qualities that make them candidates for metro-farming, subject to further evaluation:

- C Approximately 100 acres within Planning Area 6. These areas are currently proposed for development as part of the Northern Sphere Project, but may be made available for agricultural use.
- C Approximately 11 acres within the Jeffrey Open Space Spine south of Interstate 5, between Walnut Avenue and the railroad right-of-way.
- C Approximately 266 acres within Planning Area 16 (Implementation Districts G and H). Habitat sensitive agricultural operations could be considered within this area.
- C Approximately 51 acres within minor preservation areas P-10 and P-13.
- C Easements or public lands, including land within the former MCAS El Toro designated for agricultural uses in accordance with any re-use plan.

The Irvine Company and the City of Irvine are in the process of further evaluating potential sites to include in the Agricultural Legacy Program. Specific sites that may be suitable for implementation of the Agricultural Legacy Program, as well as Southern California Edison (SCE) easements/properties in general are currently being considered. The Draft Technical Memorandum for the Irvine Agricultural Legacy Program Preliminary Sites Assessment (City of Irvine November 26, 2002) identifies potential sites as well suited for inclusion in the Agricultural Legacy Program due to its soils, local and regional access, established nursery operations, and topography. Site 5 (SA-1 of the project area, which is a portion of PA 51) is included as a potential site for implementation of the Agricultural Legacy Program. Both the Base Plan and Overlay Plan propose Agriculture land use and zoning designations in this portion of PA-51.

In the past few years the City has been considering conversion of agricultural lands in three remaining areas of the City and its Sphere of Influence – the Northern Sphere, Spectrum 8, and the proposed project site. The City has examined the combined, or cumulative impact of the conversion of agricultural lands, and has also examined potential locations for agricultural land to be preserved as mitigation for some or all of the conversions of agricultural land considered in these areas. The City has also examined potential City-wide mitigation and fee programs for all of these conversions, and has concluded that it is not appropriate or feasible to preserve large scale agricultural operations, or to adopt a fee program designed to generate revenue to acquire agricultural lands elsewhere.

The City has adopted its Agricultural Heritage program which is designed to mitigate impacts on a City-wide basis as part of the City's implementation of General Plan Policy L-10 as amended in June 2002. Policy L-10 was intended by the City to apply throughout the City and its sphere areas. As part of its current proposed development plan for the Orange County Great Park, the City has designated agricultural land to be preserved, in addition to the land that would be included in the City's Agricultural Heritage program. Beyond these preserved areas, and looking at this issue on a combined basis, and in the context of each project, the City has determined that there are no additional areas within each of these areas that are suitable for agricultural preservation.

Long Term Viability of Large Scale Agricultural Production in Orange County

Even apart from the perceived potential for the conversion of agricultural uses to other uses due to development pressure, the long-term viability of agricultural production in Orange County in general continues to deteriorate. Factors that impact the viability of agricultural uses include: 1) the cost of land; 2) the cost of water; 3) the cost of labor; 4) property taxes; 5) the impact of urbanization; 6) competition; and 7) the impact of environmental regulation.

Land Value: Land prices in Orange County for raw land in the vicinity of the proposed project range from about \$600,000 to \$1,000,000 per acre, depending upon variables such as location, intended uses, existing infrastructure, existing land use entitlements, land constraints, and other issues. Agricultural production is considered not to be viable on any parcel valued at more than \$30,000-\$35,000 per acre, since a reasonable rent based on these land values would be prohibitive to a profitable agricultural operation. (See *Trends in*

Agricultural Land & Lease Values – 2001, California Chapter of the American Society of Farm Managers and Rural Appraisers, [<http://www.calasfmra.com>].

Water Costs: Irrigation water cost is a major component in determining the viability of agricultural operations. Irrigation water for existing agricultural tenants within the project area is approximately \$290 per acre foot. This water includes water purchased from the Irvine Ranch Water District and water transported from deep wells that produce water of sufficient quality for agricultural operations located in the western portion of the City and transported to the agricultural area in the northeast part of the City through a system of pipes and lift stations. This contrasts with water costs for growers in the major comparable growing areas in the Central Coast area, which includes Oxnard and Santa Maria, where the weighted average cost of agricultural surface water is \$128 per acre foot. On a regional basis, the South Coast Region, which includes Orange County, has by far the highest weighted average cost of agricultural water in the state at \$373 per acre foot. (California Department of Water Resources, California Water Plan, Bulletin 160-98, Appendix 4A)

Labor Costs: In general, an adequate labor supply is available for Irvine growers. The cost of labor is actually slightly lower for Irvine growers than in Oxnard and Santa Maria. Recently, however, growers have reported that agricultural workers are moving from the fields to higher paying warehouse, factory, and other support service jobs, which are becoming more plentiful as surrounding areas develop. Even so, the cost of labor for Irvine growers is higher in competitive markets outside of California where the minimum wage is lower. (US Department of Labor, Minimum Wage Laws in the States, [<http://www.dol.gov>].

Property Taxes: Since none of the agricultural areas are subject to Williamson Act contracts, property taxes in areas considered likely to convert to other uses reflect increasingly higher property values, subject to the constraints of Proposition 13. In other words, these areas are subject to high property taxes due to the high value of the land, making it difficult to obtain an economic return on the land from agricultural operations.

Urbanization: As land surrounding the current agricultural operations continues to develop, operational and economic constraints increase. These constraints include limitations on hours of operation, limits on chemical (pesticide and fertilizer) applications, required setbacks from adjacent non-agricultural uses, and clean up required due to the use of farm equipment on public roads. Growers also experience increasing acts of vandalism and crop theft due to adjacent urbanization. (Dr. Daniel Hagillhi, South Coast Research and Extension Center SCREC))

Competition: Increasingly, Oregon and other areas with lower production costs, such as Santa Maria and Oxnard, are also shifting to high cash crops. This shift has impacted the ability of Orange County farmers to overcome the high cost of agricultural activities in Orange County in the competitive market. In addition, competition from foreign growers is increasing considerably. Produce grown in Mexico, Chile, Argentina, and the Dominican Republic can be produced at dramatically lower costs due to cheap labor, availability of land and resources, a farm friendly environment, and the lack of regulatory requirements that are in California. The North American Free Trade Agreement (NAFTA), which calls for gradual removal of tariffs and trade barriers, is resulting in the easing of restrictions on the import of agricultural products, such as avocados, which will result in even greater competition. Mexico, for example, is by far the largest producer of avocados in the world.

(Food and Agriculture Organization of the United States, Statistical Data Base, Year 2000 Data)

Environmental Regulation: The regulation of agricultural activities is an increasingly significant cost for agricultural operations. Both the Clean Water Act and Clean Air Act, as administered through state agency regulations, increasingly affect agriculture, and particularly field crops. By way of example, under the Clean Air Act, the PM₁₀ rule affects the amount of suspended particulates from a field, just as that regulation applies to a construction project. Also, by way of example, the Clean Water Act requires states to adopt and implement water quality standards for water bodies in the state. The watershed within the project area drains into San Diego Creek and ultimately to the Upper and Lower Newport Bay. These water bodies have been classified as “impaired” under Section 303(d) of the Clean Water Act. Accordingly, the Regional Water Quality Control Board must adopt a Total Daily Maximum Load (TMDL) for these water bodies. The TMDLs must then be allocated between current and future dischargers into those bodies. TMDLs have been adopted for nutrients, sediment, and pathogens, and agricultural operators have been allocated TMDLs for these items. An additional TMDL is currently under development for toxicity, which will include agricultural chemicals.

5.8.2 Threshold For Determining Significance

The CEQA Environmental Checklist, Appendix G outlines the thresholds for determining significance for agricultural resources.

Would the project:

1. *Convert Prime Farmland, Unique Farmland, or Farmland of Statewide Importance to non-agricultural use;*
2. *Involve other changes in the existing environment, which due to their location or nature, could result in conversion of Farmland to non-agricultural use; or*
3. *Conflict with existing zoning for agricultural use, or a Williamson Act contract?*

5.8.3 Environmental Impact

The following analysis focuses on the potential impacts associated with implementation of the Base Plan and the Overlay Plan for the Former MCAS El Toro (PAs 51 and 30). The Musick Branch Jail and the IRWD parcels are a portion of the annexation component of the proposed project; however, no new development is proposed for these parcels under the proposed project. As a result, implementation of the proposed project will not result in a significant agricultural resources impact associated with the annexation of the James A. Musick Jail Facility and the IRWD Parcel.

Threshold 1: Would the project convert Prime Farmland, Unique Farmland, or Farmland of Statewide Importance to non-agricultural use?

Base Plan and Overlay Plan

A major component of the Orange County Great Park Plan is the preservation of agriculture within several areas of the property. Under the proposed Base Plan, 443 acres of land are proposed for an Agriculture land use. Of these 443 acres, a total of 370 of the approximately 1,053 acres of land classified as Prime Farmland, Unique Farmland, or Farmland of Statewide Importance will be preserved in perpetuity as agriculture. Interim agriculture will be allowed on another 121 acres of Prime Farmland and Farmland of Statewide Importance.

Under the proposed Overlay Plan, 307 acres of land are designated as an Agriculture land use. Of these 307 acres, 251 of the approximately 1,053 acres of land classified as Prime Farmland, Unique Farmland, or Farmland of Statewide Importance will be preserved in perpetuity.

Although the proposed project helps implement the Agricultural Legacy Program by proposing agricultural land uses in the portion of PA 51 that is identified by the Irvine Agricultural Legacy Program Preliminary Sites Assessment (City of Irvine November 26, 2002), both the Base Plan and Overlay Plan would result in the permanent loss of between 683 acres (under the Base Plan) and 802 acres (under the Overlay Plan) of land classified as Prime Farmland, Unique Farmland, or Farmland of Statewide Importance. This is considered a significant impact.

For a discussion of mitigation measures considered to reduce the significant impact associated with the conversion of Prime Farmland, Unique Farmland, or Farmland of Statewide Importance to non-agricultural uses, please see Section 5.8.5 Mitigation Measures of this Final Program EIR. This section discusses several mitigation measures determined to be infeasible and identifies feasible measures. Even with implementation of the feasible mitigation measures, the impact associated with conversion of land classified as Prime Farmland, Unique Farmland, or Farmland of Statewide Importance to non-agricultural uses is significant and unavoidable.

Threshold 2. Would the project involve other changes in the existing environment, which, due to their location or nature, could result in conversion of existing farmland to non-agricultural use?

Base Plan and Overlay Plan

While both the proposed Base Plan and Overlay Plans will result in the loss of some existing agriculture on-site, both plans would also preserve in perpetuity several large areas of farmland. Agriculture will continue to be allowed as an interim use, and portions of the property that are not currently used for any agricultural purposes may be converted to agriculture and utilized for agricultural production on an interim basis.

The project would not have a significant indirect effect of increasing development pressure and accelerating the loss of the remainder of the agricultural land in the surrounding area. Development pressure already exists in these surrounding lands as a result of newly constructed roadways that provide access to the area. Additionally, surrounding property owners have already submitted plans to develop the surrounding agricultural lands with a

variety of urban uses. Specifically, the recently approved 7,743 acre Northern Sphere Project, which is located directly to the north of the project area, allows a variety of residential, community commercial, commercial recreational, medical and science, institutional, multi-use, and recreation uses. The Northern Sphere Project also allows a minimum of four elementary/middle schools, and over 3,000 acres of open space. The 730-acre PA 40 (Spectrum 8), which is located directly to the west of the project area, proposes approximately 640 acres of General Industrial and Medical and Science development. An additional 21 acres of the site would be dedicated for recreational use along the Jeffrey Open Space Spine. Land uses to the east and south of the site are primarily developed.

However, a net decrease in farmland under cultivation in the project area may have an indirect consequent increase in agricultural production costs such as transportation and labor. Agricultural activities tend to be incompatible with urban and suburban neighbors because of factors such as dust, odors, pesticide use, and machinery noise associated with normal farming operations. Residential uses are proposed in the northern portion of the project area. Also, the Educational Use allows for lodging and housing. Inclusion of on-going agricultural operations in the City's standard disclosure notices would forewarn residents and occupants of new development in the project area of adjacent agricultural activities. This would offer some degree of protection to farmers from complaints and nuisance suits regarding activities that are part of normal agricultural operations. Please see Section 5.8.5 Mitigation Measures for a detailed discussion of mitigation measures considered, but determined to be infeasible, and feasible mitigation measures that will be implemented.

The conversion of agricultural land to urban uses is a long and continuing trend in Orange County. Although it is difficult to quantify the amount of agricultural land that is under development pressure within the County, it is unarguable that such pressure exists and will continue with or without implementation of the proposed project. In addition, The Irvine Company, the owner of the unincorporated lands within the City of Irvine Sphere of Influence adjacent to the project area, has development plans for this property (i.e., Northern Sphere and PA 40) and the long-term agriculture is not viable due to the reasons identified in the EIRs for the subject projects.

As a result, while there are existing pressures that would result in the conversion of agriculture within and adjacent to the project area with or without implementation of the proposed project, the project will result in a significant and unavoidable impact associated with the conversion of existing agricultural land to non-agricultural uses.

Threshold 3: Would the project conflict with existing zoning for agricultural use, or a Williamson Act contract?

Base Plan and Overlay Plan

As discussed above, no land within the project area is designated by the City of Irvine General Plan for agriculture, nor is it zoned for agricultural uses in the Irvine Zoning Code. As all agricultural land within the project area is located on government owned land, no Williamson Act contract exists for properties within the project area. Agricultural lands surrounding the project area which have been under Williamson Act contracts have been noticed for non-renewal, and as of July 1999 all of the existing Williamson Act contracts

have terminated. As a result, the proposed project will not conflict with existing zoning or an existing Williamson Act contract.

5.8.4 Significant Impacts

Base Plan and Overlay Plan

- Ag 1.** The project Base Plan will convert 574 acres of Prime Farmland, 63 acres of Unique Farmland, and 46 acres of Farmland of Statewide Importance to non-agricultural use. The Overlay Plan will convert 651 acres of Prime Farmland, 63 acres of Unique Farmland and 88 acres of Farmland of Statewide Importance to non-agricultural uses.
- Ag 2.** The project will involve changes in the existing environment, which, due to their location or nature, could result in conversion of existing farmland to non-agricultural use.

5.8.5 Mitigation Measures

Mitigation Measures Considered But Determined to be Infeasible

CEQA Section 21002.1(b) requires that “each public agency shall mitigate or avoid the significant effects on the environment of projects that it carries out or approves whenever it is feasible to do so.” The term “feasible” is defined by CEQA Section 21061.1 to mean “capable of being accomplished in a successful manner within a reasonable period of time, taking into account economic, environmental, social, and technological factors.”

A number of mitigation measures were considered for mitigating or avoiding the impact of the conversion of agricultural lands to other uses; however, no feasible mitigation measures are available that would reduce the impacts of the Base Plan or the Overlay Plan to a level less than significant. Potential mitigation measures considered include: the retention of agricultural land on-site; the purchase, set-aside, or transfer of development rights to preserve agricultural land elsewhere in the City or region, and assessing agricultural impact fees. The following is a brief discussion of the mitigation considered to attempt to reduce the impacts of the project to a level less than significant and the reasons why these measures were found to be infeasible.

Retention of Agricultural Uses

The encroachment of urban areas on agricultural lands is a long and continuing trend in Orange County. Although it is difficult to quantify the amount of agricultural land that is under development pressure within the County, it is evident that such pressure exists and will continue to exist with or without implementation of the project. The rising costs of irrigation water, increased land values, labor costs, and damage from vandalism have made

it difficult to maintain a successful large scale agricultural operation in the County. The conversion of agricultural land to urban uses is thus an important decisions that must ultimately be left to each local jurisdiction. The following describes actions considered by the City of Irvine to mitigate the loss of agricultural land.

Onsite Retention of Agricultural Uses

As discussed in subsection 5.8.1 *Environmental Setting* above, the City is working to establish an Agricultural Legacy Program, which is intended to address the local and regional loss of agricultural land. As part of this program, an initial assessment of candidate sites has been prepared (City of Irvine, November 26, 2002). Based on this preliminary assessment, several hundred acres of land will, within the next five years, be made available for metro farming, which may include such activities as specialty farming, model farming, heritage farming, and community service/educational farming. The proposed project helps implement the Agricultural Legacy Program on-site by proposing the OCGP General Plan designation and 1.1 Exclusive Agriculture Zoning designation on land within PAs 51 and 30, which will help retain on-site agricultural uses.

The retention of additional areas of the site in agricultural use is considered to be infeasible due to the constraints on the continued long-term viability of large scale agriculture in the area as discussed in the *Environmental Setting* subsection above. These constraints, particularly the economic constraints and constraints due to increased environmental regulation, will become greater over time. Despite any City actions to zone additional land for agricultural uses on-site, the City does not have the authority to require landowners to continue farming operations on land that is zoned for agricultural use. The retention of agricultural land use designations on the site will not, therefore, necessarily result in the continuation of agricultural uses. Moreover, a reduction in the development of the site would impede the City from achieving the voters' and the City's objectives for the site in a fiscally sound manner.

As noted above, the proposed project will retain a portion of the site in agricultural use, and agricultural uses may continue on other portions of the site until such time that development is to occur. These proposed long-term and interim uses, however, do not mitigate the significant impact of the conversion of significant farmland and existing agricultural land to non-agricultural uses.

Preservation of Agricultural Uses Citywide

The Irvine General Plan and the Phased Dedication and Compensating Development Opportunities Program will require the preservation of approximately 500 acres of land that has the soil quality and growing season that would otherwise qualify it as Significant Farmland.

Agricultural uses will continue on the South Coast Research and Extension Center SCREC site, which is owned by the University of California and is therefore not subject to many of the constraints on continued agricultural operations noted above. Land uses immediately adjacent to this facility should be planned with the continued agricultural operations at this

facility in mind. In addition, agricultural operations are currently occurring in open space areas or lands owned by utilities whose operations are compatible with continuing agricultural activities, such as utility corridors.

As discussed above, the City is working to establish an Agricultural Legacy Program, which is intended to address the local and regional loss of agricultural land. As part of this program, an initial assessment of candidate sites has been prepared (City of Irvine, November 26, 2002). All of the potential sites are undeveloped and most are currently available for agriculture. The topography, climate, and other factors associated with the sites make them conducive to growing a variety of crops. Based on the preliminary assessment of the candidate sites, several hundred acres of land will be made available for metro farming, which may include such activities as specialty farming, model farming, heritage farming, and community service/educational farming.

No other area of Significant Farmland within the City is planned for agricultural uses in the Irvine General Plan. The restriction of additional lands within the City for permanent and exclusive agricultural uses would be inconsistent with the goals and objectives of the Irvine General Plan. In addition, the same constraints on the continued viability of long-term, large-scale, agricultural production noted above with respect to the onsite preservation of agricultural uses would apply to these lands as well, regardless of the land use designation. Without some type of economic support or developed agreements, the mere designation of these lands for agricultural land uses will not ensure long-term agricultural operations.

Finally, even if it were feasible to preserve existing agricultural uses elsewhere in the City, the preservation of such uses would not result in the replacement of the agricultural land converted by the project. There is a finite amount of land suitable for agricultural production and there would still be a net reduction in Significant Farmland and land in agricultural production. The acquisition of fee title or conservation easements over off-site parcels would not, therefore, avoid, reduce, or compensate for the conversion of agricultural land to non-agricultural uses as a result of implementation of the project. At most, the acquisition might prevent the conversion of other farmland and agricultural uses as a result of other hypothetical future projects. This does not meet the requirement of a feasible measure as defined by CEQA.

Agricultural Impact Fees

Agriculture impact mitigation fees could be assessed against the project and used to purchase development rights in other areas so as to assure that permanent agriculture will be maintained. There are several programs that might be funded by impact fees.

The State Department of Conservation operates the California Farmland Conservancy Program, which provides grants to qualifying agencies for the acquisition of agricultural conservation easements. Establishing agricultural conservation easements involves purchasing deed restrictions on prime agricultural lands that preclude their use for development or non-agricultural purposes. The deed restriction would be permanent unless otherwise negotiated. The land under an easement remains in private ownership and use. Typically, restrictions imposed by an agricultural conservation easement limit residential, non-farm commercial, industrial, and extractive uses of the land. Deeds often allow construction of facilities for the production and processing of agricultural products. This

program does accept private contributions. Applications, however, must be made by public agencies such as a county or a city, or certain qualifying not-for-profit entities. The County of Orange and the City of Irvine have not participated in this program. No other agency in Orange County has been identified that participates in this program.

Also, the General Plan of the County of Orange contemplates an evaluation of the establishment of an Agricultural Preservation Program, which would use funds generated from the cancellation of agricultural preserves to fund grants, loans, research, and other programs relating to agricultural resources in an effort to mitigate the long-term impact of Williamson Act contract cancellations and to provide economic and technical support to County agricultural activities. The County has not yet initiated the evaluation of such a program, and has no plans to implement such a program (Northern Sphere EIR, December 2001).

Neither the City of Irvine nor the County of Orange has a fee mitigation program, nor has any specific local program been identified that might be funded by such an impact fee. To be successful, such a program would have to be implemented on a regional basis. In view of the lack of a regional fee mitigation program or any other program for the acquisition of development easements in the vicinity of the project, the imposition of a mitigation fee on a project-by-project basis is not considered to be feasible mitigation because it would not be capable of being accomplished within a reasonable period of time. Also, as is the case with the preservation of off-site agricultural resources, the preservation of existing agricultural resources by the acquisition of agricultural conservation easements would not prevent the net loss of significant farmlands and agricultural uses, and would not, therefore, mitigate the direct adverse effects of the project. Finally, the preservation of agricultural resources in the City of Irvine or even the County of Orange will not have a measurable impact on the availability of agricultural resources or agricultural production on a statewide or regional basis.

Since none of the potential mitigation measures are feasible, as discussed above, the impact related to the loss of agricultural land and significant farmland resulting from the implementation of the proposed project will remain significant and unavoidable.

Mitigation Measures Determined to be Feasible

Base Plan and Overlay Plan

Ag 1. In order to encourage agriculture as an interim land use pending development on the project site by warning future residents that they are buying or renting a house adjacent to existing agricultural operations, City Of Irvine Standard Discretionary Case Condition B.4 and City Of Irvine Standard Subdivision Condition 3.4 regarding disclosure statements shall be amended to include the following for subdivisions proposed adjacent to existing agricultural operations:

Prior to issuance of building permits, the applicant shall submit, and the Director of Community Development shall have approved, a completed occupancy disclosure form for the project. The approved disclosure form, along with its attachments, shall be included as part of the rental/lease agreement and as part of the sales literature for the project. The disclosure statement shall include the following information:

- C Continuation of agricultural operations adjacent to the site and their potential effects (spraying of pesticides, noise, dust, odor, etc.) on future residents or tenants.

Ag 2. Heritage and community service/educational farming operations shall be encouraged within utility easements and other lands. Heritage farming is defined as small-scale specialty farming operations that can be accommodated in an urban environment. An example would be the Edible Landscape project located adjacent to Harvard Avenue within the Edison right-of-way.

Ag 3. Future landowners and the City shall work cooperatively with farmers to minimize conflicts between agricultural operation and adjacent urban uses.

5.8.6 Significance of Impacts After Mitigation

Base Plan and Overlay Plan

Ag 1. Significant and unavoidable.

Ag 2. Significant and unavoidable.

Notes and References

None.

5.9 Biological Resources

The information contained in this section is summarized from the *Biological Technical Report of Findings for the Millennium Plan - Phase II* prepared by the Chambers Group, Inc. (October 1999). The document is on file at the City of Irvine.

5.9.1 Environmental Setting

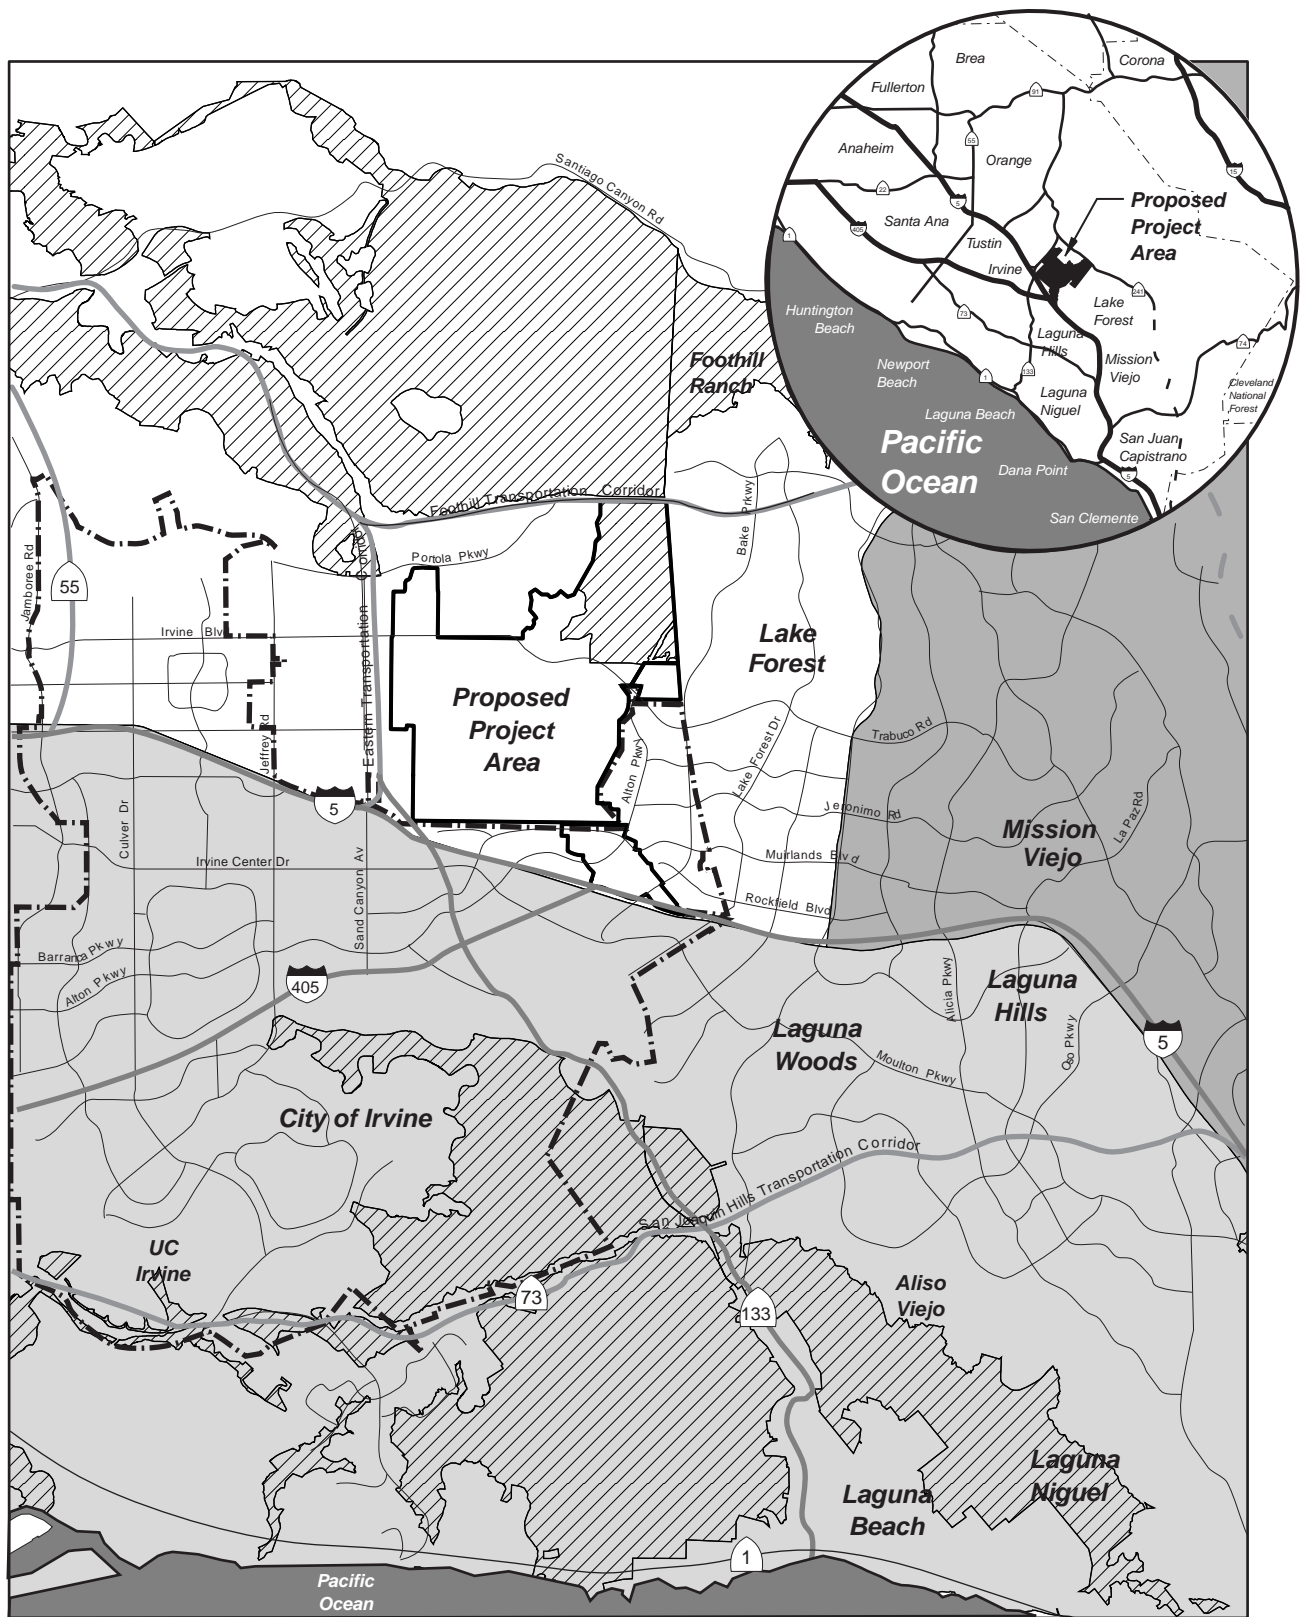

Former MCAS El Toro (PAs 51 and 30)

PAs 51 and 30 are relatively flat to moderately sloping terrain, with elevations ranging from approximately 220 to over 700 feet above mean sea level (MSL). Land uses contained on the former base consist mainly of airport runways, associated auxiliary aviation, military facilities, and housing areas. There is also a habitat preserve in PA 51, which consists of 995 acres, that has been used for military activities. The activities consisted of explosive ordinance demolition, magazine (ordnance storage), fuel storage, and pistol and archery ranges. A portion of the habitat preserve has been disturbed; however, the quality of the native habitats in the preserve is high and contains a number of special interest plant and wildlife species, including the California gnatcatcher, a species listed as threatened under the Federal Endangered Species Act.

The habitat reserve was identified for incorporation in the Orange County Central-Coastal Subregion Natural Community Conservation Plan/Habitat Conservation Plan (NCCP/HCP) Reserve. This is based on consideration of the proximity of the reserve to the Lomas de Santiago frontal slopes; the density of California gnatcatcher and coastal cactus wren, which are NCCP target species in the reserve; potential linkages to core habitat areas and other areas containing high NCCP target species concentrations; and the ability for practical management within the reserve system. Figure 5.9-1 depicts the project site in relation to the NCCP/HCP. The NCCP/HCP is discussed in more detail below.

The intent of the County's NCCP program is to provide long-term, regional protection of the natural vegetation and wildlife diversity, while allowing compatible land use and appropriate development and growth. The Central-Coastal Subregion NCCP/HCP program, which includes the former MCAS El Toro property, was adopted by the Orange County Board of Supervisors on April 16, 1996. The Plan went into effect on July 17, 1996, on execution of the Implementing Agreement by the participating landowners and public agencies and issuance of a Section 10(a) permit by the U.S. Fish and Wildlife Service (USFWS) and 2081 and 2835 management authorizations from the California Department of Fish and Game (CDFG) to the program participants.

Although areas outside the habitat preserve provide minimal native or undisturbed habitat, many of these areas do provide agricultural, ornamental, and domestic landscapes. Golf courses, agricultural fields, residential neighborhoods, and landscaped area around commercial buildings commonly support migrating and local native bird species.

Special Interest Biological Resources

Special interest species are species afforded special recognition by federal, State or local resource conservation agencies, organizations and/or jurisdictions. Special interest species include those listed as rare, threatened and/or endangered by resource conservation agencies such as the USFWS, CDFG, and the California Native Plant Society (CNPS).

In some cases, unlisted species considered sensitive by the scientific community or knowledgeable experts are included as special interest species. The special status of these species is generally due to limited, declining and/or threatened population sizes. The USFWS, CDFG, local agencies, and special interest groups such as CNPS publish “watch lists” of declining species; these lists often describe the general nature and perceived severity of the decline. In addition, recently published findings and preliminary results of on-going research provide a basis for consideration of species that are candidates for State and/or federal listing. Finally, species that are clearly not rare or threatened statewide or regionally, but whose local populations are sparse, rapidly dwindling or otherwise unstable, may be considered to be of “local concern.”

A sensitive species is considered as a potential inhabitant of the project area if its known geographical distribution encompassed part of the project area or if its distribution was near the project area and general habitat requirements of the species were present (such as the presence of roosting, nesting or foraging habitat, or a permanent water source). Furthermore, the potential for each species to occur in the project area was also assessed. The “potential for occurrence” ranking is based on the following criteria:

- C **Low potential for occurrence** - No recent or historical records exist of the species occurring in the project area or its immediate vicinity (within approximately five miles) and the diagnostic habitat requirements strongly associated with the species do not occur in the project area or its immediate vicinity.
- C **Moderate potential for occurrence** - Either a historical record exists of the species in the project area or its immediate vicinity (within approximately five miles) or the diagnostic habitat requirements associated with the species do occur in the project area or its immediate vicinity.
- C **High potential for occurrence** - Both a historical record exists of the species in the project area or its immediate vicinity (within approximately five miles) and the diagnostic habitat requirements strongly associated with the species do occur in the project area or its immediate vicinity.
- C **Species present** - The species was observed in the project area at the time of the survey on September 7, 1999 or in recent surveys.

Natural Community Conservation Program/Habitat Conservation Program (NCCP/HCP)

The State of California's NCCP pilot program is a cooperative effort to protect habitats and species. The program, which began in 1991 under the State's Natural Community Conservation Planning Act, is broader in its orientation and objectives than the California and Federal Endangered Species Acts (CESA, FESA). These laws are designed to identify and protect individual species that have already declined in number significantly. The primary objective of the NCCP program is to conserve natural communities and accommodate compatible land use. The program seeks to anticipate and prevent the controversies and gridlock caused by species' listings by focusing on the long-term stability of wildlife and plant communities and including key interests in the process.

The focus of the pilot program is the coastal sage scrub habitat of Southern California, home to the California gnatcatcher and approximately 100 other potentially threatened or endangered species. Because of its location on coastal plains and shallow slopes, urbanization and agricultural land conversion have disproportionately affected coastal sage scrub. This much-fragmented habitat is scattered over more than 6,000 square miles and encompasses large parts of three counties (Orange, San Diego, and Riverside) and smaller portions of two others (Los Angeles and San Bernardino). Fifty-nine local government jurisdictions, scores of landowners from across these counties, federal wildlife authorities, and the environmental community are actively participating in the program.

The Southern Coastal Sage Scrub NCCP region was approved in 1996 and established a 37,380-acre reserve system that includes significant areas of 12 major habitat types and covers 39 sensitive plant and animal species. The plan will guide habitat conservation and compatible land use over 209,000 acres of developed land and open space in two non-contiguous areas of Orange County (the Central and Coastal subregions, see below). The plan establishes a permanent reserve of about 38,000 acres of several types of habitat, including 19,000 acres of coastal sage scrub habitat. The NCCP region is organized into 11 planning "Subregions." For planning purposes, some of the Subregions are organized into "Subareas" that correspond to the geographic boundaries of participating jurisdictions or landowners. In each subregion and subarea, a local lead agency coordinates the collaborative planning process. Working with landowners, environmental organizations, and other interested parties, the local agency oversees the numerous activities that compose the development of a conservation plan. The CDFG and the USFWS provide the necessary support, direction, and guidance to NCCP participants in these functions.

Target and Identified Species

In 1996, the County of Orange approved the Central and Coastal Subregion NCCP/HCP and its associated Implementation Agreement. The NCCP/HCP designated the coastal California gnatcatcher, coastal cactus wren, and the orange-throated whiptail lizard as "Target Species," to be used as umbrella species to guide the design of a permanent habitat Reserve System to be created within the Central and Coastal Subregion. By providing long-term protection for the habitat required by the three "Target Species," sufficient coastal sage scrub (CSS) and other habitat would be protected to benefit a much broader range of CSS-related species. The NCCP/HCP also recognized "Identified Species" as those species that the NCCP/HCP addresses as if they were listed as endangered species under CESA or FESA.

Existing Use Areas or Special Linkage Areas

The Implementation Agreement defines “Existing Use Areas” as those areas with important populations of Identified Species but which are not included in the Reserve System and do not provide primary connectivity functions. Special Linkage Areas comprise areas that contain CSS, Target Species or provide connectivity functions between habitat areas within the Reserve System, between the Central/Coastal Subregion and other subregions, or between the Reserve System and outlying Identified Species populations such as those around Upper Newport Bay. Development within Special Linkage Areas is constrained by the Special Linkage Area provisions in the NCCP/HCP, including project design and open space requirements. The NCCP/HCP does not establish permanent commitments for the Existing Use Areas. However, significant portions of these areas contain Identified Species and these areas may serve to provide habitat for source populations in the event of declines of Identified Species within the Reserve System due to natural or other factors. Therefore, harming, harassing, modifying habitat or other activities prohibited by the Take provisions of FESA (“Take”) is not authorized in these areas under the NCCP/HCP Implementation Agreement. No Existing Use Areas or Special Linkage Areas are identified within the project area.

Protection, Mitigation, and Takings

The multiple-habitat Reserve System of the NCCP/HCP provides a diverse habitat mosaic within its boundaries. Inclusion of multiple habitat types provides significant levels of protection for a broad range of species beyond the “Target Species” that are dependent on both CSS and non-CSS habitats. In addition to protecting habitat for the “Target Species,” the Reserve System provides habitat for 36 other “Identified Species” at a level that justifies state and federal regulatory coverage under CESA and FESA. Included among these additionally covered species is the Peregrine falcon, a species that is currently listed as endangered by the USFWS.

The satisfactory implementation of the NCCP/HCP and its Implementation Agreement will adequately provide for the “conservation, protection, restoration, enhancement, and management of the Identified Species and their habitat in the Central/Coastal Subregion, and no additional mitigation for Identified Species will be required of Participating Landowners.” In addition, and specific to PAs 51 and 30, the Implementation Agreement provides that “neither USFWS nor CDFG shall seek to impose any mitigation requirements for impacts to the Identified Species or their habitat beyond those provided by the NCCP/HCP and this Agreement in connection with the reuse planning process for the former MCAS El Toro property. The mitigation measures and assurances provided in the Agreement shall be considered by USFWS and CDFG to serve as the basis for authorization of Take of any Identified Species on those portions of MCAS El Toro outside of the 1,033 acres designated for inclusion in the Reserve System.” In other words, implementation of the NCCP/HCP provides mitigation for adverse impacts to Identified Species (including Peregrine falcon) and no additional mitigation is necessary or can be required.

Habitat Preserve (Planning Analysis Zone 3)

As previously mentioned, the habitat preserve, as designated in the northeastern portion of the proposed project (Planning Analysis Zone 3), was identified for incorporation in the Orange County Central-Coastal Subregion NCCP/HCP Reserve System. The non-profit corporation, Nature Reserve of Orange County (NOC) was established for the management of the Reserve System as set forth in the Implementation Agreement. A “Fed to Fed” transfer (transfer from one federal agency to another) of the land in the habitat preserve has occurred and this area is under the control of the Federal Aviation Administration (FAA). It is anticipated that future management of the area by the Fish and Wildlife Service will occur. Following transfer, the El Toro National Wildlife Refuge (NWR) would be created. Establishment and management of the El Toro NWR would support the Orange County NCCP/HCP.

Vegetation Communities

A reconnaissance-level botanical survey was conducted on September 7, 1999, for PAs 51 and 30 to verify vegetation communities as delineated in the 1996 County of Orange EIR 563 and to determine the presence or potential presence of sensitive plant species and habitat.

Prior to the survey, the most recent records of the California Natural Diversity Database and the California Native Plant Society's Electronic Inventory of Rare and Endangered Vascular Plants of California were reviewed regarding the potential presence of threatened, endangered, candidate or other sensitive species in PAs 51 and 30. The database records are organized by U.S. Geological Survey (USGS) 7.5 minute topographic quadrangles. Records for the quadrangle containing the project area were searched.

Vegetation communities present within PAs 51 and 30 were consistent with those identified in EIR 563. Nine vegetation communities occur within PAs 51 and 30. These include Venturan-Diegan sage scrub, southern cactus scrub, chaparral, woodland, riparian scrub, grassland, open water, agriculture, and disturbed or developed. The disturbed or developed areas of the property have been severely impacted by past and present military and agricultural activities. The following discussions focus on the less disturbed habitat reserve part of the PA 51, as this is primarily where the native plant communities occur.

Venturan-Diegan Sage Scrub

This community can be defined as low, drought-deciduous and evergreen shrubs that occur on steep to moderate slopes mostly below 3,000 feet in elevation. It is considered a sensitive habitat due to its potential to support threatened and endangered species and has been acknowledged as such by its involvement in the NCCP. Four sub-communities occur in the reserve: sagebrush-black sage scrub, mixed scrub, sagebrush scrub, and bush mallow sage scrub.

Chaparral

Chaparral consists of evergreen, medium-height to tall shrubs, which commonly cover hills and low slopes of Southern California. This community is highly adapted to drought and fire conditions. Shrub canopy cover is generally continuous. California sagebrush and California buckwheat occur in the understory of the larger shrubs.

Woodlands

Woodland habitats consist of multi-layered vegetation with a canopy that is 20 to 80 percent tree cover. There are two types of wood lands in the habitat reserve, Mexican elderberry woodland and coast live oak woodland.

Riparian Habitats

Riparian habitats consist of trees, shrubs or herbs that occur along watercourses or water bodies.

Aquatic Habitat

The habitat reserve has three types of open water habitats: open water, ephemeral drainages and washes, and a freshwater swale. Most of these habitats are intermittent and do not contain standing water year round. Six drainages occur within the project area, including Marshburn Channel, Bee Canyon Channel, Agua Chinon Channel, Borrego Canyon Channel, Serrano Creek, and San Diego Creek. Limited amounts of mule fat scrub were found along the unchannelized portions of Borrego Canyon and Agua Chinon Channel. Serrano Creek exhibits hydrophytic vegetation and the appropriate hydrology to qualify as a wetland. The length of the creek between Muirlands Boulevard and the Santa Ana Freeway is proposed for channelization. Army Corps of Engineers (ACOE) jurisdictional wetlands were delineated within the project limits in San Diego Creek, scattered fragments along Borrego Canyon Channel south of the railroad tracks, and along Agua Chinon Channel south of the military housing. The vast majority of drainage courses within the project area are channelized and most are concrete-lined. Two blue-line drainages also occur along the southern boundary of PA 51 outside the habitat reserve.

Grasslands

Grassland consists of low herbaceous vegetation dominated by grasses. It grows in deep, well developed soils on gentle slopes and flats, mostly at low elevations. There are three types of grassland in the project area including native grassland, non-native annual grassland, and ruderal grassland.

Agriculture

Agricultural areas exist at several locations within PAs 51 and 30. The areas vary in size from less than one acre to about 290 acres. The largest area, 290 acres, is located in PA 30.

Disturbed/Developed

PA 51 has several locations that are disturbed/developed. They consist of urban, non-urban commercial, industrial and institutional, transportation, parks and ornamental, and cleared and graded areas. Also included in this category are the airport runways, hangars, and other related structures. There are also buildings constructed to support the Marines as well as open space and urban lawns.

Sensitive Plant Species

A sensitive species is considered a potential inhabitant if its known geographical distribution encompasses all or part of the project area or if its distribution is near the project area and general habitat requirements are present. The literature review resulted in a list of 20 special-status plant species with potential to occur within the project boundaries. A description of each of these species is included in Table 1 of the *Biological Technical Report of Findings for the Millennium Plan - Phase II* on file at the City. No federal or State listed or proposed endangered or threatened species were observed within PAs 51 and 30 during the survey on September 7, 1999.

Several sensitive plant species have the potential to occur within PAs 51 and 30. The prostrate spineflower has been observed within the habitat preserve, so is considered present. The southern tarplant, Palmer's grapplinghook, many-stemmed dudleya, Coulter's Matilija poppy, Catalina mariposa lily, and intermediate mariposa lily have a high potential to occur within PAs 51 and 30. The Coulter's saltbush, Laguna Beach dudleya, San Fernando Valley spineflower, and the Lewis's evening-primrose have a moderate potential for occurrence, while the Los Angeles sunflower, south coast saltscale, Santa Monica Mountains dudleya, heart-leafed pitcher sage, coast wooly-heads, slender-horned spineflower, Santa Barbara morning glory, tecate cypress and salt spring checkerbloom have a low potential for occurrence.

Mature Trees

No formal inventory has been performed; however, the project site contains a large number of mature trees. According to the Orange County Register (July 15, 1998. "Growing Awareness"), tree species include elm, oak, magnolia, carobwood, jacaranda, pepper, palm, and pink-flowered Laguneria pattersoni. The cost to purchase trees of similar age and condition (if they could be found) has been estimated at one million dollars or more. These trees also provide wildlife habitat in the disturbed portions of the project site.

Wildlife

Biological resources for wildlife are primarily found in the native habitats in the habitat preserve (Subarea 3) and the non-native habitats in the agricultural areas. The habitat preserve area includes high quality wildlife habitat, providing a wide variety of native vegetation, topographical conditions, and water that supports large numbers of wildlife species. Habitat in the agricultural areas is generally of low quality, consisting of homogeneous plantings of crops that lack diversity, are subject to pesticide and herbicide usage, and undergo periodic disturbance from plowing. Disturbed and developed areas

provide very little wildlife habitat value. However, agricultural fields, habitat preserve, and open grasslands do provide suitable foraging habitat for a number of raptor species, including the Swainson's hawk.

No amphibian was observed within PAs 51 and 30 during the surveys. However, a portion of the PAs 51 and 30 follows the course of the Borrego Canyon Wash and most likely supports common species such as the California chorus frog, western toad, and Pacific tree frog. One reptilian species, the western fence lizard, was observed during the surveys. Reptiles that have the potential to occur within the project area include the western whiptail, gopher snake, and side-blotched lizard.

Bird species observed during the site visit on September 7, 1999, included the mourning dove, red-tailed hawk, common raven, great egret, Anna's hummingbird, common yellowthroat, burrowing owl, song sparrow, killdeer, and turkey vulture. Local birds that utilize the local waterways, such as the snowy egret, black-crowned night-heron, and American coot are also likely to exist in PAs 51 and 30.

Two mammals, the California ground squirrel and the desert cottontail, were observed during the surveys. Bat vocalizations and guano were observed in a crevice in the ceiling of the I-5 freeway culvert, but identification of the bat species could not be determined at the time of the survey. Coyote tracks were observed within the wash at the northeast and southwest ends of the proposed wildlife corridor (discussed below).

Sensitive Wildlife Species

One sensitive wildlife species, the burrowing owl, was observed at the southwest end of the PAs 51 and 30 along Serrano Creek. Forty other sensitive wildlife species or species of local concern have the potential to occur within PAs 51 and 30. The biological technical report available at the City provides a description of federal- and State-listed endangered or threatened, State and FSOC species, and otherwise sensitive wildlife species that occur or have the potential to occur within PA 51 and 30.

Several sensitive wildlife species have the potential to occur within PAs 51 and 30. The western spadefoot, San Diego horned lizard, orange-throated whiptail, coastal western whiptail, Cooper's hawk, sharp-shinned hawk, ferruginous hawk, Swainson's hawk, northern harrier, white-tailed kite, prairie falcon, burrowing owl, California horned lark, coastal cactus wren, coastal California gnatcatcher, loggerhead shrike, Southern California rufous-crowned sparrow, grasshopper sparrow, Bell's sage sparrow, northwestern San Diego pocket mouse, and San Diego desert woodrat have been observed within PAs 51 and 30, so are considered present. The northern red diamond rattlesnake and red-shouldered hawk have a high potential to occur within PAs 51 and 30. The Riverside fairy shrimp, San Bernardino ringneck snake, coastal boa, merlin, peregrine falcon, southwestern willow flycatcher, least Bell's vireo, and yellow-breasted chat have a moderate potential for occurrence, while the quino checkerspot butterfly, arroyo southwestern toad, Coronado skink, southwestern pond turtle, golden eagle, and pacific pocket mouse have a low potential for occurrence. While not considered sensitive species, the San Diego black-tailed jackrabbit and coyote are present within PAs 51 and 30, and the southern grasshopper mouse and gray fox have a moderate potential to occur.

Habitat Linkages and Wildlife Corridors

Wildlife movement corridors are of substantial importance to the viability of regional planning efforts to obtain habitat linkages. The fragmentation of open space areas by urbanization creates isolated "islands" of wildlife habitat. In the absence of habitat linkages that allow movement to adjoining open space areas, some wildlife species, especially the larger and more mobile mammals, will not likely persist over time because they prohibit the infusion of new individuals and genetic information. Corridors mitigate the effects of this fragmentation by (1) allowing animals to move between remaining habitats, which allows depleted populations to be replenished and promotes genetic exchange; (2) providing escape routes from fire, predators, and human disturbances, thus reducing the risk that catastrophic events (such as fire or disease) will result in population or local species extinction, and (3) serving as travel routes for individual animals as they move within their home ranges in search of food, water, mates, and other needs.

Currently, the project area does not serve as a significant wildlife movement corridor between the habitat preserve and the coastal habitat preserves. Various agencies and organizations desire to establish a wildlife corridor between the Lomas Ridge and the San Joaquin Hills. Public agencies include the City of Irvine, the County of Orange, the U.S. Army Corps of Engineers, USFWS, and CDFG. This effort is also supported by various organizations, including the Laguna Canyon Foundation, The Irvine Company, and The Nature Conservancy.

Recognizing the environmental benefit for a wildlife corridor within the project area, a wildlife corridor is included in the proposed project. Figure 3-5 depicts the location of the proposed wildlife corridor. Wildlife sign (tracks, scat) and evidence of movement was found along both ends of the proposed corridor, including Serrano Creek and the I-5 undercrossing. Currently, these areas do not lead to additional wildlife habitat areas, but rather dead end into concrete channels and paved streets. The agricultural fields are the final destination of wildlife movement using these areas. The agricultural fields dead-end into Alton Boulevard and no evidence of movement along the concrete portion of Serrano Creek was observed. By definition, a corridor is a linear habitat whose primary wildlife function is to connect significant habitat areas. Therefore, by definition no wildlife corridor currently exists within the project area.

Wildlife Corridor Concept Plan

The Wildlife Corridor Concept Plan is designed to implement the draft Special Area Management Plan (SAMP)/Master Streambed Alteration Agreement (MSAA) policies for the El Toro Plan Area of the San Diego Creek Watershed. These guiding policies allowed for implementation of the SAMP/MSAA. Development within the El Toro area must be consistent with these policies in order to comply with the SAMP/MSAA. The SAMP/MSAA objective within the El Toro area is to support the delineation of specific habitat corridor linkages and aquatic habitat preservation/restoration areas.

Proposed Wildlife Corridor Vegetation and Wildlife

As part of the wildlife corridor feasibility study a vegetation and wildlife survey was completed for the proposed wildlife corridor. The following summarizes the findings.

As described in Section 3.0 – Project Description the project includes the development of a wildlife corridor where one currently does not exist (see the Environmental Impact discussion).

Wildlife is dependent on the biological resources found primarily in native habitat areas. Currently, most of the native habitat along the corridor is within the El Toro National Wildlife Reserve (NWR) and the Needlegrass Creek Conservation Area. Native vegetation can also be found along natural drainages found within the planning area, but those resources are not as significant as the El Toro NWR and Needlegrass Creek Conservation Area.

The El Toro NWR, located at the northern end of the wildlife corridor, is characterized by high quality wildlife habitat providing a wide variety of native vegetation, topographical conditions, and water that support large numbers of wildlife species. According to the Chambers Group report, an assortment of wildlife species were observed in this area, summarized in the following paragraphs.

Birds

Bird species observed included the morning dove, red-tailed hawk, common raven, great egret, Anna's hummingbird, common yellowthroat, burrowing owl, song sparrow, killdeer, and turkey vulture. Birds that utilize local waterways, such as the snowy egret, black-crowned night-heron, and American coot are also likely to occur onsite. Two red-tailed hawk nests were observed in large sycamore trees within the El Toro NWR.

Two focused surveys completed in 1996 and 1998 for the least Bell's vireo and southwestern flycatcher observed a total of four territorial male least Bell's vireo located within San Diego Creek, south of Irvine Center Drive. No southwestern willow flycatchers were located within this area. The survey also recorded several sensitive avian species including the yellow-breasted chats, yellow warblers, black-shouldered kites, sharp-shinned hawks, Cooper's hawk, and red shouldered hawks.

Mammals

Two mammals, the California ground squirrel and the desert cottontail, were observed during the survey. Bat vocalizations and guano were also observed in a crevice in the ceiling of the 1-5 culvert. The bats were not visible and identification of the species could not be determined at the time of the survey. Coyote tracks were also observed within the wash at the northeast and southwest ends of the proposed wildlife corridor.

Amphibians

Veeh Creek contains suitable habitat for the pacific pond turtle, however no evidence of this species has been found or recorded.

Sensitive Wildlife Species

Over 30 sensitive wildlife species have the potential to occur in the project area. "Sensitive" means any wildlife species native to the state of California that is vulnerable or declining and is likely to become endangered or threatened in a significant portion of its range within the state without cooperative management or removal of threats. The San Diego black-tailed jackrabbit and coyote are present, and the southern grasshopper mouse and gray fox have a moderate potential to occur.

Vegetation Communities

An investigation of existing vegetation communities was performed in 1999 to determine the presence or potential presence of sensitive plant species and habitat. Existing vegetation presents important opportunities, as it is used by wildlife for food, habitat, shelter, and protection from predators.

Nine vegetation communities were observed within the former MCAS El Toro site, many located within the El Toro NWR. They include Venturan-Diegan sage scrub, southern cactus scrub, chaparral, woodland, riparian scrub, grassland, open water, agriculture, and disturbed or developed land.

The disturbed or developed areas correspond to the former MCAS El Toro property, (not including the El Toro NWR). The following briefly describes the nine vegetation communities.

Venturan-Diegan Sage Scrub can be defined as low-drought-deciduous and evergreen shrubs that occur on steep to moderate slopes mostly below 3,000 feet in elevation. It is considered a sensitive habitat due to its potential to support threatened and endangered species. Four sub-communities occur in the El Toro NWR: sagebrush-black sage scrub, mixed scrub, sagebrush scrub, and bush mallow sage scrub.

Chaparral consists of evergreen, medium-height to tall shrubs, which commonly cover hills and slopes of Southern California. This community is highly adapted to drought and fire conditions. Shrub canopy cover is generally continuous. California sagebrush and California buckwheat occur within the understory of larger shrubs.

Woodland vegetation consists of multi-layered vegetation with a canopy that is 20 to 80 percent tree cover. There are two types of woodlands in the El Toro NWR, Mexican elderberry woodland and coast live oak woodland.

Riparian vegetation consists of trees, shrubs, or herbs that occur along intermittent and perennial waterways. It is also essential for maintaining high quality in streams and rivers.

Three types of aquatic habitat are found in the El Toro NWR: open water, ephemeral drainages and washes, and a freshwater swale. Most of these habitats are intermittent and do not contain standing water year-round. Two blue-line streams also exist along the southern boundary of the former marine base outside the El Toro NWR.

Grasslands consist of low herbaceous vegetation dominated by grasses. They thrive in deep, well developed soils on gentle slopes and flats, mostly at low elevations. Three types of grassland are found in the area: native grasslands, non-native annual grasslands, and ruderal grasslands.

Agricultural areas exist primarily south of the El Toro NWR near Musick Jail, and within Planning Area 30 (290 acres).

The El Toro Natural Wildlife Reserve is composed of primarily scrub, chaparral, and grassland vegetation communities. Riparian habitat is prevalent along the existing intermittent streams and creeks. A large portion of the reserve is disturbed due to prior MCAS El Toro activities.

Areas south of the El Toro NWR are primarily disturbed and developed. They consist of commercial, industrial, institutional, transportation, parks, ornamental, cleared, and graded areas. Also considered in this category are the airport runways, hangars, and other related structures. There are also buildings constructed to support former Marine operations as well as open spaces and urban lawns. Agriculture can be found along Irvine Boulevard just west of Alton Parkway and throughout the panhandle area.

The Spectrum 5 project area is primarily disturbed or developed but also contains riparian woodlands found adjacent to all the drainage channels within this area. Riparian woodlands can be found along San Diego Creek downstream from Irvine Center Drive, Veeh Creek, and an unnamed tributary to Veeh Creek. Willow and mulefat are commonly found in the riparian woodland corridors. Minor sections of the riparian area include emergent vegetation such as cattail, and several acres along Veeh Creek contain strands of the alien grass species known as giant reed.

Sensitive Plant Species

Several sensitive plant species may potentially occur within the project area. Only the prostrate spineflower has been observed onsite.

Habitat Areas

Three types of wildlife habitat exist in the project area that are known to provide ample resources for wildlife: Annual grasslands, coastal sage scrub and riparian.

Annual Grassland habitat occurs mostly on flat plains to gently rolling hills and can be found primarily in the El Toro NWR. Annual grassland can also be found southeast of the wildlife corridor where new development has not occurred. Many wildlife species use annual grasslands for foraging, but some require special habitat features such as cliffs, caves, ponds, or habitats with woody plants for breeding, resting, and escape cover. A variety of reptiles, mammals and birds depend on annual grassland for their habitat.

Coastal Scrub can be found on flat terraces and moderate slopes. California sagebrush, purple sage and California buckwheat are common vegetation species found in southern sage scrub, a subtype of coastal scrub found primarily in Southern California (Santa Barbara

to Orange County). Little is known about the importance of coastal scrub habitat to wildlife, however, the black-tailed gnatcatcher is found extensively within this habitat.

Riparian Habitat is a combination of plant species that thrive along intermittent and perennial waterways. These waterways include Serrano Creek, Borrego Wash, San Diego Creek and Veeh Creek. Riparian habitats are considered among the most valuable habitats for wildlife because of the presence of water, lush vegetation, and high insect populations. Less disturbed riparian areas support a wide variety of wildlife, including amphibian, reptile, bird, and mammal species.

A component of the proposed Spectrum 5 project includes the natural river management concept (NRMC). The NRMC allows flood protection while providing for natural habitat. There are approximately 26 acres of riparian habitat that will be preserved downstream of Irvine Center Drive within the San Diego Creek and approximately 3.4 acres of riparian habitat will be preserved upstream of Irvine Center Drive. The created habitat will provide the same quality of riparian habitat as the existing habitat. The NRMC will be extended north to other areas within the corridor through projects proposed in this plan.

5.9.2 Threshold For Determining Significance

The CEQA Environmental Checklist, Appendix G outlines the thresholds for determining significance for biological resources:

Would the project:

1. *Have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Game or US Fish and Wildlife Service?*
2. *Have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations or by the California Department of Fish and Game or US Fish and Wildlife Service?*
3. *Have a substantial adverse effect on federally protected wetlands as defined by Section 404 of the Clear Water Act (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption or other means?*
4. *Interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors or impede the use of native wildlife nursery sites?*
5. *Conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance?*
6. *Conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional or State habitat conservation plan?*

An evaluation of impacts using these criteria must consider the resource and its extent and distribution on a local and regional basis. For example, the permanent loss of an important resource, such as a population of a rare plant, would be considered a substantial impact. A determination of significance would depend on the degree to which the loss was substantial on a local or regional basis.

5.9.3 Environmental Impact

The following analysis focuses on the potential biological impacts associated with implementation of the Base Plan and the Overlay Plan for the Former MCAS El Toro (PAs 51 and 30). The Musick Branch Jail and the IRWD parcels are a portion of the annexation component of the proposed project; however, no new development is proposed for these parcels under the proposed project. EIR No. 564 was prepared by the County of Orange for the jail expansion and did not identify any potential impact to biological resources that may result from the proposed jail expansion. As a result, implementation of the proposed project will not result in a significant biological resources impact associated with the annexation of the James A. Musick Jail Facility and the IRWD Parcel.

Threshold 1: Would the project have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive or special status species in local or regional plans, policies or regulations, or by the California Department of Fish and Game or US Fish and Wildlife Service?

Base Plan and Overlay Plan

Coastal sage scrub is considered sensitive in regards to the habitat it provides for the California gnatcatcher, and due to the decline of this habitat in the region. The majority of the habitat preserve consists of coastal sage scrub and will be protected in perpetuity; however, small portions of the habitat preserve, such as the EOD (bomb disposal area) may probably be reconveyed to other agencies (the Federal Bureau of Investigation, in the case of the EOD) and will not be part of the wildlife refuge. These actions are not a component of the proposed project, and would need to be evaluated in terms of potential environmental effects, by the federal agency proposing the action.

No federally-listed plant species was observed within PAs 51 and 30 during the surveys. Several species of concern have a high potential to occur within the project limits. Only the habitat preserve portion of the project site contains suitable habitat for the identified sensitive plant species, with the exception of the southern tarplant. Because the habitat preserve portion of the site will remain intact, as proposed by the project under both the Base Plan and the Overlay Plan, development of the remaining portion of the site is not expected to impact these plant species. However, the southern tarplant, a federal species of concern, may be affected by development of the site. Although this species has a high potential to occur in the disturbed portions of the site, presence of this plant is undetermined, as focused sensitive plant species surveys have not yet been conducted. Such focused sensitive plant species surveys will be conducted prior to development of the site. If subsequent surveys identify this species in an area proposed for development, it may be

possible to modify the project to avoid impacts. Otherwise mitigation will be negotiated through consultation with USFWS and CDFG.

No federally-listed endangered wildlife species was observed within PAs 51 and 30 during the surveys of the project site. Two federally-listed threatened species, the California gnatcatcher and Swainson's hawk, were observed within the project area during previous surveys. The California gnatcatcher is limited to the coastal sage scrub habitat which will be preserved within the habitat preserve in PA 51, as discussed below. This species is covered under the Central-Coastal subregions of the Orange County NCCP/HCP. Because the portion of the habitat reserve conveyed to the FAA will be managed in compliance with regulations set forth by the NCCP/HCP, the potential impact to this species is considered to be less than significant.

The habitat reserve and non-native grassland within the project site serve as moderate to high quality raptor foraging habitat. Raptors that may be affected by loss of foraging habitat include the red-tailed hawk, northern harrier, turkey vulture, white-tailed kite, American kestrel, prairie falcon, merlin, peregrine falcon, ferruginous hawk, and Swainson's hawk. The Swainson's hawk has been observed foraging around the project area. The agricultural fields serve as low to moderate quality raptor foraging habitat (depending on the type of crop that is planted). Development of the site will result in the loss of some of the available raptor foraging habitat. Development of the site will not affect the 995-acre habitat reserve which comprises the southern extension of the NCCP habitat reserve. Due to the proximity of the site to the large amount of additional raptor foraging grounds, including agricultural fields, open space, and the 39,000-acre NCCP habitat reserve, impacts to raptor foraging habitat are not considered significant. In addition, under the Base Plan, low to moderate quality foraging habitat (comparable to the existing agricultural fields) in the form of the approximately 576 acres of proposed golf course, 716 acres of parkland, 438 acres of agriculture, 179 acres of wildlife corridor, and 229 acres of drainage/riparian corridor (2,138 acres total) will be available after the completion of the project. Under the Overlay Plan, low to moderate quality foraging habitat (comparable to the existing agricultural fields) in the form of the approximately 526 acres of proposed golf course, 382 acres of parkland, 303 acres of agriculture, 179 acres of wildlife corridor, and 229 acres of drainage/riparian corridor (1,619 acres total) will be available after the completion of the project.

Several federal- and state-listed wildlife species of concern were observed within the project limits. A number of these species were found within the limits of the habitat preserve and are covered under the Central/Coastal NCCP. However, no formal protection for these species exists under the Endangered Species Act, therefore, the impact to these species is not considered significant.

Threshold 2: *Would the project have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations or by the California Department of Fish and Game or US Fish and Wildlife Service?*

Base Plan and Overlay Plan

Coastal sage scrub is considered sensitive in regards to the habitat it provides for the California gnatcatcher, and due to the decline of this habitat in the region. The majority of

the land within PA 51 designated for habitat preserve consists of coastal sage scrub and has been conveyed to the FAA and will be protected in perpetuity as a portion of the NCCP/HCP; however, small portions of the habitat preserve, such as the EOD (bomb disposal area), have been and may continue to be reconveyed to other agencies (the Federal Bureau of Investigation, in the case of the EOD) and will not be part of the wildlife refuge. These non-open spaces uses could significantly impact the coastal sage scrub. The City of Irvine does not have control over whether the federal government will convey portions of the habitat preserve to governmental agencies for uses other than habitat preserve. In the event that the federal government does convey portions of the habitat preserve for non-habitat preserve uses, the federal government will be responsible for evaluating the significance of the potential impacts, and mitigating them to a level less than significant.

Threshold 3: *Would the project have a substantial adverse effect on federally protected wetlands as defined by Section 404 of the Clean Water Act (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption or other means?*

Base Plan and Overlay Plan

As discussed above, there is a limited riparian and aquatic habitat within PAs 51 and 30 which may contain wetlands as defined by Section 404. Because of the limited amount and highly disturbed nature of wetland/riparian habitat, impacts are considered significant, and mitigable. The City will permit and mitigate impacts to jurisdictional waters through subsequent consultation with ACOE pursuant to Section 404 and CDFG pursuant to Section 1600 et. seq. Wetland and riparian habitat creation and enhancement are available for mitigation within the proposed park/open space areas and wildlife movement corridor. The proposed plan offers an opportunity for substantial creation of wetland areas within the project site. The plan proposes to “daylight” two major drainage courses that currently pass under the base property via underground pipes. These areas are identified as General Plan land use “Drainage Corridor” and are shown as Subareas 20 and 21 on Figure 3-3 in the Project Description. The combined Drainage Corridor acreage is 129 acres. Additionally, wetland creation would occur within the proposed wildlife corridor (see PAZs 22a and 22b) on Figure 3-3. Riparian habitat associated with the Agua Chinon and Borrego Canyon Channels is present within the habitat reserve, but will not be affected by the project under both the Base Plan and the Overlay Plan.

Threshold 4: *Would the project interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites?*

Base Plan and Overlay Plan

As discussed above, no evidence of a wildlife corridor was found during the biological survey of PAs 51 and 30. In addition, according to the NCCP/HCP and Implementation Agreement, there are no Existing Use Areas or Special Linkage Areas within the project area. Such designations would indicate presence of important populations of sensitive species or migration corridors outside of designated preserve areas. Since there are no such areas on

the project site, no impact to fish or wildlife movement is anticipated and no mitigation is required.

Proposed Irvine Wildlife Corridor

While no wildlife corridor currently exists within the project area, as discussed above, a wildlife corridor is desired by several public agencies including the City of Irvine, County of Orange, US Army Corps of Engineers, USFWS, and CDFG. To provide for the creation of a wildlife corridor connecting the Lomas Ridge and the San Joaquin Hills, the proposed project includes a wildlife corridor land use. The proposed wildlife corridor is depicted in Figure 5.9-2.

The wildlife corridor provides connection to the 975-acre habitat preserve, as well as the Limestone-Whiting Wilderness Park. To the south, the corridor will connect to the Laguna Coast Wilderness Park through existing and future major open space linkages.

As part of the wildlife corridor feasibility study, preliminary "fatal-flaw" analysis was conducted on August 15, 1999, and has been examined on several subsequent occasions by wildlife biologists. Biologists examined the proposed route and its feasibility as a wildlife movement corridor. A focused survey of the biological conditions along the proposed corridor was conducted on September 7, 1999. Biologists surveyed the extent of the route including the adjacent connective habitat at the start and end of the proposed corridor. Serrano Creek and Borrego Canyon Wash were also surveyed for use/potential use as wildlife corridors. Subsequent to these initial surveys, the proposed wildlife corridor has been informally surveyed by wildlife biologists and members of conservation groups.

The alignment of the corridor can be described in terms of five general segments. The first segment of the corridor covers the El Toro NWR and adjacent areas to the west within the northern sphere area. Currently, the El Toro Refuge consists primarily of native vegetation. Several dirt and paved roads, some fencing, closed landfills, and munitions buildings and bunkers remain from former MCAS El Toro uses on this site. Uses surrounding this segment include agriculture, single-family housing units, the James A. Musick Branch Jail, and industrial uses located in the City of Lake Forest. The Foothill Transportation Corridor Freeway forms the northern edge of the corridor. Several intermittent streams run through the Refuge, including Borrego Canyon Wash and Agua Chinon Wash.

The El Toro NWR is designated as preservation under the proposed Orange County Great Park Plan. The conceptual alignment of the corridor begins west of the Refuge at the Foothill Transportation Corridor Freeway within the northern sphere area, linking to the Cleveland National Forest through the Agua Chinon Wash crossing under the freeway. The conceptual alignment then runs south along the western boundary of the El Toro NWR adjacent to the Agua Chinon Wash and Retention Basin. The alignment veers to the east, following topographical features, to connect to an existing intermittent stream. Joining the course of Borrego Canyon Wash, the alignment then turns west approaching the Irvine Boulevard undercrossing at Magazine Road.

The second segment covers areas of the Orange County Great Park located between Borrego Canyon Wash at Musick Jail and proposed Marine Way. The segment proceeds south under Irvine Boulevard at Magazine Road, carrying a small portion of the flow of

Borrego Canyon Wash as a constructed riparian channel. The corridor then bisects the proposed golf courses as it proceeds to proposed Marine Way. Existing uses adjacent to the corridor include hangars and buildings associated with former MCAS El Toro uses to the north, and an existing golf course and driving range to the south.

Within this segment, the core zone of the corridor surrounds the alignment of a low-flow channel diverted from Borrego Canyon Wash. This channel, downstream from the mainline Borrego Canyon Wash, is a daylighted creek promoting vegetation growth and wildlife movement options. A soft bottom channel will allow for vegetation growth, which will create a natural environment familiar to wildlife.

A 30-foot wide conservation zone is proposed that would screen the core zone from the proposed golf course on the north side of the creek.

As the corridor nears Irvine Boulevard, there is a windrow of Eucalyptus trees north of an agricultural field, where birds of prey and local small animal populations have become accustomed to this existing habitat.

Irvine Ranch Water District also has interests within this segment. This is an opportunity to achieve the water quality objectives of the corridor as the Borrego Canyon Wash begins to migrate through this area. Downstream, this wash may receive street runoff and nuisance water. The wetland strategy should begin here. Biofiltration can start the cleansing process, whereby reducing the eventual pollutants from reaching the Back Bay estuary.

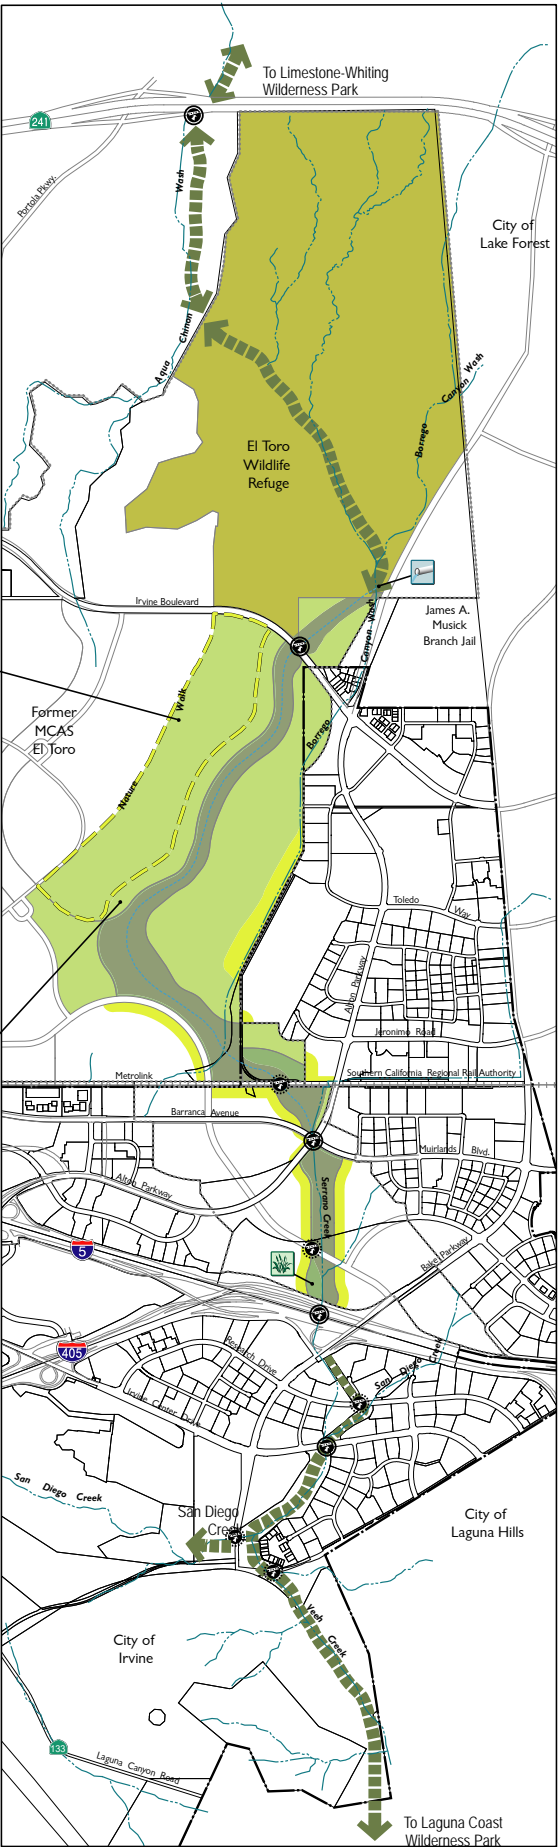

The corridor then runs south from proposed Marine Way to the Barranca Avenue/Alton Way undercrossing. All of the land in this third segment is under the planning jurisdiction of the City of Irvine.

Surrounding land uses in this segment present opportunities for creative design solutions within the corridor. A proposed 210-acre transit-oriented development is proposed adjacent to a portion of the corridor.

The corridor runs parallel to the alignment of proposed Marine Way, but is below the grade of the roadway to reduce potential conflicts. The corridor crosses over the capped channelized flood flow of Borrego Canyon Wash, passing through a proposed pier railroad bridge. Southeast of the railroad, the constructed riparian corridor merges with the natural course of Serrano Creek prior to crossing under the Alton/Barranca intersection.

Upon determination of actual location of clubhouse and residential units within golf course, these properties will be within the Encroachment Zone. Residential units and the clubhouse are subject to Encroachment Zone development regulations.

Clubhouse and residential uses within the golf course shall not be located within 500 feet of the centerline of the Core Zone

Figure 5.9-2
Wildlife Corridor Concept

The mainline Borrego Canyon Wash passes under the wildlife corridor just northeast of proposed Marine Way. From that point, the mainline channel crosses to the west, passing under Marine Way, across the railroad tracks, and into a box culvert southwest of Barranca Parkway, while the corridor (carrying low flow from the channel diverted in upper segment) continues to the southeast. Just before crossing under the SCRRA tracks, an inlet picks up the diverted Borrego Canyon Wash flow, carrying it northwest to rejoin the main channel just beyond proposed Marine Way. The inlet also carries a diverted portion of Serrano Creek from the same location. This second diverted flow forms the riparian channel used to carry the wildlife corridor under the SCRRA railroad and south to the Alton Parkway/Barranca Parkway undercrossing.

The fourth segment crosses the remaining portion of the El Toro "Panhandle." The corridor runs south from the Barranca Avenue/Alton Way undercrossing to the Interstate 5 / 405 interchange (the El Toro "Y").

The corridor runs southeast from the Barranca/Alton undercrossing, proceeding approximately 2,000 feet before passing under a proposed new undercrossing at Marine Way.

The size of this area presents an opportunity to create a detention basin, pond or lake as a means to provide additional wildlife habitat. This could be an open water/marsh area that will aid in the cleanup of water and enhance recharge of the Orange County aquifer, as well as attract a diverse range of wildlife. The wetlands produced will provide habitat for foraging and roosting waterfowl. The creation of such activities within the corridor will encourage animal movement. This area will also incorporate coastal sage scrub, where appropriate.

Within the portion of this segment north of Marine Way, a 30-foot wide conservation zone provides access to the core zone on the north side of Serrano Creek. Fencing will be added around the perimeter of this zone. South of Marine Way the IRWD water quality wetland is within the conservation zone.

This segment passes through one of the widest portions of the corridor within the built environment. Potential impacts can be reduced if parameters are defined and followed. Safeguards set in place in the early phases of corridor implementation can ensure that this area has limited human impact and high wildlife value. With the potential increase of artificial light sources and ambient noise levels generated by the planned Research and Development uses, as well as traffic on the northbound lanes of I-5, guidelines for placement of light sources within the encroachment zone are necessary. Design solutions including the choice of native plant species for screening and the placement of the core zone can also contribute to mitigating the impact of increased light and noise levels.

The fifth segment of the corridor travels south from the I-5/I-405 undercrossing through the Spectrum 5/Village 34 development project. At this location, development mitigation measures have determined the corridor alignment, width, and features.

Following the undercrossing at Interstate 5 Freeway, the corridor narrows to a width of approximately 145 feet. After crossing under Bake Parkway, the corridor continues south along Serrano Creek, crosses under Research Drive, and converges with San Diego Creek. Running southwest along San Diego Creek, the corridor separates into two segments. One

segment continues along San Diego Creek to the west, where it transitions into an open space corridor planned for walking and bicycle trails. A second segment runs along Veeh Creek crossing into Irvine Planning Area 18.

Running along Veeh Creek, this corridor segment passes under the proposed Lake Forest Drive extension, then travels southeast through the Needlegrass Creek Conservation Area, eventually crossing Laguna Canyon Road and entering the Laguna Coast Wilderness Park.

This portion of the corridor increases greatly in size as it converges into the dedicated open space areas of the Laguna Canyon Wilderness Park. Hiking and mountain bike trail linkages from the Laguna Canyon Wilderness Park could possibly exist within the Activity Zone, along San Diego Creek. As portions of Planning Area 18 adjacent to the corridor have been dedicated as open space and potential surrounding development would primarily involve low-density housing, artificial light and ambient noise potential is not as great as in other planning units. A more naturalistic appearance with wider open spaces can be provided in all zones.

The Wildlife Corridor planning efforts are on-going, and the Orange County Great Park Plan land use concepts will accommodate this on-going planning effort.

The guidelines presented here are chiefly concerned with the creation and revegetation of wildlife habitats that will flourish in the proposed areas and that will serve as protective cover for target wildlife species that will presumably utilize the proposed corridor. A preliminary design concept for the creation and/or revegetation of the proposed route has also been prepared which is consistent with the guidelines described below (Draft Irvine Wildlife Corridor Master Plan, November 2002). These terms are defined as they are generally used by restoration professionals in California and by the Society for Ecological Restoration (SER):

- C **Creation** establishes historical ecosystems on lands that did not previously support that ecosystem or on severely altered sites.
- C **Revegetation** establishes vegetation on disturbed lands. Ideally, revegetation uses plant material previously located on the site or adjacent to it, to maintain focal genetic diversity.

The viability of the final corridor will be based on the creation of suitable habitat that will serve as a linkage between habitat preserves. The revegetation/restoration plan would need to address various issues to increase the viability of the proposed corridor and will need to be prepared based on the following criteria:

- C **Reduce the amount of noise pollution and urban influence.** Sight and sound barriers need to be constructed at the edges of the corridor to help create a secluded, natural setting. Barriers may range from artificial sound walls to natural diversions such as hedges and tree lines.
- C **Remove and restore the unnecessary developed (paved) areas within the corridor right-of-way.** This includes all underpasses not associated with waterways, namely Magazine Road, and all unnecessary sidewalks and access roads. The reuse roads

crossing over the approximately 4.1 km long corridor. Astor Road is a secondary entrance that bisects both the corridor and the golf course. Restoration of this area will assist the continuity of the corridor and increase its viability.

- C **Create a protective habitat along the entire length of the corridor.** Based on observations during the site visit, the entire corridor should be revegetated with sycamore and cottonwood trees. Current conditions are suitable for the survival of these species and they will provide the necessary canopy for the corridor as well as suitable nesting sites for several bird species. Open, upland areas will need to be revegetated with native bunch grasses or an understory of drought resistant shrubs such as coastal sage scrub species. The earthen banks of the waterways will need to be revegetated with mule fat and other water associated plant species.
- C **Apply minimum height and width requirements based on the specific wildlife species.** Observations of common wildlife and plant species within the proposed migration area were recorded during the site visits. Table 5.9-1 provides a list of wildlife species expected to utilize the corridor. The species list was developed based on species observed during the site visit, species known to occur in the project vicinity.

Because of the length and proximity to highly urbanized areas, daily use of the corridor will likely be limited to reptiles, amphibians, birds, and small mammal species. The coyote is probably the largest predator that would utilize the corridor. However, deer and mountain lion are known to occur within the preserve and habitat just north of the preserve. Therefore, the corridor should be designed to accommodate these larger species that would require an escape route in case of wildfires or other emergencies.

While the project will not impact any existing wildlife corridor or movement since none currently exist in the project area, Mitigation Measure Bio B3 will ensure that the City of Irvine will continue to work with State and federal agencies to implement the revegetation/restoration plan necessary to create a viable wildlife corridor within the project area. The City has already engaged in this process as is demonstrated through the preparation of the Draft Irvine Wildlife Corridor Master Plan, which is independent of this project.

Threshold 5: Would the project conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance?

Base Plan and Overlay Plan

In order to protect and enhance the existing urban forest resource by application of sustainability in landscaping policies and through the provision of professional management, the City of Irvine enacted the Urban Forestry Ordinance (UFO) (Section 5-7-401 et al) in 1994. PAs 51 and 30 contain a large number of trees, many of them mature, representing a wide range of species. The potential destruction or damage to these trees is considered a significant impact.

Threshold 6: *Would the project conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan?*

Both the Base Plan and the Overlay Plan designate the land in PAZ of PA 51 for habitat preserve, consistent with the adopted NCCP/HCP. The habitat preserve in PA 51 has been conveyed to the FAA and is expected to be preserved and maintained consistent with the NCCP/HCP. Since the proposed project is consistent with the adopted NCCP/HCP, no significant impact will occur.

**Table 5.9-1
Target Wildlife Species of Wildlife Corridor**

Reptiles	Amphibians
C Western fence lizard	C Pacific tree frog
C Gopher snake	C Western toad
C Coachwhip	C California chorus frog
C Side blotched lizard	
Mammals	Birds
C Striped skunk	C Showy egret
C Raccoon	C Great egret
C Burrowing rodents	C Lesser goldfinch
C Desert cottontail	C Great blue heron
C Blacktail jackrabbit	C Nuttall's woodpecker
C Coyote	C Common yellow throat
	C Yellow-rumped warbler
	C Bewick's wren
	C Song sparrow

5.9.4 Significant Impacts

Base Plan and Overlay Plan

- Bio 1.** The southern tarplant, a federal species of concern, may be affected by development of the site. This is considered a significant impact.
- Bio 2.** There is a limited amount of highly disturbed wetland habitat on the project site. The project may result in an impact to this habitat.
- Bio 3.** PAs 51 and 30 contain a large number of trees, many of them mature, representing a wide range of species. Implementation of the proposed project may result in damage and destruction to the trees. A significant impact related to conflicts with the City of Irvine's Urban Forestry Ordinance may occur.

5.9.5 Mitigation Measures

Base Plan and Overlay Plan

- Bio 1.** Prior to approval of a subdivision map for each project area, a focused survey for the southern tarplant, mountain plover, and burrowing owl, shall be conducted. Prior to approval of a subdivision map for development within, or in proximity to Serrano Creek, a focused survey shall be conducted for the least Bell's vireo and southwestern willow flycatcher. Should the focused survey identify a significant population of southern tarplant or mountain plover, or the presence of burrowing owl, least Bell's vireo, or southwestern willow flycatcher in an area proposed for development, impacts shall be avoided through incorporation of the species into an open space easement, or if impacts cannot be avoided, then mitigation shall be negotiated through consultation with the United States Fish and Wildlife Service (USFWS) and the California Department of Fish and Game (CDFG).
- Bio 2.** Prior to approval of a subdivision map for each project area, a wetland delineation shall be performed for all areas within the master plan subarea that contain the potential for wetland habitat and/or jurisdictional waters. The loss of impacted wetlands shall be mitigated through the implementation of a wetland mitigation plan prepared and accepted by the appropriate agency (i.e., U.S. Army Corps of Engineers, U.S. Fish and Wildlife Service, California Department of Fish and Game). Wetlands impacted on-site shall be mitigated through on-site or off-site replacement, re-creation (i.e. within the proposed wildlife corridor), and/or revegetation as deemed acceptable by the appropriate jurisdictional agencies.
- Bio 3.** The City shall continue to work with State and federal agencies during the implementation of the proposed project to implement the revegetation/restoration plan for the wildlife corridor. Measures such as sight and sound barriers, including artificial sound walls and natural diversions (e.g. hedges and tree lines) shall be incorporated into corridor design to ensure the viability of the corridor. The City shall implement the corridor consistent with the design criteria and viability analysis established in the Final Program EIR.
- Bio 4.** Prior to issuance of a grading permit for each project area, a complete inventory of all trees of trunk diameter at breast height (DBH) greater than six inches and any significant (as determined by a certified arborist selected by the City) plants on the project site, excluding those within the habitat preserve shall be prepared. This inventory shall be prepared by an arborist certified by the International Society of Arboriculture and shall include (but not be limited to) data for each tree such as species, variety, DBH, condition (excellent, good, fair, poor, dead), and any recommendations. All trees in this inventory shall be considered "Significant Trees" under the City of Irvine's Urban Forestry Ordinance (UFO) (Section 5-7-401 et al) and the UFO shall apply to all trees included in this inventory.

5.9.6 Significance of Impacts After Mitigation

Base Plan and Overlay Plan

Less than significant.

6.0 Alternatives

CEQA requires the consideration of alternative development scenarios and the analysis of impacts associated with the alternatives. Through comparison of these alternatives to the proposed project, the advantages of each can be weighed and analyzed. Section 15126.6 of the CEQA Guidelines states that an EIR, “describe a range of reasonable alternatives to the project, or to the location of the project, which would feasibly attain most of the basic objectives of the project, but would avoid or substantially lessen any of the significant effects of the project, and evaluate the comparative merits of the alternatives.” (Section 15126.6(a)).

Additionally, Section 15126.6(e) and 15126.6(f) of the Guidelines state:

- C The specific alternative of “no project” shall also be evaluated along with its impact...If the environmentally superior alternative is the “no project” alternative, the EIR shall also identify an environmentally superior alternative among the other alternatives.
- C The range of alternatives required in an EIR is governed by a ‘rule of reason’ that requires the EIR to set forth only those alternatives necessary to permit a reasoned choice. The alternatives shall be limited to ones that would avoid or substantially lessen any of the significant effects of the project. Of those alternatives, the EIR need examine in detail only the ones that the lead agency determines could feasibly attain most of the basic objectives of the project. The range of feasible alternatives shall be selected and discussed in a manner to foster meaningful public participation and informed decision-making.

Pursuant to the Guidelines stated above, a range of alternatives to the proposed project is considered and evaluated in this Final Program EIR. These alternatives were developed in the course of project planning and environmental review. The discussion in this section provides:

1. A description of alternatives considered;
2. An analysis of whether the alternatives meet most of the objectives of the project (described in Section 1.0 of this Final Program EIR); and
3. A comparative analysis of the alternatives under consideration and the proposed project. The focus of this analysis is to determine if alternatives are capable of eliminating or reducing the significant environmental effects of the project to a less than significant level.

Alternatives Initially Considered but Rejected From Further Consideration

Millennium Plan

In June 1999, the City of Irvine considered an annexation, General Plan amendment, and zone change for the project area based on the proposed land uses of the El Toro Reuse Planning Authority Millennium Plan.¹ The Millennium Plan proposed over 21,000,000 square feet of non-residential development and 5,897 dwelling units. Unlike the Orange County Great Park, the Millennium Plan did not propose a wildlife corridor through the project area. Additionally, the proposed central park was not large enough to meet plan objectives of implementing a diverse urban park with active and passive recreational amenities consistent with the recent passage of Measure W. Implementation of the Millennium Plan, as originally proposed, would create greater impacts than the proposed project in most of the environmental categories including traffic, air quality, noise, geology and seismicity, hydrology and water quality, agricultural resources, biological resources, paleontological resources, cultural resources, aesthetics, population/housing and public services, facilities and utilities. Also, because of its intensity it would not be as compatible with the surrounding communities. As such, the Millennium Plan is rejected from further consideration.

Alternative Location

This chapter does not include a consideration of alternative locations to the proposed project. Section 15126(f) (2) of the CEQA Guidelines states, in part, that the “key question and first step in analysis is whether any of the significant effects of the project would be avoided or substantially lessened by putting the project in another location. Only locations that would avoid or substantially lessen any of the significant effects of the project need to be considered for inclusion in the EIR.” Development of the proposed project at an alternative location would likely result in similar and, in some cases, greater impacts than those identified in this Final Program EIR. Furthermore, it has been determined that no feasible alternative locations exist considering the fact that the project is the reuse of the former MCAS El Toro.

Aviation Reuse

The project site was previously proposed by the County of Orange to be reused as a commercial airport. Under the aviation reuse plan, the site would be developed with a full international passenger and cargo service airport with a projected 2020 service level of approximately 28.8 million annual passengers (MAP). The aviation reuse plan would include a terminal area and associated facilities, aircraft parking areas, and cargo facilities. Non-aviation uses included in the aviation reuse plan include habitat, open space, and recreation land uses, as well as several public facilities. (EIR #573)

¹ The City of Irvine previously considered implementing the Millennium Plan land use plan for the project site. However, the Millennium Plan was not adopted by the City and was subsequently followed by the Millennium Plan II. The Millennium Plan II was adopted for the City and represents the City's General Plan land uses for the project site.

According to the analysis of potential environmental impacts contained in EIR #573, implementation of this, or similar, aviation reuse plan will result in a greater impacts to land use, traffic/circulation, air quality, noise, public health and safety, geology and seismicity, hydrology and water quality, agricultural resources, biological resources, aesthetics, population/housing, public services and facilities, and utilities.

An aviation reuse plan would not meet the primary objectives of the proposed project. Also, the spirit and intent of the recently passed Measure W, by the county voters would not be met. As such, this alternative is rejected from further consideration.

Agricultural Preservation

The Agricultural Preservation Alternative assumes that all of the existing agriculture on site will be permanently retained for agricultural production. The primary difference between this alternative and the proposed project is that this alternative would preserve all of PA 30 for agricultural production (in addition to the existing agricultural area located north of Irvine Boulevard in PAZ 1, which is proposed to be preserved under the project). Additionally, the area north and south of Irvine Boulevard in PAZ 4 and a portion of PAZ 18 would be preserved. The remainder of PA 51 would be developed according to the proposed project.

The feasibility of preserving agricultural resources in perpetuity is addressed in detail in Section 5.8 – Agricultural Resources of this Final Program EIR. The long-term viability of agricultural production in Orange County continues to deteriorate. As described in Section 5.8, factors that impact the viability of agricultural uses include: 1) the cost of land; 2) the cost of water; 3) the cost of labor; 4) property taxes; 5) the impact of urbanization; 6) competition; and 7) the impact of environmental regulation. The retention of more area of the site in agricultural use than is proposed under the plan is considered to be infeasible due to the constraints on the continued long-term viability of large scale agriculture in the area. These constraints, particularly the economic constraints and constraints due to increased environmental regulation, will become greater over time. Despite any City actions to zone additional land for agricultural uses on-site, the City does not have the authority to require landowners to continue farming operations on land that is zoned for agricultural use. The retention of agricultural land use designations on the site will not, therefore, necessarily result in the continuation of agricultural uses. Moreover, a reduction in the development of the site would impede the City from achieving the voter's and the City's objectives for the site in a fiscally sound manner.

As noted above, the proposed project will retain a portion of the site in agricultural use, and agricultural uses may continue on other portions of the site until such time that development is to occur. These proposed long-term and interim uses; however, do not mitigate the significant impact of the conversion of significant farmland and existing agricultural land to non-agricultural uses. As such, this alternative is rejected from further consideration.

Alternatives Under Consideration

The alternatives considered in this EIR are summarized in Table 6-1 and include:

1. No Project/Measure W PA 51/Millennium Plan II PA 30
2. Existing City of Irvine General Plan (Millennium Plan II Land Uses)
3. Measure W PA 51/Millennium Plan II PA 30 - Modified
4. Alternative Land Use Plan – University Village
5. Increased Residential Alternative

Table 6-1
Comparison of Project Alternatives to Proposed Project

Impact Category	Alternative 6.1 No Project/Measure W PA 51/Millennium Plan II PA 30	Alternative 6.2 Existing City of Irvine General Plan (Millennium Plan II Land Uses)	Alternative 6.3 Measure W PA51/ Millennium Plan II PA30 - Modified	Alternative 6.4 Alternative Land Use Plan – University Village	Alternative 6.5 Increased Residential Alternative
Land Use	Similar	Similar	Similar	Similar	Similar
Traffic/Circulation	Less	Greater	Less	Greater	Greater
Air Quality	Less	Greater	Less	Greater	Greater
Noise	Less	Greater	Less	Greater	Greater
Public Health and Safety	Similar	Similar	Similar	Similar	Similar
Geology and Seismicity	Less	Greater	Less	Similar	Greater
Hydrology and Water Quality	Less	Greater	Less	Similar	Greater
Agricultural Resources	Similar	Greater	Similar	Similar	Similar
Biological Resources	Less	Greater	Less	Similar	Similar
Paleontological Resources	Less	Greater	Less	Similar	Similar
Cultural Resources	Less	Greater	Less	Similar	Similar
Aesthetics	Less	Greater	Less	Similar	Greater
Population/Housing	Less	Greater	Less	Less	Less
Public Services and Facilities	Less	Greater	Less	Greater	Greater
Utilities	Less	Greater	Less	Similar	Greater
Conclusion	Superior	Inferior	Superior	Inferior	Inferior

Less = impact of project alternative is less than impact of proposed project.

Similar = impact of project alternative is similar to impact of proposed project.

Greater = impact of project alternative is greater than impact of proposed project.

6.1 NO PROJECT/MEASURE W PA 51/MILLENNIUM PLAN II PA 30

CEQA requires analysis of the No Project Alternative (Public Resources Code Section 15126). According to Section 15126.6(e) of the CEQA Guidelines, “the specific alternative of ‘no project’ shall also be evaluated along with its impact. The ‘no project’ analysis shall discuss the existing conditions at the time the notice of preparation is published, at the time environmental analysis is commenced, as well as what would be reasonably expected to occur in the foreseeable future if the project were not approved, based on current plans and consistent with available infrastructure and community services.”

Description of Alternative

The No Project/Measure W PA 51/Millennium Plan II PA 30 assumes that the former base would eventually be redeveloped according to the general provisions of Measure W for PA 51, which is the unincorporated portion of the base, and Millennium Plan II for PA 30, which is the portion of the base located within the City of Irvine. Table 6-2 provides a statistical summary of the potential development associated with this alternative. To develop this comparison, the Great Park concept plan was relied on to project land uses in PA 51. PA 30 land uses were based on the adopted City of Irvine General Plan and zoning. As depicted, approximately 5,203,000 square feet of non-residential development, 165 dwelling units, and 7,637 students would occur under this alternative. Approximately 3,535 acres would be devoted to open space, recreation, and agricultural uses. This compares to a maximum of 3,625 dwelling units, 6,585,594 square feet of non-residential, and 7,637 students that could occur under the proposed project.

Land Use

Implementation of the No Project/Measure W PA51/Millennium Plan II PA30 Alternative would result in a similar land use impact as the proposed project. This alternative would implement the mandate of the voter approved Measure W for development of PA 51 with park uses. Implementation of the No Project/Measure W PA51/Millennium Plan II PA30 Alternative would have a similar impact as the proposed project regarding conflicts with the County of Orange Master Plan of Arterial Highways and the existing Airport Environs Land Use Plan (AELUP), Air Installation Compatible Use Zones (AICUZ), and Policy Implementation Line (PIL) since non-aviation reuse of the former base conflicts with these existing plans. No other land use conflict would occur under this alternative.

Traffic/Circulation

Implementation of the No Project/Measure W PA51/Millennium Plan II PA30 Alternative would result in less of a traffic/circulation impact associated with the proposed project. Under this alternative, approximately 5,203,000 square feet of non-residential development would occur, 7,637 additional students in the area would be expected, and

Table 6-2
Existing City of Irvine General Plan Land Uses
(Millennium Plan II Land Use Plan)

Land Use Categories				
General Plan Land Use Category	Zoning District (using City of Irvine Districts)	Zoning Number	Max. sq. ft.	Max. d.u.'s
PA 51				
County of Orange	Exclusive Agriculture	1.1	–	–
County of Orange	Recreation	1.5	–	–
County of Orange	Preservation	1.4	–	–
County of Orange	Recreation	1.5	–	–
County of Orange	Recreation	1.5	26,000	
County of Orange	Institutional	6.1	1,285,000	7,637 students
County of Orange	Medical and Science	5.5	300,000	
County of Orange	Recreation	1.5	963,500	165
County of Orange	Recreation	1.5	25,000	
County of Orange	Recreation	1.5	–	–
County of Orange	Preservation	1.4	–	–
County of Orange	Institutional	6.1	300,000 Inst. 122,500 OCTA 263,000 Warehousing	
County of Orange	Institutional	6.1		375 parking spaces
Total PA 51			3,285,000	165 du's 7,637 students
PA 35				
Institutional – Public Facility	Institutional (already pre-zoned)	6.1	N/A (jail, water facility)	–
Total PA 35				–
PA 30				
Institutional	Institutional	6.1	–	–
Preservation	Preservation	1.4	–	–
Community Commercial	Vehicle-Related Commercial	4.3B	201,000	–
Commercial Recreation	Commercial Recreation-Arena/Stadium	4.4	85,000 seats	–
Recreation	Recreation – Outdoor Sports	1.5	41,000	–
Research and Industrial	Medical and Science	5.5	1,676,000	–
Total PA 30			1,918,000	–
Project Area Total			5,203,000	165 du's 7,637 students

165 dwelling units would be constructed. This is compared to 6,585,594 square feet of non-residential development, 7,800 students, and 3,625 dwelling units that could occur under the proposed project (pursuant to the Overlay Plan). Development of PA51 according to Measure W land uses would generate approximately 83,347 average daily trip (ADT) and development of PA30 according to the Millennium Plan II land uses would generate approximately 34,750 ADT.⁵ As such, the total trips generated by this alternative is 118,097 ADT. This compares to 148,000 trips generated by the project according to the Overlay Plan.

Air Quality

Implementation of the No Project/Measure W PA51/Millennium Plan II PA30 Alternative would result in less of an air quality impact associated with the proposed project as the level of development and corresponding trip generation would be less. Mobile source air quality emissions are estimated to be approximately 20 percent less than the project, as the trips generated by this alternative are approximately 20 percent less than the project.

Noise

Implementation of the No Project/Measure W PA51/Millennium Plan II PA30 Alternative would result in less of a noise impact as the proposed project, as the overall amount of development and vehicular trips on surrounding roadways would be less.

Public Health and Safety

Implementation of the No Project/Measure W PA51/Millennium Plan II PA30 Alternative would result in a similar public health and safety impact as the proposed project. This alternative would cause portions of PA51 containing existing structures to be developed, resulting in the need to demolish existing structures. Development would occur in those areas containing remediation sites. However, the impact associated with structures and population being located adjacent to wildland fire hazard area would be less.

Geology and Seismicity

Implementation of the No Project/Measure W PA51/Millennium Plan II PA30 Alternative would result in less of a geology and seismic impact associated with seismic ground shaking, soil erosion or loss of topsoil, and expansive soils since there would be less overall development within the project area.

Hydrology and Water Quality

Implementation of the No Project/Measure W PA51/Millennium Plan II PA30 Alternative would result in less of a hydrology and water quality impact as the proposed project. Most of the development would be concentrated in PA30, and, as compared to the proposed project, significantly less development and impervious surfaces would occur within PA51. Additionally, under this alternative, the proposed drainage corridors would be implemented as is proposed under the project.

Agricultural Resources

Implementation of the No Project/Measure W PA51/Millennium Plan II PA30 Alternative would result in a similar impact related to the loss of agriculture. This alternative would preserve the same amount of acreage of agriculture as is proposed under the Overlay Plan.

Biological Resources

Implementation of the No Project/Measure W PA51/Millennium Plan II PA30 Alternative would result in less of an impact than the proposed project in regards to potential conflicts with the City of Irvine Urban Forestry Ordinance, since less development would occur under the alternative. Also, because less of the site would be converted to urban uses, potential biological impacts would be reduced. As with the proposed project, this alternative would allow for the creation of drainage corridors through the project site that could allow for wetland creation, and this alternative would provide the same wildlife corridor alignment as the proposed project.

Paleontological Resources

Implementation of the No Project/Measure W PA51/Millennium Plan II PA30 Alternative would result in less of an impact to paleontological resources than the proposed project. Under this alternative, development would be concentrated primarily in PA30, with substantially less development occurring in PA51 as compared to the project. Therefore, the potential for this alternative to directly or indirectly destroy a unique paleontological resource or unique geologic feature is less than the project.

Cultural Resources

Implementation of the No Project/Measure W PA51/Millennium Plan II PA30 Alternative would result in less of an impact to cultural resources than the proposed project. Under this alternative, development would be concentrated primarily in PA30, with substantially less development occurring in PA51 as compared to the project. Therefore, the potential for this alternative to directly impact cultural resources is less than the project.

Aesthetics

Implementation of the No Project/Measure W PA51/Millennium Plan II PA30 Alternative would result in less of an aesthetic impact related to light and glare than the project since there would be less intensive development occurring within PA51 than is proposed under the project.

Population/Housing

Implementation of the No Project/Measure W PA51/Millennium Plan II PA30 Alternative would result in less of a population/housing impact related to the jobs/housing balance as the proposed project as there would be less employment generating land uses. In regards to inducing population growth in the area, this alternative would have a similar impact as the proposed project since it would generate jobs and new residential opportunities that would attract new residents to the area.

Public Services and Facilities

Implementation of the No Project/Measure W PA51/Millennium Plan II PA30 Alternative would result in less of an impact than the project related to the construction or expansion of public facilities. This alternative would result in less of a demand for school facilities and parks, as only approximately 165 dwelling units would be allowed under this alternative as compared to 3,625 dwelling units that would occur under the proposed project.

Utilities

Implementation of the No Project/Measure W PA51/Millennium Plan II PA30 Alternative would result in a similar impact related to the construction or expansion of utilities as a similar backbone system would be required to support this alternative, although the sizing and layout may vary to reflect the alternative configuration of land uses. Because less development would occur, overall energy consumption would be less than the project.

Conclusion

This alternative is environmentally superior to the proposed project. This alternative would result in less impacts to traffic/circulation, air quality, noise, geology/soils, hydrology/water quality, biological resources, paleontological resources, cultural resources, public services and utilities. Implementation of the No Project/Measure W PA51/Millennium Plan II PA30 Alternative would result in a similar impact to land use, public health and safety, and agricultural resources. The alternative meets the following project objectives identified in Section 3.0 – Project Description of this Final Program EIR:

2. Convert the former MCAS El Toro to a Great Park with regional open space, cultural and recreational facilities.
4. Coordinate location and development of roadways and transportation systems in the project area with the local and regional circulation and transportation systems.
5. Create a wildlife corridor connection through the property which may potentially connect the Cleveland National Forest to the north and the coastal open space preserves to the south.

6.2 EXISTING CITY OF IRVINE GENERAL PLAN (Millennium Plan II Land Uses)

This alternative assumes that the project area would not be developed according to the proposed General Plan Amendment (GPA) and Zone Change. Instead, the project area would be developed with land uses consistent with the existing City of Irvine General Plan and Zoning of the property which was previously approved by the City of Irvine under the Millennium Plan II project.

Description of Alternative

The Existing City of Irvine General Plan Alternative (Millennium Plan II Land Uses) assumes that the former base would eventually be redeveloped according to the Millennium Plan II land use plan. Figure 6-1 depicts the City of Irvine adopted land uses for PAs 51 and 30 and Table 6-3 lists the land use summary. As depicted, the existing City of Irvine General Plan land use designations of the project area would allow a total of 15,773,000 square feet of non-residential uses and 3,216 maximum dwelling units. This compares to a maximum of 3,625 dwelling units and 6,585,594 square feet of non-residential uses that could be developed according to the Overlay Plan.

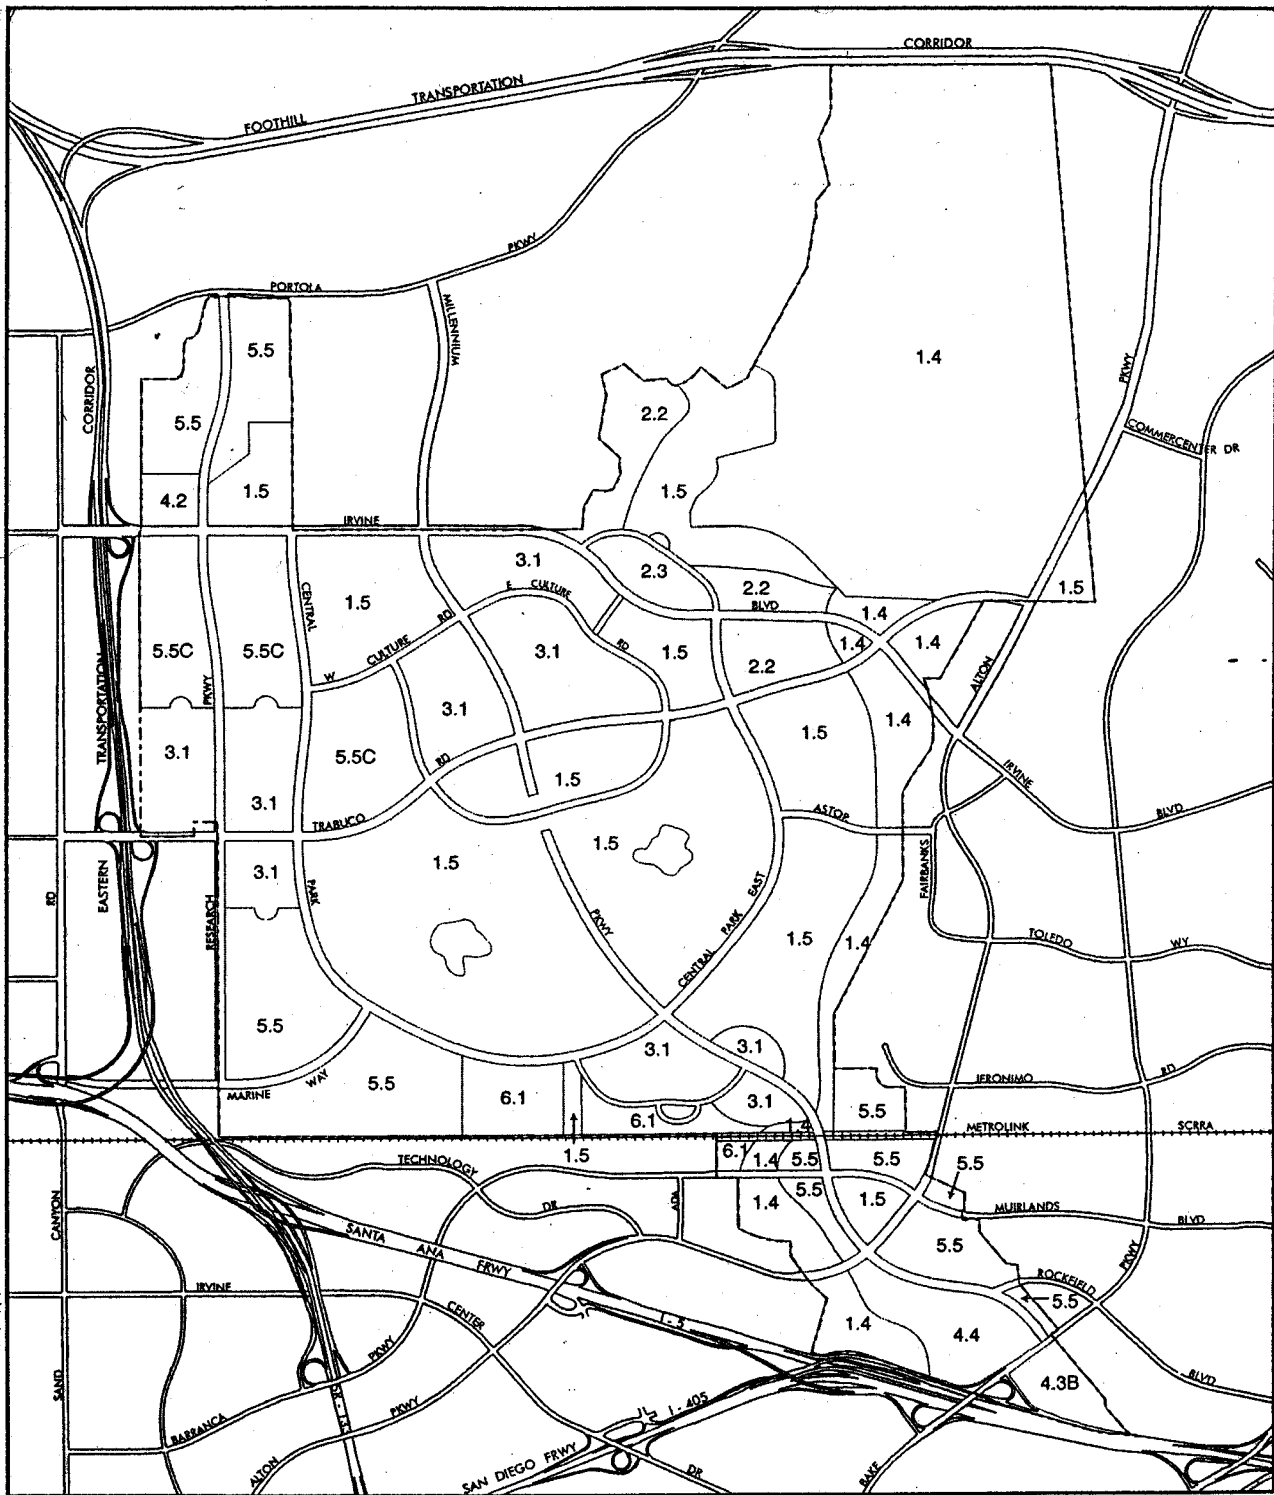

Land uses that could occur under this alternative include preservation, recreation, low and medium density residential, multi-use, community commercial, research and industrial, and institutional.

Land Use

Implementation of the Existing General Plan (Millennium Plan II Land Uses) Alternative would result in a similar land use impact as the proposed project. This alternative would implement, to some degree, the intent of the voter approved Measure W for development of PA 51 with park uses as a large portion of PA 51 is designated for recreation uses under the Millennium Plan II. This alternative would result in similar land use impacts related to conflicts with the County of Orange Master Plan of Arterial Highways and the existing Airport Environs Land Use Plan (AELUP), Air Installation Compatible Use Zones (AICUZ), and Policy Implementation Line (PIL), since the proposed development would conflict with these existing plans. This alternative would not impact off-site land uses.

Traffic/Circulation

Implementation of the Existing General Plan (Millennium Plan II Land Uses) Alternative would result in a substantially greater traffic/circulation impact than the proposed project. The Existing General Plan Alternative would result in a greater amount of traffic generated within the project area as the development intensity of the Millennium Plan II is greater than the proposed project. The Existing General Plan (Millennium Plan II Land Uses) Alternative is anticipated to generate approximately 228,000 ADT while the proposed project is anticipated to result in the generation of approximately 91,000 to 148,000 ADT. This alternative would place a significantly greater demand on the roadway system, in turn, impacting a larger area, and requiring more roadway infrastructure improvements.

Zone #	General Plan Land Use Category	Zoning District	Zone #	General Plan Land Use Category	Zoning District
1.4	Preservation	Preservation	4.4	Commercial Recreation	Commercial Recreation
1.5	Recreation	Recreation	5.5	Research and Industrial	Medical and Science
2.2	Low Density	Low Density Residential	5.5C	Research and Industrial	ERT Campus
2.3	Medium Low Density	Medium Low Density Residential	6.1	Institutional	Institutional
3.1	Multi-Use	Multi-Use			
4.2	Community Commercial	Community Commercial			
4.3B	Community Commercial	Vehicle-Related Commercial			

Figure 6-1

Millenium Plan II Land Use

Table 6-3
Existing City of Irvine General Plan Land Uses
(Millennium Plan II Land Use Plan)

Land Use Categories				
General Plan Land Use Category	Zoning District	Zoning Number	Max. sq. ft.	Max. d.u.'s
PA 51				
Preservation	Preservation	1.4	-	-
Recreation	Recreation	1.5	519,000	-
Low Density	Low Density Residential	2.2	-	772
Medium Density	Medium Density Residential	2.3	-	176
Multi-Use	Multi-Use	3.1	4,463,000	2,313
Community Commercial	Community Commercial	4.2	177,000	-
Research and Industrial	Medical and Science	5.5	4,566,000	-
Research and Industrial	ERT Campus	5.5C	3,615,000	-
Institutional	Institutional	6.1	513,000	-
Total PA 51			13,853,000	3,261
PA 35				
Institutional – Public Facility	Institutional (already pre-zoned)	6.1	N/A (jail, water facility)	-
Total PA 35				-
PA 30				
Institutional	Institutional	6.1	-	-
Preservation	Preservation	1.4	-	-
Community Commercial	Vehicle-Related Commercial	4.3B	201,000	-
Commercial Recreation	Commercial Recreation-Arena/Stadium	4.4	85,000 seats	-
Recreation	Recreation – Outdoor Sports	1.5	41,000	-
Research and Industrial	Medical and Science	5.5	1,676,000	-
Total PA 30			1,918,000	-
Project Area Total			15,773,000	3,261

Air Quality

Implementation of the Existing General Plan (Millennium Plan II Land Uses) Alternative would result in a greater air quality impact than the proposed project since this alternative would have significantly more construction, development, and corresponding levels of traffic, resulting in substantially more construction and operational (both mobile and stationary) emissions than would occur under the project. The Existing General Plan (Millennium Plan II Land Uses) Alternative is anticipated to generate approximately 228,000 ADT while the proposed project is anticipated to result in approximately 91,000 to 148,000 ADT. The Millennium Plan II project would generate unmitigated emissions amounting to approximately 1.56 tons per day of ROG, 2.10 tons per day of NO_x, 8.83 tons per day of CO, and 0.75 tons per day of PM₁₀.¹ This is compared to the unmitigated emissions estimate for the proposed project (Overlay Plan) which are estimated at approximately .66 tons per day of ROG, .06 tons per day of NO_x, 1.38 tons per day of CO, and .21 tons per day of PM₁₀.

Noise

Implementation of the Existing General Plan (Millennium Plan II Land Uses) Alternative would result in a greater noise impact than the proposed project since this alternative would generate greater traffic within the project area and greater traffic noise. Unlike the proposed project, this alternative would result in a significant traffic-generated noise impact for the segment of Trabuco Road between Bake Parkway and Lake Forest Drive.² As indicated in Section 5.4 – Noise of this Final Program EIR, no impact would occur at this location under the proposed project.

Public Health and Safety

Implementation of the Existing General Plan (Millennium Plan II Land Uses) Alternative would result in a similar impact as the proposed project related to the disturbance of structures with asbestos-containing building materials or lead based paints. Buildings would be demolished under this alternative, and mitigation would be required to ensure that the building materials are properly handled and disposed. Implementation of this alternative would also result in a similar impact related to the potential health risks from remediation activities. Remediation would need to occur consistent with the health risk standards of the existing General Plan land uses. This alternative would also result in a similar impact related to wildland fire hazards as development would occur adjacent to a wildland fire hazard area in the northeastern portion of PA 51.

Geology and Seismicity

Implementation of the Existing General Plan (Millennium Plan II Land Uses) Alternative would result in a greater geology and seismic impact associated with seismic ground shaking, soil erosion or loss of topsoil, and expansive soils since there would be substantially more development within the project area. There would also be an increase in the number of residents and workers/employees impacted by seismic groundshaking and an increase in the amount of property and people subject to risk.

Hydrology and Water Quality

Implementation of the Existing General Plan (Millennium Plan II Land Uses) Alternative would result in a greater hydrology and water quality impact than the proposed project

related, as substantially more development would occur than the proposed project. With more development, the rate and amount of surface runoff would be greater than under the Orange County Great Park plan. Additionally, this alternative would not involve the creation of natural drainage corridors as proposed under the project.

Agricultural Resources

Implementation of the Existing General Plan (Millennium Plan II Land Uses) Alternative would result in a greater impact related to the loss and conversion of agricultural resources. Under existing General Plan designations, no portion of the project site would be retained for agricultural uses in perpetuity, whereas, the proposed project would preserve approximately 438 acres of agricultural land under the Base Plan, and 303 acres of agricultural land under the Overlay Plan.

Biological Resources

Implementation of the Existing General Plan (Millennium Plan II Land Uses) Alternative would result in a greater impact than the proposed project with respect to potential conflicts with the City of Irvine Urban Forestry Ordinance as development would occur that would impact existing trees within the project area. This alternative would result in the creation of a wildlife corridor on the eastern boundary of the project area; however, the wildlife corridor would be more constrained by adjacent land uses than the wildlife corridor proposed under the project. This alternative would not involve the creation of natural drainage corridors through the project site that offer the opportunity for wetland creation. Additionally, because no agricultural lands would be preserved and less parkland would be developed, the potential raptor foraging area within the project site would be less than the project.

Paleontological Resources

Implementation of the Existing General Plan (Millennium Plan II Land Uses) Alternative would result in potentially a greater impact to paleontological resources than the proposed project. Because much more development would occur, the potential for disturbing paleontological resources as a result of grading activity is greater.

Cultural Resources

Implementation of the Existing General Plan (Millennium Plan II Land Uses) Alternative would result in potentially a greater impact to cultural resources than the proposed project. Because much more development would occur, the potential for disturbing cultural resources as a result of grading activity and development is greater.

Aesthetics

Implementation of the Existing General Plan (Millennium Plan II Land Uses) Alternative would result in a greater aesthetic impact than the proposed project as this alternative would allow significantly more development which has the potential to increase the light and glare produced in the project area and cause a change to the visual quality of the project area. Additionally, less park and open space uses would be provided.

Population/Housing

Implementation of the Existing General Plan (Millennium Plan II Land Uses) Alternative would provide approximately 3,261 housing units. However, this alternative would also provide approximately 30,000 to 35,000 jobs in the project area which would exacerbate the jobs/housing imbalance to a greater degree than the proposed project. In regards to inducing population growth in the area, this alternative would have a greater impact than the proposed project since it would generate significantly more jobs that would attract new residents to the area and increase pressure for the construction of additional housing.

Public Services and Facilities

Implementation of the Existing General Plan (Millennium Plan II Land Uses) Alternative would result in a greater impact related to the construction and expansion of public facilities, as there would be significantly more demand placed on these facilities from residential and non-residential development. This alternative would generate a similar for police, requiring approximately 20 sworn police officers, 2 sworn police supervisors, 2 non-sworn support staff, and 4 marked police vehicles. The alternative would generate approximately 2,251 students within the Irvine Unified School District;³ this is approximately 726 students more than the proposed project.

Utilities

Implementation of the Existing General Plan (Millennium Plan II Land Uses) Alternative would result in a greater impact related to the construction or expansion of utilities as significantly more development would occur within PAs 51 and 30 that would require new or expanded utilities. The daily potable water demand under this alternative is 3.3 million gallons per day. The daily sewer generation is 2.9 million gallons per day;⁴ this is approximately 1.55 million gallons per day more water and 2 million gallons per day more sewage than the proposed project.

Conclusion

This alternative is environmentally inferior to the proposed project. Implementation of the Existing City of Irvine General Plan (Millennium Plan II Land Uses) Alternative would result in greater impacts to traffic/circulation, air quality, noise, geology and seismicity, hydrology and water quality, agricultural resources, biological resources, paleontological resources, cultural resources, aesthetics, population/housing, public services and facilities, and utilities than the proposed project. This alternative would result in similar impacts to land use and public health and safety as the proposed project. The alternative meets the following project objectives identified in *Section 3.0 Project Description* of this Final Program EIR:

1. Annex the former MCAS El Toro site and adjacent lands within the City's Sphere of Influence.
4. Coordinate location and development of roadways and transportation systems in the project area with the local and regional circulation and transportation systems.
5. Create a wildlife corridor connection through the property which may potentially connect the Cleveland National Forest to the north and the coastal open space preserves to the south.

6. Respond positively and effectively to the DON's decision to sell the property to private interests by allowing private development of some land while ensuring the implementation of park and open space amenities.

6.3 MEASURE W PA 51/MILLENNIUM PLAN PA 30-Modified

Description of Alternative

The Measure W PA 51/Millennium Plan II PA 30-Modified assumes that the former base would eventually be redeveloped according to the general provisions of Measure W for PA 51, which is the unincorporated portion of the base, and modified land uses of the Millennium Plan II for PA 30, which is the portion of the base located within the City of Irvine. Table 6-4 provides a statistical summary of the potential development associated with this alternative. To develop this comparison, the Great Park concept plan was relied on to project land uses in PA 51. PA 30 land uses were generally based on the adopted General Plan and zoning; however, the Research and Industrial use was decreased by 1,190,000 square feet, and 500 residential units were added. As depicted, approximately 4,013,000 square feet of non-residential development, 665 dwelling units, and 7,637 students would occur under this alternative. Approximately 3,535 acres would be devoted to open space, recreation, and agricultural uses. This compares to a maximum of 3,625 dwelling units, 6,585,594 square feet of non-residential, and 7,637 students that could occur under the proposed project.

Land Use

Implementation of the Measure W PA51/Millennium Plan II PA30 - Modified Alternative would result in a similar land use impact as the proposed project. This alternative would implement the mandate of the voter approved Measure W for development of PA 51 with park uses. Implementation of the Measure W PA51/Millennium Plan II PA30 - Modified Alternative would have a similar impact as the proposed project regarding conflicts with the County of Orange Master Plan of Arterial Highways and the existing Airport Environs Land Use Plan (AELUP), Air Installation Compatible Use Zones (AICUZ), and Policy Implementation Line (PIL) since non-aviation reuse of the former base conflicts with these existing plans. No other land use conflict would occur under this alternative.

Table 6-4
Measure W PA 51/Millennium Plan II PA 30 - Modified

Medium Density	Medium Density Residential	2.3	–	500
Total PA 30			728,000	–
Project Area Total			4,013,000	665 du's 7,637 students

Traffic/Circulation

Implementation of the Measure W PA51/Millennium Plan II PA30 – Modified Alternative would result in less of a traffic/circulation impact associated with the proposed project. Under this alternative, approximately 4,013,000 square feet of non-residential development would occur, 7,637 additional students in the area would be expected, and 665 dwelling units would be constructed. This is compared to 6,585,594 square feet of non-residential development, 7,800 students, and 3,625 dwelling units that could occur under the proposed project (pursuant to the Overlay Plan). Development of PA51 according to Measure W land uses would generate approximately 83,347 ADT and development of PA30 according to land uses in this alternative would generate approximately 28,513 ADT.⁵ As such, the total trips generated by this alternative is 111,860 ADT. This compares to 148,000 trips generated by the project according to the Overlay Plan.

Air Quality

Implementation of the Measure W PA51/Millennium Plan II PA30 - Modified Alternative would result in less of an air quality impact associated with the proposed project as the level of development and corresponding trip generation would be less. Mobile source air quality emissions are estimated to be approximately 25 percent less than the project, as the trips generated by this alternative are approximately 25 percent less than the project.

Noise

Implementation of the Measure W PA51/Millennium Plan II PA30 - Modified Alternative would result in less of a noise impact as the proposed project, as the overall amount of development and vehicular trips on surrounding roadways would be less.

Public Health and Safety

Implementation of the Measure W PA51/Millennium Plan II PA30 – Modified Alternative would result in a similar public health and safety impact as the proposed project. This alternative would cause portions of PA 51 containing existing structures to be developed, resulting in the need to demolish existing structures. Development would occur in those areas containing remediation sites. However, the impact associated with structures and population being located adjacent to wildland fire hazard area would be less.

Geology and Seismicity

Implementation of the Measure W PA51/Millennium Plan II PA30 - Modified Alternative would result in less of a geology and seismic impact associated with seismic ground shaking, soil erosion or loss of topsoil, and expansive soils since there would be less overall development within the project area.

Hydrology and Water Quality

Implementation of the Measure W PA51/Millennium Plan II PA30 - Modified Alternative would result in less of a hydrology and water quality impact as the proposed project. Most of the development would be concentrated in PA30, and, as compared to the proposed project, significantly less development and impervious surfaces would occur within PA 51.

Additionally, under this alternative, the proposed drainage corridors would be implemented as is proposed under the project.

Agricultural Resources

Implementation of the Measure W PA51/Millennium Plan II PA30 - Modified Alternative would result in a similar impact related to the loss of agriculture. This alternative would preserve the same amount of acreage of agriculture as is proposed under the Overlay Plan.

Biological Resources

Implementation of the Measure W PA51/Millennium Plan II PA30 - Modified Alternative would result in less of an impact than the proposed project in regards to potential conflicts with the City of Irvine Urban Forestry Ordinance, since less development would occur under the alternative. Also, because less of the site would be converted to urban uses, potential biological impacts would be reduced. As with the proposed project, this alternative would allow for the creation of drainage corridors through the project site that could allow for wetland creation, and this alternative would provide the same wildlife corridor alignment as the proposed project.

Paleontological Resources

Implementation of the Measure W PA51/Millennium Plan II PA30 - Modified Alternative would result in less of an impact to paleontological resources than the proposed project. Under this alternative, development would be concentrated primarily in PA30, with substantially less development occurring in PA51 as compared to the project. Therefore, the potential for this alternative to directly or indirectly destroy a unique paleontological resource or unique geologic feature is less than the project.

Cultural Resources

Implementation of the Measure W PA51/Millennium Plan II PA30 - Modified Alternative would result in less of an impact to cultural resources than the proposed project. Under this alternative, development would be concentrated primarily in PA30, with substantially less development occurring in PA51 as compared to the project. Therefore, the potential for this alternative to directly impact cultural resources is less than the project.

Aesthetics

Implementation of the Measure W PA51/Millennium Plan II PA30 - Modified Alternative would result in less of an aesthetic impact related to light and glare than the project since there would be less intensive development occurring within PA 51 than is proposed under the project.

Population/Housing

Implementation of the Measure W PA51/Millennium Plan II PA30 - Modified Alternative would result in less of a population/housing impact related to the jobs/housing balance as the proposed project as there would be less employment generating land uses. In regards

to inducing population growth in the area, this alternative would have a similar impact as the proposed project since it would generate jobs and new residential opportunities that would attract new residents to the area.

Public Services and Facilities

Implementation of the Measure W PA51/Millennium Plan II PA30 - Modified Alternative would result in less of an impact than the project related to the construction or expansion of public facilities. This alternative would result in less of a demand for school facilities and parks, as only approximately 665 dwelling units would be allowed under this alternative as compared to 3,625 dwelling units that would occur under the proposed project.

Utilities

Implementation of the Measure W PA51/Millennium Plan II PA30 - Modified Alternative would result in a similar impact related to the construction or expansion of utilities as a similar backbone system would be required to support this alternative, although the sizing and layout may vary to reflect the alternative configuration of land uses. Because less development would occur, overall energy consumption would be less than the project.

Conclusion

This alternative is environmentally superior to the proposed project. This alternative would result in less impacts to traffic/circulation, air quality, noise, geology/soils, hydrology/water quality, biological resources, paleontological resources, cultural resources, public services and utilities. Implementation of the Measure W PA51/Millennium Plan II PA30 - Modified Alternative would result in a similar impact to land use, public health and safety, and agricultural resources. The alternative meets the following project objectives identified in Section 3.0 – Project Description of this Final Program EIR:

3. Convert the former MCAS El Toro to a Great Park with regional open space, cultural and recreational facilities.
4. Coordinate location and development of roadways and transportation systems in the project area with the local and regional circulation and transportation systems.
5. Create a wildlife corridor connection through the property which may potentially connect the Cleveland National Forest to the north and the coastal open space preserves to the south.

6.4 ALTERNATIVE LAND USE PLAN – University Village

Description of Alternative

The Alternative Land Use Plan – University Village, generally involves redesignation of Planning Area Zone (PAZ) 5 from Research and Development (R&D) to Medium High

Density Residential (MHDR). The student population of the proposed university is increased from 7,800 to 15,000, including approximately 1,500 dorm rooms on PAZ 7. Figure 6-2 depicts the Alternative Land Use Plan – University Village. Table 6-5 provides the development data for this alternative. As compared to the Overlay Plan, the changes are as follows:

PAZ 5 – Land Use changes from R&D to MHDR. Square feet change from 1,000,000 to 0. Dwelling units change from 0 to 1,580.

PAZ 7 – Students increase from 1,306 to 2,512. Square footage changes from 243,302 to 467,900. 1,500 residence hall rooms are added.

PAZ 8 – Students increase from 5,570 to 10,711. Square footage changes from 1,037,234 to 1,994,735.

PAZ 9 – Students increase from 172 to 331. Square footage changes from 32,013 to 61,566.

PAZ 10 – Students increase from 752 to 1,446. Square footage changes from 140,045 to 269,248.

The unincorporated area would be annexed into the City. No new development is proposed for the Musick Jail and IRWD properties, though the County of Orange may decide to expand the jail according to the proposed jail expansion plans.

Land Use

Implementation of the Alternative Land Use Plan – University Village would have a similar impact as the proposed project regarding conflicts with the County of Orange Master Plan of Arterial Highways and the existing Airport Environs Land Use Plan (AELUP), Air Installation Compatible Use Zones (AICUZ), and Policy Implementation Line (PIL) since non-aviation reuse of the former base conflicts with these existing plans. As with the project, this alternative would not impact off-site land uses.

Traffic/Circulation

Implementation of the Alternative Land Use Plan – University Village would result in a greater traffic/circulation impact than the proposed project. More development would occur under this alternative than would occur under the proposed project including an increase in the student population of the university. Total vehicular trip generation would be roughly 161,000 ADT as compared to 148,000 ADT generated by the Overlay Plan.

Air Quality

Implementation of the Alternative Land Use Plan – University Village would result in a greater air quality impact than the project. This alternative would place housing (1,580 dwelling units) in proximity to the proposed university, thereby, potentially reducing commuter trip lengths and associated air emissions; however, the increase in permitted student population would result in an additional 13,117 vehicle trips generated within the project area. As such, the mobile emissions would be approximately eight percent higher than the proposed project.

Noise

Implementation of the Alternative Land Use Plan – University Village would result in a greater noise impact than the proposed project, as the overall amount of vehicular trips on surrounding roadways would be greater.

Public Health and Safety

Implementation of the Alternative Land Use Plan – University Village would result in a similar public health and safety impact as the proposed project. As with the proposed project, this alternative would result in all of the area within PA 51 containing existing structures to be developed, resulting in the need to demolish existing structures. Development would occur in those areas containing remediation sites and structures and population would be located adjacent to wildland fire hazard area.

Geology and Seismicity

Implementation of the Alternative Land Use Plan – University Village would result in a similar geology and seismic impact associated with seismic ground shaking, soil erosion or loss of topsoil, and expansive soils since there would generally be a similar amount of overall development within the project area.

Hydrology and Water Quality

Implementation of the Alternative Land Use Plan – University Village would result in a similar hydrology and water quality impact as the proposed project. Under this alternative, the proposed drainage corridors would be implemented as is proposed under the project.

Agricultural Resources

Implementation of the Alternative Land Use Plan – University Village would result in a similar impact as the proposed project related to the loss of agriculture. This alternative would preserve the same amount of acreage of agriculture as is proposed under the Overlay Plan.

Biological Resources

Implementation of the Alternative Land Use Plan – University Village would result in a similar impact to the proposed project in regards to potential conflicts with the City of Irvine

Urban Forestry Ordinance, since the area of the project site that is developed would be similar to the project. As with the proposed project, this alternative would allow for the creation of drainage corridors through the project site that could allow for wetland creation, and this alternative would provide the same wildlife corridor alignment as the proposed project.

Paleontological Resources

Implementation of the Alternative Land Use Plan – University Village would result in a similar impact to paleontological resources as the proposed project. Under this alternative, development would occur in the same areas as would occur under the proposed project, therefore the potential for this alternative to directly or indirectly destroy a unique paleontological resource or unique geologic feature is similar to the proposed project.

Cultural Resources

Implementation of the Alternative Land Use Plan – University Village would result in a similar impact to cultural resources as the proposed project. Under this alternative, development would occur in the same areas as would occur under the proposed project, therefore the potential for this alternative to impact cultural resources is similar to the proposed project.

Aesthetics

Implementation of the Alternative Land Use Plan – University Village would result in a similar light and glare as the project since the area of the project site that is developed would be similar. The impact related to the change in visual quality of the project area would also be similar as development would occur in the same areas as proposed under the project.

Population/Housing

Implementation of the Alternative Land Use Plan – University Village would result in less of a population/housing impact related to the jobs/housing balance than the proposed project. There would be a reduction in the overall amount of employment generating land uses, and an increase in housing units with the change in PAZ 5 to residential. In regards to inducing population growth in the area, this alternative would have a similar impact as the proposed project since it would generate jobs and new residential opportunities that would attract new residents to the area.

Public Services and Facilities

Implementation of the Alternative Land Use Plan – University Village would result in a greater impact than the project related to the construction or expansion of public facilities. This alternative would significantly increase the demand for school facilities and parks, as approximately 1,580 additional dwelling units and 1,500 dorm rooms, and the corresponding population would be allowed under this alternative as compared to the proposed project.

Utilities

Implementation of the Alternative Land Use Plan – University Village would result in similar impacts related to the construction or expansion of utilities as a similar backbone system would be required to support this alternative, although the sizing and layout may vary to reflect the alternative configuration of land uses.

Conclusion

This alternative is environmentally inferior to the proposed project. Implementation of the Alternative Land Use Plan – University Village would result in greater impacts to traffic/circulation, air quality, noise and public services and utilities. The impact to land use, public health and safety, geology and seismicity, hydrology and water quality, agricultural resources, biological resources, paleontological resources, cultural resources, and aesthetics would be similar to the proposed project. The alternative will result in less of an impact to population/housing. The alternative meets all of the following project objectives identified in Section 3.0 – Project Description of this Final Program EIR:

1. Annex the former MCAS El Toro site and adjacent lands within the City's Sphere of Influence.
2. Convert the former MCAS El Toro to a Great Park with regional open space, cultural and recreational facilities.
3. Amend the General Plan and Zoning Ordinance to implement proposed Orange County Great Park land use designations.
4. Coordinate location and development of roadways and transportation systems in the project area with the local and regional circulation and transportation systems.
5. Create a wildlife corridor connection through the property which may potentially connect the Cleveland National Forest to the north and the coastal open space preserves to the south.
6. Respond positively and effectively to the DON's decision to sell the property to private interests by allowing private development of some land while ensuring the implementation of park and open space amenities.

6.5 INCREASED RESIDENTIAL ALTERNATIVE

Description of Alternative

This alternative would increase the amount of residential units provided in the project area. Under this alternative, the land uses proposed within PAZs 17a and 17b would be changed as shown in Table 6-6.

**Table 6-6
Increased Residential Alternative**

PAZ/Acreage	Project Land Use	Alternative Land Use	Development Potential
17a/236	Commercial Recreation	Medium High Residential	3,540 d.u.'s
17b/73	Cemetery	Medium High Residential	1,095 d.u.'s
TOTAL/310			4,635

The medium high density residential units would be comprised of approximately 3,476 single-family residential units and 1,159 multi-family residential units. All other land uses would be the same as proposed under the Overlay Plan. Figure 6-3 depicts the Increased Residential Alternative.

Land Use

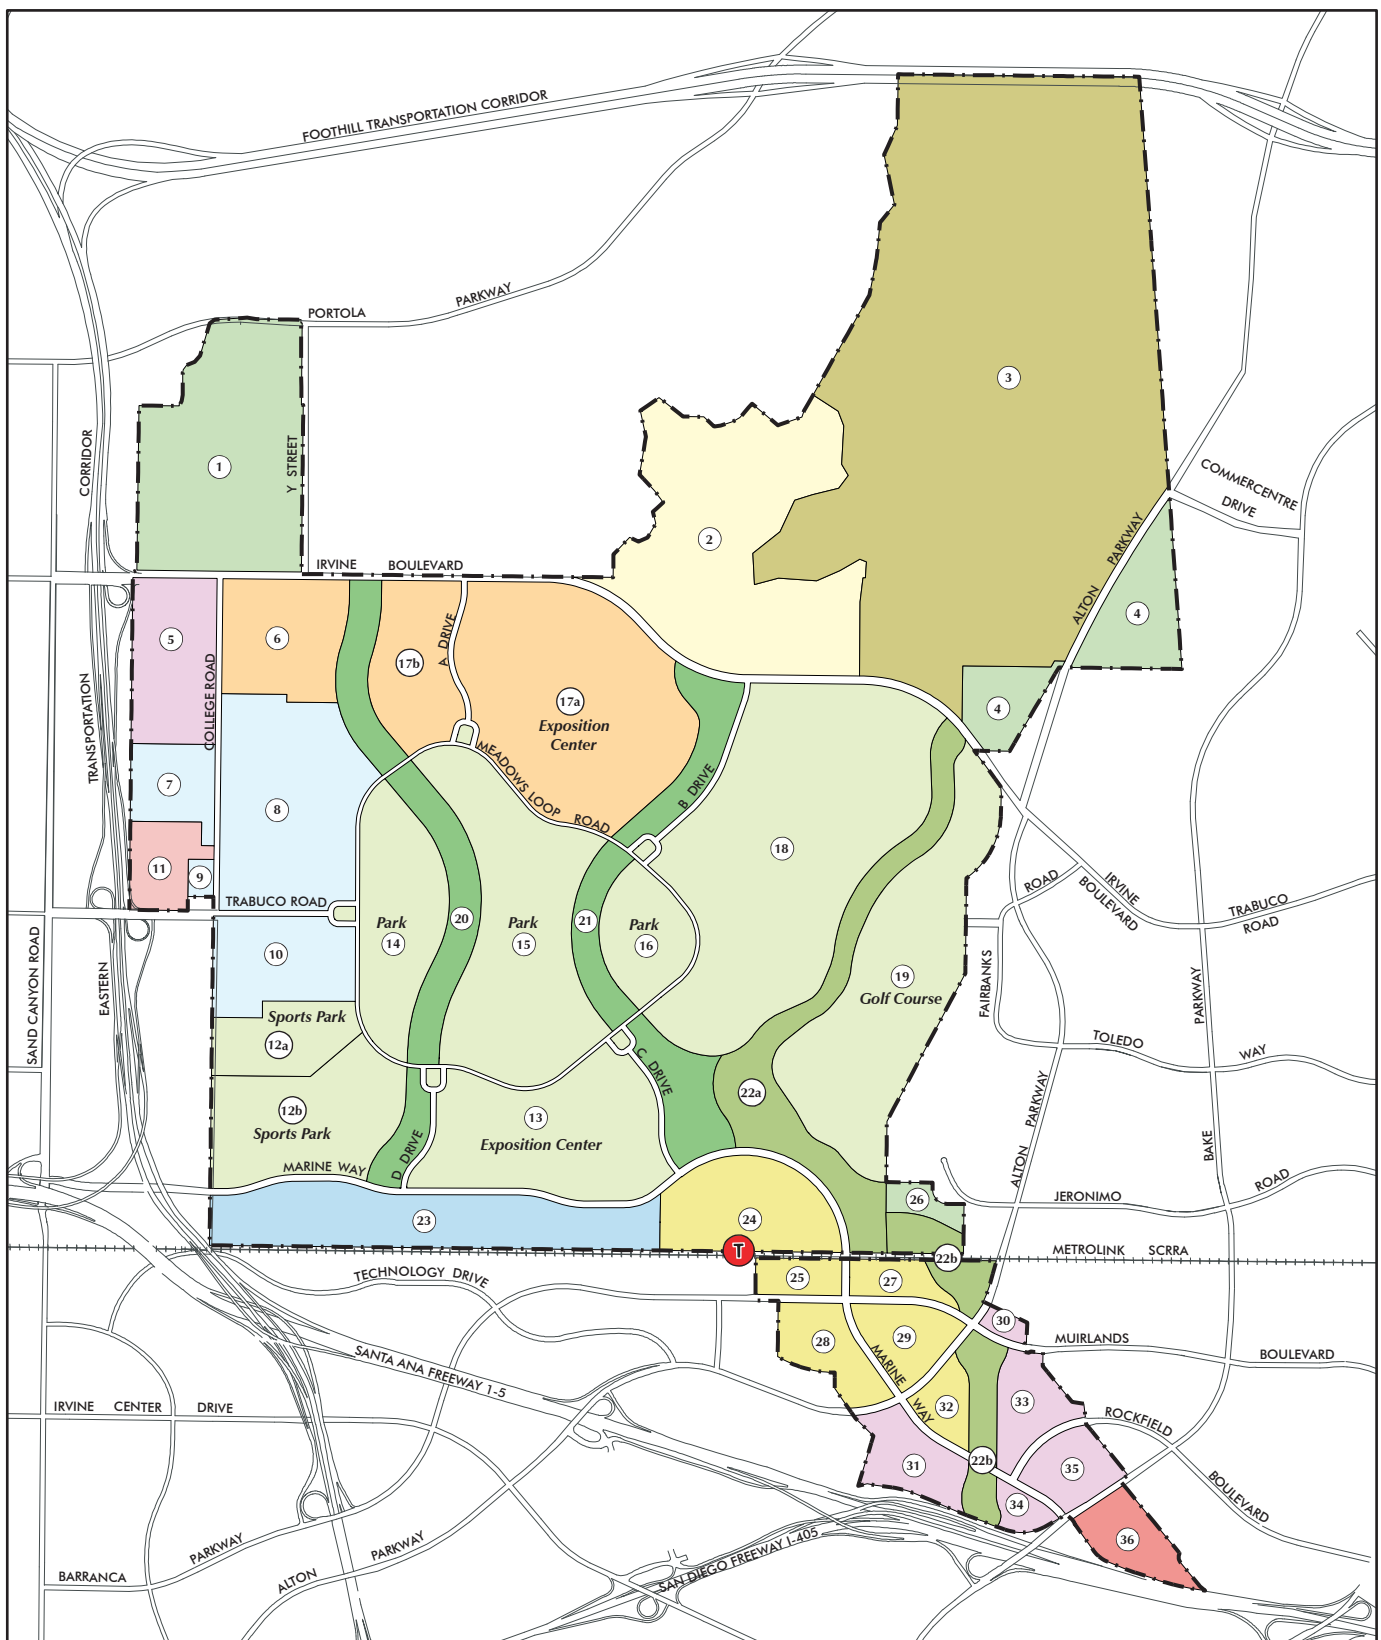

Implementation of the Increased Residential Alternative will have a similar impact as the proposed project regarding conflicts with the County of Orange Master Plan of Arterial Highways and the existing Airport Environs Land Use Plan (AELUP), Air Installation Compatible Use Zones (AICUZ), and Policy Implementation Line (PIL) since non-aviation reuse of the former base conflicts with these existing plans. As with the project, this alternative would not impact off-site land uses.

Traffic/Circulation

Implementation of the Increased Residential Alternative will result in a greater traffic/circulation impact than the proposed project. The increase of 4,635 residential dwelling units would generate approximately 37,010 daily trips (3,476 single-family dwelling units would generate approximately 28,733 daily trips and 1,159 multi-family dwelling units would generate approximately 8,277 daily trips). The commercial recreation and cemetery land uses as proposed under the project would generate approximately 5,867 daily trips. Therefore, implementation of this alternative would represent an increase in 31,143 ADT over the proposed project.

Air Quality

Implementation of the Increased Residential Alternative will result in a greater air quality impact than the proposed project as more development would occur, resulting in greater construction and operational emissions. The trip generation of this alternative is substantially greater (31,143 ADT) than the proposed project; therefore, the mobile air quality emissions generated by this alternative would be greater.

- 17c Planning Area Zone
- T Irvine Transportation Center

Figure 6-3
Alternative 6.5
Increased Residential Alternative

Noise

Implementation of the Increased Residential Alternative will result in a greater noise impact than the proposed project. This alternative would result in the generation of approximately 31,143 additional ADT than the proposed project, which would be distributed on the surrounding roadway system, and increasing the traffic noise levels along these roadways.

Public Health and Safety

Implementation of the Increased Residential Alternative will result in a similar public health and safety impact to the proposed project. As with the proposed project, this alternative would result in all of the area within PA 51 containing existing structures to be developed, resulting in the need to demolish existing structures. Development will occur in those areas containing remediation sites and structures and population will be located adjacent to wildland fire hazard area.

Geology and Seismicity

Implementation of the Increased Residential Alternative will result in a greater geology and seismic impact associated with seismic ground shaking, soil erosion or loss of topsoil, and expansive soils, as there will be a greater amount of overall development within the project area.

Hydrology and Water Quality

Implementation of the Increased Residential Alternative will result in a greater impact associated with hydrology and water quality than the proposed project. A greater amount of development and impervious surfaces would occur under this alternative as the proposed cemetery use in PAZ 17b would be developed with residential uses.

Agricultural Resources

Implementation of the Increased Residential Alternative will result in a similar impact to agricultural resources as the proposed project. Under this alternative, the same areas of the project site that are currently used for agricultural production would be developed with an alternative land use. Likewise, as with the proposed project, PAZ 1 would be retained for agricultural use.

Biological Resources

Implementation of the Increased Residential Alternative will result in a similar impact as the proposed project in regards to potential conflicts with the City of Irvine Urban Forestry Ordinance. Although a different land use is proposed for PAZ's 17a and 17b, the potential for disturbance to biological resources would be similar. Also, this alternative would allow for the implementation of the proposed wildlife corridor, as is proposed under the project.

Paleontological Resources

Implementation of the Increased Residential Alternative will result in a similar impact to paleontological resources as the same area of the project site would be disturbed by development activity as would occur under the proposed project. As with the proposed project, future development under this alternative has less potential to directly or indirectly destroy a unique paleontological resource or unique geologic feature.

Cultural Resources

Implementation of the Increased Residential Alternative will result in a similar impact to cultural resources as the same area of the project site would be disturbed by development activity as would occur under the proposed project.

Aesthetics

Implementation of the Increased Residential Alternative will result in a greater aesthetic impact related to light and glare than the project since there will be an overall increase in the amount of development occurring within the project area.

Population/Housing

Implementation of the Increased Residential Alternative will result in less of a population/housing impact related to the jobs/housing balance than the proposed project. This alternative would reduce the overall amount of employment generating land uses by approximately 236 acres and would increase the number of residential units by 1,010 dwelling units as compared to the project. As such, the alternative would reduce the project's contribution to the jobs housing imbalance. While the alternative would reduce the impact, it would remain significant and unavoidable.

Public Services and Facilities

Implementation of the Increased Residential Alternative will result in a greater impact related to the construction or expansion of public facilities as significantly more residential units would be constructed on the project site. The impact related to the construction of new school facilities will also be greater than the proposed project as there will be a greater amount of residential units and corresponding student generation.

Utilities

Implementation of the Increased Residential Alternative will result in a greater impact related to the construction or expansion of utilities as the increased residential uses would likely require a larger utility backbone system to support the alternative.

Conclusion

This alternative is environmentally superior to the proposed project with respect to the impact to population/housing. However, implementation of the Increased Residential

Alternative will result in a greater impact to traffic/circulation, air quality, noise, geology and seismicity, hydrology and water quality, aesthetics, and public services and facilities/utilities than the proposed project. This alternative will result in similar impacts to land use, public health and safety, agricultural resources, biological resources, paleontological resources and cultural resources as would occur under the proposed project. The alternative meets the following project objectives identified in Section 3.0 – Project Description of this Final Program EIR:

1. Annex the former MCAS El Toro site and adjacent lands within the City's Sphere of Influence.
2. Convert the former MCAS El Toro to a Great Park with regional open space, cultural and recreational facilities.
4. Coordinate location and development of roadways and transportation systems in the project area with the local and regional circulation and transportation systems.
5. Create a wildlife corridor connection through the property which may potentially connect the Cleveland National Forest to the north and the coastal open space preserves to the south.
6. Respond positively and effectively to the DON's decision to sell the property to private interests by allowing private development of some land while ensuring the implementation of park and open space amenities.

7.0 Analysis of Long-Term Effects

The CEQA requires the discussion of the cumulative impacts, growth-inducing impacts, and long-term impacts of a proposed project. The following sections address these issues as they relate to implementation of the Orange County Great Park project.

7.1 CUMULATIVE IMPACTS

The CEQA Guidelines define cumulative effects as “two or more individual effects that, when considered together, are considerable or which compound or increase other environmental impacts.” The CEQA Guidelines further state that the individual effects can be the various changes related to a single project or the changes involved in a number of other closely related past, present, and reasonable foreseeable probable future projects (Section 15355). The CEQA Guidelines allow for the use of two alternative methods to determine the scope of projects for the cumulative impact analysis:

- List Method - A list of past, present, and reasonably anticipated future projects producing related or cumulative impacts, including those projects outside the control of the agency.
- Regional Growth Projections Method - A summary of projections contained in an adopted general plan or related planning document which is designed to evaluate regional or area wide conditions (Section 15130).

For the purpose of this Final Program EIR, the Regional Growth Projections Method has been utilized for analysis of cumulative impacts. The cumulative analysis is based on buildout assumptions identified in the Center for Demographic Research’s *Orange County Projections 2000*.

Orange County Projections 2000

Cumulative impacts related to the proposed project will encompass environmental changes resulting from the combined effects of the proposed project and other existing or planned land uses in and around the project area. This cumulative analysis takes into consideration buildout of local and regional general plans as well as population forecasts for the County of Orange and the region as a whole (as shown in Table 7-1 and Figure 7-1).

Major projects included within the buildout assumptions and this cumulative analysis include: Eastern Transportation Corridor (ETC); Alton Parkway Extension; Foothill Transportation Corridor North (FTC); Saddleback Meadows; Foothill Aliso Commercial Center; Natural Community Conservation Plan (NCCP); MCAS Tustin Reuse Plan; James A. Musick Facility; Planning Area 17; Planning Area 27; Planning Area 40; Northern Sphere;

Woodbridge General Plan Amendment (Planning Area 15); and the Irvine Ranch Land Reserve.

Cumulative Impact Analysis

Land Use

The geographic scope for land use includes Orange County as depicted on Figure 7-1, with a focus on projects occurring around the former MCAS El Toro. Development under the proposed project will occur according to the City of Irvine's Land Use Element. The proposed project is intended to result in beneficial land use impacts by providing non-aviation reuse of the former MCAS El Toro and implement a Great Park Plan. The proposed project designates the 974-acre Habitat Preserve to ensure that development within the project area is compatible with the established Orange County Natural Community Conservation Program (NCCP). Furthermore, the proposed project will not result in any land uses or circulation routes that might physically divide established communities either within the City or in other adjacent areas. Future development of cumulative projects will comply with the adopted land use standards, policies and ordinances, and will be compatible with land uses in the areas surrounding the project site. Development for related projects and areas surrounding the site will be governed by policies, implementation measures, and programs to ensure orderly urban development. This will ensure that no significant cumulative land use impact will occur. In addition, none of these projects would require the disruption or division of the physical arrangement of an existing community. As such, cumulative land use impacts are not considered significant.

Traffic

The geographic scope for traffic includes cumulative growth projections for Orange County including the projects described above. The 2025 and Post 2025 analyses contained in Section 5.2 – Transportation/Traffic assess the traffic impacts of all cumulative development anticipated by the Year 2025 and beyond. As shown in these analyses, all intersections and roadway/freeway/tollway/ramp segments will operate at acceptable levels of service with the existing or planned improvements. However, it has been assumed in the traffic analysis that the cumulative impact of project traffic along with other regional growth at the identified ramp and freeway locations will be mitigated through a combination of regional programs that are the responsibility of other agencies. If these programs are not implemented by the agencies with the responsibility to do so, the cumulative freeway/tollway ramp impacts would remain significant and unavoidable. As a result, the proposed project will result in a cumulatively significant traffic impact that may remain significant and unavoidable.

Air Quality

The geographic scope for air quality includes the South Coast Air Basin (SCAB) and the traffic study area defined in Section 5.2. The SCAB is depicted in Figure 5.3-1 in Section 5.3. In 2000, the annual maximum concentrations of ozone (O_3), carbon monoxide (CO), particulate matter (PM_{10}), and sulfates (SO_x) exceeded both Federal and State standards in some or all areas in the SCAB. However, standards for nitrogen dioxide (NO_2), sulfur dioxide (SO_2), and lead (Pb) were not exceeded. A summary of measured criteria pollutant concentrations at the Saddleback air quality monitoring station (located at the former MCAS El Toro) for selected years between 1995 and 2000 are shown in Table 5.3-3 in Section 5.3.

NO₂ concentrations are not measured at this station; however, no station in Orange County has recorded an exceedance of NO₂ standards since at least 1990.

Although air quality tends to vary year to year due primarily to meteorological conditions, air quality at the Saddleback monitoring station appears to be improving (which generally has been the case throughout the SCAB). The primary long-term air quality impacts from development of the proposed project will result from operational emissions from area sources and motor vehicles. Projected SCAB emission estimates for the year 2025 and the estimated average mitigated operation emissions for the proposed project for the year 2025 are presented in the table below. From the estimates presented, it is evident that emissions from the project are less than one percent of the total projected SCAB emissions.

Projected Emission Estimates For SCAB From the 1997 AQMP Compared to Emission Estimates For the Project Area

Emission Estimates (tons/day)						
Pollutant	Projected 1997 AQMP Emissions		Base Plan (2025)		Overlay Plan (2025)	
	Year 2007*	Year 2025**	Unmitigated Emissions	Mitigated Emissions	Unmitigated Emissions	Mitigated Emissions

Source: <http://www.aqmd.gov/aqmp/97aqmp/chapters/m-chap3>

Emissions due to development in the proposed project will exceed SCAQMD thresholds of significance for oxides of nitrogen and reactive organic gases during construction (short-term impact) and for oxides of nitrogen, reactive organic gases, carbon monoxide, and

particulate matter less than ten microns in diameter (PM10) during operation from area source and vehicular emissions (long-term impact for both interim year and buildout year). Together, construction and operation emissions will also exceed applicable thresholds of significance. Although construction activities for the related projects may not overlap, the environmental analysis of this Final Program EIR assumes that they would. Operation emissions in conjunction with related projects and other emissions in the SCAB will also coincide. Since air quality in the SCAB does not comply with federal or state standards, these emissions will contribute to a cumulatively significant impact on air quality. Similar to project-specific impact, no feasible mitigation measures exist to reduce this cumulative impact to a level of less than significant because any project of substantial size will result in this impact.

The proposed project is not expected to result in other unmitigable air quality impacts, such as those related to carbon monoxide hotspots (see Section 5.3). Pursuant to the CEQA Guidelines (Section 15130), no other cumulative impact related to air quality will result.

Noise

The geographic scope for noise includes growth projections for Orange County and the traffic study area defined in Section 5.2. The proposed project will contribute to vehicular-generated noise along roadways in the vicinity of the site. All future cumulative projects, including the proposed project, must take future noise levels into account when siting sensitive receptors and include appropriate mitigation for on- and off-site impacts. Existing ordinances and regulations will ensure that project-specific on- and off-site impacts will be less-than-significant.

Noise generated from activities on the proposed project site will contribute to ambient noise in the surrounding area. However, since noise energy dissipates with distance, the extent of increases in noise will be limited to areas near the site. As discussed in Section 5.4, no impact related to on- and off-site noise generation has been identified. No other noise-related impacts, such as for groundborne vibration, are identified herein. Therefore, pursuant to the CEQA Guidelines (Section 15130), no significant cumulative impact related to noise will result.

Public Health and Safety

The geographic scope for public health and safety includes growth projections for Orange County with an emphasis on the area immediately surrounding the former MCAS El Toro. As discussed in Section 5.5, structures on the project site and portions of the project site are contaminated with hazardous materials by past military activities, such as asbestos and lead-based paint. Other hazards exist on the site, such as hazardous material deposits. Although the DON is required to remediate on-site hazardous materials and other hazards prior to conveyance, the proposed project will facilitate this cleanup, resulting in a beneficial impact. Future cumulative development that utilizes hazardous materials will be required to comply with all regulations pertaining to handling, storing, and disposing hazardous materials. The development of other cumulative projects has the potential to expose persons to hazards or hazardous materials; however, as with the proposed project, mitigation measures can be implemented to address the presence of hazards and hazardous materials on a site specific basis. The combined effect of the development and operation of cumulative projects is not cumulatively significant, as potential hazards are limited to each specific site, and each

project will need to comply with City, State, and federal regulations and policies adopted to protect the public from hazards, which will ensure that the cumulative public health and safety impact remains at a level less than significant.

Geology and Seismicity

The geographic scope for geology and seismicity includes growth projections for Orange County within the framework of the regional geologic setting. Regional geology is depicted on Figure 5.6-1. Most of the soils on the site are well-suited for urban development, including construction. All on-site impacts related to soils, such as erosion, loss of topsoil and expansive soils, must be mitigated prior to development pursuant to the City's General Plan and implementing zoning ordinance.

The level of seismic activity expected in the project area will be similar to the County as well as other regions of Southern California. The exposure of people or structures to risk of loss, injury, or death will not be substantial or adverse because potential for seismic activity is similar to elsewhere in the region. All development at the former MCAS El Toro and new development in the region in general will be required to be constructed to withstand probable seismic forces, including seismic-related ground failure like liquefaction. As cumulative projects are constructed, more people and structures will be exposed to seismic hazards due to earthquakes. Other geotechnical constraints, such as expansive soils and landslides may present hazards to cumulative development. Adherence to site specific geotechnical recommendations, building codes, and applicable grading ordinances will reduce potential cumulative geotechnical impacts to a level less than significant.

Hydrology and Water Quality

The geographic scope for hydrology and water quality includes growth projections for Orange County within the context of the Santa Ana River watershed (including the San Diego Creek watershed) and the Orange County aquifer. The proposed project will result in changes to on-site land uses. Although in some areas the amount of impervious surfaces will increase, a portion of the open space provided by the Orange County Great Park Plan will be utilized for drainage facilities that would offset this increase. All on-site development will be required to analyze on-site runoff to ensure that adequate infrastructure is provided to convey that runoff to local and regional facilities. The existing Flood Control Master Plan for San Diego Creek (Master Plan) assumed certain cumulative development, including urban reuse of the former MCAS El Toro. As projects are proposed within the watershed that do not conform to the growth and land use assumptions contained in the Master Plan, detailed hydrology studies will be required to analyze additional flood control improvement that will be required for that development to proceed. The provision of drainage corridors as a component of the project as well as mitigation measures contained in this Final Program EIR will ensure that project-specific impact will be less than significant. The cumulative impact on drainage and flood control facilities within the Santa Ana River watershed and Orange County aquifer will be less than significant.

The proposed project and cumulative development will be required to comply with all local and regional plans regulating water quality, including total maximum daily loads (TMDLs) for the Newport Bay watershed, the Drainage Area Master Plan (DAMP) for Orange County, NPDES permits, and implementing ordinances adopted by the City of Irvine. Project-related water quality impacts will not differ substantially from current conditions as existing channels

are all improved/channelized and are proposed to remain the same under the Orange County Great Park Plan. Sediment loads currently carried by these channels may decrease in the future due to recently installed detention basins in Bee Canyon, Round Canyon, and the Marshburn Basin. Additionally, to improve water quality within the San Diego Creek watershed, natural drainage corridors will be included in the Great Park Plan. In addition, the Irvine Ranch Water District (IRWD) is proposing to develop water quality wetlands within the project area. The wetlands are planned to be located along the Bee Canyon Channel, Aqua Chinon Channel, Serrano Creek, and the Upper San Diego Creek. Since existing regulatory programs exist to improve local surface water quality, project-specific impacts will be less than significant. Regional BMPs such as the TMDL programs, the DAMP, the MSW Permit, the regional sediment basins, and the San Joaquin Marsh program have been designed under the assumption that the San Diego Creek watershed would continue to become more urbanized. The regional control measures anticipate a reduction in overall agricultural land uses, with their high levels of pollutant runoff, and an increase in urban uses, with an associated increase in runoff volumes. The regional control measures would absorb any cumulative adverse effects of the proposed development. To the extent that the project would improve water quality, that benefit would be shared by the watershed.

The TMDL program is designed to identify all those constituents that adversely impact the beneficial uses of a particular water body, and then to identify the appropriate reduction in pollutant concentrations and/or loadings needed so that the water body can attain its beneficial uses as identified in the Basin Plan.

Other projects in the area would be expected to be reviewed by local and regional jurisdictions regarding project approvals; therefore, they would presumably comply with the same regulatory surface water quality requirements as the proposed project. Compliance with these regulations would ensure the cumulative impact remains less than significant.

Agricultural Resources

The geographic scope for agricultural resources includes Orange County and the growth expected within the County. The encroachment of urban areas on agricultural lands is a long and continued trend in Orange County. Though it is difficult to quantify the amount of agricultural land that is under development pressure within the County, it is evident that such pressure exists and will continue to with or without implementation of the project. The rising cost of irrigation, increased land values, labor costs, and damage from vandalism have made it difficult to maintain a successful large scale agricultural operation. The conversion of agricultural land to urban uses is an important policy decision that is ultimately left to each jurisdiction. In order to address the cumulative loss of agricultural land within Irvine, the City has established an Agricultural Legacy Program, which intends to retain certain sites within Irvine for metro farming activities. Despite the fact that the project will help implement the City's Agricultural Legacy Program by retaining agricultural uses on-site, the loss of the remaining agricultural land is a cumulatively significant loss of local and regional agriculture. The project will result in a cumulatively significant and unavoidable impact associated with the loss of agriculture. For a discussion of regional mitigation measures considered to mitigate project impacts but determined to be infeasible, please see Section 5.8 – Agricultural Resources of this Final Program EIR.

Biological Resources

The geographic scope for biological resources includes the Natural Community Conservation Plan (NCCP) Planning Area in conjunction with growth projections for Orange County. The City of Irvine and jurisdictions within the NCCP Planning Area will continue to develop in accordance with the adopted General Plans of the respective jurisdictions. The primary cumulative impact on biological resources is the fragmentation of ecosystems resulting from the incremental loss of native habitats. As fragmentation continues, the remaining ecosystems will become more isolates and fragmented. The result will be that connectivity between patches of habitat and the wildlife populations they support will be lost. The proposed project designates the 974-acre Habitat Preserve to ensure that development within the project area is compatible with the established Orange County Natural Community Conservation Program (NCCP). Furthermore, the project proposes a major wildlife corridor that would connect two preservation areas in the County, the Lomas Ridge and San Joaquin Hills. This wildlife corridor is proposed where there is currently no link between these areas.

The establishment of the Nature Reserve of Orange County, a 37,000 acre reserve that was approved on July 17, 1996, will provide regional biological benefits that would be unlikely to occur with a piecemeal conservation strategy. The Nature Reserve was designed to prevent the incremental loss of native habitat and the fragmentation of ecosystems, as well as to compensate for impacts of individual projects. Establishment of the Reserve System will protect approximately forty Identified Species, including three Target Species (gnatcatcher, Cactus wren, and orange-throated whiptail lizard), which are the focus of the NCCP planning, and use the CSS and related habitat. The implementation of the NCCP, dedication of lands, and endowment by the participating landowners mitigate impacts of proposed and future development on covered habitats and identified species. The City of Irvine participates in this and the NCCP program, and requires development to be in accordance with the NCCP. As a result, cumulative biological impacts are mitigated to a level less than significant.

Paleontological Resources

The geographic scope for paleontological resources includes growth projections for Orange County with a focus on the immediate area surrounding the former MCAS El Toro. Implementation of the City's standard conditions of approval, which includes requirements to ensure that paleontological resources are not impacted from development, and mitigation required by this Final Program EIR will ensure that impacts to paleontological resources in the project area are mitigated. This mitigation includes requirements for certification of the site by a registered paleontologist prior to issuance of grading permits and measures to recover fossils if they are discovered during grading. Such procedures are generally standard in the region, and will be applied elsewhere when appropriate. Implementation of these measures as specific cumulative projects are proposed and developed will ensure the potential cumulative impact to paleontological resources is less than significant.

Cultural Resources

The geographic scope for cultural resources includes growth projections for Orange County with a focus on the immediate area surrounding the former MCAS El Toro. Implementation of mitigation measures identified in Section 5.11 – Cultural Resources will reduce potential project impacts on cultural resources to less-than-significant levels. Although other projects in the region will result in significant impacts on cultural resources, existing structures at the former MCAS El Toro do not contribute to any substantial historic or cultural district in the region. There are no features or characteristics of the project area that define or include unique ethnic cultural values and no known or documented religious or sacred uses associated with the site or the region. Development of cumulative projects has the potential to impact archaeological resources. The cumulative impact to cultural resources can be mitigated through data recovery and avoidance of important cultural resources.

Aesthetics

The geographic scope for aesthetics includes growth projections for Orange County with a focus on the immediate area surrounding the former MCAS El Toro. The proposed project site is located in a rapidly urbanizing portion of southern Orange County where changes to the aesthetic environment abound. Specifically, new development in the area will alter the natural terrain and result in artificial topography. Alteration of the natural topography from the proposed project will be limited, and mitigation measures contained in this Final Program EIR (see Section 5.12 – Aesthetics) will ensure that project-level impacts as a result of this change will be less than significant. Existing City policies regarding visual quality, such as requiring site design review, will also work to ensure high aesthetic quality of future development. Substantial amounts of open space will be retained as well. The cumulative impact is considered less than significant.

Population and Housing

The geographic scope for population and housing includes Orange County and the growth projections for the County. Figure 7-1 depicts the Orange County Regional Statistical Areas. Other cumulative projects generally have been accounted for in these growth projections; however, future unknown development may also result in an exceedance of projections. Based on future projections, the Orange County Subregion is anticipated to become increasingly jobs-rich over the next 20 years. The proposed Base Plan and Overlay Plan for the former MCAS El Toro site would substantially add to employment generation characteristics of Irvine and the region. Since, the project-related employment would exacerbate the cumulative subregional jobs/housing imbalance, the cumulative population and housing impact is considered significant and unavoidable.

Public Services and Facilities

The geographic scope for public services and facilities includes growth projections for Orange County with a focus on the immediate area surrounding the former MCAS El Toro. Future regional growth will result in increased demand for public services and facilities, including law enforcement, fire protection and emergency medical services, park and recreational facilities and programs, and schools. Service providers will continue to evaluate levels of service desired and potential funding sources to meet this demand.

The proposed project will result in increased demand for public services and facilities and will contribute to the need to construct these facilities and operate such services. The Orange County Great Park Plan includes those facilities that will need to be constructed as a result of demand from on-site development. As such, the environmental impacts of constructing and operating these public facilities and services as a result of cumulative demand has been evaluated in this Final Program EIR, and no additional impact will occur.

Utilities

The geographic scope for utilities includes growth projections for Orange County with a focus on the immediate area surrounding the former MCAS El Toro. Future regional growth will result in increased demand for utilities, including water facilities and services, wastewater facilities and services, solid waste disposal, energy utilities, and communications. Utility providers will continue to evaluate levels of service desired and potential funding sources to meet this demand. Utility services are available for the proposed project and the proposed project includes general designs for utility systems.

The proposed project will result in increased demand for utilities and will contribute to the need to construct and operate these utilities. The Orange County Great Park Plan includes those utilities that will need to be constructed as a result of demand from on-site development. As such, the environmental impacts of constructing and operating utilities as a result of cumulative demand has been evaluated in this Final Program EIR, and no further impact will occur.

7.2 GROWTH INDUCING IMPACTS

Section 15126.2(d) of the CEQA Guidelines states that the EIR address the growth-inducing impact of the proposed project. Specifically, the EIR must “discuss the ways in which the proposed project could foster economic or population growth, or the construction of additional housing, either directly or indirectly, in the surrounding environment. Included in this are projects that would remove obstacles to population growth....[i]ncreases in the population may tax existing community service facilities, requiring construction of new facilities that could cause significant environmental effects.” The EIR must also “discuss the characteristic of some projects which may encourage and facilitate other activities that could significantly affect the environment, either individually or cumulatively. It must not be assumed that growth in any area is necessarily beneficial, detrimental, or of little significance to the environment.”

Impact Analysis

Growth-inducing impacts can be either direct or indirect, as described below.

Direct Impacts

Direct growth-inducing impacts are generally associated with the provision of urban services, such as utilities, improved roadways, and police protection, to an undeveloped or

rural area. The provision of these services allows new development to occur more easily, and can induce landowners to convert their property to urban or more intense urban uses. Other direct impacts include substantial economic expansion and the related multiplier effects that ripple through the economy and produce more growth and regulatory changes brought about that might result in physical changes off-site.

Infrastructure Expansion

The former MCAS El Toro site is largely developed, and changes in land uses as proposed under the proposed project will involve the demolition of existing structures, construction of new development, and the provision of new roadways and infrastructure systems to serve this development. Areas on the northern and southern sections of the site that are currently in agricultural use are planned to be developed with urban land uses. In addition, there are adjacent agricultural areas and underutilized sites near the former MCAS El Toro (to the northwest, northeast, and southeast) that may be induced by the proposed project to develop in the future. However, the proposed project is primarily conversion of the former MCAS El Toro to park/open space/recreation uses that will not contribute to conversion of adjacent agricultural areas to urban areas.

The roadway and infrastructure improvements that will accompany future development under the proposed project may improve access to nearby vacant areas (over 1,000 acres located north of the site and designated for low-density residential development) and increase pass-by traffic. The provision of infrastructure improvements under the proposed project may also decrease the costs associated with extending or improving the existing infrastructure to these vacant sites and, therefore, make future development less costly and more expedient for developers.

The proposed roadways will provide traffic access through the site. These roadways may make the surrounding area more attractive to investors, property owners and future residents and, thus, induce development in these areas. Therefore, the proposed project may facilitate development in these nearby vacant areas by making them more attractive residential sites or commercial and industrial centers.

Environmental impact associated with growth-inducing infrastructure expansion will be assessed in accordance with CEQA as such new infrastructure projects are proposed. Mitigation for significant environmental impacts associated with such projects will be the responsibility of those projects.

Economic Growth

The proposed project is designed to develop the former MCAS El Toro facility with primarily open space/recreational, commercial, research and development, and institutional uses.

The planned residential development on the site is expected to partially accommodate housing demand that will be created by employees on-site wanting to reside near their places of work. These housing units, in addition to the estimated 55,000 housing units planned, but not yet built, in the County, will increase the housing stock of Orange County.

The project is primarily focused on providing park/open space/recreation opportunities. These land uses will not generate a significant number of jobs. The planned land uses under

the proposed project that would attract jobs to the area, include research and development, institutional, and educational. With the exception of research and development, these sectors are not considered economic drivers. Thus, the proposed project promotes economic growth; however, that is not the goal of the project.

The presence of a qualified labor force in the region and the high demand for research and development and office space in Orange County led to the provision of adequate space for these sectors under the proposed project. The provision of a university campus on the site to support and develop this labor force is planned to attract high technology industries that demand a highly skilled labor force.

Environmental impact associated with growth-inducing economic development, (such as demand for industrial facilities, increased traffic, noise and air quality impacts) will be assessed in accordance with CEQA as such new projects are proposed. Since it is unclear at this time how growth-inducing economic development may affect growth in the area, it is not possible to quantify potentially significant impacts or identify mitigation measures to reduce such impacts to less-than-significant levels. Mitigation for significant environmental impacts associated with such projects will be the responsibility of those projects.

Removal of Development Restrictions

Since 1981 the recognized planning document for land use in the environs of the former MCAS El Toro has been the 1981 Air Installation Compatibility Use Zones (AICUZ) study. As part of this study, noise and accident potential zones were developed for areas surrounding the former MCAS El Toro property. A land use compatibility matrix and applicable land use and zoning strategies were developed in an effort to achieve and maintain compatible land uses near the former MCAS El Toro site. The Noise Element of the Orange County General Plan establishes the 65 dB(A) CNEL contour contained in the 1981 AICUZ as the Policy Implementation Line (PIL) in which new residential construction is not permitted, although exceptions may exist for neighborhood infill conditions. At the time of development of the 1981 AICUZ, some residential development had already occurred within what will become the 65 dB(A) CNEL contour.

Since 1973, the City of Irvine has incorporated such factors as noise and accident potential into its General Plan, zoning, and development policies. In 1980, the City and the Marine Corps entered into a Memorandum of Understanding (MOU) that established the AICUZ study as the “basic planning resource in conjunction with the amendment of the City’s adopted General plan in so far as it relates to aircraft noise and hazard.”

Consistent with the passage of Measure W by Orange County voters and the County of Orange plans for the project site, the proposed project does not include aviation uses on the site, and thus will allow removal of development restrictions associated with the aircraft clear zones and flight patterns and the noise-restricted areas around the former MCAS El Toro. Previously development-restricted areas in the City, adjacent cities, and unincorporated areas in the County of Orange could develop with residential and other land uses, at higher densities, and at higher building heights. Such a scenario could allow new development in the surrounding area that would not have been possible if the aviation uses remained on the site.

Since it is unclear at this time how the removal of these development restrictions may affect growth in the area, it is not possible to quantify potentially significant impacts or identify mitigation measures to reduce such impacts to less-than-significant levels. Furthermore, these development restrictions are imposed by a variety of jurisdictions, and the City cannot guarantee implementation of mitigation measures outside of its jurisdiction. Therefore, no feasible mitigation is available to reduce this potentially significant impact.

Indirect Impacts

Indirect or secondary growth-inducing impacts consist of growth induced by additional demand for housing, goods, and support services associated with population and employment increases caused by or attracted to the area.

The adoption and implementation of the proposed project will allow for the intensification of urban land uses on-site and will create short-term construction employment, as well as long-term employment in research and development, institutional, and educational land uses. Additional employment opportunities in the City will be partially met by the local labor force, although individuals from areas outside the region may relocate to the County to be near these jobs. These off-site employees may, in turn, create additional demand for housing. While planned residential development on the site is expected to accommodate some of this demand, adjacent residential areas are expected to experience an increase in demand due to the availability of jobs on the site. As indicated earlier, some 55,000 housing units have yet to be built in planned developments in the surrounding area. These units are expected to meet demand resulting from new jobs on-site.

The jobs and households on-site will also create demand for goods and services in the area. This demand may be met by the existing Irvine Spectrum development and new commercial, recreational, and retail uses that will be developed on-site, as well as in the surrounding area. Providing the goods and services needed to support new development on-site will lead to increases in demand for housing and support services, which in turn will induce additional growth in the City and the surrounding area. Thus, new development under the proposed project is expected to produce a multiplying pattern of development, investment, and growth in the community.

Roadway improvements, infrastructure systems, and provision of public services in the area may encourage residential, commercial, and industrial construction in adjacent areas, which will increase local population and employment bases. The intensification of land uses will foster growth and increases in utility consumption, as well as in demand for public services. Construction of capital improvements that are needed to support development will affect the pace of growth in the project area. The availability of adequate utilities and infrastructure in the area is expected to indirectly serve to promote development of adjacent areas.

The reduction of land in the project area in agricultural production, will have the indirect effect of increasing development pressure and accelerating the loss of the remainder of the agricultural land within the area. A net decrease in farmland under cultivation in an area has a consequent increase in agricultural production costs such as transportation and labor. Agricultural activities tend to be incompatible with urban and suburban neighbors because of factors such as dust, odors, pesticide use and machinery noise associated with normal farming operations. Farmers may also experience increased costs associated with garbage

dumping on their property, theft of produce and equipment, vandalism of equipment, and increased traffic on roads used to move equipment between fields. Development within the project area may reduce the attractiveness of continued production on nearby farmlands, and may increase the financial rewards of taking land out of agricultural use.

However, conversion of agricultural land to urban uses is a long and continuing trend in Orange County. Though it is difficult to quantify the amount of agricultural land that is under development pressure within the County, it is unarguable that such pressure exists and will continue with or without implementation of the proposed project. As a result, while there are existing pressures that would result in the conversion of agricultural land within and adjacent to the project area with or without implementation of the proposed project, it is expected that the conversion of agricultural land within the project area will serve to indirectly promote the conversion and development of agricultural land within the area.

7.3 SIGNIFICANT IRREVERSIBLE ENVIRONMENTAL CHANGES

Section 15126 of the CEQA Guidelines states, in part, that the EIR should address “significant irreversible environmental changes which would be caused by the project should it be implemented. Uses of nonrenewable resources during the initial and continued phases of the project may be irreversible since a large commitment of such resources makes removal or non-use thereafter unlikely. Primary impacts and, particularly, secondary impacts (such as highway improvement which provides access to a previously inaccessible area) generally commit future generations to similar uses. Also, irreversible damage can result from environmental accidents associated with the project. Irretrievable commitments of resources should be evaluated to assure that such current consumption is justified.”

Impact Analysis

Annexation of the former MCAS El Toro site, the Musick jail site, and the IRWD parcel will increase the land area within the jurisdictional boundaries of the City of Irvine. No new development on the Musick jail site or the IRWD parcel is proposed as part of the annexation. Thus, no irreversible environmental changes are expected with the annexation of these two sites. The following analysis focuses on the environmental changes that are anticipated with new development planned on the former MCAS El Toro site under the proposed project.

Adoption of the proposed project will result in the redevelopment of the site, including demolition of most of the existing on-site structures. The proposed project proposes construction of a variety of new structures and facilities; provision of new infrastructure systems; and provision of public facilities and other public improvements to serve future development in the area. New structures built under the proposed project will represent a long-term commitment to park/open space/recreational, research and development, and institutional uses proposed on the site. This new development at the former MCAS El Toro site will preclude aviation and military uses. Thus, irreversible and long-term effects associated with the proposed project implementation include new research and

development and institutional development on the site, as well as new roadways, storm drain facilities, water system, sewer system, and other facilities that will support planned development. Because the proposed project will be implemented over a long period (20 years or more), certain environmental impacts associated with future development projects will be incremental and cumulative over the long-term.

Primary Impacts

Implementation of the proposed project will result in an irreversible commitment of non-renewable and renewable resources, including land, construction materials, aggregate materials, water, and energy resources.

Incremental loss of agricultural land and undeveloped/underdeveloped areas on site will occur. Aside from the conversion of the agricultural areas, runways, taxiways and aprons, and underdeveloped sections of the site to more intensive urban uses, the project site does not possess significant on-site mineral, energy, oil, or cultural resources that will be adversely affected by new development under the proposed project (see Section 5). The existing runways will be recycled for use in construction project roadways and other features requiring aggregate materials. The proposed habitat reserve along the eastern edge of the site will be preserved to protect biological resources in this area.

Construction activities carried out to implement the proposed project will require a wide variety of construction materials, including such non-renewable resources as sand, gravel, and steel, and renewable resources such as lumber. Resources committed during construction are unlikely to be recovered, even after the 50- to 75-year life span of the physical structures is reached. The amount of resources that will be committed is not considered significant relative to available resources in the region and considering the incremental phasing of development within the proposed 20+-year time frame. Furthermore, this use of resources is not considered wasteful nor will it be substantial relative to other urban development at a similar scale in the region.

Water and energy resources will also be irretrievably committed during construction of various developments planned on site. Once constructed, ongoing maintenance of structures built in the project area will result in further commitment of water and energy resources in the form of fuel, natural gas, and electricity. These commitments represent long-term obligations that will accompany future development activities. Utility providers have indicated that available resources and facilities are adequate to serve future development under the proposed project.

Specific development projects that are constructed under the proposed project represent a commitment to the improvements and land uses planned in the area. The provision of new infrastructure, roadways, and public facilities on-site will also enhance the physical environment through the elimination of existing, older infrastructure systems. The City of Irvine and other affected agencies will maintain roadways, parks, and other public facilities on-site and serving the site. This will entail financial, personnel, and facility resources from service providers.

The proposed project is intended to redevelop the former MCAS El Toro site with a variety of land uses that will reflect similar development in the City and desired by the City; to ensure the adequate provision of public services and infrastructure; and to prevent the

adverse impacts associated with haphazard development. Annexation of the former MCAS El Toro site will be consistent with City policies regarding land annexation and related provision of infrastructure within its Sphere of Influence. This annexation will also allow the City of Irvine to regulate redevelopment efforts at the site.

In summary, annexation of the former MCAS El Toro site, Musick Jail site, and IRWD parcel and implementation of the proposed project will involve the following irreversible environmental changes:

- New development under the proposed project will lead to the loss of agricultural land on-site. These existing agricultural areas are planned for the development of the wildlife corridor, open space/park, and sports park uses.
- The project involves the commitment of approximately 4,738 acres (former MCAS El Toro) to land uses proposed under the proposed project, resulting in the elimination of existing on-site development. Some structures ("The Castle", former bachelor housing) and uses (golf course, habitat preserve) may be retained, and some may serve as interim facilities until permanent facilities are constructed (i.e., El Toro Marine School and some existing office buildings, some of which have been retrofitted for other uses).
- New vehicle trips on proposed and surrounding roadways will be generated by new development under the proposed project. Planned roadways on-site are expected to provide access into the site and allow changes in traffic patterns due to the alternative routes provided on-site.
- Vehicle trips generated by new development under the proposed project will result in increases in air pollutants, including criteria air pollutants, associated with vehicle exhaust. Greater pollutant emissions are also expected from new stationary sources that may be built within the project area.
- New development under the proposed project will introduce long-term noise from vehicles traveling to and from the project site. The vehicular noise will add to ambient noise levels on-site and in the surrounding area. New sources of stationary noise are also expected from future development and on-site activities.
- The project will require the commitment of energy, water, and other natural resources for the construction and operation of new development. However, existing resources are available to meet the projected demand and utility providers can serve new development under the proposed project without adverse impacts.
- Implementation of the proposed project will involve demolition of existing structures that have asbestos-containing materials and lead-based paint and the disposal of other hazardous materials on the site. Abandonment of water wells and fuel tanks will also occur, along with the remediation of identified contaminated soils. Thus, elimination of existing public health and safety hazards will accompany the proposed project.
- Implementation of the proposed project will result in an increase in the demand for utilities and will require the extension of existing infrastructure to individual lots on

the site. An increase in demand for public services and facilities operated by the City of Irvine and affected service agencies will also occur. This demand can be served by facilities and staffing of public service agencies.

- The proposed project will lead to demolition of existing structures on site, the construction of new structures, and changes in the visual quality of the site. New light sources will be introduced to the environment. These changes will not result in significant adverse impacts after mitigation.
- The preclusion of an airport and airport uses in accordance with Measure W, which was passed by Orange County voters in 2002.

Secondary Impacts

Annexation of the proposed project area and its implementation will alter the pattern of on-site development through development of a primarily park/open space in the area and demolition of existing military facilities. New development planned under the proposed project will involve the provision of new roadways and infrastructure systems to serve individual lots and projects on-site. The proposed project will provide an extensive circulation network on-site and will divide the existing site into smaller planning areas for future development. While the former MCAS El Toro is not open to public access, the proposed project will provide public access to most of the site, as well as allow vehicles and people to pass through the site.

In the post-buildout period, when planned land uses change or areas are redeveloped within the project area, public service facilities and infrastructure that are constructed under the proposed project will continue to permit on-site urban development. These public improvements will also allow the site and the surrounding area to develop and accommodate additional population growth well beyond buildout of the project area. Recycling of land uses in and around the project area will be subject to City of Irvine General Plan policies for planned growth, phased development, and provision of public facilities and services. Therefore, no environmentally significant secondary impacts are anticipated to result from project implementation.

7.4 UNAVOIDABLE SIGNIFICANT ENVIRONMENTAL EFFECTS

Based on the data and conclusions in Section 5 of this Final Program EIR, annexation of the former MCAS El Toro, Musick Jail and IRWD parcel and new development projects that will be implemented under the proposed project may result in significant unavoidable traffic/circulation, air quality, agricultural resources and population/housing impacts that cannot be fully mitigated. Implementation of the recommended mitigation measures will reduce all other impacts to less-than-significant levels.

Traffic/Circulation

The 2025 and post 2025 analyses indicates that all intersections and roadway/freeway/tollway/ramp segments will operate acceptable levels of service with the existing or planned

improvements. However, it has been assumed in the traffic analysis that the cumulative impact of project traffic along with other regional growth at the identified ramp and freeway locations will be mitigated through a combination of regional programs that are the responsibility of other agencies. If these programs are not implemented by the agencies with the responsibility to do so, the cumulative freeway/tollway ramp impacts would remain significant and unavoidable.

Air Quality

SCAQMD thresholds for oxides of nitrogen and reactive organic gases will be exceeded during construction activities on the site. Operational emissions (stationary and vehicular) will exceed SCAQMD thresholds for criteria pollutants, including oxides of nitrogen, reactive organic gases, and carbon monoxide from year 2007 through the post 2025 development level. Given the size of the proposed project, these impacts are not surprising. No feasible mitigation measures exist to reduce these impacts to less-than-significant levels.

Agricultural Resources

The proposed project will result in the permanent loss of Prime Farmland, Unique Farmland, and Farmland of Statewide Importance (important farmland) to non-agricultural use within the project area. The project will accelerate the permanent loss of important agricultural land to non-agricultural use in the project vicinity as well. Appropriate amounts of agricultural and open space lands to be preserved are determined through City land use policy decisions. Mitigation measures in Section 5.8 will reduce the impact of the project on agricultural resources by encouraging agriculture as an interim land use pending development. However, impacts to agricultural resources will remain significant and unavoidable.

Population and Housing

The proposed Base Plan and Overlay Plan for the former MCAS El Toro site would substantially add to employment generation characteristics of Irvine and the region. Since, the project-related employment would exacerbate the subregional jobs/housing imbalance, the population and housing impact is considered significant and unavoidable. No feasible mitigation has been identified that would reduce this impact to a level less than significant.

7.4 AREAS OF LESS THAN SIGNIFICANT IMPACT

Based on the analysis contained in Section 5, environmental impacts from the proposed project will be less than significant without mitigation or will be less than significant with mitigation for the following issue areas:

- Land Use
- Paleontological Resources
- Noise

- Cultural Resources
- Public Health and Safety
- Aesthetics
- Geology and Seismicity
- Hydrology and Water Quality
- Public Services and Facilities (includes Recreation)
- Biological Resources
- Utilities

9.0 Responses to Comments

Comments and Responses to Public and Other Agency Comments

The Orange County Great Park Draft EIR was circulated for public review for a period of 45 days extending from February 19, 2003 to April 4, 2003. The Draft EIR was distributed to a variety of public agencies and individuals.

In accordance with CEQA Guidelines Section 15088, the City of Irvine has evaluated the comments on environmental issues received from those agencies/parties and has prepared written responses to each pertinent comment relating to the adequacy of the environmental analysis contained in the Draft EIR. There has been good faith, reasoned analysis in response to comments, rather than conclusionary statements unsupported by factual information.

The agencies, organizations, and interested persons listed on the “Response to Comments Index” submitted comments on the Draft EIR during the public review period. Each comment submitted in writing is included, along with a written response where determined necessary. Each comment letter is identified with a letter in the upper right corner of the first page of the letter. The individual comments have been given reference numbers, which appear in the right margin next to the bracketed comment. For example, Letter A will have comment numbers A1, A2, etc.

In response to comments received, certain revisions have been made in the Final Program EIR. All revisions are marked in ~~strikeout~~/underline format. These revisions to the Final Program EIR are generally minor text changes that do not constitute significant additional information that changes the outcome of the environmental analysis or require recirculation of the document (Guidelines Section 15088.5). All such changes are noted in the responses to comments.

The agencies, organizations, and individuals that submitted comments on the Draft EIR are identified in Table 9-1 Responses to Comments Index. The comment letters and responses are provided on the following pages.

Response to Comment A1

This letter acknowledges that the City has complied with the State Clearinghouse review requirements for the EIR pursuant to the California Environmental Quality Act. No further response is required.

Response to Comment B1

The EIR is the environmental document pursuant to CEQA that identifies, analyzes and discloses potential environmental impacts and mitigation measures for the Orange County Great Park Plan. The Orange County Great Park Plan is consistent with the intent of Measure W since it allocates approximately 84 percent of the total land area of the former MCAS El Toro to open space, recreational, institutional, educational, cultural, and other public uses. Measure B was an advisory measure passed by the voters in November of 2002. The EIR does not analyze the impacts of the provisions of Measure B. Furthermore, because Measure B was passed as a County initiative, it does not have any legal effect with respect to actions taken by the City of Irvine with respect to lands within, or annexed to, the City. Section 5.5 of the EIR *Public Health and Safety* discusses the issues related to contamination on the base property and the various determinations and actions taken and planned to be taken by the responsible parties and regulatory agencies. Further, arguments for or against ballot measures published in voter pamphlets are not part of the language of the ballot measures subject to voters' action and therefore, are not in any way binding if the ballot measure passes. As such, the proponent's arguments for Measure B are not a binding mandate.

Response to Comment B2

The meteorological station used in the EIR is administered by the AQMD with wind velocity data generated, verified, and published by that public agency. The station referenced in Section 5.3 *Air Quality* is located on the project site, and is consequently represents the best source of on-site wind velocity data for air quality purposes. According to the website maintained by the AQMD (and referenced in the EIR on page 5.3-1), this data is neither erroneous nor obsolete.

Response to Comment B3

The proposed zoning regulations will allow for development on a similar scale as existing residential, industrial, office, and commercial buildings in the City of Irvine.

The objectives of the proposed project are defined on page 3-29 of the EIR. The project objectives are not to develop an aviation use at the former MCAS El Toro. As described in the EIR, the voter-approved Measure W initiative amended the County General Plan for the area of the base north of the Southern California Regional Rail Authority (SCRRA) Metrolink rail line (PA 51) to designate the unincorporated land for park, open space and other uses, removing the designation of the site as a commercial airport from the County General Plan (EIR, p. 1-2). Therefore, a detailed analysis of an aviation reuse alternative is not permitted under the Orange County General Plan and is not required under CEQA because an aviation reuse of the site does not meet the basic objectives of the project. Furthermore, on 25 February 2003, the Orange County Board of Supervisors, acting as the El Toro Local Redevelopment Authority, rescinded the Airport System Master Plan, thus removing an airport at the former MCAS El Toro from all County plans.

Response to Comment B4

As stated in Response to Comment B3, Measure W amended the County General Plan to remove the designation of the site as a commercial airport. Therefore, implementation of a commercial airport at this location is not consistent with the County General Plan nor is it consistent with most of the basic objectives of the project.

Section 6.0 Alternatives of the EIR addresses a reasonable range of alternatives to the proposed project as required by the CEQA Guidelines.

Response to Comment B5

This comment does not address the adequacy of the EIR nor does it raise an environmental issue with respect to the proposed project. While the City recognizes there are heightened security concerns regarding airports in general, there is no evidence to indicate that construction of a new airport, at any location, would alleviate security concerns at the existing John Wayne Airport.

Response to Comment B6

It is beyond the scope of the EIR to consider potential impacts of a non-aviation plan on existing residential communities contiguous to the Los Angeles International Airport, Ontario International Airport, Long Beach International Airport and Santa Ana (John Wayne) International Airport. As stated in Response to Comment B3, the proposed project objectives meet the spirit and intent of Measure W, which changed the County General Plan designation for the former MCAS El Toro from airport to non-aviation uses. This EIR analyzes the potential impacts of Annexation, General Plan Amendment and Zoning of the former base property and not those of Measure W. Furthermore, on 25 February 2003, the Orange County Board of Supervisors, acting as the El Toro Local Redevelopment Authority, rescinded the Airport System Master Plan, thus removing an airport at the former MCAS El Toro Airport from all County plans.

Refer to Final Environmental Impact Report No. 573 *For the Civilian Reuse of MCAS El Toro and the Airport System Master Plan for John Wayne Airport and Proposed Orange County International Airport* for information pertaining to reports and supporting data from studies conducted for that EIR.

Response to Comment B7

The Orange County Great Park plan proposes several features that will address on-site water quality control and flood protection. These project features provide a unique opportunity for water quality and flood protection to be addressed on a regional level and in a comprehensive manner. The proposed water quality and flood control concept plan is shown on Figure 5.7-2 of the EIR. A description of the concept plan is provided on pages 5.7-16 through 5.7-22 of the EIR. The EIR identifies future potential permit requirements for project implementation, including Section 404 Permit(s) from the U.S. Army Corps of Engineers (EIR, p. 3-30). A Section 404 permit(s) will be obtained as necessary, as future projects are proposed within the project area. In the context of the size of the entire site, there is a relatively small amount of existing wetland habitat which is generally limited to the Borrego channel and San Diego Creek. The mitigation of potential impacts to wetland habitat as a result of project implementation will be addressed through the Section 404 permit process. The construction of the proposed 179-acre wildlife corridor will provide significant opportunity for the creation and enhancement of viable wetland habitats within the project area. Drainage improvements and flood control facilities will also be created on-site through the daylighting of the Bee Canyon and Agua Chinon channels.

Response to Comment C1

Page 3-31 of the EIR has been revised to include the California Public Utilities Commission under "Actions and Approvals of Other Agencies." The modified text reads:

- California Department of Fish and Game-Approvals related to wildlife corridor and habitat areas
- Federal Department of the Interior (DOI) Fish and Wildlife Agency
- Southern California Regional Rail Authority (SCRRA)
- Orange County Transportation Authority (OCTA) – Revisions to the County Master Plan of Arterial Highways (MPAH)
- Irvine Unified School District
- Saddleback Unified School District
- California Public Utilities Commission – Highway Rail Crossings

Response to Comment C2

Comment noted. The City will notify and coordinate with the CPUC as appropriate, with respect to any future trails planning on or adjacent to the railroad right-of-way.

Response to Comment D1

The traffic analysis is based on the most current regional growth projections that have been adopted by the County of Orange which incorporates the most current projections for all the cities in the County. The concept of trip banking in Laguna Woods, related to available trips on Moulton Parkway, was not considered, as the traffic model addresses regional traffic impacts.

Response to Comment D2

The difference in daily traffic volumes cited in this comment is most likely due to the collection of traffic count data at different times. The 20 percent variation is quite possibly due to day to day variation in traffic conditions or changes in traffic patterns that occur as various roadway improvements are implemented. It does not affect the findings and conclusions of the Traffic Impact Analysis because project impacts and resulting mitigation are all based on more detailed analysis of peak hour conditions.

Response to Comment D3

The traffic analysis is based on the most current regional growth projections that have been adopted by the County of Orange which incorporates the most current projections for all the cities in the County. No roadway or intersection improvements attributable to the Laguna Hills Mall were included in the Great Park traffic study. Therefore, the analysis is inherently conservative, as any additional improvements may result in a decrease in the Great Park project traffic impacts that were identified. Mitigation Measure Trans. 6 is consistent with the El Toro Roadway and Landscape Improvement project.

Response to Comment D4

Concurrently with the proposed project, the City of Irvine is considering adoption of the North Irvine Transportation Improvement (NITM) program. The NITM program does two things: it prioritizes and schedules the construction of traffic improvements needed to address development in the Great Park, and other undeveloped areas of North Irvine; also, it imposes a nexus fee program to ensure the timely construction of these improvement events. Traffic mitigation improvements within the City of Laguna Woods and other areas outside of Irvine will receive fair-share funding from the NITM program.

The City of Irvine recognizes that as the agency with jurisdiction over the intersections and as the lead agency for the construction of intersection improvements must concur with the proposed mitigation measures if those mitigation measures are to be implemented.

Response to Comment D5

The DON intends to incorporate temporary institutional controls in remediating IRP Sites 16 and 24 on the base. The Record of Decision for Site 24 states that “the Environmental Restriction Covenant and Agreement(s) will include information summarizing the remedial actions at Site 24 and provisions for terminating or modifying the Environmental Restriction Covenant and Agreement(s) when cleanup levels established in this ROD have been achieved and the remedial equipment has been removed.” Refer to the *Final Record of Decision, Operable Unit 1, Site 18 – Regional Volatile Organic Compound Groundwater Plume, Operable Unit 2A, Site 24 – VOC Source Area, Former MCAS El Toro, California* (Bechtel National, Inc. 2002) for additional information. The Record of Decision for Site 16 is expected to contain a similar process for removal of temporary restrictions. Responsibility for development and enforcement of the temporary restrictions rests exclusively with the DON and the applicable state agencies depending on the nature of the controls. The City has no authority over the federal process to implement Institutional Controls at the former

MCAS EL Toro regardless of mitigation measures proposed in the EIR. See also the attached letter from the DON dated 25 April 2003, describing the public sale plan, including Findings of Suitability to Transfer and Lease in Furtherance of Conveyance processes as well as the methodology of imposing, monitoring, and removing environmental remediation restrictions.

Response to Comment D6

The City will adopt rules, policies, and regulations as needed that will supplement the implementation of the temporary institutional controls by the DON and other agencies. The City's approach will be similar to and consistent with rules, policies, and regulations in use to control development and construction activities and enforced in a similar manner. Until the institutional controls are adopted by the DON via an Environmental Restriction Covenant and Agreement(s), the City cannot identify with certainty the specific rules, policies, and regulations that will be needed. Refer to Response to Comment D5 for an example of regulations that control development and construction activities.

Response to Comment D7

The City is cognizant of the potential for stormwater impacts from contaminated sites. However, at both Sites 16 and 24, the remediation activities are focused on treating contaminated groundwater. Because hazardous materials are not present at the surface of the site, there is minimal potential for stormwater to create a hazardous materials runoff. At Site 16, remediation of subsurface soil may be required, but it is expected to be completed prior to a fee conveyance to another party. Also refer to Response to Comment D8.

Response to Comment D8

Individual projects within the project area will be responsible for the development and implementation of specific Storm Water Pollution Prevention Plans (SWPPPs) and Water Quality Management Plans (WQMPs) to address the potential pollutants of concern based on the location, size, and type of development and proposed operations. Site specific BMPs and structural controls will be identified for each individual project based on the need to target specific potential sources of pollution. Implementation of Mitigation Measures H/WQ 1 and H/WQ 2 (EIR, pages 5.7-24, 25) will ensure that these uses are implemented in accordance with local and state regulatory requirements.

Response to Comment D9

The City of Irvine agrees that implementation of a regional approach to stormwater management is preferred. To further this goal, the City's proposed Orange County Great Park drainage plan concept provides for the creation of large, natural drainage features that are designed to address regional water quality and flood control in a comprehensive manner. The proposed natural drainage corridors will function in a manner so as to control surface water flows and maintain and/or improve surface water quality, for stormwaters that emanate from both on-site development and development that occurs in surrounding areas. As described in the EIR, the drainage corridor concept is consistent with and facilitates the regional flood control master plan adopted by the Orange County Public Facilities and Resources Department, The Irvine Company, and the cities of Tustin and Irvine. In addition, regional water quality issues are proposed to be addressed by the project through the construction of "natural treatment system" (NTS) basins within the proposed natural drainage corridors. The IRWD has issued a draft Master Plan and draft EIR on this program. Figure 5.7-2 of the EIR identifies the location of the proposed drainage corridors and potential NTS water quality basins.

Response to Comment E1

Comment noted.

Response to Comment F1

This comment does not note any specific sections or tables requiring revision. The references to appendices and volumes identified in the EIR Section 5.2 *Traffic/Circulation* have been reviewed and revised appropriately. Additionally, the other EIR sections have been updated to correspond the correct lettering of appendices, as appropriate.

Response to Comment F2

The Jeffrey Road extension is not part of this project. Both the Jeffrey Road extension and the SR 133/Trabuco Road interchange are included in the North Irvine Transportation Model (NITM) program and are prioritized for construction in the NITM program based on the comprehensive NITM program traffic study. The NITM program does two things: it prioritizes and schedules the construction of traffic improvements needed to address development in the Great Park, and other undeveloped areas of North Irvine; also, it imposes a nexus fee program to ensure the timely construction of these improvement events.

Response to Comment F3

The normal practice in the City of Irvine has been a threshold criterion of 0.02 for major arterials, not 0.01 as stated in the comment. The 0.03 threshold is used for Congestion Management Plan (CMP) roadways to ensure consistency with the Orange County Congestion Management Plan.

Response to Comment F4

The freeway mainline and ramp peak hour analysis is included in the EIR pages 5.2-35, 5.2-36 and Appendix G. Furthermore, freeway congestion does in fact influence the traffic volume forecasts in the Traffic Impact Analysis. The Irvine Transportation Analysis Model (ITAM) takes congestion effects into account and distributes traffic to the most desirable/least congested route. Also refer to Response to Comment F24.

Response to Comment F5

Improvements associated with Trabuco Road and Irvine Boulevard have been included in the Great Park Traffic Impact Analysis and the NITM program, along with the Northern Sphere development itself. The mitigation measures for the Northern Sphere have been adopted by the City of Irvine as required mitigation measures. These improvements will also be conditions of approval for subdivisions processed within the Northern Sphere.

The financial difficulties of the State do not affect the funding source for the I-5 Freeway/Culver Drive interchange improvements. The funding source is Measure "M" funds derived from County tax revenue resulting from a sales tax increase approved by Orange County voters; as a result, the Measure M funds are not controlled by the State.

Response to Comment F6

The phasing listed is correct. The Portola Parkway to SR-241 segment should not be included. Refer to Response to Comment F2. Since the Trabuco Road/SR-133 interchange is funded but may not be completed until after 2025, it is appropriate to show the improvement operational in the post-2025 timeframe.

Response to Comment F7

The EIR correctly states that unfunded buildout roadway segment improvements are summarized in Table 4-3 of Appendix G. Regardless of the title of the table, the table accurately identifies unfunded future roadway improvements.

Response to Comment F8

The traffic associated with the unfunded, full expansion of the Musick Jail site is not included in the City of Irvine's current ITAM. However, based on the Musick Jail final EIR traffic analysis, the proposed expansion is expected to generate 4,253 additional trips on a daily basis. The additional 4,253 trips represent an increase of less than one percent compared to the other known development projects (e.g., Northern Sphere and Planning Area 40/Spectrum 8) that were explicitly included in the traffic analysis. The percentage is even smaller when all development anticipated within the study area (both within the City of Irvine and adjacent jurisdictions) is considered. Therefore, these additional trips are not considered significant. In addition, the Musick Jail expansion project is also required to mitigate any significant traffic impacts it may cause or contribute to.

Response to Comment F9

The segment of the I-5 Freeway referenced in the comment carries seven percent of the project traffic, not 10 percent as stated in the comment. The results contained in the Figure 5.2-17 take into account traffic redistribution effects. For instance, trips that leave the project site may be balanced by the South County work trips that now go to project provided employment opportunities rather than further north to the Irvine Business Complex.

Response to Comment F10

Within the EIR Section 5.2 *Traffic/Circulation*, references to Volume III Appendix K have been updated to references to Volume II Appendix G, where appropriate.

Response to Comment F11

The assumption that other mitigation measures are possible and not undesirable is based upon information from Caltrans, OCTA, and SCAG as embodied in the Regional Transportation Plan, wherein alternative improvements such as enhanced traffic service, TGM programs, etc. will serve to reduce freeway congestion. An example of an alternative improvement would be to provide additional mainline capacity.

Response to Comment F12

As shown in the EIR and supporting Traffic Impact Analysis (Appendix G, Tables 7-12 through 7-25), the project related traffic drops below the significance threshold at the Jeffrey Road interchange.

Response to Comment F13

The NITM Program includes engineering concept plans for freeway and corridor improvements. The engineering and right of way analysis completed as part of the NITM program has determined that the proposed mitigation measures are feasible.

Response to Comment F14

The comment suggests that Irvine Boulevard or Bryan Road might be impacted further west than the western limit of the study area. The traffic study analysis shows that neither the Culver Drive at Irvine Boulevard nor the Culver Drive at Bryan Avenue intersections are impacted by the project as shown on Tables 7-34, 7-37, and 7-40 of Appendix G of the EIR.

Response to Comment F15

The Traffic Impact Analysis includes all of the locations identified in the comment. The I-5 Freeway Northbound on- and off-ramps at Trabuco Road are analyzed as a single

intersection in the traffic study rather than two separate locations as implied in the comment. The second intersection is located at Trabuco Road/Culver Drive.

Response to Comment F16

Irvine Center Drive and Irvine Boulevard within the study area are examples of CMP roadways. Exhibit 9-A in Appendix G of the EIR specifically identifies CMP facilities within the study area.

Response to Comment F17

Irvine Boulevard within the study area is a CMP roadway and was analyzed using a significance threshold of three percent in the traffic study.

Response to Comment F18

The performance threshold for Irvine Boulevard is LOS "E" rather than LOS "D". Using the 2000 Highway Capacity Manual, the additional roadway performance increase in delay allowed is up to 25-seconds in the peak hour.

Response to Comment F19

The City of Irvine's approved analysis methodology is the intersection capacity utilization (ICU) methodology. Although the ICU methodology does not specifically include any provision for the effects of pedestrian activities, the assumed capacity of 1,700 vehicles per lane per hour (vphpl) is less than the ideal capacity of 1,900 vphpl that are used in more detailed analysis methodologies. One factor that could account for the more conservative capacity per lane is the effect of pedestrian activities.

Response to Comment F20

There is no Table 2-23 in the Traffic Impact Analysis (Appendix G of this EIR). It is assumed that the comment refers to Table 2-1 (Daily Roadway Capacity Assumptions). The capacities for freeways greater than 10 lanes were not explicitly listed on Table 2-1. However, the following capacities were identified in the analysis contained in Section 7:

<u>Lanes</u>	<u>Capacity (vehicles per day)</u>
12	250,000
14	290,000
16	330,000
18	370,000

Response to Comment F21

The traffic count data throughout the City of Irvine was collected in 2002. Only a small amount of traffic count data in the already developed areas of the adjacent cities to the east of the City of Irvine utilized existing conditions data from 2000 or 2001. Furthermore, such daily data has no effect on the future conditions traffic volume forecasts or analysis. Finally, the project impacts are identified and mitigation has been developed on the basis of the more detailed peak hour traffic data and analysis.

Response to Comment F22

The volume refers to the segment from the I-5 Freeway northbound on- and off-ramps to Yale Avenue.

Response to Comment F23

The capacity listed is a general planning capacity and reflects three northbound lanes and four southbound lanes (for a total of seven lanes). It is appropriate to use this capacity in the analysis, as the fourth southbound through-lane has most likely been constructed in response to actual traffic patterns and presumably serves the requirements of the greatest traffic volume. The Traffic Impact Analysis peak hour assessment of conditions at the actual intersection of Culver Drive at Trabuco Road takes into account merging into three southbound lanes.

Response to Comment F24

The traffic forecasts have been developed using the Irvine Transportation Analysis Model (ITAM), Version 3.01. The ITAM takes congestion effects into account, and congestion influences the assignment of traffic to the freeway and surrounding roadway system. It should be noted the generalized planning level freeway mainline capacities in the ITAM model are far lower than the volumes (exceeding 2,300 vehicles per hour) that have been observed on busy freeways in southern California.

Response to Comment F25

This data was inadvertently omitted from the existing conditions summary table only. The analysis results are included in Appendix F of the Traffic Impact Analysis (Page F-5) which is included as Appendix G of this EIR and indicate that the existing ICU values at this location are 0.58 in the AM peak hour and 0.82 (LOS "D") in the PM peak hour.

Response to Comment F26

The footnote means that the SR-133/Trabuco Road interchange was not treated as a funded 2007-2025 improvement in the EIR and was not included in the primary Traffic Impact Analysis. A special issues analysis examining the benefits/impacts of including this interchange for 2025 conditions was also included in the Traffic Impact Analysis.

Response to Comment F27

There is no change in the number of lanes shown on the I-5 Freeway north of Sand Canyon on the exhibits in the EIR or the supporting Traffic Impact Analysis. The segment of the I-5 Freeway north of Sand Canyon is shown as a 14-lane freeway ("14F") for existing conditions (Exhibit 3-A in the Traffic Impact Analysis and Figure 5.2-4 in the EIR); 2007 Conditions (Exhibit 4-A in the Traffic Impact Analysis and Figure 5.2-10 in the EIR); 2025 Conditions (Exhibit 4-C in the Traffic Impact Analysis and Figure 5.2-12 in the EIR); and Post-2025 Conditions (Exhibit 4-E in the Traffic Impact Analysis and Figure 5.2-15 in the EIR).

Response to Comment F28

It is incorrect to assume that the use of socioeconomic data (SED) rates results in generally lower traffic volumes. Traffic models validated using land use data or SED have both been shown to match (validate to) existing traffic volumes quite well. The adopted ITAM, version 3.01, uses socioeconomic data as a basis for analysis.

Response to Comment F29

The students included in the Great Park Traffic Impact Analysis were all treated as commuter students, thus generating the highest possible number of trips to and from the project. The model can handle both commuter students and resident (non-institutionalized group quarters) students. The analysis assumed 4,000 students in the 2007 analysis for both the Base Plan and the Overlay Plan. The analysis assumed 7,637 students in 2025 for the Base Plan and 7,800 students in 2025 for the Overlay Plan. This represents a change of 3,637

(Base Plan) to 3,800 (Overlay Plan) students from 2007 to 2025. The source of this data is the Great Park project description.

Response to Comment F30

The types of activities described in the comment are accounted for in the trip rates for residential land uses (see Table 5-10). These types of activities are potentially included as non-home based productions (Other-to-Other or O-O) or as attractions (Home-to-Work/H-W or Other-to-Other/O-O).

Response to Comment F31

The numbers of students are based on the Great Park project description. The hours of travel have been derived from the regional travel demand model and correspond closely to home-work trips, which exhibit a heavy concentration in the peak hours of traffic. Staff and maintenance workers were derived directly from the number of students (see Table 5-9 of Appendix G to the EIR, land use to socioeconomic data conversion factors). There is no distinction between residents and commuter students made in the ITE Trip Generation Manual. ITAM does differentiate between commuter and resident students, and the Traffic Impact Analysis assumed the worse case scenario of all commuter students.

The trip generation rate for students is reasonable. The project was assumed to include only commuter students. Not every student travels to a college campus everyday. Nor does every student drive a single occupant vehicle to school. Finally, the data being referenced is land use based student trip generation, which was provided for informational purposes only and does not relate to the primary traffic impact analysis.

Response to Comment F32

The comment refers to the trip distribution exhibits. These exhibits present the percentage of project traffic, not actual traffic volumes. The percentage of trips oriented to the west is likely to drop over time, as the largest undeveloped areas of Orange County are located east of the project and will be more likely to interact with the Great Park project further out in time (e.g., 2025 versus 2007). The second part of the comment also mistakes the project trip distribution percentages for actual project volumes.

Response to Comment F33

The extents of the study area are appropriate. The study clearly identifies areawide congestion on the freeway system. The Traffic Impact Analysis has verified that the project's potentially significant impacts extend no further west than Jeffrey Road. The Traffic Impact Analysis (Appendix G of the EIR) informs the reader of the project impacts. The ITAM model, version 3.01, takes into account on-going development.

Response to Comment F34

Although the Great Park traffic study included all Northern Sphere roadway improvements identified as mitigation measures, improvements that were "project features" (including the referenced improvement) were inadvertently omitted. This does not affect the findings and conclusions of the Great Park traffic study, other than to potentially reduce the required mitigation. The NITM Program does take the referenced improvement into account.

Response to Comment F35

In accordance with the adopted City Traffic Study Guidelines, the subject roadway segment is not long enough to warrant separate analysis as a roadway segment. The more detailed peak hour analysis completed for the intersections of Culver Drive at Trabuco Road and

Culver Drive at the I-5 Freeway southbound ramps more accurately depicts the actual lane requirements for the segment of Culver Drive between these two intersections. The reason no peak hour segment analysis was performed for Culver Drive from Trabuco Drive to Walnut is that the daily roadway segment analysis for the subject segments was below the 0.02 impact significance criteria.

Response to Comment F36

The mainline freeways are already deficient under existing conditions. It is the responsibility of the regional agencies to address these deficiencies. Pursuant to City policy, the City of Irvine is working in close coordination with Caltrans regarding the improvements needed to mitigate identified project impacts. The City of Irvine does not control freeway improvements and cannot guarantee the implementation of the identified mitigation measures. For that reason, the EIR conservatively concludes that the impacts remain significant and unmitigated. Refer to Response to Comment F24 regarding the impact of freeway congestion on trip distribution.

Response to Comment F37

In accordance with the Caltrans standards, the Type 7 ramp most accurately defines the subject ramp. The Traffic Impact Analysis has identified a deficiency and mitigation to reduce the project impact to insignificant levels has also been identified, regardless of the initial ramp configuration.

Response to Comment F38

The geometric configuration referred to in the comment is actually shown in the ITAM model as Walnut Avenue. The ramp itself conforms to Caltrans standards and the analysis has been completed at an appropriate level of detail and accuracy. The movement of trucks is explicitly considered in Caltrans design standards.

Response to Comment F39

Refer to Response to Comment F24. The NITM Program is the implementing mechanism for the freeway ramp mitigation at the proposed SR-133/Trabuco Road interchange. This improvement will reduce traffic congestion at the I-5 Freeway/Sand Canyon Avenue interchange by providing an alternative means of freeway access. Therefore, no additional traffic diversions as theorized in the comment are anticipated.

Response to Comment F40

Refer to Response to Comment F36. The City of Irvine is working with Caltrans to implement mitigation related to the Great Park project where project impacts have been identified. The commentor is addressing areawide congestion issues. Because the City of Irvine does not control freeway improvements and cannot guarantee the implementation of the identified mitigation measures, the impacts remain significant and unmitigated, as described in the Traffic Impact Analysis.

Response to Comment F41

Comment noted. In accordance with the City's adopted traffic study guidelines, the threshold for significance of traffic impacts is a 0.02 increase in the volume-to-capacity ratio caused by the project. The identified roadway segment was measured to have a volume-to-capacity increase of less than 0.02 and thus no further analysis was required.

Response to Comment F42

No mitigation is required because the project does not worsen the ICU value by 0.02 or more. In fact, the Great Park project actually results in a decrease in ICU in some instances.

Response to Comment F43

Comment noted. The discussion in the Great Park traffic study is intended to address pedestrian and bicycle circulation issues directly related to the project site. Future bicycle connections through PA9A or within the SCRRA right-of-way are not a part of this project. Refer to Response to Comment F59.

Response to Comment F44

Although the westbound approach (Bryan Avenue) currently has two lanes in each direction, the table referenced in the comment (Table 3 in Appendix G of the EIR) incorrectly indicates three westbound through lanes and will be corrected in the final EIR. The City's Traffic Impact Analysis for existing and buildout conditions assumed the existing two lanes in each direction. Table F-44 is included in the Appendix to this Response to Comments document; this table shows the corrected 2007 and 2025 traffic conditions and indicates that no significant traffic impacts occur.

Response to Comment F45

The comment is correct, the ">" symbol indicates a right turn "overlap" or green arrow that allows simultaneous movement with the associated left turn movement (e.g., northbound right turns and westbound left turns, etc.).

Response to Comment F46

Based on the NITM Program engineering concept drawings, the east-side of Yale Avenue would be widened by 6 feet or less to accommodate the proposed improvement. No widening on the west-side of Yale Avenue, where the landscape is located, is anticipated.

Response to Comment F47

The NITM analysis has further investigated this location and the improvement noted in the EIR has been modified. The improvement required will be funded by NITM. The current engineered proposal to provide acceptable levels of service at this location would not include a free westbound right turn lane at this location. A dual westbound right turn lane configuration would be accomplished by widening the north side of Trabuco Road approximately 12 feet. Slight widenings of Culver Drive will also be required to accommodate the 3rd northbound through lane. The improvement required will be funded by NITM.

Response to Comment F48

The third EB-through lane identified for Irvine Boulevard at Jeffrey Road could be accomplished by widening the north side of Irvine Boulevard.

Response to Comment F49

Comment noted. The timing of these improvements may in fact occur in conjunction with the PA-8A development, but is not related to the Great Park impacts or mitigation requirements.

Response to Comment F50

Based on the Orange County Public Library (OCPL) capacity standards and an anticipated population of 7,681, under the Great Park overlay an additional 1,536 square feet of floor space and 11,522 volumes will be required to serve the project. Since the average size of a library facility is 10,000, construction of a new facility would not be warranted. To meet the

demand the Heritage Park facility could possibly be expanded in conjunction with demand created by other projects. The project area will continue to be served by the El Toro Branch facility and the new Foothill Ranch facility. Since a portion of property taxes are specifically allocated for capital improvement and operating costs for the County public library system, additional residents will make a financial contribution to expand and/or construct new library facilities.

Response to Comment F51

The Foothill and Eastern Transportation corridors are currently used by a substantial number of commuters. It is expected that tolls will be removed from the Foothill and Eastern Transportation Corridors in the future (i.e., post 2025). Also, buildout of the region would not occur for another 20-25 years. Regardless of whether or not tolls are collected, the completion of the Foothill and Eastern Transportation corridors will improve accessibility to new distant residential developments. Traffic impacts are addressed in the Traffic Impact Analysis in Appendix G of this EIR.

Response to Comment F52

New development within the surrounding area, including but not limited to, the Spectrum 8 and Northern Sphere projects, will include the development of additional residential dwelling units and provide housing opportunities. Therefore, a portion of future housing demand will be absorbed by these developments. The EIR does not premise the conclusions regarding population and housing impacts on the ability of other developments to provide housing. The EIR has concluded that the proposed project will result in a significant unavoidable impact associated with jobs/housing balance. Also refer to Response to Comment HH1.

The City agrees that, in general, residential uses create a greater demand on city services while generating less revenue, whereas non-residential uses (commercial and employment based uses) create less of a demand on services and generate more revenue for the City. These basic fiscal principles are evaluated for each General Plan amendment proposed within the City, including the Orange County Great Park plan and the information is provided to the City Council.

A white paper was developed to further evaluate key issues raised by the Spectrum 8 draft EIR population and housing analysis. The *Population/Housing Issues in Planning Area 40* (Carla Walecka, March 2003) concludes that, in a broader context, southern Orange County is a housing-rich community and the jobs/housing imbalance is not the only methodology that applies to regional growth forecasts. Growth impacts resulting from the proposed project have been substantially anticipated by adopted city, county, and regional growth forecasts. The referenced document states that:

“Professional literature and research customarily examine jobs/housing relationships at a subregional or county scale, not at the project or city scale...the [Spectrum 8] project is very beneficial because it balances the housing-rich nature of southern Orange County. Without jobs [in central Orange County], south Orange County residents would have to travel farther north or east for job opportunities. This would result in greater imbalance between jobs and housing opportunities, and exacerbate congestion and associated air pollution.”

The City of Irvine concurs with the conclusions stated in the Spectrum 8 EIR and further evaluated in the *Population/Housing in Planning Area 40* document (Carla Walecka, March 2003).

Response to Comment F53

As stated on page 5.14-2 of this EIR, the standard response times promoted by the City of Irvine Police Department are considered appropriate for the community. As stated in the EIR on page 5.14-2, the City of Irvine's Police Department response guidelines state:

- Responding to "emergency" events within six minutes, 85 percent of the time.
- Responding to "crimes in progress" events within 10 minutes, 85 percent of the time.
- Responding to "less serious crimes occurring now" events within 20 minutes, 90 percent of the time.
- Responding to "routine calls for service" events within 60 minutes, 85 percent of the time.

These response times are established by the City's Strategic Business Plan to ensure that appropriate resource levels are required for the Public Safety Department.

Response to Comment F54

Estimates of police personnel required for the Great Park are based upon current demand levels coupled with anticipated call for service based on the specific land uses in the plan rather than an officer-per-resident standard. Based on the City of Irvine's Police Department current staffing formula, the proposed project would require between 17 and 22 sworn police officers, three to five sworn police supervisors, and eight to 11 non-sworn support staff. Funding required for these new police personnel would be provided through a special assessment levied against the property owners within the project area.

Response to Comment F55

Following annexation, the entire project area will be within the City's corporate boundary and within the jurisdiction of the City of Irvine Police Department. Sharing the cost of policing the Great Park with the County of Orange is a policy issue. The fiscal plan for the OCGP Plan proposes fees and assessments to fund police services for the public park portions (i.e., Sportspark, Meadows Park, Exposition Area South, and the drainage and wildlife corridors). Special assessments will be applied to new development within the project area remaining on the tax rolls after the dedication of public use areas identified in the Great Park Plan.

Response to Comment F56

Refer to Response to Comment F53. Proposed additional police personnel numbers are based on the City of Irvine Police Department's staffing formula; anticipated calls for service to the project area are determined by the Police Department based on historical data regarding the proposed land uses.

Response to Comment F57

The comment regarding "mitigation measures" refers to the construction and/or operation of public facilities within the project area. Construction impacts related to the development of public facilities within the project area are likely to be short-term events; operation impacts are considered long-term events. Construction and operation impacts associated

with public facilities are considered under in Sections 5.1 *Land Use*; 5.2 *Traffic and Circulation*; 5.3 *Air Quality*; and 5.4 *Noise*.

Response to Comment F58

Comment noted. Section 5.14.2.1 *Public Services and Facilities Environmental Setting* has been amended to read:

“OCFA is planning two additional fire stations. Station No. 55 will be located ~~in Northwood~~ on the north side of Portola Parkway between Yale and Jeffrey, and Station No. 47 will be located near Sand Canyon and Interstate 405.”

Response to Comment F59

The final alignment of the Venta Spur connection through PA9, specifically in the area east of Sand Canyon, has not been determined. Figure 3-7 has been corrected to show a Class I trail along the north side of Trabuco Road, from the Eastern Transportation Corridor to the Meadows Loop Road.

Response to Comment F60

Comment noted. The actual parkland dedication requirement will be calculated during the review of subdivision maps for future residential developments, using the most current City of Irvine standard. It should be noted that community parkland dedication requirements will be deemed satisfied with the commitment to participate in the Development Agreement. The total amount of parkland in the project far exceeds the minimum required by the existing or proposed standard.

Response to Comment F61

Refer to Response to Comment F50. The square footage assigned to PAZ13 for museum/library facilities is necessary to determine traffic and other environmental impacts of the proposed project. The determination of how that square footage will ultimately be developed is dependent upon future opportunities and funding sources for these types of public facilities.

Response to Comment F62

The EIR bases its water demand analysis on the greatest demand, which is the Overlay Plan, as it proposes the greatest level of development under the proposed project. Refer to the attached IRWD comment letter (specifically comment G4) which confirms that the water district would utilize the Overlay Plan as representing the “worst case scenario” for water demand. Refer also to the IRWD Water Supply Assessment (Appendix C of the EIR) for further information about water supply.

Response to Comment F63

The Orange County IWMD’s CIWMP was approved in 1996 and shows that sufficient solid waste disposal capacity is available in the County for approximately 25 years, based on population projections for the area. Considering the potential for expansion by the County does not imply that current and near-future capacity is lacking.

The Regional Landfill Options for Orange County (RELOOC) is a long-term 40-year plan that is part of the County’s effort to assure that the countywide landfill system remains adequate, solvent, and efficient in the long term. Sufficient local capacity for Irvine at Bowerman

Landfill and the other County disposal sites is not in doubt in the short to mid-term even without implementation of RELOOC. In the longer term, RELOOC provides sufficient contingencies should they become necessary to manage additional solid waste from future anticipated countywide development. Refer to Response to Comment H49.

Response to Comment F64

Refer to Responses to Comments F63 and H48. Although the IWMD system has capacity for approximately 25 years, the District anticipates that the Bowerman Landfill will reach capacity by 2022. The ability to accommodate waste at other facilities is being planned by the IWMD.

Response to Comment F65

Comment noted. A primary goal of City policy will continue to be maintaining compliance with the California Integrated Waste Management Act (AB939), requiring good faith effort to divert 50 percent of total solid waste from landfills. Contrary to the assertion that recycling goals for the project are “unambitious and meaningless,” the specific goal of this project to recycle 75 percent of construction and demolition debris commits the City to a much more ambitious effort than the minimum required by state law.

Regarding recycling (diversion) rate calculations, the City cannot exclude any materials generated by the project that, if landfilled, would be counted as disposal and therefore detrimental to the City’s overall diversion rate and its compliance with AB939. Any material that would be counted as disposal at the landfill should be calculated and credited to the City as diversion if it is recycled.

Response to Comment F66

Comment noted. Mitigation Measure SW 5 (page 5.15-24 of the EIR) has been amended to read:

“For green waste, the project applicant must submit a written plan to the City and implement such a plan to ensure that the green waste material generated by landscape maintenance operations is collected by a City-authorized waste hauler or recycling agent, that the maximum feasible amount of that collected green waste is recycled, and that a minimum of 50 percent of the green waste from the project is diverted from landfills by recycling, as that term is defined by California Public Resources Code Section 40180.”

Response to Comment F67

As with the development of any new project, modifications to existing electric systems would be necessary. Such is the case with the proposed project. As stated in Section 5.15.5.3 *Utilities Environmental Impact*:

“...the proposed project would consume 59.1 million kilowatt hours per year....The proposed project would have a peak load of 14,771 kilowatts. Sufficient available capacity exists at the Irvine and Limestone Substations to serve the proposed project’s load estimates. However, the existing overhead 4 kilovolt distribution system currently serving the former MCAS El Toro would be replaced with an underground 12 kilovolt distribution system....The additional electrical load imposed by the proposed project is within the capacity of SCE.”

The EIR states on page 5.15-27 that the Base and Overlay Plans propose to replace the existing electrical system in its entirety, complying with modern design methods, performance standards, and specifications. The new system will be installed to generally coincide with the routing of new and existing roadways. Electrical lines will be required to be underground pursuant to City standards. The specifics of the new electric distribution system and the necessary environmental evaluation will be determined as site specific plans for the installation are prepared.

Response to Comment F68

The proposed project will be served from the 12kV distribution lines that interconnect with the existing SCE 66/12kV Irvine Substation, directly outside the gate of the former MCAS El Toro. This substation has sufficient capacity to serve the proposed project. Sub-transmission lines interconnect this substation to the existing SCE 230/66kV Santiago substation and the 66/12 kV Bryan Substation. SCE has indicated that no additional sub-transmission lines are planned to increase the capacity at the Irvine substation.

Refer to Response to Comment F67 for information pertaining to the modification of existing electrical systems resulting from implementation of the proposed project. Modifications deemed necessary to the electrical system will be considered as specific development proposals are initiated. Section 5.15.5.3 *Utilities Environmental Impact* states:

“...new [electrical] system will be installed to generally coincide with the routing of new and existing roadways circulating throughout the project. Electrical lines will be required to be underground pursuant to City standards.”

The EIR states on page 5.15-29 that sufficient available capacity exists at the substations serving the proposed project and “that the existing overhead 4kV distribution system currently serving the MCAS El Toro would be replaced with an underground 12 kV distribution system.” No analysis has indicated that a new transmission line greater than 12 kV will be required to serve the proposed project. The specifics of the new electric distribution system and the necessary environmental evaluation will be determined as site specific plans for the installation are prepared.

Response to Comment F69

SCE generally uses a peak load standard of 50,000 kW for "significant impact". The proposed project's maximum estimated electrical demand is 35,000 kW.

The CEQA Environmental Checklist, Appendix G, outlines the Thresholds for Determining Significance for energy. As stated in Section 5.15.5.2 *Utilities Threshold for Determining Significance*:

“Would the project result in substantial adverse physical impacts associated with the provision of new or physically altered energy and communication transmission facilities, need for new or physically altered energy and communication transmission facilities, the construction of which would cause significant environmental impacts, in order to maintain acceptable levels of service?”

The City defines a significant impact to the current level of electric service for the project to be requiring more electrical energy than SCE has the stated ability to provide. The Threshold for Determining Significance is answered in full in Section 5.15.5.3 *Utilities Environmental Impact*.

Section 5.15.5.3 *Utilities Electrical Facilities and Service* discusses the expansion of the electrical system to serve the project. The EIR states on page 5.15-30 that the proposed project's consumption of electricity is 0.05 percent and peak demand is 0.06 percent of the California Energy Commission's forecast for Southern California Edison (SCE) in 2012. Furthermore, SCE has indicated its ability to serve the projected project in accordance with all applicable tariff schedules.

Response to Comment F70

Section 5.15.5.3 *Utilities Electrical Facilities and Service* discusses the expansion of the electrical system to serve the project. The comment discusses the adequacy of generation and transmission systems and incentives and disincentives to investment in electrical system infrastructure on a statewide basis. These comments are considered beyond the scope of the proposed project. SCE indicates that there is no transmission congestion within the project area.

Response to Comment F71

SCE has sufficient transmission capacity to provide power to the project. Refer to Responses to Comments F67 through F69 for information pertaining to the modification of existing electrical systems resulting from implementation of the proposed project. Analysis indicates that a new transmission line greater than 12 kV will not be required to serve the proposed project. Any other SCE system enhancements would be required to obtain the necessary licensing/regulatory approvals and would not impact the proposed project.

Response to Comment G1

Comment noted.

Response to Comment G2

The first paragraph on EIR page 5.15-5 is amended to read:

“The proposed project’s impact on water supply and the ability of the water provider to provide a water source to the project site has been assessed by the IRWD in accordance with the requirement of ~~SB901~~ SB610 and SB221, both effective 2 January 2002, and the water supply assessment (WSA) contained in Appendix C complies with the most recent statutory requirements and concludes that adequate supplies are available to serve the proposed project.”

Response to Comment G3

Comment noted. The record is hereby incorporated by reference.

Response to Comment G4

Comments noted.

Response to Comment G5

Comment noted.

Response to Comment G6

Comment noted.

Response to Comment G7

Comment noted.

Response to Comment G8

The assumption should be clarified that only existing infrastructure that meets IRWD standards will be preserved for future use.

Response to Comment G9

The EIR is amended to correctly indicate that potable water is and will be used to irrigate the IRWD parcel.

Response to Comment G10

Comments noted.

Response to Comment G11

Comment noted.

Response to Comment H1

The proposed zoning for the property consisting of the Base Plan and the Overlay Plan is fully described in the “Introduction”, “Project Description” and “Land Use” sections of the EIR. As described in those sections, the proposed zoning consists of a Base Plan which provides a lower intensity and density of development and a higher proportion of land dedicated to open space and public uses. The Overlay Plan provides a higher intensity and density of development if the property owners enter into a Development Agreement with the City of Irvine (Appendix D of the EIR) requiring, among other provisions, dedication of land for open space and public uses and payment of fees for the provision and maintenance of the public infrastructure.

The parcels to be dedicated to the County of Orange through the Development Agreement are labeled as PAZ23 with General Plan and zoning designation of Institutional (Inst/Inst – 6.1/6.1) and PAZ4 with General Plan and zoning designation of Agriculture in both Base and Overlay plans. The development intensity for these sub-areas is also identical under both Base and Overlay plans. This information is provided in Tables 3-3 and 3-4 of the EIR.

The EIR provides a clear description of the “project” stating that the commonly used overlay zoning tool has been utilized for the project site. The EIR also clearly states that the Overlay Plan represents the maximum density and intensity of development proposed. All sections of the EIR analyze the potential impacts of both the Base Plan and the Overlay Plan and identify mitigation measures for each plan.

Response to Comment H2

The Great Park EIR assesses potential impacts of proposed uses for the entire former MCAS El Toro owned by the federal government and administered by the DON. The DON has been supplied with the proposed land plan and the EIR. The DON agreed that the land plan is consistent with their Record of Decision and their intent to sell the property at public auction. The DON has also agreed with the provision of the Great Park Development Agreement that requires, among other things, the dedication of 100-acres of property from the property owner to the County upon the election of receiving the development rights of the Overlay Plan. The EIR assumes certain development intensities that are consistent with the intentions of the landowner (DON) and the expectations of the City of Irvine. The EIR also assumes development intensities for the 100-acres that may be dedicated to the County, consistent with the list of uses provided in the Property Tax Transfer and Pre-Annexation Agreement in Section 2.2.4. Although the County refers to previously proposed land plans and the County’s 1996 EIR, these documents are not consistent with the current intentions of the landowner (DON) or the City of Irvine and are not relevant to this EIR. If the County becomes the owner of the 100-acres, it can then assess development intensities provided in the program EIR and evaluate its specific development plans for the site. No specific development plans for the site by the County have been provided to the City, nor is the County a landowner of the property. Any development proposed by the County, if it becomes a landowner in the future, which is not consistent with the proposed plan and EIR, will require additional environmental evaluation.

The City recognizes that the County’s development of governmental uses on the 100-acres is not subject to City zoning or building controls. The City also recognizes that its land use assumptions for the 100-acres are an estimate based upon no current County plan, and that any trip limits used in the Traffic Impact Analysis for the Great Park project do not restrict the County’s use of the 100-acres for governmental purposes. Finally, the City recognizes

that, as the County defines its project and proposed uses for the 100-acres, the County will analyze traffic and other impacts from this project as required by law.

Response to Comment H3

Comment noted. While the EIR evaluated the Musick Jail Facility for its contribution of impacts to the project, the Final EIR will reflect that the Musick Jail Facility will not be included in the City of Irvine's annexation proposal.

Response to Comment H4

Comment noted. Mitigation Measure H/WQ 3 (EIR page 5.7-26) has been amended to read:

"Prior to approval of the first tentative tract or parcel map in the project area, detailed hydrology and hydraulic analysis shall be conducted. Studies and analysis shall be prepared in accordance with OCFCD methodologies and standards and the Flood Control Master Plan for San Diego Creek, as well as any additional guidelines in effect at the time of project design. Recommendations contained in the hydrology studies and/or hydraulic analysis to address drainage/flooding issues related to proposed development shall be implemented. Compliance with this measure shall be verified by the Community Development Department."

Response to Comment H5

The hydrologic and hydraulic analysis referenced in Mitigation Measure H/WQ 3 are to be performed in "accordance with OCFCD Methodologies...as well as any additional guidelines in effect at the time of the project design" which includes utilizing the appropriate Manning's "n" value for the conveyance type. Approval from the OCFCD will be obtained prior to any construction activity on the proposed drainage corridors.

Response to Comment H6

The hydrologic and hydraulic analysis referenced in Mitigation Measure H/WQ 3 are to be performed in "accordance with OCFCD Methodologies, as well as any additional guidelines in effect at the time of the project design" would include analyzing as applicable the effects of sediment deposition, meandering, scour, erosion and bank stability with appropriate recommendations for slope protection. Approval from the OCFCD will be obtained prior to any construction activity on the proposed drainage corridors.

Response to Comment H7

The hydrologic and hydraulic analysis referenced in Mitigation Measure H/WQ 3 are to be performed in "accordance with OCFCD Methodologies, as well as any additional guidelines in effect at the time of the project design" includes addressing drainage/flooding issues related to proposed development. Approval from the OCFCD will be obtained prior to any construction activity on the proposed Bee Canyon and Agua Chinon drainage corridors.

Response to Comment H8

The hydrologic and hydraulic analysis referenced in Mitigation Measure H/WQ 3 are to be performed in "accordance with OCFCD Methodologies, as well as any additional guidelines in effect at the time of the project design" would include studying diversions with appropriate justification and mitigation. Approval from the OCFCD will be obtained prior to any construction activity on the proposed Agua Chinon drainage corridor and the proposed Borrego wildlife corridor.

Response to Comment H9

The hydrologic and hydraulic analysis referenced in Mitigation Measure H/WQ 3 are to be performed in “accordance with OCFCD Methodologies, as well as any additional guidelines in effect at the time of the project design” would include addressing the concerns raised in this comment. Approval from the OCFCD will be obtained prior to any construction activity on the proposed Borrego Channel and Serrano Creek corridors.

Response to Comment H10

Comment noted. Prior to concept design or preliminary engineering it will be necessary to receive approval from the Manager, Flood Control Division. Initial meetings have occurred regarding the drainage plan.

Response to Comment H11

Maintenance responsibility for the proposed flood control facilities has not been determined. The question of maintenance responsibility will need to be addressed during the preliminary design process. Maintenance will be, in part, the County of Orange’s responsibility for some facilities, and the City of Irvine’s responsibility for other facilities, depending on the ultimate design solution implemented.

Response to Comment H12

Mitigation Measure H/WQ 3 addresses preparing detailed studies in accordance with...“the Flood Control Master Plan for San Diego Creek (FCMPSD).” Refer to Response to Comment H4.

Response to Comment H13

Refer to Response to Comment H11.

Response to Comment H14

Refer to Response to Comment H11.

Response to Comment H15

Mitigation Measure H/WQ 4 addresses the potential impact of project construction and flood control improvements occurring in tandem. Approval from the OCFCD will be obtained prior to any construction activity.

Response to Comment H16

The Natural Treatment System (NTS) basin proposed to be placed in Marshburn Basin is a part of the Irvine Ranch Water District NTS system and not of this proposed project. Because the basin will be upstream of the development area, the basin is not a part of the project design.

Response to Comment H17

The hydrologic and hydraulic analysis referenced in mitigation measure H/WQ 03/B3 are to be performed in “accordance with OCFCD Methodologies, as well as any additional guidelines in effect at the time of the project design” includes reconciling Master Plan facilities (e.g., raceway stormdrain) in relationship to the project requirements.

Response to Comment H18

Adequacy of existing facilities should be analyzed based on ultimate discharges as provided by the OCFCD. Mitigation Measure H/WQ 3 would include this type of analysis. Refer to Response to Comment H4.

Response to Comment H19

Mitigation Measure H/WQ 4 addresses the LOMR process.

Response to Comment H20

Any work within OCFCD or County of Orange right of way will require encroachment permits. The submittal process for an encroachment permit would occur at the time construction drawings are available for submittal.

Response to Comment H21

A significant amount of open space and recreational opportunities comparable to the type of activities associated with County regional parks will be provided within PA 51 of the project site. As described in Section 3.0 and illustrated on Figure 3-1 of the EIR, PA 51 is proposed to be annexed into the City. Upon annexation, this portion of the project area will be subject to City of Irvine General Plan land use and zoning designations. There is no equivalent “regional park” land use designation or zoning district in the City. Therefore, no portion of the project site has been designated as “regional park” although the functionality of proposed park areas will be very similar to various existing parks in the County’s regional parks system. Tables 3-3 and 3-4 of the EIR provide a statistical summary of open space and recreational acreage proposed within the project area.

Response to Comment H22

Refer to Response to Comment T1. As described in Section 5.9 *Biological Resources*, a wildlife corridor is proposed where one currently does not exist. Figures 1-2, 1-3 and 5.9-2 of the EIR depict the proposed wildlife corridor alignment. As shown, a majority of the wildlife corridor traverses passive uses, such as the golf course and park uses which are not anticipated to generate significant noise levels. In fact, the alignment of the wildlife corridor was shifted west, away from existing industrial uses located immediately east of the base, in part with consideration of potential indirect effects from these existing off-site uses. Within PA 30, the alignment of the corridor is fixed between the underpass of the SCRRRA railroad tracks and the I-5 Freeway/I-405 Freeway undercrossing. In this area, indirect effects are likely to be of more concern to the functionality of the wildlife corridor.

The EIR describes guidelines that will be incorporated into the implementation of the corridor. Specifically, as described in Section 5.9 *Biological Resources*:

“The revegetation/restoration plan would need to address various issues to increase the viability of the proposed corridor and will need to be prepared based on the following criteria:

Reduce the amount of noise pollution and urban influence. Sight and sound barriers need to be constructed at the edges of the corridor to help create a secluded, natural setting. Barriers may range from artificial sound walls to natural diversions such as hedges and tree lines” (EIR, page 5.9-22).

With respect to Planning Area Zone 2, under the proposed Overlay Plan PAZ 2 is proposed for residential development; however, this portion of the project site is currently developed with residential uses associated with the former base (refer to Figure 1-4 of the EIR). Any

reuse or redevelopment of PAZ 2 with residential uses would not likely increase the level of noise impacts on the adjacent habitat preserve.

Response to Comment H23

Implementation of the proposed project will not create an impact to any existing wildlife corridors. Therefore, the provision of a linear corridor through Planning Area Zone 2 (PAZ 2) is not a mitigation measure required to mitigate any significant impact associated with the proposed project.

The City agrees that maintaining connectivity to regional habitat preserve areas is desirable. As such, the City has proposed the wildlife corridor as a major feature of the proposed project. The primary goal of the wildlife corridor is to provide a viable connection between the Habitat Preserve Area (which, in turn, is connected to the NCCP Preserve Area) with the Laguna Coast Wilderness Park to the south. The alignment of the corridor has been carefully planned with significant input from various wildlife entities and stakeholders.

Response to Comment H24

With respect to Planning Area Zone 2, under the proposed Overlay Plan PAZ 2 is proposed for residential development; however, this portion of the project site is currently developed with residential uses associated with the former base (refer to Figure 1-4 of the EIR). Any reuse or redevelopment of PAZ 2 with residential uses would not likely increase the level of lighting impacts on the adjacent habitat preserve.

Response to Comment H25

The proposed Conservation Zone widths have been planned to achieve the maximum widths feasible. However, the proposed wildlife corridor is constrained in several areas as a result of many factors including existing development, roadways, and topographical conditions. The functionality of the wildlife corridor is not solely dependent upon width, and in areas where the width becomes more restrictive more care would need to be taken to implement measures to reduce the potential for edge effects and ensure that the corridor is attractive for wildlife.

Response to Comment H26

Tables 3-3 and 3-4 of the EIR depict a statistical summary of potential project development, including park acreages. Page 5.9-16 of the EIR has been corrected as follows:

“In addition, under the Base Plan, low to moderate quality foraging habitat (comparable to the existing agricultural fields) in the form of the approximately 576 acres of proposed golf course, ~~988~~ 716 acres of parkland, 438 acres of agriculture, 179 acres of wildlife corridor, and 229 acres of drainage/riparian corridor (~~2,410~~ 2,138 acres total) will be available after the completion of the project.”

Response to Comment H27

Tables 3-3 and 3-4 of the EIR depict a statistical summary of potential project development, including park acreages. Page 5.9-16 of the EIR has been corrected as follows:

“Under the Overlay Plan, low to moderate quality foraging habitat (comparable to existing agricultural fields) in the form of approximately 526 acres of proposed golf course, ~~547~~ 382 acres of parkland, 303 acres of agriculture, 179 acres of wildlife corridor, and 229 acres of drainage/riparian corridor (~~4,784~~ 1,619 acres total) will be available after the completion of the project.”

Response to Comment H28

Page 5.9-18 of the EIR has been corrected as follows:

“The wildlife corridor provides connection to the ~~995~~ 975-acre habitat preserve, as well as the Limestone-Whiting Wilderness Park.”

Response to Comment H29

The City has a policy of encouraging alternative modes of transportation, including bicycling. The City of Irvine General Plan Circulation Element Policies establish various goals and implementation measures for this purpose. As such, the City of Irvine has one of the most advanced bike trails systems in Orange County. The proposed plan links the entire Planning Area 51 through Class I and II bicycle trails as well as a hiking and riding trail system. The Class I trails have been designed to link the recreational, educational and culture uses within the Great Park. In addition, the City’s Bicycle Transportation Plan is scheduled to be updated in 2005. Bike trail alignments, amenities, and grade separations will be discussed in that update.

Response to Comment H30

The County Master Plan of Regional Riding and Hiking Trails does not show the connection between the Serrano Creek and Hicks Canyon Trails alluded to in the comment. The Riding and Hiking Trail link that is being deleted is shown on the City of Irvine Trails Network Plan only. The link being deleted has been determined to be infeasible due to existing industrial development along the proposed route through PA 35, the inability to use the existing flood control improvement at Bake Parkway for the trail undercrossing, and other route specific impediments.

Response to Comment H31

The County of Orange’s proposed Borrego Canyon bikeway traverses the NCCP/HCP that remains in federal control and is considered to be habitat for sensitive and endangered species. As such, the City has chosen not to show the proposed connection. The project does not propose to add this trail connection. A Class I off-street bikeway will be located in the proposed drainage swale that carries Agua Chinon drainage between Irvine Boulevard and the Irvine Transportation Center. The County should consider realigning its proposed Borrego Canyon bikeway to join this trail or using the proposed Class II bikeway along the future Alton Parkway extension as an alternate route for bicyclists.

Response to Comment H32

Page 5.14-18 of the EIR has been revised as follows:

“Both on-road (~~Class I~~ Class II) and off-road (Class I ~~Class II~~) bikeways are planned for the site, linking the site with the regional bikeway system.”

Refer to Responses to Comments H35 through H38 with respect to regional trail connections.

Response to Comment H33

The EIR does address policies and programs supporting alternative modes of transportation. This EIR has followed CEQA Guidelines (Appendix G) as the guide to select Significance Thresholds. While the proposed trail system may differ in some areas with other plans, it

does propose an extensive bike trail system that links the project internally and to the regional system. On page 5.2-63, the EIR presents the opportunities offered by the proposed project's recreational, educational, and transit-oriented uses for an enhanced bike trail network. The EIR also states that connections should be considered to Portola Parkway as well as encouraging additional trails for a more extensively linked network. As the project reaches its implementation stages, there will be opportunities for these considerations. Refer to Responses to Comments H29 through H31.

Response to Comment H34

The subheading "Trails and Bikeways" has been added between the fourth and fifth paragraphs on page 5.2-62 of the EIR.

Response to Comment H35

Cyclists of all levels will be able to use the proposed trail system for recreational and transportation purposes within the opportunities that the network will provide. As a community with an extensively designed and used bike trail system, the City of Irvine continually plans and develops additional trails, as well as linkages and amenities to enhance these opportunities. As stated in the EIR, the City of Irvine will continue to encourage such enhancements through the planning and implementation stages of the project. Refer to Response to Comment H29.

Response to Comment H36

Comment noted. The design of the Irvine Transportation Center includes the opportunity to link to Barranca and ultimately Alton Parkway via bicycle.

Response to Comment H37

The City of Irvine General Plan Circulation Element has established policies to connect the City's trails to the regional trail network. The Great Park plan will provide opportunities for the expansion of the trail system. As stated in the EIR, the City will continue to encourage such enhancements throughout the planning and implementation stages of the project.

Response to Comment H38

Figure 3-7 (EIR page 3-23) represents the trail system envisioned in the proposed project. The Great Park Plan includes vast areas of open space, recreational uses, as well as institutional and educational uses which will require detailed planning and design during the subsequent phases of the project. The enhancement of the trail system will be part of the detailed planning process for those land uses, and can be integrated with the opportunities offered by those plans.

Response to Comment H39

Comment noted. Refer to Responses to Comments H29 and H38.

Response to Comment H40

The suggestion for inclusion of the Class I bikeway network into the Transportation Management Plan (TMP) will be considered. The TMP is not, however, intended to construct or maintain bikeways. The City of Irvine will coordinate with the County of Orange's Harbors, Beaches, and Parks during the implementation phase of the project for information about the bike trails that could be included in the TMP.

Response to Comment H41

Comment noted. The potential for grade-separated crossings will be identified during the later phases of more specific planning and implementation of the project.

Response to Comment H42

Figure 3-7 (EIR page 3-23) depicts the Great Park Plan Trail Network. Staging areas and details will be identified during the later phases of more specific planning and implementation of the project.

Response to Comment H43

The EIR addresses the proposed General Plan and zoning for the project site. At this time, the Equestrian Center is a permitted land use within the proposed General Plan and zoning designation for the existing site. The property will transfer to private ownership through the DON sale. The future property owner will determine the viability of an equestrian use at that time.

Response to Comment H44

The City of Irvine appreciates the offer to make a presentation on bikeways and trails planning to the County of Oranges, Harbors, Beaches, and Parks and the Orange County Regional Recreational Trails Advisory Committee.

Response to Comment H45

Mitigation Measures C1 through C4 address cultural resources; Mitigation Measure P1 (see Section 5.10 Paleontological Resources) addresses the potential for paleontological resource finds.

Any cultural resources discovered as a result of implementation of Mitigation Measures C1 through C3 would be curated at an acceptable archaeological repository within the County. Fees for storage and curation would be the responsibility of the developer/applicant for individual projects.

Response to Comment H46

Because 95 percent of PA 30 has not been surveyed, Mitigation Measure C1 requires an initial survey report which would include a records search, literature review, and walkover survey. A testing report will be required if the results of the initial survey report indicate the potential for cultural resources to be present on that portion of the project site subject to the cultural survey.

Response to Comment H47

Refer to Response to Comment H45.

Response to Comment H48

As described in the EIR, the County of Orange IWMD owns and operates three landfills to serve the solid waste disposal needs of the County. The City disposes the majority of its solid wastes at the Bowerman landfill. When the daily tonnage limit of one of the three IWMD landfills is exceeded, waste imported to that facility is reduced accordingly, and the excess tonnage is disposed of at one of the other facilities. The IWMD accepts wastes from outside of Orange County. Project refuse can be disposed of within any one of the three landfills in the County landfill system. The currently permitted maximum daily tonnage at the Bowerman landfill is 7,263, which is adjusted to increase by 1.75 percent per year with a maximum of 8,500 tons per day. Currently, the landfill accepts approximately 6,700 tons

per day. Under the proposed Overlay Plan, the project would generate approximately 35 tons per day of solid waste. Thus the project would increase the tonnage received by the Bowerman landfill to approximately 6,735 tons per day, which is well below the existing 7,263 tons per day and the future 8,500 tons per day limit of the landfill.

Response to Comment H49

The Bowerman currently accepts additional landfill waste from outside Orange County. Should the cumulative effect of development within the Central Region watershed cause the daily tonnage ceiling to be exceeded, the waste being imported will be reduced by an amount sufficient to stay within tonnage limits.

Additionally, the California Integrated Waste Management Board requires that all counties have an approved Countywide Integrated Waste Management Plan (CIWMP). To be approved, the CIWMP must demonstrate sufficient solid waste disposal capacity for at least 15 years, or identify additional available capacity outside the County's jurisdiction. Orange County's CIWMP, approved in 1995, estimates future solid waste disposal demand based on countywide population projections adopted by the Board of Supervisors. IWMD's database estimates that the Orange County landfill system has capacity for approximately 25-years; therefore no significant cumulative solid waste impacts are anticipated. Continuation of local government efforts required under AB 939 to divert wastes from the County's landfills will also reduce the magnitude of cumulative impacts.

RELOOC is an acronym for "Regional Landfill Options for Orange County." The RELOOC program is a 40-year strategic plan under preparation by the County IWMD, and is proposed to ensure that waste generated by the County is safely disposed of and that the County's future disposal needs are met. The County IWMD is currently in the process of conducting the environmental review for the RELOOC program, with the EIR anticipated to be released in spring 2003.

The County's waste disposal system includes three landfills, 20 former refuse disposal stations, and four household regional hazardous waste collection centers. The RELOOC implementation strategy is based on a "Phased Option" approach to managing solid waste disposal in the County, consisting of Phase 1 Short Term Strategies and Phase 2 Long-Term Strategies. Phase 1 strategies include, among others, fully utilizing the capacity of existing landfills before seeking new site or alternative waste disposal methods. This would be achieved by maximizing operational efficiency at existing landfills (e.g., compacting refuse), increasing landfill capacity of the Frank R. Bowerman and Olinda Alpha landfills, and proactively encouraging recycling. Phase 2 strategies include determining if there is a need to increase the daily amount of solid waste permitted at the Prima Deschecha landfill, identification of strategies, including new technology, to maximize solid waste disposal capacity, and completion of a feasibility study of expanding the Bowerman landfill into the adjacent Round Canyon after the Bowerman landfill reaches capacity.

Response to Comment H50

Refer to Response to Comment H49.

Response to Comment H51

Refer to Responses to Comments F65, F66, and H49.

Response to Comment H52

Refer to Response to Comment H49.

Response to Comment H53

For both the Base Plan and Overlay Plan, only future roadway improvements with an identified funding source have been included for 2007 and 2025 conditions. Only the post-2025 (General Plan buildout) scenario includes unfunded improvements. This reflects circulation needs and development levels consistent with and required for General Plan buildout conditions only and is appropriate in this context.

Response to Comment H54

All of the intersections identified in the comment were in fact included in the Great Park Traffic Impact Analysis.

Response to Comment H55

Refer to Response to Comment H2. The “trip cap” approach is an appropriate mechanism for ensuring that future development conforms to the Great Park project description. As part of the North Irvine Transportation Improvement Program (NITM), each development proposal must submit a traffic analysis demonstrating consistency with the planned trip cap. The NITM program does two things: it prioritizes and schedules the construction of traffic improvements needed to address development in the Great Park, and other undeveloped areas of North Irvine; also, it imposes a nexus fee program to ensure the timely construction of these improvement events.

Response to Comment H56

This is unnecessary since the minor differences in the ICU assumptions between the City of Irvine and other jurisdictions, if any, would not affect the findings and conclusions of the Great Park Traffic Impact Analysis.

Response to Comment H57

Refer to Response to Comment H55.

Response to Comment H58

The Traffic Impact Analysis evaluates peak hour mainline freeway conditions for all land use scenarios. The peak hour mainline freeway conditions are presented in the EIR on pages 5.2-35 and 5.2-36 (Base Plan) and pages 5.2-53 and 5.2-54 (Overlay Plan) (see specific references to Appendix G).

Response to Comment H59

Ongoing studies and analysis (monitoring) in accordance with the NITM program will continue to ensure that mitigation measures are implemented in a timely and appropriate manner.

Response to Comment H60

Comment noted. The MPAH amendment process has been specifically identified as a required project mitigation measure. The City of Irvine has initiated a request to OCTA for the review of the proposed MPAH amendments.

Response to Comment H61

Although an industrial reuse was contemplated during the initial efforts to clean up the base, the remediation strategies put in place allow for other reuses. The DON, with the concurrence of the other members of the Base Cleanup Team, considers all “no further action” sites and all remediated sites at the base to be available for unrestricted uses. Therefore, the use of such sites is consistent with the land uses proposed in the Great Park Plan. At locations that are to be used for schools (K-12), additional evaluation of the sites by DTSC is required by law.

Considerations for remedial actions objectives are provided in 40 CFR 300.430(e)(2)(i) that states, “remediation goals shall establish acceptable exposure levels that are protective of human health and the environment and shall be developed by considering the following...for known or suspected carcinogens, acceptable exposure levels are generally concentration levels that represent an excess upper bound lifetime cancer risk to an individual of between 10^{-4} and 10^{-6} using information on the relationship between dose and response.” The Department of the Navy (DON) will be responsible for remediation of the former MCAS El Toro to these exposure levels. The DON has stated that some land-use controls (i.e., easements, covenants, institutional controls, ordinances, etc.) will be required in order to restrict public access on approximately seven Installation Restoration Plan (IRP) sites. The DON will employ limited land use controls at IRP sites 2, 3, 5, 16, 17, 18, 24; the use of such controls has yet to be determined for IRP sites 1, 8, 11, and 12. This action has been deemed necessary until the IRP sites in question can be remediated to the above mentioned acceptable exposure levels.

Section 3.0 *Project Description Actions and Approvals of Other Agencies* has been amended to reflect the requirement that DTSC approve the acquisition and/or development of property for public schools. The added additional language reads as follows:

“California Department of Toxic Substances Control (DTSC) – Approval of acquisition and/or development of property for public schools based on hazardous materials evaluation.”

Response to Comment H62

In the April 2003 Draft Final EBS, the DON identifies approximately 84 percent of the base as suitable for transfer through a fee conveyance. The DON considers areas that are suitable for transfer to be available for unrestricted uses. The percentage of transferable property has increased since 1995 due to additional investigation and sampling performed in 2002 and 2003 as part of the EBS update. Additionally, numerous areas have received “no further action” concurrence from the site regulators since 1995, thus increasing the acreage suitable for transfer from the original estimate of 67 percent. Refer to the *Final Environmental Baseline Survey, Former MCAS El Toro, California* (Earth Tech, Inc. April 2003) for additional information.

Approximately 84 percent of the former air station property is suitable for transfer by deed without remediation or land-use controls. Most of the remaining 16 percent of the former air station consists of areas with subsurface groundwater contamination and may be transferred to private control through a lease in furtherance of conveyance until the remediation is complete and fee title can be conveyed. Land-use controls, as defined in Response to Comment H61, for such groundwater contamination will be limited to prohibitions on the extraction and use of groundwater and limited surface controls to protect monitoring and remediation equipment.

Response to Comment H63

Additional remediation plans are not required, as specific land use designations (i.e., residential, industrial, park, or recreation) are irrelevant. Per 40 CFR 300.430(e)(2)(i), "remediation goals shall establish acceptable exposure levels that are protective of human health and the environment and shall be developed by considering the following...for known or suspected carcinogens, acceptable exposure levels are generally concentration levels that represent an excess upper bound lifetime cancer risk to an individual of between 10^{-4} and 10^{-6} using information on the relationship between dose and response." The DON is required to remediate the site to these exposure levels. Analysis of supplemental remediation costs, if any, are not required by CEQA. The cost and responsibility of remediation rests with the DON. Refer to Response to Comment H61.

Response to Comment H64

Refer to Responses to Comments H61 and H63.

Response to Comment H65

The City of Irvine's Solvent Study identified a potential conduit of contamination, the base sanitary sewer system, and analyzed the maximum potential releases that could have occurred based on a review of historical records and engineering practices. The City submitted the report to the DON for consideration of alternate sources for contamination on the base. In response, the DON gave careful consideration to the rationale and logic of the report, conducted extensive testing of a likely source (Building 307, the base laundry and dry cleaning facility located within IRP Site 24), and concluded that the potential releases were most likely very limited. While the City of Irvine concurs with the DON's conclusions, based on its evaluation of Building 307, the City recognizes that there is a potential, albeit small, for hidden releases of solvents and other hazardous substances. Mitigation Measure HH 5 puts in place a process for responding to potential unidentified contamination when it is encountered during any construction activities on the base. The April 2003 Draft Final EBS released by the DON addresses concerns brought up in the City of Irvine's Solvent Study. Refer to the City of Irvine's letter of response dated 21 March 2003 attached in the Appendix.

Response to Comment H66

It is the responsibility of the DON along with the rest of the members of the Base Cleanup Team (including USEPA, DTSC, and RWQCB) to review evidence of contamination presented by any and all parties, including those identified by the commentor. In the April 2003 Draft Final EBS, the DON reviews all of the evidence presented by other parties for potential additional locations of concern, including the City of Irvine's Solvent Study. The DON performed studies to address issues raised in the Solvent Study and the conclusions are presented in the April 2003 Draft Final EBS. While many potential locations of concern do not warrant further investigation, the DON considers 76 locations to require evaluation for potential releases. Those sites that pose a significant risk to health and safety will be subject to remediation sufficient to allow a fee conveyance of the site for unrestricted uses.

Response to Comment H67

Refer to Response to Comment H65. The EIR will be revised to note that the DON evaluated potential soil contamination adjacent to runways and under certain runway extensions in the April 2003 Draft Final EBS. There date is no evidence that there are significant levels of unknown contaminants in these areas. The City of Irvine believes that the DON's April 2003 Draft Final EBS addresses all concerns brought up in the GeoSyntech report and the City of Irvine's Solvents Study. Refer to the City of Irvine's letter of response dated 21 March 2003 attached in the Appendix.

Response to Comment H68

The April 2003 Draft Final EBS released by the DON addresses and responds to concerns brought up in the County's environmental site assessment (the GeoSyntech report). Per the Base Realignment and Closure Business Plan for MCAS El Toro (March 2000) and the April 2003 Draft Final EBS, the DON states that approximately 84 percent of the former air station is environmentally suitable for transfer by deed without remediation or land use restriction. Most of the remaining 16 percent consists of areas with subsurface groundwater contamination and may be transferred through a lease in furtherance of conveyance. Some portions of the land area remaining to be remediated will have restricted public access via land use controls until remediation is complete. The DON does not propose to remediate the site to a specific land use designation (i.e., industrial, residential, park, or recreation) as the federal regulations codified under 40 CFR 300.430(e)(2)(i) designate acceptable exposure levels regardless of proposed land use. Refer to Response to Comment H66.

Response to Comment H69

At the time of the review of the County's EIR 563 and 573 processes, the clean-up of the former MCAS El Toro was not far along, therefore the City identified a number of issues that it believed should be addressed prior to going forward with reuse. Subsequently, the DON completed a substantial portion of its investigations and decisions about remediation such that there are relatively few unknowns regarding contamination at this time. Consequently, it is not necessary to revisit issues that the DON has addressed.

Response to Comment H70

The DON recently released an updated baseline environmental analysis of the former air station (Draft Final EBS April 2003). There is no evidence to date indicating the presence of pools of solvents in the bedding of the existing sewer alignments. Refer to Response to Comment H65.

Response to Comment H71

Refer to Responses to Comments H65 and H70. Air quality and traffic impacts attributable to construction activities for both the Base Plan and Overlay Plan, including grading activities, were modeled using the URBEMIS 2001 and the Irvine Transportation Analysis Model (presented in Section 5.3 *Air Quality* and Section 5.4 *Traffic/Circulation*), respectively.

Response to Comment H72

Comment noted. Mitigation Measure HH5 requires that applicants for grading permits within the boundaries of Site 24 prepare a worker health and safety plan that acknowledges the presence of residual VOCs in soil and groundwater at Site 24 and provides adequate measures to protect worker health and safety. Land use controls, as outlined in Response to Comment H61, will be employed at IRP Site 24 in order to prevent extraction or use of contaminated groundwater without prior approval, to protect the integrity of the remedial actions (e.g., protect extraction and treatment equipment and monitoring wells), and to allow access to the site for equipment operation, maintenance, and monitoring. Also refer to Responses to Comments H65 and H77.

Response to Comment H73

The DON evaluated the potential for contamination associated with the piping that ran between an on-base plating shop and an industrial wastewater treatment facility and determined that contamination did not exist. Refer to Responses to Comments H65 and H66.

Response to Comment H74

The vast majority of tanks have been removed under the supervision of the appropriate regulatory agencies. The few tanks that have been or will be abandoned in place will be rendered inert under the supervision of the appropriate regulatory agencies. The information on the status of the storage tanks located on the project site has been updated to reflect the April 2003 Draft Final EBS. Section 5.5.1 *Public Health and Safety Environmental Setting* (5.5-9) has been amended to read:

"Based on the April 2003 Draft Final EBS, a total of 404 USTs were in use at the former air station. Of these USTs, 357 have been remediated and received findings of "no further action." Of a total of 39 ASTs used in support of the military mission at the former MCAS El Toro, 36 have been remediated and received findings of "no further action."

Response to Comment H75

Comment noted. Access to monitoring wells will be protected by restrictions placed on the property prior to sale by the DON. Mitigation Measure HH 6 will be added to Section 5.5.5 *Public Health and Safety Mitigation Measures* to read as follows:

"The City or Irvine shall develop and maintain the location and status, as well as other pertinent information, of all monitoring wells located on the former MCAS El Toro in a geographic information systems database (GIS). The City will review all permit applications on the former air station for well locations that may be affected by a permit, and require applicants to maintain appropriate access. Access to wells will be limited to authorized personnel."

Response to Comment H76

The use of significant quantities of CFC/HCFC refrigerants is not required for implementation of the proposed project. Compliance with SCAQMD rule 1415 requires the capture and recovery of refrigerants resulting in insignificant impacts to the environment.

Response to Comment H77

Although grading operations are not expected to result in the release or disturbance of asbestos or lead, demolition of existing structures may result in such releases. Section 5.5.5 *Public Health and Safety Mitigation Measures* (5.5-27) states:

"Prior to the issuance of a grading permit, the applicant shall prepare and the Director of Community Development shall approve a protocol plan (including but not limited to worker training, health and safety precautions, additional testing requirements, and emergency notification procedures) in the event of unknown hazardous materials are discovered during grading, construction, and/or related development activities."

Response to Comment H78

The DON is required to complete all necessary remedial actions before fee title to the former MCAS El Toro is transferred from federal ownership. The DON may transfer control of those portions of the property not found suitable for transfer of fee title though a lease in furtherance of conveyance. Even after the fee title is transferred, the federal government is required to conduct further remediation if additional contamination caused by DON actions is discovered or if a remedy fails to perform adequately. Federal law also provides that the

DON may be required to indemnify the new owners or certain other parties for liabilities arising from claims for personal injury or property damage resulting from the release or threatened release of any hazardous substances, pollutants or contaminants, or petroleum or petroleum derivatives attributable to DON activities on military installations. Refer to the following letters that are attached in the Appendix to this Response to Comments document: H.T. Johnson, Assistant Secretary of the Navy, Installations and Environment, Letter to the Editor, Los Angeles Times, 5 August 2002; and the letter to the City of Irvine from the DON dated 25 April 2003. Also see the "DOD Policy on Responsibility for Additional Environmental Cleanup after Transfer of Real Property" electronically at: [http://www.dtic.mil/envirodod/Policies/BRAC/brac_flu.htm].

Response to Comment H79

All hazardous wastes generated in the course of the proposed project will be managed in compliance with regulatory requirements and sent to a licensed hazardous waste facility, thereby minimizing risks and rendering impacts to public health and safety less than significant.

Response to Comment H80

Section 5.3 *Air Quality* and Section 5.4 *Traffic/Circulation* of the EIR address the issue of human health impacts resulting from diesel exhaust particulates.

Response to Comment H81

Existing users of pesticides and fertilizers at the base, agricultural leaseholders and landscape maintenance staff, must meet regulatory requirements for the storage, application, and disposal of registered pesticides. Proposed uses will be similar. Compliance with regulatory requirements will minimize both exposures to pesticides and the potential risk of accidental releases resulting in less than significant impacts to public health and safety.

Response to Comment H82

Only SCAQMD-compliant paints and coatings are legally available for use in the proposed project. Compliant coatings minimize the use and release of VOCs resulting in less than significant impacts to public health and safety.

Response to Comment H83

Non-point source pollution and related TMDLs are addressed in Section 5.7 *Hydrology/Water Quality*. Mitigation Measures H/WQ 1 states:

"A Storm Water Pollution Prevention Plan and Water Quality Management Plan are to be prepared [prior to project implementation]. A Notice of Intent for coverage of projects under the General Construction Activity Storm Water Runoff Permit will be submitted to the State Water Resources Control Board prior to issuance of grading permits in the project areas. This requirement will be met to the satisfaction of the City Engineer for: a) any disturbance of one-acre or more of soil...b) General Dewatering NPDES Permit of the Santa Ana RWQCB, and c) provisions of the Countywide Permit....As future projects are planned, designed, and constructed in the project area, specific BMPs and other water quality control methods will be utilized to reduce water quality degradation in the Newport Bay watershed."

Monitoring protocols implemented as part of the BMPs and other Permits identified in this Mitigation Measure would require quantification of non-point source pollution loading as part of the TMDLs identified for the Newport Bay watershed.

Response to Comment H84

Refer to Response to Comment H83.

Response to Comment H85

Air quality emissions are presented and analyzed in Section 5.3 *Air Quality*. Growth inducement due to the proposed project is addressed in Section 7.2 *Growth Inducing Impacts*.

Response to Comment H86

Information pertaining to the consistency between the proposed project and the SCAQMD's AQMP and SIP is presented in Section 5.3 *Air Quality*.

Response to Comment I1

This comment recites the primary components of the proposed project.

Response to Comment I2

Refer to Responses to Comments I3 through I13.

Response to Comment I3

Page 3-30 of the EIR has been corrected as follows:

~~Orange County~~ Airport Land Use Commission (ALUC) ~~for Orange County -~~
~~Amendment Revision~~ of the Airport Environs Land Use Plan (AELUP), dated 1995.

This correction has also been made in other applicable sections of the document.

Response to Comment I4

Page 5.1-5 of the EIR has been modified to include the text of Policy J-1.d as follows:

Policy J-1.d address hazards associated with aircraft operations. Policy J-1.d states, "Use the most current available Airport Environs Land Use Plan (AELUP) as a planning resource for evaluating aircraft operations, land use compatibility and land use intensity."

Response to Comment I5

Page 5.1-6 of the EIR has been modified as follows:

The Airport Land Use Commission for Orange County Airport Land Use Commission (ALUC) prepares a comprehensive land use plan and regulates land uses for each public and military airport. The ALUC adopted the has Airport Environs Land Use Plans for (AELUP) covering the former MCAS El Toro, the former MCAS Tustin, John Wayne Airport (JWA) (adopted 2002), Armed Forces Reserve Center Los Alamitos, and Fullerton Municipal Airport (2002), Joint Forces Training Base Los Alamitos (2002), Heliports projects (2002) and for MCAS El Toro (adopted 1995) ... Figures found in Appendix D of the 1995 AELUP depict the noise and safety zones for MCAS El Toro. Figure 5.1-1 depicts the APZs for the former MCAS El Toro as shown in the 1995 AELUP.

The MCAS El Toro property is still owned by the Federal government. The 1995 AELUP applicable to that property remains in effect and has not been amended. California Public Utilities Code Section 21670, et. seq. requires that local General Plans and Zoning be consistent with the land use compatibility plan (AELUP). The Public Utilities Code provides a method whereby a local jurisdiction may override an Airport Land Use Commission finding of inconsistency with the AELUP.

Response to Comment I6

Page 5.1-15 of the EIR has been revised as follows:

The land use, safety, and noise restricted areas as identified in the AELUP, AICUZ, and the PIL for the former MCAS El Toro facility are no longer impacted by aircraft noise from military air operations now that the base has closed for military use. The MCAS El Toro property is still owned by the Federal government. The 1995 AELUP applicable to that property remains in effect and has not been amended. California Public Utilities Code Section 21670, et. seq. requires that local General Plans and

Zoning be consistent with the land use compatibility plan (AELUP). The Public Utilities Code provides a method whereby a local jurisdiction may override an Airport Land Use Commission (ALUC) finding of inconsistency with the AELUP.

Response to Comment I7

Refer to Responses to Comments I9 and I10.

Response to Comment I8

Reference 6 on page 5.1-27 of the EIR has been revised as follows:

Orange County Airport Land Use Commission for Orange County. Airport Environs Land Use Plan, adopted November 1995. 1975-90.

Response to Comment I9

Page 5.1-15 of the EIR states that the proposed project, “would not result in a significant land use compatibility impact, even though it would conflict with the adopted AELUP.” This language is consistent with the language contained in Section 6.0 Alternatives.

Response to Comment I10

On 17 April 2003, the ALUC formally acknowledged that the ALUC has no statutory jurisdiction over the proposed project. Further, according to the ALUC’s 17 April 2003 staff report, ALUC staff has reviewed the project and finds no AELUP issues.

In the 17 April 2003 staff report the ALUC has also stated that the ALUC does have jurisdiction within the AELUP surrounding the former military airfield. The Orange County Great Park EIR recognizes the potential for growth-inducing impacts as a result of the removal of development restrictions within the AELUP areas surrounding the former base (e.g., EIR, page 7-13). However, Measure W changed the County of Orange’s General Plan to delete any airport development opportunity at the former MCAS El Toro and the DON, in its Record of Decision, chose a non-aviation reuse plan. Consequently, changes in land use restrictions are based on that voter-approved initiative and subsequent DON decisions, not on this project, which modifies the Irvine General Plan designations from a more intensive non-aviation use (known as “Millennium Plan II, adopted in February 2000) to the less intensive, park-oriented non-aviation use proposed by the Great Park project. Many of the areas referenced by the commentor are located within other jurisdictions (primarily the City of Lake Forest and newly incorporated Aliso Viejo). The City of Lake Forest is currently in the preliminary stages of preparing a land use study of the subject area. The City of Aliso Viejo has just recently initiated preparation of a General Plan. It is anticipated that any future proposal by any jurisdiction with lands currently located within the AELUP would be required to evaluate, with specificity, the potential environmental impacts associated with adoption of any proposed land use changes. This information would then be available to the ALUC when amending the AELUP as it relates to that jurisdiction.

Response to Comment I11

Refer to Response to Comment I10. There is no need to include growth-inducing impacts as a significant unavoidable impact of the proposed project.

Response to Comment I12

Page 8-5 of the EIR has been corrected as follows:

~~Orange County~~ Airport Land Use Commission for Orange County, Airport Environs
Land Use Plan, 1995. ~~1975-1990~~.

Response to Comment I13

The documentation referenced by the commentor will be provided to the Airport Land Use Commission as requested.

Response to Comment J1

Comment noted.

Response to Comment J2

Coordination between project developers and the Fire Authority, as with other service providers, is a requirement of development of this type and magnitude. Any necessary agreements regarding fire protection services will occur in accord with established procedures.

Response to Comment J3

Refer to Response to Comment J2.

Response to Comment J4

Comment noted.

Response to Comment J5

Comment noted. See Section 5.5 *Public Health and Safety* for information pertaining to hazardous materials related to agricultural and military activities.

Response to Comment J6

Comments noted. See Section 5.5 *Public Health and Safety* for information pertaining to wildland fires.

Response to Comment J7

Development standards of the type noted are either legal requirements or will be negotiated and established during the review and approval process for the master development plans or other approvals given by the City.

Response to Comment J8

Any further reduction of the surplus area will be determined by the General Services Administration. The effect of future government ownership and operations in areas proposed to remain in government control will need to be assessed once the specific areas are established.

Response to Comment J9

Refer to Response to Comment H65. The commitment by the DON is to convey land based on the federal regulations codified under 40 CFR 300.430(e)(2)(i); the regulations designate acceptable exposure levels suitable for the proposed reuse of the former air station. If an unknown hazard appears during construction, appropriate responses will be taken by the City in coordination with the DON and the Fire Authority and other responsible agencies. Refer to the April 2003 Draft Final EBS for additional information on the status of underground storage tanks, pipelines, and other specified information. See Section 5.5 *Public Health and Safety* for information pertaining to hazardous materials and wastes. Mitigation Measure HH 5 states:

“Prior to the issuance of a grading permit, the applicant shall prepare and the Director of Community Development shall approve a protocol plan (including but not limited to worker training, health and safety precautions, additional testing requirements, and emergency notification procedures) in the event of unknown hazardous materials are discovered during grading, construction, and/or related development activities. The applicant and/or property owner that discovers

contamination due to past military operations not previously identified by the DON shall be responsible for notifying the DON, appropriate regulatory agencies, and the Director Community Development of the City of Irvine in a timely manner.”

Response to Comment J10

Response to Comment J15

The location of IRP sites are identified on Figure 5.5-1 (EIR page 5.5-8).

Response to Comment J16

The project is a General Plan amendment, zone change, development agreement, and annexation. The detailed information discussed in the comment will be available in the design phase.

Response to Comment J17

Coordination with OCFA will occur during the design phase and during the project approval process, consistent with City standard procedures.

Response to Comment J18

Refer to Response to Comment J17.

Response to Comment J19

Comment unclear due to partial sentence provided as comment.

Response to Comment J20

Regulation of agricultural chemicals application and storage will continue for land proposed to be retained for agricultural use.

Response to Comment J21

Comment noted.

Response to Comment J22

Fire protection agreements are a requirement prior to development. This issue is also referenced in the Urban Services Plan (provided as an attachment to this document).

Response to Comment J23

Comment noted. Fire service was considered in establishing maximum water demand and subsequent backbone infrastructure sizing.

Response to Comment J24

OCFA will be listed as an Action Agency in the EIR on pages 3-30/3-31.

Response to Comment J25

Corrections will be made in the final EIR as noted.

Response to Comment J26

Refer to Responses to Comments J1 through J25.

Response to Comment K1

The elements and development characteristics of the proposed project are specifically defined in Section 3.0 *Project Description*. The analysis of potential environmental impacts is based on the development and operation of the project as defined in Section 3.0.

The City has proposed a concept plan that will meet the spirit and intent of Measure W while maintaining a fiscally-balanced plan. Annexation of PA 51 is proposed in order to ensure the City can control the logical development of the property, and to maintain high service levels for public service and utility providers. Although the project site will be incorporated into the City of Irvine, the proposed uses are regional in nature and are intended to benefit and serve all residents of the County.

Response to Comment K2

This comment references the adequacy of the DON's Environmental Impact Statement (EIS) and the Record of Decision for the Disposal of the former MCAS El Toro issued by the DON and co-signers of the Federal Facilities Agreement. This comment does not address the adequacy of the Orange County Great Park EIR.

Response to Comment K3

The DON has analyzed a non-aviation alternative in its EIS for the Disposal and Reuse of the former MCAS El Toro. The Orange County Great Park project, however, is proposed by the City of Irvine. The City is designated as the "lead agency" under CEQA, and in this capacity, is responsible for preparation and certification of an EIR that addresses the potential environmental impacts associated with implementation of the proposed project as defined in Section 3.0 of the EIR. The DON is not required to prepare an EIR for the proposed project as a range of alternatives were previously addressed in the DON's EIS for the federal action. The Orange County Great Park project is proposed by the City of Irvine and does not involve a federal action beyond the disposal of the property which is addressed in the federal EIS.

Response to Comment K4

Section 7.1 *Cumulative Impacts* of the EIR analyzes the potential environmental impacts associated with the development of the proposed project in conjunction with the projected growth in the region, including the Northern Sphere. This cumulative impact analysis includes analyses of impacts to traffic, air quality and energy.

With respect to aviation, implementation of the proposed project does not involve a use that would impact existing airports and aviation activity. The proposed project is the reuse of a former military air base which is currently not utilized for any type of aviation use. The Measure W initiative changed the County of Orange's General Plan and deleted the airport designation for the former MCAS El Toro. Furthermore, on 25 February 2003 the Orange County Board of Supervisors, acting as the El Toro Local Redevelopment Authority, rescinded the El Toro Airport System Master Plan, thus removing an airport at MCAS El Toro from all County plans.

Response to Comment K5

This comment addresses the adequacy of the Final Environmental Impact Statement and Record of Decision issued by the DON for the closure of the former MCAS El Toro. This comment does not address the adequacy of the Orange County Great Park EIR and no further response is necessary.

Response to Comment K6

As described in Section 5.5 *Public Health and Safety* of the EIR, the DON will be responsible for clean-up and remediation activities on the base. Page 5.5-11 of the EIR states, "Under CERCLA, contaminated federal property cannot be transferred until all necessary remedial actions have been taken or a remediation system is operating properly and successfully. Cleanup responsibility remains with the DOD until the property is fully remediated. Therefore, some of the former air station property cannot be transferred immediately." Additionally, "As established by BRAC III, the DON will continue its environmental restoration activities after installation disposal. Sites that require continuing monitoring and remediation will receive continuing investigation/remediation beyond installation closure, which occurred in July 1999." (EIR, page 5.5-15) Additionally, Mitigation Measures HH1 through HH5 are proposed to ensure that no significant impact associated with the presence of hazardous materials or contamination occurs with implementation of the proposed project. Refer to Responses to Comments H61 and M26 for information pertaining to the DON's remediation requirements.

Response to Comment K7

Refer to Response to Comment K1.

Response to Comment L1

Refer to Responses to Comments DD1 through DD14, which respond to the Department of Toxic Substances Control comment letter on the EIR.

Response to Comment M1

Refer to Responses to Comments M2 through M95 which respond to each comment raised by the commentor.

Response to Comment M2

This comment correctly summarizes the primary components of the proposed project, as described in the EIR. However, the City does not agree with the commentor's statement that the Great Park is not a feasible reuse of the project site and that the magnitude of the proposed land uses are understated. The proposed uses are considered feasible in terms of constructability as well as a fiscal standpoint. Proposed uses have been carefully considered so as to achieve a fiscally balanced plan while maintaining the spirit and intent of Measure W.

The proposed project characteristics are described in detail in Section 3.0 *Project Description*. The EIR focuses on the Overlay Plan as it presents the highest level of potential impact in order to ensure mitigation at the highest level. Tables 3-3 and 3-4 provide a detailed summary of the potential maximum development potential of the project according to both the Base Plan and Overlay Plan.

Response to Comment M3

The proposed Orange County Great Park land uses are proposed within City of Irvine Planning Areas (PAs) 30 and 51. Lands within PA 51 are not subject to Measure W while they remain under the jurisdiction of the County of Orange. To the extent that these lands are not annexed under the Great Park Plan, there will be no impact to the County's General Plan and zoning. However, PA 30 is located within the jurisdictional boundary of the City, and is not subject to Measure W. Generally, the more intensive land uses are proposed within PA 30. Comparatively, the Overlay Plan is more intense than the Base Plan, which are clearly depicted in Tables 3-3 and 3-4 of the EIR. However, the Overlay Plan allows for a similar amount of the open space, park, recreational and public uses within PA 51 as could occur under the Base Plan.

The City does not concur that the Overlay Plan constitutes "massive development" as inferred by the commentor. Regardless of whether land uses are developed according to the Base Plan or the Overlay Plan, the spirit and intent of Measure W will be met with implementation of the proposed project, for that portion of the project site currently subject to Measure W. In either case, the development potential of the Base Plan and the Overlay Plan are clearly illustrated in Tables 3-3 and 3-4 of the EIR.

Response to Comment M4

As stated in the EIR, "the purpose of the project is to assure that reuse of El Toro is consistent with the intent of Measure W approved by the voters in March, 2002 while responding to the decision of the federal government to sell the land". The proposed zoning with the Base Plan and Overlay Plan assures the fulfillment of this purpose, regardless of the option chosen by the buyers of the property. While the option of the Overlay Plan provides a potential higher return to the developers in exchange for providing the land and infrastructure for the public uses, the Base Plan, through the regulation of the permitted land uses, also assures that the land will be developed for open space, recreation, educational, and cultural facilities, agriculture, and other park-like uses. Project applicants may opt to develop under the Base Plan and forego the increased intensity and development rights that are available through the Development Agreement and Overlay Plan.

Response to Comment M5

The former air station will be divided into four parcels for sale by the DON. The requirement through the Development Agreement for land dedication and maintenance fee participation under the Overlay Plan option assures that the public uses are implemented. Conversely, under the Base Plan the land use regulations will be the mechanism for the implementation of the park and open space uses. Under the Base Plan, public funding is not required because park and open space lands are not required to be dedicated.

Response to Comment M6

The zoning allows the development of the Great Park under both options. With the Overlay Plan the Great Park will be implemented through land dedication and fee contributions, and the City (or its designee), in turn, will be the developer of those public uses. Under the Base Plan, the owner of the property will develop the land based on the designated land uses, including the open space, recreational, educational and cultural facilities, agriculture, and other park-like uses, since those are the permitted land uses provided by the Base Plan option.

Response to Comment M7

The EIR analyzed the potential impacts of the Overlay Plan as the maximum buildout of the Plan, including the Development Agreement as an integral part of the Overlay Plan option. If a buyer declines to enter into the Development Agreement, the property would have the General Plan and zoning designation provided in the Base Plan. Any subsequent increase in the density and intensity would require the preparation of a General Plan Amendment, zone change, and the required environmental documentation addressing both project-specific and cumulative impacts.

Response to Comment M8

The City of Irvine is not involved with the sale of land parcels; the DON has publicly stated that it will sell all parcels of the former MCAS El Toro concurrently. As the owner of the property, the DON has indicated that it will divide the land into the four parcels as indicated on the attached figures. The EIR provides an analysis of the project's potential impacts based upon the maximum amount of development allowed under the Base Plan and Overlay Plan regardless of the manner in which the DON sells the property. (Note: The four referenced parcel figures are included in the Appendix to this Response to Comments document).

Response to Comment M9

The proposed maximum development intensity of the project is defined in Section 3.0 *Project Description*. The City does not propose to exceed the level of development beyond that defined in Section 3.0 and analyzed in the EIR. The development potential is based on densities and intensities achievable under the proposed General Plan land uses and zoning designations, subject to the specific density and intensity caps that are explicit in the proposed project. Any proposed increase in the level of development beyond that described and analyzed in the EIR would require the preparation of subsequent or supplemental environmental documentation to address the potential environmental impacts of such a proposal. The land use densities of the proposed project, as with land use densities for all similar proposed projects in Irvine, are based on and controlled by the maximum allowable development intensity. As such, the density range establishes the framework for analysis within the limits of the maximum development intensity.

Response to Comment M10

The proposed project sets specific maximum levels of density and intensity and the City of Irvine has no intention of changing these levels. Refer to Response to Comment M9.

Response to Comment M11

Comment noted.

Response to Comment M12

The EIR discusses all potential environmental effects of the Overlay Plan which is the maximum buildout scenario as defined in the project description. The City of Irvine has no intention of adding development intensity beyond that which is presented in the EIR. Refer to Responses to Comments M9 and M10.

Response to Comment M13

Refer to Responses to Comments M9 and M10

Response to Comment M14

Per the Overlay Plan, the maximum number of dwelling units in PAZ2 is set at 850, notwithstanding the number of units that could be calculated using the maximum range of the zoning designation. The maximum intensity of development for both the Base and Overlay Plans is specifically depicted in Tables 3-3 and 3-4 of the EIR. Refer to Response to Comment M9.

Response to Comment M15

Refer to Response to Comment M9.

Response to Comment M16

Comment noted.

Response to Comment M17

The air quality impact analysis contained in Section 5.3.3 *Air Quality Environmental Impacts* adequately assesses the air quality impacts of runway removal as part of the overall project construction. In order to confirm the validity of the initial URBEMIS 2001 model, additional analysis of the airport runway model was completed. As part of this additional analysis, it was determined that the URBEMIS 2001 site grading PM₁₀ fugitive emissions calculations are based on the emission factor prepared by the CARB for construction activities, that include: limited-to-heavy trenching activities; limited-to-heavy earth moving activities by scrapers; road pre-paving activities; paving activities; road grading; scraper excavations; general construction of pads, framing, landscaping, etc.; and drilling, blasting, compaction, and trucking of excavated and fill material. The secondary set of URBEMIS 2001 model runs were performed with the demolition tab enabled. The results of the initial URBEMIS 2001 model run and the secondary URBEMIS 2001 calculations are presented as Table M-1 in the Appendix of this Response to Comments document. The results of the secondary URBEMIS 2001 calculations show that unmitigated PM₁₀ emissions increased to approximately 458-tons per year as compared to 451-tons per year using the initial URBEMIS 2001 data. This represents an increase of less than seven tons, or 1.4 percent of the total unmitigated PM₁₀ emissions. The difference is statistically insignificant and the additional analysis is provided to confirm that the initial analysis adequately assesses the air quality impacts of runway removal as part of the overall project construction. Section 5.3.3 will be amended with the addition of the secondary URBEMIS 2001 calculations and qualitative description.

The Mitigation Measures proposed will apply to all construction activities, including demolition and removal of the runways as well as grading and excavation. Mitigation Measure AQ2 has been amended to read:

“Prior to the commencement of construction activities required to demolish and/or remove existing DON infrastructure, including runways, the Director of Community Development shall receive and approve a construction emissions mitigation plan from the chosen demolition contractor. Prior to the issuance of grading permits, the applicant shall submit, and the Director of Community Development shall approve a construction emissions mitigation plan. The plans ~~plan~~ shall identify implementation procedures for each of the following emission reduction measures and all feasible mitigation measures shall be implemented. If certain measures are determined infeasible, an explanation thereof shall be provided.”

Response to Comment M18

Refer to Response to Comment M17. Section 5.3.3 *Air Quality Environmental Impacts* states:

“Both the Base Plan and Overlay Plan propose the development of the entire 4,693-acre base within a 19-year (2007-2025) time frame. For estimation of air emissions, it was assumed that either plan is subdivided into two phases based on utility and extent of the development...For the estimation of air quality emissions from construction of the various facilities, construction activity is assumed to last for a period of three years during each phase. This assumption conservatively accounts for both demolition and grading/excavation activities as major sources of construction-related emissions. The URBEMIS 2001 model is used for estimating construction emissions for all stages of development...Due to the limited availability of specific data regarding construction activities and equipment requirements, the URBEMIS 2001 model default options were used.”

Response to Comment M19

The DON will not transfer fee title to the property of the former MCAS El Toro until the parcels have been remediated to acceptable exposure levels; property not meeting acceptable exposure levels will not transfer or may be transferred to private control through a lease in furtherance of conveyance until the remediation is complete. The EIR will be revised to note that the DON, in the April 2003 Draft Final EBS, evaluated potential soil contamination adjacent to runways and underneath certain runway extensions. In addition, Mitigation Measure HH 5 puts in place a process for responding to potential unidentified contamination were it to be encountered during any construction activity on the former MCAS El Toro. Also refer to Response to Comment M24.

Response to Comment M20

Refer to Responses to Comments M17 and M19 for potential contamination issues associated with runways. Potential impacts to air quality related to the removal of runways, tarmac, and related infrastructure were modeled using URBEMIS 2001 and is presented in Section 5.3 *Air Quality*.

Response to Comment M21

Refer to Responses to Comments M16 through M20. Referenced analysis has been conducted and findings presented in the EIR.

Response to Comment M22

This comment incorrectly assumes that the proposed project provides the authority to develop an additional 14,000 acres of land. Even if the proposed project is not approved and implemented, based on Measure W, the Orange County General Plan precludes development of an airport on the former MCAS El Toro and thereby removes previous land use restrictions due to aircraft operations. Even in the absence of the proposed project development would have to adhere to the non-aviation designation of the site based on the provisions of Measure W. The project proposes to change the City of Irvine General Plan and zoning designations for the project site from one non-aviation land use plan (e.g., the Millennium Plan, adopted in February 2000) to another non-aviation land use plan, designated the Great Park Plan.

The cumulative analysis provided in Section 7.1 of the EIR is consistent with the provisions of CEQA and the CEQA Guidelines. As stated in the EIR, the CEQA Guidelines allow for the analysis of cumulative impacts to utilize the Regional Growth Projections Method. According to CEQA Guidelines Section 15130, the Regional Growth Projections Method can be a summary of projections contained in an adopted general plan or related planning document which is designed to evaluate regional or area wide conditions. As described in the EIR (EIR, page 7-1), the Regional Growth Projections Method has been utilized for analysis of cumulative impacts. The cumulative analysis is based on buildout assumptions identified in the Center for Demographic Research's *Orange County Projections 2000*. This cumulative analysis takes into consideration buildout of local and regional general plans as well as population forecasts for the County of Orange and the region as a whole (as shown in Figure 7-1 and Table 7-1) (EIR, page 7-1). The EIR is consistent with the CEQA Guidelines provisions for the use of the Regional Growth Projections Method in the evaluation of cumulative impacts, as the OCP-2000 projections are adopted based on regional growth estimates utilized by various jurisdictions throughout the County.

Furthermore, the commentor appears to confuse the intent of CEQA Guideline Section 15130(b)(1)(B)(2) with respect to "probable future projects." CEQA Guideline Section 15130(b)(1)(B)(2) addresses the list approach for analysis of cumulative impacts. As previously stated, the Orange County Great Park EIR does not rely on the list approach for the analysis of cumulative impacts. Also, CEQA Guideline Section 15130(b)(1)(B)(2) does not apply to the 14,000 acres of land referenced by the commentor as it does not meet the criteria of the Guideline. Specifically: 1) the 14,000 acres is not the subject of an application requiring an agency approval which has been received at the time the notice of preparation was released; 2) the 14,000 acres is not a project identified in an adopted capital improvements program, general plan, regional transportation plan, or other similar plan; 3) the 14,000 acres is not a project anticipated at a later phase of a previously approved project; and 4) the 14,000 acres is not a public agency project for which money has been budgeted." Also refer to Response to Comment I10.

With respect to the City of Lake Forest, the City's adopted General Plan was both reviewed and has been included in the preparation of the Orange County Great Park EIR. Land use assumptions for cumulative growth include the adopted land uses of the City of Lake Forest General Plan. The City of Lake Forest has recently amended its General Plan to remove references to the aviation-use of the airport, and to delete references to the noise contours and AICUZ boundaries formerly associated with the base operations. However, no land use changes were adopted as part of this recently approved General Plan amendment. Also, no land use changes have been identified or are proposed by the City at this time. The City has just recently solicited proposals to initiate a land use study that would examine potential land use changes within the areas previously restricted by aviation use of the

former base. No formal land use change recommendations are expected until sometime in 2004. Because the nature, extent, and timing of potential land use changes that could occur in this area have not been determined, any additional analysis, beyond that provided in the EIR, would be speculative.

With respect to the City of Aliso Viejo, the City is a newly incorporated City and does not have an adopted General Plan. The City is currently in the preliminary stages of preparing a General Plan, which is expected to be adopted in late 2003 or 2004, well beyond the timeframe associated with the Orange County Great Park EIR. Rather than engage in speculation as to the nature, extent, and timing of potential land use changes that could occur in this newly incorporated jurisdiction, the Orange County Great Park EIR relies upon adopted growth projections as allowed by the CEQA Guidelines for the Regional Growth Projections Method.

The analysis of the 14,000-acres is addressed in the EIR, to the degree that the project would cause growth-inducing impacts in the City of Irvine and surrounding jurisdictions (EIR, page 7-13). The EIR concludes that the growth-inducing impacts are significant.

Response to Comment M23

The EIR describes the project's potential contribution to regional air emissions and provides a comparison of these emissions to the projected air emissions within the basin as a whole. The EIR does not rely upon this comparison as the basis for determining the significance of the project's air quality impacts. Rather, this comparison is made to assess the magnitude of the proposed project's impact on the region as a whole. While the EIR states that the project will have a negligible impact on the overall air quality within the SCAB, the EIR concludes that, "due to the size of the project, certain impacts that result from development will be "unavoidable" as these impacts cannot be completely mitigated and most of these changes are irreversible. This is considered a significant unavoidable impact, although the overall effect on air quality within the Basin for the life of the proposed project is estimated at less than one half of one percent." (EIR, page 5.3-55).

With respect to the EIR's conclusion of cumulative air quality impacts, the EIR's conclusion of significance is based on the cumulative impact associated with the regional growth projected pursuant to OCP-2000. The EIR concludes that area-wide emissions as a result of cumulative development pursuant to OCP-2000 projections are considered significant. As stated in the EIR, "operation emissions in conjunction with related projects and other emissions in the Basin will also coincide. Since air quality in the SCAB does not comply with federal or state standards, these emissions will contribute to a cumulatively significant impact on air quality," (EIR, page 7-6). The tables provided in the discussion of cumulative air quality impacts provide a quantification of pollutant emissions estimates for the year 2025 based on the adopted 1997 Air Quality Management Plan. Also, regional emissions projections are graphically depicted in Figure 5.3-2 of the EIR.

The potential cumulative impacts with respect to CO hotspots are also quantified and evaluated in Section 5.3 *Air Quality*. Table 5.3-29 depicts the CALINE 4.0 8-hour Carbon Monoxide Modeling Results for Post-2025, and demonstrates that no project-specific or cumulative Carbon Monoxide Hot Spot will result.

Response to Comment M24

The EIR includes data and analysis from the DON and other sources of information and uses these sources to draw conclusions for potential impacts to public health and safety. The

federal government is required to remediate the site to acceptable exposure levels. As part of its obligation to remediate, the DON continues to monitor the site and publish results of its monitoring and remediation efforts. The April 2003 Draft Final EBS is the most relevant evaluation of continuing remediation efforts; it identifies an additional 76 new potential release locations, all of which require further evaluation for potential releases to the environment and subsequent remediation, if required. The April 2003 Draft Final EBS catalogs the types of sites and distinguishes between those that require no further action, those that require further evaluation, those that require implementation of response actions, and those that require completion of ongoing response actions. The DON will not transfer fee title to the property of the former MCAS El Toro until the parcels have been remediated to acceptable exposure levels; property not meeting acceptable exposure levels will not transfer or may be transferred to private control through a lease in furtherance of conveyance until the remediation is complete. Property not transferred in fee title by the DON can only be developed with institutional controls established by the DON until remediation is complete and the fee title is complete. The April 2003 Draft Final EBS concludes that of the 3,738-acres of base property that are expected to become available for transfer, approximately 84 percent are environmentally suitable for transfer of fee title at the present time. The EIR will be revised to incorporate the latest information available in the April 2003 Draft Final EBS.

Response to Comment M25

Refer to Response to Comment M24.

Response to Comment M26

There is no indication that recordkeeping by the DON differed significantly from recordkeeping in private industry during the period the base was in operation. Uses of hazardous materials are well-documented, as are facility plans and operating procedures. While quantities of wastes may not have been well-documented in the period prior to the advent and enforcement of RCRA at the base, that is also the case in the private sector. The extensive process of records reviews, visual inspections, and interviews has created as thorough a record of hazardous materials use and disposal practices as exists. The DON and the regulatory agencies participating in the Federal Facilities Agreement concur that the protocol for investigating the base is sound, that the vast majority of potential contamination locations at the base have been identified, and that significant areas of unidentified contamination are not likely to be found. The City is concerned that there may be small areas of unidentified contamination and that these may be encountered during grading and construction activities. Mitigation Measure HH 5 addresses this potential by requiring applicants for grading permits to prepare a protocol plan that will guide responses to the discovery of unknown contamination. Furthermore, the DON is required to complete all necessary remedial actions before title to the former MCAS El Toro is transferred from federal ownership. Even after the title is transferred, the federal government is required to conduct further remediation if additional contamination caused by DON actions is discovered or if a remedy fails to perform adequately. Federal law also provides that DON may be required to indemnify the new owners or certain other parties for liabilities arising from claims for personal injury or property damage resulting from the release or threatened release of any hazardous substances, pollutants or contaminants, or petroleum or petroleum derivatives attributable to DON activities on military installations. Refer to the following letters that are attached in the Appendix to this Response to Comments document: H.T. Johnson, Assistant Secretary of the Navy, Installations and Environment, Letter to the Editor, Los Angeles Times, 5 August 2002; and the letter to the City of Irvine from the DON dated

25 April 2003. Also see the "DOD Policy on Responsibility for Additional Environmental Cleanup after Transfer of Real Property" electronically at:
[http://www.dtic.mil/envirodod/Policies/BRAC/brac_flu.htm].

GeoSyntec based its evaluation on the use of PRGs (preliminary remediation goals) for identified contaminants. As the U.S. Environmental Protection Agency notes:

"Preliminary Remediation Goals (PRGs) are tools for evaluating and cleaning up contaminated sites. They are risk-based concentrations that are intended to assist risk assessors and others in initial screening-level evaluations of environmental measurements. The PRGs contained in the Region 9 PRG Table are generic; they are calculated without site specific information. However, they may be re-calculated using site specific data.

PRGs should be viewed as Agency guidelines, not legally enforceable standards. They are used for site "screening" and as initial cleanup goals if applicable. PRGs are not de facto cleanup standards and should not be applied as such. However, they are helpful in providing long-term targets to use during the analysis of different remedial alternatives. By developing PRGs early in the decision-making process, design staff may be able to streamline the consideration of remedial alternatives. " EPA, Region 9, Superfund Program:
[<http://www.epa.gov/region09/waste/sfund/prg/index.htm>].

The City supports the use of PRGs in the screening process, but recognizes that site specific characteristics may result in the adoption and implementation of cleanup goals that protect public health and safety without achieving the PRGs. The City will review the specific sites mentioned in the comment and address them in the final EIR.

Considerations for remedial actions objectives are provided in 40 CFR 300.430(e)(2)(i) that states, "remediation goals shall establish acceptable exposure levels that are protective of human health and the environment and shall be developed by considering the following...for known or suspected carcinogens, acceptable exposure levels are generally concentration levels that represent an excess upper bound lifetime cancer risk to an individual of between 10^{-4} and 10^{-6} using information on the relationship between dose and response." This means that the DON will be responsible for remediation of the former MCAS El Toro to these exposure levels prior to the transfer of the fee title to the property. The DON has stated that some land-use controls (i.e., easements, covenants, institutional controls, ordinances, etc.) will be required in order to restrict public access on approximately seven Installation Restoration Plan (IRP) sites if those properties are transferred through a lease in furtherance of conveyance. The DON will employ limited land use controls at IRP sites 2, 3, 5, 16, 17, 18, 24; the use of such controls has yet to be determined for IRP sites 1, 8, 11, and 12. This action has been deemed necessary until the IRP sites in question can be remediated to the above mentioned acceptable exposure levels.

Response to Comment M27

Refer to Response to Comment H65. The DON has conducted a revised EBS of the remaining acreage at the former air station (April 2003 Draft Final EBS). The DON has sufficiently analyzed the existing locations of concern and has addressed recommendations for additional potential locations of concern set forth in the City of Irvine's Solvents Study (January 2000) and the GeoSyntec report commissioned by the County of Orange (November 2001). The Solvents Study and GeoSyntec report predate the March 2003

letter from the City of Irvine; the April 2003 Draft Final EBS conducted by the DON sufficiently addresses environmental concerns at former MCAS EL Toro. The City of Irvine has concluded that the assessment of the potential release locations is fair and appropriate.

Response to Comment M28

While the DON did not identify any specific spills or releases prior to 1983 (documentation of waste management practices improved dramatically following the implementation of RCRA beginning in the early 1980s), it acknowledged practices that resulted in releases that most likely caused the contamination problems at the base. These practices included disposal of hazardous materials and wastes to sewers, primarily storm sewer drains, disposal of hazardous wastes in base landfills, use of hazardous materials and wastes in controlling dust on roads and impermeable surfaces, uncontrolled runoff of hazardous wastes, lack of monitoring of underground storage tanks and storage facilities, and the use of hazardous materials and wastes for training of emergency response personnel. The DON's analysis of these practices led to its list of potential locations of concern (LOCs), evaluation of the LOCs, and responses where required. Where other parties, including the City of Irvine, the Restoration Advisory Board, the County of Orange, and the regulatory agencies involved in the base cleanup, have identified other potential locations of concerns, the Navy has responded with additional investigation. In some cases, the Navy, with the concurrence of the regulatory agencies, has concluded that releases did not occur or were not of sufficient magnitude to warrant further evaluation or remediation. For example, in response to the City's Solvent Study, the DON investigated Building 307, the Laundry and Dry Cleaning facility for the base. In its Final Technical Memorandum, the DON concluded that significant releases did not occur at that location and further investigation was not needed. In other cases, the DON has pursued additional evaluation as in the case of the discovery of radium dials at IRP Site 2, which prompted a thorough historical radiological analysis and a radiological survey of much of the base. This evaluation is ongoing. In sum, the City of Irvine considers the DON's process to be responsive to input from interested parties and to be sufficiently comprehensive.

Response to Comment M29

The DON responded to the GeoSyntec report in the April 2003 Draft Final EBS and concurred with seven of the 339 sites recommended for further action or assessment. The remaining 332 sites were either previously assessed, are currently being assessed, or will be assessed in the near future, have closure NFA letters signed by a regulatory agency or are recommended for NFA and are pending regulatory concurrence, or are considered to not require further action or assessment. Regulatory agencies concur with the DON's assessment of the GeoSyntec Report. The DON's April 2003 Draft Final EBS identifies new potential release locations that require further investigation, but does not identify conclusively any significant new risks to public health and safety, nor does it substantially alter conclusions drawn in the EIR.

Response to Comment M30

Refer to Responses to Comments M27 and M29 for information regarding the DON's April 2003 Draft Final EBS and information pertinent to the GeoSyntec report.

Response to Comment M31

Refer to Response to Comment M26. The City of Irvine will continue to review and monitor the base cleanup as it progresses. The City expects the DON to evaluate the seven

GeoSyntec recommended new sites with which it concurs regarding the need for further evaluation, along with the other 69 new locations of concern, in a manner that follows regulatory requirements and guidelines and meets the highest of professional standards. At any sites that require remediation to protect public health and safety, the City expects that the DON will meet agreed upon remediation goals that will ultimately result in the transfer of fee title to the property in a condition suitable for unrestricted use.

Response to Comment M32

The DON has publicly stated that it will indemnify new land owners of former air station property in order to mitigate potential soil contamination that is attributable to historic DON operations. Refer to Response to Comment H67. Also refer to Responses to Comments M27 and M29 for information regarding the DON's April 2003 Draft Final EBS and information pertinent to the GeoSyntec report.

Response to Comment M33

Refer to Response to Comment M26. Also refer to Responses to Comments M27 and M29 for information regarding the DON's April 2003 Draft Final EBS and information pertinent to the GeoSyntec report.

Response to Comment M34

Refer to Response to Comment M26. There is no evidence that the Overlay Plan, due to its greater development, will result in greater human contact with contaminated or potentially contaminated soil. For both the Base Plan and the Overlay Plan, the greatest potential impact to public health and safety is the risk of exposure to unidentified contamination, rather than the risk of contact with known contaminated soil or groundwater. Whether currently identified or not, the DON is obligated to remediate the former MCAS El Toro to acceptable exposure levels. Mitigation Measure HH 5 addresses the potential for exposure and reduces the risk to below a threshold of significance.

Response to Comment M35

Refer to Response to Comment M34. The two examples cited in the letter are addressed through Mitigation Measure HH 5. The radiological anomaly found at IRP Site 2 (radium dial) was found on the surface of the site. Perchlorates were identified as part of the required regular groundwater monitoring at the base. In the case of the radiological anomaly, HH 5 requires the preparation of a protocol plan to guide responses to the discovery of unexpected contamination. The plan must include a response to the discovery of a radiological entity as well as more common toxic contaminants. Were the DON to identify additional contaminants of concern in particular geographic locations, protocol plans may be revised. Mitigation Measure HH 5 is amended to read:

"Prior to the issuance of a grading permit, the applicant shall prepare and the Director of Community Development shall approve a protocol plan (including but not limited to worker training, health and safety precautions, additional testing requirements, and emergency notification procedures) in the event of unknown hazardous materials are discovered during grading, construction, and/or related development activities. Additionally, said protocol plan will be revised should the discovery of previously unknown hazardous materials be made during any of the above mentioned development activities."

While the DON is reasonably certain that they have identified all potential locations of concern at the former MCAS El Toro, they are prepared to respond to any future

identification of potential contamination following transfer of the fee title to the property. This is a prudent approach where complete certainty is not possible.

Response to Comment M36

Refer to Responses to Comments H65, H67, and M27 for information regarding the City of Irvine's Solvents Study. Refer to Response to Comment M26 for information pertaining to protection of human health and the environment from known or suspected carcinogens, including TCE.

Response to Comment M37

Refer to Responses to Comments H65, H67, and M26 for information regarding the City of Irvine's Solvents Study.

Response to Comment M38

See Response to Comment H65. The DON responded to the City of Irvine Solvent Study in the April 2003 Draft Final EBS. In its response, the DON concludes that the City of Irvine Solvent's Study methodology was faulty in regards to the magnitude of solvent use and potential releases via the sanitary sewer system and that the likelihood of releases was small. The DON concluded that the lack of significant releases associated with Building 307, the Laundry and Dry Cleaning Facility, supported its prior conclusion that the sanitary sewer system is not a significant conduit of contamination to subsurface soil or groundwater.

Response to Comment M39

See Responses to Comments H65 and M38.

Response to Comment M40

See Responses to Comments H65 and M38. The April 2003 Draft Final EBS specifically evaluated the City of Irvine Solvent's Study and concluded that the methodology presented in the study was faulty. Upon review of the April 2003 Draft Final EBS, the City of Irvine now accepts this assessment.

Response to Comment M41

See Response to Comment H65, M38, and M40.

Response to Comment M42

There is no evidence to suggest that unknown contaminated soils are likely to be discovered during excavation of the project site. Refer to Response to Comment M26 for information pertaining to the protection of human health and the environment from known or suspected carcinogens. Per the Mitigation Measures outlined in Section 5.6.5 *Geology and Seismicity Mitigation Measures*:

"Prior to issuance of a building permit, as per existing City policies, geotechnical studies shall be prepared at the time specific development projects are proposed to address site specific geotechnical considerations. The scope of each geotechnical study is based on the underlying geotechnical conditions of the individual site...The purpose of the subsurface evaluation is to further evaluate the subsurface conditions in the area..."

In the unlikely event that unidentified contaminants are discovered, the EIR provides an appropriate Mitigation Measure to deal with this scenario. Section 5.5.5 *Public Health and Safety Mitigation Measures* has been amended and read as follows:

“Prior to the issuance of a grading permit, the applicant shall prepare and the Director of Community Development shall approve a protocol plan (including but not limited to worker training, health and safety precautions, additional testing requirements, and emergency notification procedures) in the event of unknown hazardous materials are discovered during grading, construction, and/or related development activities. Additionally, said protocol plan will be revised should the discovery of previously unknown hazardous materials be made during any of the above mentioned development activities.”

Response to Comment M43

Refer to Responses to Comments M35 and M42. There is no evidence to suggest that unknown contaminated soils are likely to be discovered during excavation of the project site. The former MCAS El Toro will be remediated to an exposure level acceptable to human health and the environment. Mitigation Measure HH 5 addresses this potential issue by requiring grading permit applicants to prepare a protocol plan that responds to unidentified contamination. Refer to the document *Reusing Cleaned Up Superfund Sites: Recreational Use of Land Above Hazardous Waste Contaminant Areas* – EPA Office of Emergency Response (March 2001) for technical information on how sites with waste contaminated areas have been safely reused for recreational purposes while ensuring the integrity and protectiveness of the remedy are maintained.

Response to Comment M44

Refer to Responses to Comments H65, M35, M38, M40, M42, and M43.

Response to Comment M45

Refer to Responses to Comments H65, M35, M38, M40, M42, and M43. The City of Irvine accepts the DON’s conclusion in the April 2003 Draft Final EBS that widespread unidentified contamination is not likely to exist at the base. However, if unidentified contamination is discovered, Mitigation Measure HH 5 has been amended and responds to the potential for such localized unidentified contamination to exist and be encountered during grading activities.

Response to Comment M46

Refer to Responses to Comments H65, M35, M38, M40, M42, and M43. The DON is required to complete all necessary remedial actions before the fee title to the former MCAS El Toro is transferred from federal ownership. Even after the title is transferred, the federal government is required to conduct further remediation if additional contamination caused by DON actions is discovered or if a remedy fails to perform adequately. Federal law also provides that DON may be required to indemnify the new owners or certain other parties for liabilities arising from claims for personal injury or property damage resulting from the release or threatened release of any hazardous substances, pollutants or contaminants, or petroleum or petroleum derivatives attributable to DON activities on military installations. Refer to the following letters that are attached in the Appendix to this Response to Comments document: H.T. Johnson, Assistant Secretary of the Navy, Installations and Environment, Letter to the Editor, Los Angeles Times, 5 August 2002; and the letter to the City of Irvine from the DON dated 25 April 2003. Also see the “DOD Policy on Responsibility for Additional Environmental Cleanup after Transfer of Real Property” electronically at:

[http://www.dtic.mil/envirodod/Policies/BRAC/brac_flu.htm]. Using the proposed Mitigation Measure GS2 will require geotechnical assessment for specific development prior to construction; construction delays using this methodology will likely not occur.

Response to Comment M47

Refer to Response to Comment M46.

Response to Comment M48

Refer to Responses to Comments H78 and M46. The DON is required to complete all necessary remedial actions before the fee title to the former MCAS El Toro is transferred from federal ownership. Even after the title is transferred, the federal government is required to conduct further remediation if additional contamination caused by DON actions is discovered or if a remedy fails to perform adequately. Federal law also provides that DON may be required to indemnify the new owners or certain other parties for liabilities arising from claims for personal injury or property damage resulting from the release or threatened release of any hazardous substances, pollutants or contaminants, or petroleum or petroleum derivatives attributable to DON activities on military installations. Refer to the following letters that are attached in the Appendix to this Response to Comments document: H.T. Johnson, Assistant Secretary of the Navy, Installations and Environment, Letter to the Editor, Los Angeles Times, 5 August 2002; and the letter to the City of Irvine from the DON dated 25 April 2003. Also see the "DOD Policy on Responsibility for Additional Environmental Cleanup after Transfer of Real Property" electronically at: [http://www.dtic.mil/envirodod/Policies/BRAC/brac_flu.htm].

Response to Comment M49

Refer to Response to Comment M46. The comment acknowledges that federal law requires the DON to remediate any contamination attributable to their actions and indemnify the community from its effects; there is no basis to speculate that the DON will not comply with the law. While the purpose of an EIR is to evaluate environmental and not economic impacts, no economic consequences would result due to the DON's indemnification.

Response to Comment M50

Refer to Responses to Comments H65, M26, M35, M43, and M46.

Response to Comment M51

Refer to Responses to Comments H65, M35, M38, M40, M42, M43, and M46.

Response to Comment M52

Refer to Responses to Comments H65, M26, M35, M43, M44, and M46. The DON's initial 1995 EBS and April 2003 Draft Final EBS outline specific areas of soil contamination that will require remediation prior to ownership transfer. The DON has stated that some land-use controls (i.e., easements, covenants, institutional controls, ordinances, etc.) will be required in order to restrict public access on approximately seven Installation Restoration Plan (IRP) sites. The DON will employ limited land use controls at IRP Sites 2, 3, 5, 16, 17, 18, 24; the use of such controls has yet to be determined for IRP Sites 1, 8, 11, and 12. This action has been deemed necessary until the IRP Sites in question can be remediated to the above mentioned acceptable exposure levels.

Response to Comment M53

Refer to Responses to Comments M54 through M58.

Response to Comment M54

The study included explicit phase and analysis for 2007 conditions (short-term), 2025 (long-term), and post-2025 (General Plan buildout) conditions. This is consistent with

requirements of the City of Irvine Traffic Impact Analysis guidelines. The 2007 analysis was included specifically to identify necessary phasing of short-term and long-term improvements. The City of Irvine has also developed an implementing mechanism in the form of the North Irvine Transportation improvement Mitigation (NITM) program. Ongoing monitoring of study area conditions, as a feature of the NITM program, is in the form of an interim and 5-year review.

Response to Comment M55

The EIR, in conjunction with NITM, provides significant detail regarding the timing of construction of necessary roadways, and links development to the completion of the roadways. The information regarding the timing of construction of facilities presented in the referenced tables was obtained directly from the agency responsible for each improvement or the environmental document that required associated with each improvement. Construction of those improvements in the subject tables that are related to future development is tied to the development as required mitigation measures, and/or conditions of approval, that must be constructed in conjunction with the specified development. The tables referred to in the comment represent the best knowledge available regarding the timing of future development and anticipated roadway improvements.

Response to Comment M56

Refer to Responses to Comments M54 and M55. The EIR and NITM provide for comprehensive phasing for all necessary traffic improvement. For non-NITM improvements, Mitigation Measure Trans 4 specifically requires their construction by the developers of the Great Park, with construction phased in relation to Great Park development. The non-NITM improvements are designed to mitigate the specific impacts for which these improvements are required in the EIR. With respect to NITM improvements, the NITM program allocates funding responsibility for all improvements on a proportioned basis between Great Park and other properties generating traffic that necessitate the improvement. NITM also sets forth a phasing program for construction.

Response to Comment M57

Refer to Response to Comment M56.

Response to Comment M58

Refer to Response to Comment M56.

Response to Comment M59

The statement that no peak hour impacts were identified is incorrect. The segment of University Drive between the I-405 southbound ramps and Michelson Drive was identified for 2025 conditions as a roadway segment where an additional southbound through lane was required. The results of the daily and peak roadway segment analysis, in conjunction with the peak hour intersection analysis, did in fact accurately and adequately identify potential project impacts and required mitigation measures (mid-block or through travel lanes).

The key difference between the roadway segment daily and peak hour analysis is that the daily capacities assume a variety of impediments to capacity, including the presence of cross-street intersections that consume a substantial proportion of available capacity. The peak hour capacities are focused on identifying the potential need for mid-block travel lanes based on unimpeded mid-block conditions.

The basic assumptions of the daily segment analysis and the peak hour segment analysis are different, corresponding to the different purposes of the two types of analysis. The daily segment analysis is intended to be utilized as a very general measure of roadway performance and includes the potential capacity reductions due to mid-block intersections. The peak hour segment analysis is intended to evaluate the specific need for mid-block travel lanes in the absence of cross-street interference.

Response to Comment M60

Refer to Response to Comment M59.

Response to Comment M61

The policy addressed in the comment is an already existing rather than proposed General Plan policy. The proposed project merely makes PA 30 subject to Policy B-1 of the General Plan Circulation Element. The application of the existing policy to PA 30 has been specifically analyzed in the EIR and the analysis concludes that the application of this policy allows for LOS E at two intersections (EIR Page 5.2-58). It is the prerogative of the City of Irvine to establish appropriate performance standards within its local jurisdiction.

Response to Comment M62

Refer to Response to Comment M61. The issue of thresholds of significance (impact) is separate from the concept of the local jurisdiction's right to establish the appropriate performance standard for the community.

Response to Comment M63

The comment deals with additional analysis provided by the EIR to examine future conditions if the City approves the General Plan Amendment and Zone Change for PA 40 (the "probably future project"). This project was previously approved but subjected to a litigation challenge. The PA 40 impacts and PA 40's responsibility to fund its proportionate share of traffic mitigation are set forth in the NITM program. Application of the NITM program will generate sufficient fees to timely fund construction of all traffic improvements necessary for the development of the Great Park, PA 40, and the remainder of undeveloped north Irvine.

Response to Comment M64

The Great Park Traffic Impact Analysis does take into account all anticipated growth in traffic for surrounding communities and the entire region, based on adopted growth forecasts for the entire County of Orange and surrounding region. The area model (ITAM) includes existing development and regional growth projections for Orange County and the relevant portions of Los Angeles County, Riverside County, San Bernardino County, and Ventura County, as well as projected increases in interactions with the surrounding areas via the regional roadway system.

Response to Comment M65

The Traffic Impact Analysis executive summary is simply a summary of the proposed mitigation program; they are discussed in greater detail on page 5.2-71 of the EIR. That analysis concludes that if such programs were not implemented by the responsible regional agencies the cumulative impacts would be significant and unavoidable. Also refer to Responses to Comments F36 and S6.

Response to Comment M66

The sources referenced in the comment represent specific funding sources that are responsible for implementing the roadway improvements identified in the Traffic Impact Analysis developed for the EIR. The funding sources generally fall into two categories; the first funding source category is development projects that have been approved. The implementation mechanism/assurance of funding is the specific condition of approval requiring that the improvement be constructed in conjunction with the approved development project. The second funding source category is local agencies that have included specific improvements within their capital improvement program. Projects are only included in the local agency capital improvement program when they are associated with a specific funding source identified by the local agency.

Response to Comment M67

Land use based trip rates and socioeconomic data (SED) based trip rates simply reflect two different but commonly accepted approaches to evaluating traffic. There are underlying differences in the ways that land use based models and SED based models are used to forecast future traffic. Traffic models validated using land use data or SED have both been shown to match (validate to) existing traffic volumes quite well. Traffic forecasts for the Great Park Traffic Impact Analysis that match the regional SED driven forecasts are now a mandatory modeling consistency requirements based on stated and federal legislation. The ITAM model incorporates the conversion from one approach to the other and has been validated to existing traffic volumes.

Response to Comment M68

A key difference between land use based and SED based models is how they treat “linked” trips. A land use based model treats linked trips as two shorter individual trips. A SED based model treats the same linked trip as a longer single trip. The land use model has higher trip generation because it assumes that longer trips have stops and computes one longer trip as multiple shorter trips. As a result, the 6,256 trips under the land use model is a different way of expressing the same number of trips under the SED because they are both based on the same vehicle miles traveled per day.

Response to Comment M69

Refer Responses to Comments M54 to M58.

Response to Comment M70

Both direct and indirect potentially significant noise impacts are discussed in detail in the EIR. Section 5.4.3 *Noise Environment Impacts* discusses noise impacts relating to project construction activities, post-construction, traffic noise, project land use noise, and off-project area noise. Refer to the EIR, pages 5.3-22 through 5.3-34, as well as the Environmental Noise Assessment technical report (Appendix H of the EIR), for presentation of noise data and a comprehensive discussion of potential noise impacts. Traffic noise impacts were analyzed and determined based on current, accepted FHWA and Caltrans modeling methods, as well as compatibility guidelines established by the local county and city jurisdictions. Beyond this program level analysis, more detailed traffic noise assessments may be conducted as specific projects are developed.

Response to Comment M71

Noise impacts related to traffic generated by the project both on- and off-site are discussed in Section 5.4.3 *Noise Environmental Impacts* from traffic volume data presented in Section 5.2.3 *Traffic/Circulation Environmental Impacts*. The potential traffic noise impacts on noise-

sensitive receptors due to the Great Park Plan were evaluated in accordance with methodologies established by the FHWA and CALTRANS, as well as compatibility guidelines established by the local county and city jurisdictions. Beyond this program level analysis, more detailed traffic noise assessments may be conducted as specific projects are developed. Mitigation Measure Trans 1 does not indirectly confirm the conclusion surmised in Comment M71; part of the purpose of requiring a project applicant to apply for annexation to the Irvine Spectrum TMA is to address traffic, air and noise impacts. Mitigation Measure Trans 1 further states that should this annexation application not be approved, a TMA shall be developed and implemented for the project. Additionally, the EIR concludes that traffic impacts resulting from the proposed project would be reduced to a less than significant level with implementation of the identified Mitigation Measures.

Response to Comment M72

The comment is in reference to residential development located in the transit-oriented development area which is designed to be in close proximity to the Urban Transportation Center and railway. Section 5.4.1 *Noise Environmental Setting* states:

“The Irvine Transportation Center, a major multi-modal transit center linking bus, commuter rail, and Amtrak rail services, is located along the southern edge of the project area, adjacent to the Southern California Regional Rail Authority railroad.”

California Building Standards establish uniform minimum noise insulation performance standards to protect persons from the effects of excessive noise in multi-family dwellings. Furthermore, as stated in Section 5.4 *Noise California Building Standards*:

“Interior noise levels attributable to exterior noise source must not exceed 45dBA in an habitable room...When the exterior noise levels cause interior noise levels to exceed 45dBA, the building must be designed to prevent the transmission of exterior noise....The California Building Standards will apply to...habitable dwellings other than detached single-family homes within the project site.”

Response to Comment M73

Refer to Responses to Comments M70 through M72.

Response to Comment M74

Comment 74 is responded to in Responses to Comments M75 through M79.

Response to Comment M75

Refer to Figure 5.7-1 for drainage areas and topography information. Per the EIR, a Flood Control Master Plan has been adopted by the City of Irvine, the City of Tustin, the Irvine Company, and the Orange County Environmental Management Agency and is currently being implemented in phases by these agencies. The phasing of flood control system improvements in PAs 51 and 30 will be coordinated with street-phasing schedule so that stormdrains are installed prior to or in concert with road construction. The City's DAMP requires that BMPs be implemented in order to reduce increased runoff to stormdrains. The EIR concludes that the potential for flooding to occur both on- and off-site as a result of future development of the project area is considered a significant impact. To this end, Mitigation Measure H/WQ4 is provided to reduce that potential impact to one of less than significant.

Response to Comment M76

As described in the EIR, the project site is located within the San Diego Creek watershed. No formal delineation of the 100-year flood plain has been prepared by FEMA for the project site as it has been under federal ownership. However, as described in the EIR, the "Flood Control Master Plan for San Diego Creek" (John M. Tettemer and Associates, 1989) identified a range of flood control improvements for the San Diego Creek watershed that would control flood peaks based on a 100-year flood (EIR page 5.7-4). The proposed project will provide for the construction of drainage improvements that are consistent with the Flood Control Master Plan. While the EIR states that some flood control deficiencies remain in the existing condition, any potential flood control deficiencies would be corrected through the implementation of the drainage improvements identified on Figure 5.7-2 Proposed Drainage System of the EIR and through implementation of Mitigation Measures H/WQ 3 and H/WQ 4.

As described in the EIR, developers with property located in the newly delineated 100-year floodplain will be required to construct such improvements as necessary to remove the property from the 100-year floodplain and to prepare a Letter of Map Revision (LOMR) request to have the FIRMs revised to remove the development areas from the 100-year floodplain upon completion of the flood control facilities.

Response to Comment M77

Refer to Response to Comment M76.

Response to Comment M78

This comment incorrectly recites text from EIR page 5.7-6. The EIR does analyze the potential impacts resulting from stormwater volume, identifies appropriate mitigation measures, and addresses how well they will reduce the impacts to a level less than significant (see EIR pages 5.7-13 through 5.7-26).

As described in the EIR, as part of site planning for the reuse of the former MCAS El Toro, a hydrology study for the 100-year storm event was prepared. Design discharges were developed, and Table 5.7-3 of the EIR provides a quantified summary of the peak flows. (EIR, page 5.7-15, 16) A drainage concept plan has been prepared for the project which addresses stormwater flows on the project site. The locations and sizes of drainage pipes and the proposed drainage channels were determined based upon the level of anticipated runoff from various land uses so as to maintain and improve the existing level of flood control service within the project area.

Response to Comment M79

The requirement for Section 404 Permit and related wetlands and dredge/fill permits are a component of the project; the EIR identifies future potential permit requirements for project implementation, including the potential need to obtain a Section 404 Permit from the US Army Corps of Engineers (EIR, p. 3-30). Issues related to dredge and fill of regulated waters is also addressed on 5.9-17 with specific mitigation cited on page 5.9-25. Permits will be obtained as necessary as future projects are proposed within the project area. There is only a small amount of wetland habitat located on the project site. The provision of large "daylighted" earthen drainage corridors in addition to the proposed wildlife corridor will provide ample opportunity for the development of viable wetland habitats within the project area.

Response to Comment M80

Refer to Response to Comment M22. The development of the 14,000-acres previously contained in the AICUZ is not affected by this project.

Response to Comment M81

Refer to Response to Comment M22.

Response to Comment M82

The proposed project will accommodate regional drainage control facilities. The project does not rely upon flood control systems already in place to mitigate potential impacts; rather, the EIR analyzes water quality impacts and the project proposes a comprehensive approach to addressing drainage control through the provision of drainage and flood control facilities on-site that will accommodate both project-specific runoff volumes as well as provide for regional flood control facilities. Refer to EIR pages 5.7-13 through 5.7-26.

Response to Comment M83

This comment introduces Comments M17 and M87 through M94.

Response to Comment M84

Refer to Response to Comment M17.

Response to Comment M85

Refer to Response to Comment M17. The existing analysis in the EIR evaluates both demolition and construction impacts.

Response to Comment M86

Refer to Responses to Comments M17 and M85.

Response to Comment M87

To provide a reasonable means to estimate air construction emissions in the EIR, it was assumed that either plan (Base and Overlay Plan) is divided into two phases based on the reasonable utility and extent of development being considered at this stage of the project. The first phase is assumed to last ten years (2007-2016) and the second phase is assumed to last the remaining nine years (2017-2025). For each phase, construction activity was assumed to last for a period of three-years, but spread out over a four-year schedule for emission estimation purposes. At this stage of the project, the aforementioned phased methodology of estimating air construction emissions is a reasonable approach considering the level of broad environmental impact analysis. The air quality impact remains the same whether demolition and construction occurs over two, three-year time periods or a single twenty-year time period; the quantity of the construction-related air emissions does not change whether the construction occurs over a shorter or longer timeframe. By analyzing over a shorter time period the EIR evaluates the more intense development scenario for these emissions.

Response to Comment M88

Refer to Response to Comment M87.

Response to Comment M89

The comment misapprehends the restrictions set forth in the proposed General Plan amendment; the numerical limits for allowable uses within the Great Park are the maximum allowed intensity level. Refer to Responses to Comments M9 and M87. The air quality analysis presented in the EIR is based on the buildout limits of the Overlay Plan and the Base Plan.

Response to Comment M90

Refer to Response to Comment M89.

Response to Comment M91

Section 5.3.5 of the EIR outlines several proposed construction and operational air quality impact mitigation measures that are recommended by the South Coast Air Quality Management District (SCAQMD) that may be implemented during the various phases of the project. Mitigation Measures AQ1 through AQ4 are outlined on pages 5.3-53 through 5.3-55 and will be implemented during various phases of the project.

Response to Comment M92

The comment is in error; see Mitigation Measures AQ1 and AQ2 on pages 5.3-53 and 5.3-54 in the EIR. Refer to Response to Comment M91.

Response to Comment M93

Refer to Responses to Comments H67, H77, and M87.

Response to Comment M94

Refer to Responses to Comments H67, H77, and M19.

Response to Comment N1

Comment noted. Traffic studies prepared in conjunction with specific development applications within the project site will be forwarded to the TCA for review as appropriate.

Response to Comment N2

Comment noted.

Response to Comment N3

Comment noted.

Response to Comment N4

Comment noted.

Response to Comment O1

Comment noted. This letter concludes that the EIR includes a discussion of the proposed project's consistency with SCAG policies and applicable regional plans, which were outlined in the SCAG's November 6, 2002 letter on the Notice of Preparation for the EIR.

Response to Comment P1

The City of Irvine proposes the construction of natural drainage corridors as a major project feature in order to achieve drainage control as well as water quality, biological, and aesthetic benefits associated with wetland/riparian restoration. To that extent the City anticipates restoration efforts will involve, among other disciplines, urban stream restoration specialists. The City envisions that these areas will be planted with native species to the extent practicable.

Response to Comment P2

The City of Irvine recognizes that site-specific best management practices (BMPs) implemented for each specific construction project will need to comply with RWQCB NPDES requirements. As required by Mitigation Measure H/WQ 2, prior to issuance of a grading permit for site specific development, evidence shall be provided that demonstrates that all stormwater runoff and dewatering discharges from the project area shall be managed to the extent practicable or treated as appropriate to comply with water quality requirements identified in the Santa Ana Regional Water Quality Control Board Basin Plan, including Total Maximum Daily Load (TMDL) Implementation Plan adopted for this watershed.

Response to Comment P3

The City of Irvine intends to reconstruct the currently underground Bee Canyon Channel and Agua Chinon Channel into natural drainage corridors. However, it is not likely that any new flood plain delineations prepared for the project area will reflect historic zones of flooding, as they will need to reflect the existing and proposed hydrological condition within the project area, not historic conditions.

Response to Comment P4

As depicted in Figure 5.7-2 of the EIR, four potential Irvine Ranch Water District (IRWD) NTS Water Quality Basins are proposed within the project area. One basin is proposed at the northern portion of the project site (PAZ 1) within the Marshburn Basin, while the remaining three are proposed at the “downstream” end of the two drainage corridors, and the wildlife corridor. The placement of the NTS facilities allow for regional water quality to be addressed by the IRWD in its environmental assessment of their NTS project. However, the City of Irvine will also provide, as necessary to meet NPDES requirements, structural and non-structural BMPs on a site-specific basis to ensure that polluted runoff is minimized.

Response to Comment P5

Development is not proposed within the Serrano Creek; however, some drainage improvements are proposed within this area as part of the overall drainage concept plan. While implementation of the proposed project will result in some isolated wetland impacts, the overall quality and value of wetland habitat is anticipated to be significantly enhanced by the proposed natural drainage corridors.

Response to Comment P6

It is anticipated that the “Q” will change as a result of project development. For example, currently undergrounded drainage systems that are proposed to be daylighted and restored as part of the project would experience a change in Q as these areas will become vegetated, with a meandering alignment and varying topographic conditions. Also, these drainages will be designed to accommodate additional runoff created by new development within the project area. However, all drainage facilities are proposed so as to avoid impacts to downstream and/or off-site facilities.

Response to Comment P7

Comment noted.

Response to Comment P8

Comment noted.

Response to Comment Q1

For the Final EIR, the IRWD letter dated 4 April 2003 will be added to Appendix C of the EIR along with the supplemental material provided as part of this document. This supplement confirms the validity and does not materially affect the conclusions reached in the WSA prepared for the subject project.

Response to Comment R1

A traffic study area for the purpose of assessing the project's potential traffic impacts has been defined, and is illustrated in Figure 5.2-1 of the EIR. The limits of the study area are defined by the amount of trips resulting from the proposed project and the potential to impact circulation systems. As shown in Figure 5.2-1, the trip distribution of the proposed project would not extend into areas of Newport Beach and Huntington Beach, and a significant amount of traffic is not expected to utilize Pacific Coast Highway.

Response to Comment R2

Refer to Response to Comment R1.

Response to Comment R3

Estimating the number of airline passengers generated by the proposed project and determining which airports these passengers would utilize is speculative. Additionally, this information does not represent a potential environmental impact.

Response to Comment R4

The amount of urban runoff generated by the project that will be recycled or used for irrigation has not been quantified. Normally, urban runoff is not recycled and directly utilized for irrigation purposes. Reclaimed water, which is sewage that has been substantially treated, is the primary water source utilized for irrigation purposes in the City. However, the proposed project will provide unique project features that will offer opportunity for recharge of groundwater from runoff in the form of the construction of two major natural drainage corridors – the Bee Canyon Channel and Agua Chinon Channel. Both of these channels currently traverse the project site underground and do not contribute to recharge in the area. Reclaimed water will be provided to the project area to serve a majority of the landscaping needs on-site.

Response to Comment R5

Analysis of project impacts to public services as well as public health and safety is included in the EIR. There is no evidence to provide a link between homelessness, infectious disease, and lawlessness.

Response to Comment R6

There is no provision in the Orange County Great Park plan that dictates where residents should live and work. The Transit Oriented Development (TOD) land use designation proposed within the project area is intended to encourage the use of alternative modes of transportation by locating housing units in proximity to major public transit systems (e.g., the Metrolink station), employment centers, and shopping. Under the TOD designation, more refined TOD principles will be employed in this area as specific developments are proposed, such as the provision of pedestrian connections, to encourage the use of alternative modes of transportation.

Response to Comment R7

The Orange County Great Park plan does not dictate where employees working within the project site shall live. It is anticipated that persons residing in other communities will commute to the project site. This issue has been factored into the trip generation assumptions of the traffic analysis of the EIR.

Response to Comment R8

It is anticipated that the Orange County Great Park will be visited and used by a variety of people, who both live and work in the area, as well as tourists from other areas. The Orange County Great Park is envisioned to provide a variety of uses that will attract a large cross-section of people.

Response to Comment R9

Public transportation will be available to the project site. No determination has been made as to whether or not there will be a charge for parking in any portion of the project site, and if so, what that amount would be.

Response to Comment R10

The City has not determined the number of picnic tables that will be provided at the Orange County Great Park. This will be determined as site-specific park and recreational improvements are implemented within the various portions of the project site.

Response to Comment R11

No determination has been made whether the Orange County Great Park will provide a petting zoo feature, although this type of use is considered compatible with the type of uses envisioned for the park.

Response to Comment R12

No determination has been made whether the Orange County Great Park will provide a carousel, although this type of use is considered compatible with the type of uses envisioned for the park.

Response to Comment R13

The potential air quality impacts of the proposed are analyzed in Section 5.3 *Air Quality*. Table 5.3-12 depicts the Mitigated Construction Emissions for the development of the project area. These emission estimates conservatively account for demolition and grading/excavation activities as major sources of construction emissions.

Response to Comment R14

Construction noise, including the demolition of runways, is evaluated in Section 5.4 *Noise*. Table 5.4-8 depicts Typical Noise Levels for Construction Equipment. As shown, the noise level associated with the operation of unquieted jack hammers ranges between 75 and 85 dBA measured at 50 feet.

Response to Comment R15

The runway debris is proposed to be recycled onsite for use in constructing roadways and other supporting infrastructure for the project. As described on page 3-28 of the EIR, the runways can be removed in a sequential manner with stockpiling of materials onsite as required to permit maximum economy of scale in the operation.

Response to Comment R16

The runways will not be available for emergency landings once removal activities have been initiated.

Response to Comment R17

The demolition activities and runway removal will be phased with development onsite. Most of the supporting infrastructure will be constructed in the early phases of the

development of the project site, which is expected in the first 3 to 5 years of project site development.

Response to Comment R18

Specific activities of any federal agency, including the Federal Aviation Administration (FAA) and Federal Bureau of Investigation (FBI) are subject to federal environmental regulations, including review under the National Environmental Policy Act (NEPA). Potential land use compatibility impacts would need to be evaluated based on the specific activity proposed by the federal agency. There is no information that indicates the FAA will use one-fourth of the former air station for aviation purposes, as such use is inconsistent with the Record of Decision adopted by the DON.

Response to Comment R19

Refer to Response to Comment R18.

Response to Comment S1

The comment states that the assumptions used in the analysis are theoretically within reason. The ITAM tool used to develop the future forecasts is consistent with the OCTAM travel demand forecasting tool, which is the regionally (County of Orange) adopted tool for developing future traffic forecasts on the regional roadway system, including the freeways and transportation corridors. Both ITAM and OCTAM have been validated against existing conditions including the freeways and transportation corridors.

Response to Comment S2

The planning level capacities used in the analysis (2,000 vehicles per hour per lane) are reduced to below their operational level capacities as observed in southern California (2,300 vehicles per hour per lane). It is reasonable to assume that including the additional capacity provided by an additional (truck climbing lane) offsets the loss of capacity that is already reflected in the planning level capacities used in this analysis. Regardless of capacity, the project contributes less than 0.03 to the volume capacity ration on the subject segments and accordingly does not exceed the CMP impact threshold for further analysis.

Response to Comment S3

Caltrans staff was contacted regarding ramp metering practices within the study area. No quantitative ramp metering plan was available for inclusion in the analysis and Caltrans could not provide a consistent schedule of ramp meter operations so it is impossible to determine where ramp metering will occur or when any given ramp meter will be operational. Therefore, it is appropriate to utilize the existing unmetered condition as the basis for projecting future traffic conditions and potential deficiencies. Storage of vehicles for a metered condition would of necessity utilize the arterial roadway system approaching the ramps to provide storage.

Response to Comment S4

The comment does not refer to any specific location(s) such that no site-specific response is possible. The Traffic Impact Analysis indicates that future traffic volumes are generally expected to increase over time. Isolated cases where improved future levels of service are projected to occur are most likely related to planned/funded improvements at the location in question.

Response to Comment S5

Proposed mitigation measures are based on environmental factors; the City of Irvine has no control over agreements entered into between Caltrans and other governmental agencies. The non-compete clause, for example, could result in one or more of the City of Irvine's mitigation measures not being implemented, but this is outside of the City of Irvine's control. To the extent that the non-compete clause interferes with implementation of mitigation measures proposed by the EIR, cumulative impacts would not be mitigated and thus remain significant and unavoidable. The following text has been added to Mitigation Measure Trans 7 on page 5.2-70 of the EIR:

"The City shall perform toll and revenue impact studies for any mitigation measure (improvement) that may be impacted by the non-compete clause or any similar agreement restricting a public agency's authority to construct improvement."

Response to Comment S6

The regional funding programs referenced in the EIR are not used as project mitigation. Rather, these programs are recognized as the regional approach to addressing cumulative impacts. The EIR mitigation measures address all project impacts that were identified in the Traffic Impact Analysis, subject to constraints such as those identified in Response to Comment S5 (TCA non-compete agreements).

Response to Comment S7

Comment noted.

Response to Comment T1

The EIR recognizes that the proposed Great Park project area currently and historically has had some wildlife movement; however, the project area does not currently serve as a significant wildlife movement corridor between the habitat preserve and the coastal habitat preserves. Additionally, by definition, a corridor is a linear habitat whose primary wildlife function is to connect significant habitat areas. Therefore, by definition, no wildlife corridor currently exists within the project area.

The Wildlife Corridor planning efforts are on-going, and the Orange County Great Park Plan land use concepts will accommodate this on-going planning effort to ensure that the proposed route of the new wildlife corridor is a viable one. Previously, as a part of the wildlife corridor feasibility study, preliminary "fatal-flaw" analysis was conducted on 15 August 1999, which has been examined on several subsequent occasions by wildlife biologists. The biologists examined the proposed route and its feasibility as a wildlife movement corridor. Additionally, a focused survey of the biological conditions along the proposed corridor was conducted on 7 September 1999. The biologists surveyed the extent of the route including the adjacent connective habitat at the start and end of the proposed corridor. Serrano Creek and Borrego Canyon Wash were also surveyed for use/potential use as wildlife corridors. Subsequent to these initial surveys, the proposed wildlife corridor has been informally surveyed by wildlife biologists and members of conservation groups.

As depicted in the Section 3.0 *Project Description* Figure 3-7 of this EIR, the riding and hiking trail is proposed to parallel Irvine Boulevard until it reaches the Habitat Preserve. At this point, the riding and hiking trail will extend north toward SR 241 and the Agua Chino Reservoir. The biking and hiking trail does not enter the Wildlife Corridor.

As described in Figure 5.9-2, the proposed development within Planning Area 18 includes a golf course with a clubhouse and some residential uses. To ensure the compatibility with the Wildlife Corridor, the clubhouse and residential units will be subject to development regulations that will be created as part of a wildlife corridor master plan.

The City of Irvine will continue to work with State and federal agencies to implement the revegetation/restoration plan necessary to create a viable wildlife corridor within the project area.

Response to Comment U1

Considerations for remedial actions objectives are provided in 40 CFR 300.430(e)(2)(i) that states, "remediation goals shall establish acceptable exposure levels that are protective of human health and the environment and shall be developed by considering the following...for known or suspected carcinogens, acceptable exposure levels are generally concentration levels that represent an excess upper bound lifetime cancer risk to an individual of between 10^{-4} and 10^{-6} using information on the relationship between dose and response." The DON will be responsible for remediation of the former MCAS El Toro to these exposure levels regardless of the land use designation or the population that resides there. The DON has publicly stated that it will indemnify new land owners of former air station property in order to mitigate potential soil contamination that is attributable to historic DON operations.

Response to Comment U2

The objectives of the proposed project are defined in Section 3.0 *Project Description* of the EIR. As described, Measure W amended the County of Orange General Plan to remove the designation of the project site as a commercial airport. Therefore, implementation of a commercial airport would not be consistent with Measure W.

Response to Comment V1

Comment noted. Refer to Responses to Comments V2 through V20 for a detailed response to each of the comments raised by the commentor.

Response to Comment V2

Page 5.2-41 of the EIR, under the heading Master Plan of Arterial Highways Amendment, discusses the issues of consistency with the MPAH and the proposed amendments. The EIR also recognizes that typically, a cooperative study would occur prior to the City amending its General Plan. However, since OCTA cannot recognize the City of Irvine's jurisdiction on the former MCAS El Toro until the annexation is complete, the EIR states that the City of Irvine will enter into a cooperative agreement as soon as possible following the annexation of the property to the City of Irvine.

Mitigation Measure Tran 8 addresses this issue:

"Following adoption of a land use plan and circulation plan for the Great Park property and before the issuance of any building permits within the base property, the City of Irvine shall enter into a cooperative study with OCTA and other affected jurisdiction to amend the Orange County Master Plan of Arterial Highways. Marine Way, Trabuco Road from the SR-133 tollway to College Road, and Y Street should be included on the MPAH."

Response to Comment V3

The post year 2025 roadway network is depicted in Figure 5.2-23. The assumed roadway network does not include the extension of Culver Drive north of Portola Parkway.

Response to Comment V4

The discrepancy is a typographical error on Table 5.2-11 (Table 5-15 of the Traffic Impact Analysis). These tables have been amended to reflect the correct figure of 9,732 trips. The figure of 9,732 trips was correctly utilized in both the air quality analysis and the actual traffic impact analysis.

Response to Comment V5

Refer to Response to Comment S6. Although the City of Irvine intends that the project will contribute its fair share towards mitigation/improvements on impacted freeway segment, the City of Irvine does not control the implementation process. Therefore a statement of overriding considerations is necessary if certain mitigation measures are not implemented by the responsible agency (Caltrans). Caltrans comments on the EIR, for instance, specifically identified their non-compete agreement with the Transportation Corridor Agency(ies) (TCA) as a potential impediment. The regional funding programs referenced in the EIR are not used as project mitigation. Rather, these programs are recognized as the regional approach to address cumulative impacts. The impact of OCTA providing extra-peak and off-peak train service was not evaluated in the Traffic Impact Analysis, thereby making the analysis more conservative with regard to future traffic impacts.

Response to Comment V6

Refer to Responses to Comments H2 and V4. The City of Irvine has made every effort to accurately reflect anticipated project land uses and trip intensities in preparing the Great Park plan. However, in the event that the OCTA facility generates more traffic than was analyzed in the EIR, additional and separate environment analysis may be required for the OCTA facility. Any development proposed by OCTA, if it becomes a landowner in the

future, which is not consistent with the proposed plan and EIR will require additional environmental evaluation.

Response to Comment V7

The explanatory variable of employment is intended to capture both actual employee trips and ancillary traffic, such as buses entering and leaving the facility, maintenance vehicles etc. Regarding any traffic not anticipated in the Great Park project description, refer to the Response to Comment V6.

Response to Comment V8

The City of Irvine intends to coordinate closely with OCTA regarding the realignment of Marine Way and any impact to the existing OCTA Bus Operations and Maintenance facility. Meetings have already taken place with regard to the realignment issue.

Response to Comment V9

The City of Irvine standard street design manual specifies transit amenities such as concrete bus pads, bus turnouts, layover areas, benches, and other amenities. All streets in the Great Park will be designed in compliance with the City of Irvine standard street design manual. The specifics of the transit system will be determined prior to the implementation of the project. As stated in Mitigation Measure Tran 7:

"Prior to issuance of any building permits on the Great Park property, the City of Irvine shall coordinate with the Orange County Transportation Authority to restructure transit service plans to provide effective service to the project area."

Mitigation Measure Tran 2 states:

"Prior to the first building permit, the City shall prepare a transit system/infrastructure fee program to fund improvements identified as mitigation measures for the project area."

The implementation of these two Mitigation Measures will provide the necessary detailed transit service and the associated funding which would subsequently be used for detailed identification of transit amenities.

Response to Comment V10

Comment noted. If development of the project requires temporary use of OCTA's right-of-way, appropriate agreements will be entered into prior to entry.

Response to Comment V11

During implementation phases of the proposed project, the City of Irvine will evaluate the demand for additional park and ride facilities to serve the project area. Additional parking area at the Irvine Transportation Center is included in the Overlay Plan.

Response to Comment V12

The various public uses and educational facilities may create the need for an internal shuttle service. This will be addressed during the implementation phases of the project as more detail on the operational aspects of the various land uses are known and the ability to finance an internal shuttle service is evaluated.

Response to Comment V13

The comment appears to refer to the extension of Marine Way as an at-grade crossing. Marine Way is intended to be a grade-separated over-crossing of the SCRRRA rail lines.

Response to Comment V14

The traffic analysis of the EIR has addressed the Level of Service of the entire network serving the Great Park Plan, including all the streets mentioned in the comment.

Response to Comment V15

Refer to Responses to Comments C1 and V13.

Response to Comment V16

Use of the term “major event” in the comment is unclear. The operators of facilities located in the referenced location would be required to submit traffic and parking management plans as part of their master plans for the City of Irvine’s approval. This EIR addresses the impacts and identifies mitigation measures for the Great Park Plan and zoning designations for the proposed project. Operational issues will be part of the future permit processing of those facilities.

Response to Comment V17

Comment noted.

Response to Comment V18

The City of Irvine General Plan Circulation Element has established policies to connect the City’s trails to the regional trail network. The Great Park Plan will provide opportunities for the expansion of the trail system. As stated in the EIR, the City will continue to encourage such enhancement throughout the planning and implementation stages of the project. The Class II bike trail will remain along Irvine Boulevard and link to the Class I bike trails in the drainage corridors that traverse the Great Park.

Response to Comment V19

Refer to Responses to Comments C2 and H29. The City of Irvine is adding the County of Orange’s proposed bike trail to its Trail Network. Were funding to become available through the County, or were the City to initiate the specific design of the Class I bike trail mentioned in the comment, coordination with OCTA would be required.

Response to Comment V20

Comment noted.

Response to Comment W1

Measure W was drafted in response to evidence that the citizens of Orange County opposed a commercial airport at El Toro and preferred a non-aviation reuse of the base property with public benefit uses such as open space, recreational, educational and cultural amenities. In order to change the airport designation of the former MCAS El Toro in the County's General Plan, Measure W also had to specifically override Measure A which had established the airport designation for the former MCAS El Toro in the Orange County General Plan. Until the annexation of the former MCAS El Toro is completed, the base property remains within the County jurisdiction. A ballot measure amending the County's General Plan does not apply to the City of Irvine.

Response to Comment W2

The first two websites cited dealt with the estimated number of homes during plan preparation; the third website deals with the actual project in the EIR of which 3,625 is the correct number in the Overlay Plan.

Response to Comment W3

The maximum number of dwelling units allowed under the Overlay Plan is 3,625.

Response to Comment W4

The maximum number of dwelling units (3,625) is established by the proposed General Plan and zoning standards within the project area. Any increase in the total number of residential units would require a General Plan amendment, zone change, and associated environmental review.

Response to Comment W5

Refer to Responses to Comments M3 and M4. It should also be noted that the majority of development intensity is located in PA30, the portion of the project area already in the City of Irvine and not affected by Measure W.

Response to Comment W6

The Measure W land use plan did not show a lake. Some conceptual drawings published by the proponents of Measure W included a lake in the Great Park. This EIR covers the annexation, General Plan Amendment and Zoning of the El Toro property. The detail design of the Great Park and its amenities, including landscaping, water features, hardscape design and materials and other such details will be prepared in the subsequent phases of the implementation of the project, subject to all applicable development and environmental policies and standards.

Response to Comment W7

The advertisements and commercials discussed in this comment were disseminated by the proponents of Measure W and not by the City of Irvine. Those materials depicted a conceptual representation of a future countywide park with an array of natural and manmade amenities. Neither Measure W nor the Orange County Great Park Plan identify or specify any particular species of animals to be included in their project description.

Response to Comment W8

The comment does not address environmental issue relating to the EIR.

Response to Comment W9

The comment does not address environmental issue relating to the EIR.

Response to Comment W10

As required by CEQA, this EIR identifies, analyzes and discloses the potential environmental impacts of the proposed project and identifies feasible mitigation measures to minimize those impacts. CEQA does not require an economic analysis or a financing plan as a component of an EIR. Projections for economic and financial fluctuations are beyond the scope of this EIR.

Response to Comment W11

Refer to Response to Comment W10. The funding and financing strategy for the implementation of the proposed project are discussed in Section 3.0 *Project Description* and in the draft Development Agreement.

Response to Comment W12

The comment represents anecdotal information which is not relevant to the subject matter and scope of this EIR.

Response to Comment W13

The issues related to population, employment, and housing affordability are discussed extensively in Section 5.13 *Population and Housing*. As stated in Section 5.13.4, the jobs to housing imbalance will remain a significant impact and a statement of overriding consideration will have to be developed.

Response to Comment W14

Refer to Response to Comment W13.

Response to Comment W15

The future traffic impacts of the proposed project are based on the Irvine Transportation Analysis Model (ITAM 3.01). This model provides a quantitative and objective framework for projecting and analyzing future traffic conditions in the City of Irvine and roadways immediately adjacent to the City. The ITAM databases have been continually updated as new knowledge about development patterns and the circulation network has become available. The model is derived from the Orange County Transportation Analysis Model (OCTAM), which is a travel demand forecasting tool used by OCTA to evaluate circulation system needs throughout the County. The ITAM structure allows for the analysis of land use and roadway network alternatives using the data provided as input. For more information regarding land use assumptions and other parameters used in the traffic model, refer to ITAM 3.01 Technical Documentation and ITAM 3.01 Primary Study Area Database Expansion Technical Supplement.

Response to Comment W16

Refer to Responses to Comments H71, H77, and M18. The air quality impact analysis is contained in Section 5.3 of the EIR.

Response to Comment W17

Refer to Responses to Comments H71, H77, and M20.

Response to Comment W18

Per page 5.4-24 of the EIR:

“The main noise producing activities are anticipated to occur primarily during the early phases of construction. Portions of the infrastructure construction activities

and runway demolition may occur simultaneously. The sound levels associated with this worst case scenario were evaluated at the nearest off-project area residences. The combined sound level was estimated for: 20 pieces of large mobile equipment operating at a distance of 5,000 feet; five concrete breakers operating at a distance of 6,000 feet; and two crusher plants operating at a distance of 10,000 feet. These distances represent the closest possible location of the construction equipment to the nearest off-project area residences. Based on these equipment types and quantities, the combined effect of this equipment would result in a sound level of approximately 56dBA at the nearest off-project area residential locations during the heaviest construction period."

General construction noise impacts, including runway demolition, are discussed in Section 5.4.3 of the EIR based on the program level analysis. As specific projects are developed and specific construction activities are planned, more detailed analysis of potential construction noise impacts may be conducted.

Response to Comment W19

Refer to Response to Comment M91. Per Section 5.3.4 *Air Quality Mitigation Measures*, prior to the start of demolition and construction within the project area adjacent sensitive receptors shall be informed of the planned demolition and construction activities. The erection of fences around construction areas, staggered use of equipment near sensitive receptors, diversion of trucks away from sensitive receptors shall be employed. Additional mitigation measures will be used as determined appropriate and necessary when greater detail is known regarding the exact construction phasing methodology and logistics are determined.

Response to Comment W20

Erection of fences such as wind fences or partial temporary barriers and enclosures provide a wind-sheltered region in the vicinity of the disturbed area. The wind-shelter area reduces the mechanical turbulence generated by ambient winds, thus reducing the entrainment and wind erosion of small particulate matter.

Response to Comment W21

Construction would not be allowed to occur until contaminated soils are remediated to acceptable levels; therefore, it is not anticipated that the use of wash off stations for construction trucks will result in the generation of toxic water runoff.

Response to Comment W22

City inspectors, using professional judgment, will determine if the quantity of soil carried over to the streets constitutes substantial material. Street sweeping will be regularly practiced during construction activity to ensure soils are not washed into storm drains.

Response to Comment W23

Soil materials collected as a result of street sweeping will be recycled and disposed of on-site.

Response to Comment W24

Refer to Response to Comment H48. As described on page 5.15-20 of the EIR, demolition activities, including the removal of existing runways and buildings, at PA 51 will generate debris materials that will need to be disposed at local landfills. Additionally, green waste will be produced as a result of on-going park and landscaping maintenance. The City requires

construction and demolition debris recycling for new development projects. This will allow the reuse of building materials and reduce waste volume requiring disposal. Additionally, Mitigation Measure SW2 is proposed that requires 75 percent reduction of solid waste of those materials that cannot be recycled. Mitigation Measure SW2 states:

“For solid waste which is determined to be inappropriate for recycling (as that term is defined by California Public Resources Code Section 40180), the project applicant must submit a written plan to the City and implement such plan to ensure that 75 percent of the material, or the maximum amount feasible as determined by the technical evaluation, is diverted from the landfill through other methods that comply with state statutes and regulations.”

The construction waste is anticipated to consist primarily of green waste and recyclable concrete. There will be very little solid waste sent to landfills; furthermore it is anticipated that this material will be significantly less when the project has been fully implemented.

Response to Comment W25

A substantial portion of the runway materials are proposed to be recycled on-site to the maximum extent feasible. It is anticipated that the remainder will be recycled in development projects located within the region. As a result, the truck hauling from the former MCAS El Toro will displace other truck hauling that would occur with no anticipated net increase in materials hauling.

Response to Comment W26

Refer to Response to Comment W25. Local construction hauling is assumed in the Traffic Impact Analysis. The anticipated quantity of traffic resulting from material hauling, which would only occur for materials not used on-site, is expected to be less than the volume of traffic resulting from the project itself.

Response to Comment W27

Refer to Responses to Comments M17 and M87. The total emission estimates from construction of the proposed project are presented in Tables 5.3-19 and 5.3-20 (page 5.3-25) of the EIR. As compared to the total projected emissions for the SCAB, the mitigated emissions after Base Plan implementation constitutes 0.05 percent (for ROG) to 0.20 percent (for CO) of the total SCAB emissions. The mitigated emissions after implementation of the Overlay Plan would constitute from 0.09 percent (for NOx) to 0.39 percent (for CO) for the total SCAB emissions.

Response to Comment W28

AQMD Rule 1196(d) lists the requirements for new fleet vehicles. A link to the AQMD fleet vehicles rule is: [http://www.aqmd.gov/news1/fleet_rule_home.htm].

These rules do not impose any emission limits but rather require the use of alternative fuel vehicles, dual-fuel vehicles and use of low emission vehicles. AQMD Rule 1620 provides emission credits for clean off-road mobile equipment.

The AQMD is seeking to gradually shift to low emissions and alternative fuel vehicles in order reduce air pollution from motor vehicles pursuant to air quality management plans. Overall program direction for managing and reducing motor vehicle emissions is based on technology needs identified in AQMD's Air Quality Management Plan; state and federal rules and regulations; annual research and development coordination meetings with the

California Air Resources Board; periodic meetings with various technology, clean fuel, and industry working groups, and annual meetings with the Technology Advancement Advisory Group.

Response to Comment W29

Although there is ample opportunity for a substantial amount of recycled runway materials to be utilized on-site, there will be some recycled runway materials that will be sold for construction purposes outside of the project area. The effect on the concrete recycling market cannot be predicted as the quantity and timing of sales is not known. CEQA requires analysis of environmental not economic impacts.

Response to Comment W30

Refer to Response to Comment W29.

Response to Comment W31

Base Plan intersections were included in the EIR Traffic Impact Analysis and considered in the CO air quality impact analysis based on the following criteria (refer to Table 5.3-26 in the EIR). Since localized CO air quality impacts generally reach their peak in the vicinity of traffic congestion, only those intersections and roadways with the highest traffic congestion level of service (LOS) designations were considered in the air quality analysis. The high congestion intersections naturally represent the highest potential for localized air quality impact resulting from the project.

Roadway system performance with respect to traffic and congestion is generally described in terms of a LOS scale that ranges from designations of "A" to "F". Level of Service "A" represents the highest or best LOS, while LOS "F" represents the lowest or worst LOS. During peak hours, LOS A, B, C, and D are generally (at a minimum) considered acceptable, while LOS E and F represent degrees of deteriorating traffic system performance. Intersections with LOS designations of D, E, and F were included in the CO air quality impact analysis, while intersections and road way systems with LOS designations of A, B, and C were not.

Response to Comment W32

Refer to Response to Comment W31.

Response to Comment W33

Section 5.5 *Public Health and Safety* states:

"The Norwalk Pipeline was used as a jet fuel distribution system in support of the military mission at the former MCAS El Toro. The pipeline originates in Norwalk, California, enters the project site near the existing commissary located adjacent to Irvine Boulevard, and runs through the former air station housing to the former storage tank facilities. In May 1999, all the jet fuel was purged from the pipeline from Norwalk to the former air station using a pigging process and replaced with inert gas (nitrogen). The Defense Energy Support Center currently maintains the pipeline."

Response to Comment W34

Section 5.5 *Public Health and Safety* states:

“The County of Orange, in coordination with all other local jurisdictions and emergency response providers in the County, is responsible for the preparation, maintenance, and implementation of emergency response plans...for the County. The Orange County Emergency Plan is the official emergency plan for the County. The plan is a basic reference and training document for emergency preparedness, response, recovery, mitigation, and provides the authority and basis for the development of more detailed departmental and functional standard operating procedures”

Response to Comment W35

New air traffic routes in the vicinity of the former El Toro MCAS due to the lifting of air-space restrictions are not a function of the proposed Great Park Plan but rather the closing of the former air station. It is anticipated that these routes would remain whether or not the Great Park Plan was developed. Noise sampling of existing conditions recorded existing aircraft overflights as part of the existing ambient noise.

Response to Comment W36

The FAA may maintain some existing ancillary facilities within the 4,700-acre base property. The largest presence of the FAA will be in the +/-970-acre habitat area (which will remain in federal ownership) and where the FAA may continue to use some of its communication relay facilities. VORs are used as navigational devices within the National Airspace System (NAS). The VOR purpose is to provide azimuth (direction) and is transmitted in all directions and each signal can be considered a course or route, referred to as a radial. It works much like a road map when you're attempting to get from a departure point to a destination. For example, a hypothetical VOR at El Toro may be used by aircraft traveling from Los Angeles to San Diego, without the aircraft ever flying at such altitudes over the area where the VOR is located to generate additional aircraft noise impacts as a result of the existence of the device. In any event, the discussions about maintaining the existing VOR within the base property are still on-going between the FAA and the DON. However, since the operational closure of El Toro in 1999, that VOR has not been used and currently is not included in the navigational charts used by the FAA. Nor is El Toro's VOR on any approach/departures charts. In addition, historically, the VOR at El Toro was used for aircraft operations for the former MCAS El Toro only. As such, the subject VOR is not used as a navigation aid supporting the current flow of traffic in the Southern California area of operations.

Response to Comment W37

Based on Response to Comment W36, the existing VOR at the former MCAS El Toro is not used as a navigational device within the Southern California Airspace and discussions about its removal or relocation are underway. Radio wave transmissions from other FAA facilities may remain on the former air station. Detailed land use restrictions would accompany any sale that involved lands adjacent to and impacted by FAA radio waves.

Response to Comment W38

Refer to Response to Comment R18. It is likely that there will be use of live ammunition at the FBI training facility.

Response to Comment W39

Refer to Response to Comment R18.

Response to Comment W40

Refer to Response to Comment R18.

Response to Comment W41

The proposed acreage designated for agricultural activities under both the Base Plan and Overlay Plan represents a net decrease in acreage currently available for agricultural activities at the project site. Local water supplies would not be strained by these proposed reductions in agricultural activity; refer to the Irvine Ranch Water District Water Supply Assessment in Appendix C of the EIR.

Response to Comment W42

Refer to Response to Comment W41.

Response to Comment W43

The Irvine Ranch Water District will be the designated provider for domestic, recycled, and wastewater services for the proposed project.

Response to Comment W44

Agricultural producers that hire labors for agricultural activities are required to pay California Minimum Wages.

Response to Comment W45

Refer to Responses to Comments W13 and W14. Assessing the potential impacts to local traffic requires specific information regarding the future commuting options for day laborers; this information is not available and would prove speculative.

Response to Comment W46

The area proposed for agricultural use is currently being utilized for agricultural purposes. Any use of pesticides will need to be in compliance with US Department of Agriculture regulations. The City of Irvine envisions the proposed agricultural areas to become components of the City's Agricultural Legacy Program. To that extent, agricultural farming activities onsite may include organic farming activities, which would also reduce the amount of pesticides and fertilizers utilized in these agricultural areas.

Response to Comment W47

Refer to Response to Comment W46.

Response to Comment W48

Refer to Response to Comment W46.

Response to Comment W49

Refer to Response to Comment W46.

Response to Comment W50

Organic farming is a component of the City of Irvine's proposed agricultural heritage program which may be implemented, in part, in the portions of the project site designated for agricultural use.

Response to Comment W51

The City of Irvine is not aware of any claims by Native Americans as to any ancestral use of any portion of the project site.

Response to Comment W52

No specific development project is proposed; however, there will be opportunity for collaboration and involvement of Native Americans groups, should cultural facilities be constructed that involve Native American heritage.

Response to Comment W53

Comment noted.

Response to Comment W54

The Orange County Great Park will be served by the City of Irvine Police Department at the same level of service as other portions of the City.

Response to Comment X1

Following the passage of Measure W, and the subsequent issuance of a federal Record of Decision (ROD), on 23 April 2002, the Orange County Board of Supervisors acting as the Local Redevelopment Authority (LRA) with a majority vote decided to cease all further planning for El Toro by the County and to defer all further planning for El Toro to the City of Irvine and support the City's annexation of the property. In addition, on 25 February 2003, the Orange County Board of Supervisors adopted a resolution rescinding the Airport System Master Plan for El Toro in recognition of the fact that the future reuse of El Toro would be for non-aviation uses.

In addition to action taken by the County of Orange Board of Supervisors, the DON has been working with the City on the sale of property since April 2002.

Response to Comment X2

The intent of Measure W was to repeal Measure A and amend the Orange County General Plan by eliminating the airport land use designation for El Toro and to redesignate the property for a mix of non-aviation uses with a vast portion allocated to open space, recreational, educational and cultural uses.

Section Two B of Measure W states:

"Purpose. This Initiative will allow for the creation of one of America's greatest parks, with open space, sports and recreation facilities, museums, libraries, arts and cultural attractions, and a home for major universities and research centers. It will also not generate the traffic, congestion, noise, and air pollution associated with the development of a commercial airport."

Section Two J of Measure W states:

"Replaces the aviation use designation with non-aviation designations to ensure that the property will become a multi-use center for education, park, recreation, cultural and other public-oriented uses. These designations permit the development of El Toro over time, thus allowing future generations to determine specific uses consistent with this Initiative."

As such, the proposed project is consistent with the intent of Measure W by providing a non-aviation mixed use plan with a substantial portion allocated to open space and public uses.

Response to Comment X3

Measure W is an alternative that was analyzed in Alternative 6.1, the No Project/Measure W in PA 51 and Millennium Plan II in PA 30 alternative. This alternative is considered superior from an environmental analysis perspective.

When Measure W qualified for the ballot, it was assumed that the DON would transfer the property at no cost or very low cost to the public agency conducting the reuse of the property. Shortly after the Measure W election in March 2002, the DON announced its intention to sell virtually all of the former MCAS El Toro to the highest bidder. To the extent that the implementation of Measure W would require substantially greater governmental funding than if the land was provided at no cost, Measure W is less feasible today under the DON's chosen conveyance program.

Response to Comment X4

The Eastern Transportation Corridor is not identified as State Route (SR) 55 on EIR pages 1-5 and 5.1-8.

Response to Comment X5

In Figure 1-3 on page 1-7, Planning Area Zone 6 is proposed as Medium Density Residential development.

Response to Comment X6

Figures 1-2 and 1-3 depict the land use for each of the Planning Area Zone (PAZs). Furthermore, each PAZ has more detailed development data not shown in Figures 1-2 and 1-3. For example, the Project Description Table 3-3 of this EIR describes the development data for the Base Plan. Table 3-3 specifies that 60 Multiple-family residential units are proposed within the PAZ 10, and 165 multiple-family residential units are proposed within the PAZ 17a. Additionally, Table 3-4 describes the development data for the Overlay Plan. Table 3-4 proposes 850 single-family residential units for PAZ 2, 800 senior housing units for PAZ 6, 60 multiple-family residential units for PAZ 10, 165 multiple-residential units for PAZ 17a, 250 single-family residential units for PAZ 18, 635 multiple-family residential units for PAZ 24, 50 multiple-family residential units for PAZ 25, 170 multiple-family residential units for PAZ 27, 345 multiple-family residential units for PAZ 28, and 300 multiple-family residential units for PAZ 29.

Response to Comment X7

The County Counsel's impartial analysis of Measure W published in the voter pamphlets stated:

“This measure would amend the Orange County General Plan (“General Plan”) with respect to unincorporated land within the El Toro Marine Corps Air Station (“MCAS El Toro”), and repeal Measure A, which was adopted by the voters on 8 November 1994, designating much of MCAS El Toro for civil aviation and related uses.”

Therefore, Measure W was a voter approved General Plan Amendment of the County's General Plan via the initiative process. As such, Measure W applies only to the El Toro property while the property remains within the unincorporated county area and under the jurisdiction and land use authority of the County of Orange. There are no provisions in the Measure W language mandating adherence by any other jurisdiction to the provisions of the measure. The proposed project includes the Annexation, General Plan Amendment, Pre-Zoning and Zoning of the unincorporated portion of the Planning Area 51.

Response to Comment X8

As described on page 5.1-15, the land use, safety, and noise restricted areas as identified in the AELUP, AICUZ, and the PIL for the former MCAS EL Toro facility are no longer impacted by aircraft noise from military operations now that the air station has closed for military use. The military mission at the former air station has been terminated and there are no actual noise or safety hazards generated by aircraft flight which would threaten the proposed development; implementation of the proposed project would not result in a significant land use compatibility impact, even though it would conflict with the adopted AELUP. Implementation of the Base Plan or Overlay Plan would result in a non-aviation reuse of the former MCAS El Toro property. On 17 April 2003 the ALUC formally acknowledged that the ALUC has no statutory jurisdiction over the proposed project.

Response to Comment X9

The Great Park Traffic Impact Analysis demonstrates that no measurable impacts to streets or intersections within the City of Tustin will occur as a result of the proposed Great Park project. The methodology applied to determine the extent of the study area is to examine the increase in intersection capacity utilization (ICU) value and determine whether or not the increase exceeds the impact significance threshold (0.02). This method of determining traffic impacts and hence the study area boundary is employed by jurisdictions throughout California, including many jurisdictions in Orange County. The analysis included in the EIR demonstrates that the increase in ICU value attributable to the project is less than 0.02 west of Culver Drive. Therefore it was not necessary for the EIR to analyze the roadway segments and intersections listed in the comment. The roadway segments and intersections listed in the Response to the NOP were analyzed. The analysis completed in the EIR showed steadily decreasing traffic impacts at an increasingly greater distance from the project. The increase in traffic caused an ICU increase of less than 0.02 prior to reaching the City of Tustin. It should be noted that the Great Park project is several miles from any part of the City of Tustin and no project impacts were identified beyond Culver Drive in the City of Irvine.

Concurrently with the proposed project, the City of Irvine is considering adoption of the North Irvine Transportation Improvement (NITM) program. The NITM program does two things: it prioritizes and schedules the construction of traffic improvements needed to address development in the Great Park, and other undeveloped areas of North Irvine; also, it imposes a nexus fee program to ensure the timely construction of these improvement events. NITM aggregates the traffic mitigation requirements for Northern Sphere, Great Park, and PAs 1, 2, and 40 and allocates funding proportionately among the projects. The NITM program provides fair share funding for four intersections within or at the border with the City of Tustin; Irvine Boulevard/Tustin Ranch Boulevard, Jamboree Road/Irvine Boulevard, Jamboree Road/El Camino Real, and Red Hill Boulevard/Irvine Boulevard.

Response to Comment X10

All of the projects identified in the comment were incorporated in the Traffic Impact Analysis. PAs 1 and 2 are included in the City's General Plan. As a result, traffic generation from these already approved projects or land uses were analyzed as the future conditions for purposes of analyzing Great Park traffic impacts.

Response to Comment X11

As stated in the comment, the direct contribution of the project to increased traffic on the I-5 Freeway is already minimized by the existing congestion on that roadway, and the resulting impacts to the arterial roadway system have been identified and analyzed.

Response to Comment X12

Refer to Responses to Comments M64 and X9. Application of traditional study area boundary determination methodologies concludes that project traffic is not contributing significantly to future traffic volume increases in the City of Tustin. Increased traffic volumes result from regional growth including, but not limited to, City of Tustin's plan for the reuse and urbanization of MCAS Tustin.

Response to Comment X13

Refer to Responses to Comment X9 and X12.

Response to Comment X14

Substantial improvements to parallel routes (Irvine Boulevard and Trabuco Road), funded by north Irvine developers and the Great Park, are expected to reduce the future traffic volumes on Bryan Avenue.

Response to Comment X15

Refer to Response to Comment X9. The project contributes fair share funding to four intersections that have been identified by the NITM program. No project impacts are anticipated in the City of Tustin. However, the NITM program does identify very small traffic shares (approximately 1.5 percent) towards which the project will be contributing at locations significantly impacted by other projects (e.g., Northern Sphere) located in closer proximity to the City of Tustin.

Response to Comment X16

The ITAM traffic forecasting tool has been developed explicitly in response to modeling consistency requirements and is the most appropriate tool for use in the Great Park traffic study. The OCTAM 2.8 tool referred to in the comment was “retired” by the Orange County Transportation Authority (OCTA) several years ago and is no longer appropriate for any type of regional or subregional analysis.

Response to Comment X17

Mitigation measures aimed at reducing significant impact to sensitive receptors from air quality impacts are described in Section 5.3.5 *Air Quality Mitigation Measures*. Mitigation Measure AQ1 states:

“Prior to the start of demolition and construction within the project area, adjacent sensitive receptors shall be informed of the planned demolition and construction activities. Measures to avoid significantly impacting these receptors shall be developed and implemented by the project proponent in coordination with these uses. Other applicable mitigation measures such as erection of fences around construction areas; staggered use of equipment near sensitive receptors; diversion of trucks away from receptors; etc., shall be employed as necessary. Compliance with this measure shall be verified by the Director of Community Development.”

Response to Comment X18

Comment noted. Mitigation Measure AQ4 and AQ5 will be located underneath a subheader that reads: “Operational Emissions Mitigation.” Mitigation Measure AQ5 has been amended to read:

“Future employment generating non-residential development shall include measures to reduce vehicle trips, including: the promotion of carpool incentives and alternative work schedules; easy access to public transit systems; trail linkages between uses; low-emissions vehicle fleets; the provision of on-site facilities, such as banking machines, food courts, and bicycle parking facilities, and other transportation demand management measures, as deemed appropriate.”

Response to Comment X19

Refer to Response to Comment M17. Section 5.3.3 *Air Quality Environmental Impacts* states:

“The URBEMIS 2001 model is used for estimating construction emissions for all stages of development. Estimates of land use and acreage absorbed are obtained for the plan proposal and modification for the development. Due to the limited availability of specific data regarding construction activities and equipment requirements, the URBEMIS 2001 model default options were used.”

Response to Comment X20

Disposition of the fuel line outside of PA 51 is not part of the proposed project and beyond the City’s legal authority and jurisdiction. The portion of the pipeline referenced in the comment is under the authority of the federal government. The EIR discusses information from the DON on that portion of the pipeline. Refer to Section 5.5.1 *Public Health and Safety Environmental Setting* (page 5.5-19) for a detailed discussion of the status of the jet fuel distribution system.

Response to Comment X21

Comment noted.

Response to Comment Y1

The project impacts to Jeffrey Road have been thoroughly and completely evaluated in the Great Park Traffic Impact Analysis and EIR and all project impacts have been mitigated to a level of insignificance.

Response to Comment Y2

The analysis of the traffic impacts of the Great Park project have been analyzed in the EIR and supporting Traffic Impact Analysis and there has been no reliance on other environmental documents. The North Irvine Transportation improvement Program (NITM) is a mechanism for implementing the required mitigation for the Great Park and other significant development projects located in close proximity to the Great Park.

Response to Comment Y3

Refer to Response to Comment F50.

Response to Comment Y4

Refer to Response to Comment F50.

Response to Comment Y5

Refer to Response to Comment F50.

Response to Comment Y6

Refer to Response to Comment F50.

Response to Comment Z1

The intersection referenced in the comment is not an intersection of two arterial roadways. Towne Center Drive is not shown on the Orange County Master Plan of Arterial Highways. The analysis of required lanes at adjacent intersections included in the Great Park Traffic Impact Analysis does not indicate the need for additional through lanes on Alton Parkway at Town Centre Drive.

Response to Comment Z2

The cumulative impacts and resulting roadway infrastructure needs of the Great Park project and surrounding development are analyzed under typical weekday conditions. Substantially lower overall traffic conditions can be expected on a weekend (Saturday). Therefore, no additional weekend analysis is required to evaluate areawide traffic impacts. The Sportspark would be required to prepare and submit traffic and parking management plans as part of their master plans for the City of Irvine's approval. This EIR addresses the impacts and identifies mitigation measures for the Great Park Plan and zoning designations for the proposed project. Operational issues will be part of the future permit processing of those facilities.

Response to Comment Z3

Concurrently with the proposed project, the City of Irvine is considering adoption of the NITM program. This program includes concrete, feasible mitigation measures that, if fully funded, will bring intersections back to the appropriate level of service. The EIR Traffic Impact Analysis includes an entire chapter (Chapter 9 of the Traffic Impact Analysis) devoted to CMP compliance. As part of this analysis, the EIR Traffic Impact Analysis and NITM identified all intersections in the City of Lake Forest to which project traffic contributed to an unacceptable level of service. The NITM program imposes fair share fee obligations on the project and other properties in the City of Irvine and its sphere of influence to fund their proportionate share of the mitigation to bring that intersection to an acceptable or pre-project level of service, based upon the extent of the properties' contribution of traffic. The City of Irvine recognizes that as the agency with jurisdiction over the intersections and as the lead agency for the construction of intersection improvements, the City of Lake Forest must concur with the proposed mitigation measures if those mitigation measures are to be implemented.

Response to Comment Z4

The extensions of Portola Parkway and Alton Parkway have been analyzed in the post-2025 Great Park Traffic Impact Analysis. The extensions were not included in the scenarios analyzing conditions prior to 2025.

Response to Comment Z5

Comment noted.

Response to Comment AA1

Comment noted.

Response to Comment AA2

Per this comment, the following has been added to Section 5.14 *Public Services and Facilities* page 5.14-25:

“Based on Table 5.14-6, the IUSD estimated the cost for typical District elementary, middle, and high schools. According to the District, the estimated acreage needed for an elementary school is 10-acres with a total building area of 45,000 square feet and the estimated acreage for a middle school is 15-acres with a total building area of 65,000 square feet. The District also estimated that an acre of land would cost \$1-1.5million, resulting in a total building cost of \$218 per square foot for elementary and middle schools (not including land for Oak Creek Elementary School in 2000). According to the District, the total building area needed for a high school expansion would be 20,000 to 30,000 square feet, resulting in an estimated total cost of \$3.2million.”

Response to Comment AA3

The EIR states that at this General Plan analysis it is unknown where exactly the housing units will be placed within each individual planning area (i.e., whether the new units will be in IUSD or SVUSD). For analysis purposes, the highest number of potential units was used to estimate the “worse-case” scenario for both districts. As a result, the analysis overestimated the amount of new or expanded school facilities that would be needed to serve the project. Therefore, the number of new students generated by the project is most likely overestimated and the number of new students will most likely be well under the estimated number of 1,525.

In regard to this comment requesting the shifts in the school attendance boundaries, the EIR states the following on page 5.14-26:

“In the event that a new school is not built, IUSD may consider shifts in the school attendance boundaries for existing elementary, middle, and high schools. This could result in existing communities within IUSD to change from their current school assignment to another District school in order to better accommodate new growth within PAs 51 and 30.”

Response to Comment AA4

The following sentence has been added to Section 5.14 *Public Services and Facilities* page 5.14-25:

“The District’s consultants are currently analyzing the land bordering the existing El Toro Elementary site for purposes of realigning the property lines and/or expanding the site from approximately 10-acres to 13-acres in order to better accommodate a K-8 school.”

Response to Comment AA5

The EIR states on page 5.14-25:

“To accommodate the expected student growth from the project during buildout of the proposed project and prior to final construction of the new elementary school,

IUSD may re-open the El Toro Marine Elementary School and/or assign students residing in the project area to various schools with available capacity."

Response to Comment AA6

In order to obtain development rights under the Overlay Plan the landowner must enter into a Development Agreement that requires, among other things, the dedication of a 13-acre school site at no cost to IUSD. State law (Government Code Section 65995 and following) establishes the exclusive means of obtaining developer impact mitigation for public school construction.

Response to Comment AA7

Comment noted.

Response to Comment AA8

Comment noted.

Response to Comment BB1

This comment generally recites the major components of the proposed project and the responsibilities of the US Fish and Wildlife Service.

Response to Comment BB2

This comment summarizes the responsibilities of the California Department of Fish and Game.

Response to Comment BB3

Comment noted. The portion of the project site designated for habitat preserve is consistent with the NCCP/HCP. This property will remain under the ownership of the Federal Aviation Administration (FAA).

Response to Comment BB4

The City of Irvine is a participant in the Special Area Management Plan/Master Streambed Alteration Agreement (SAMP/MSAA) process. The City anticipates continued participation and coordination with the wildlife agencies in constructing the proposed natural drainages on-site.

Response to Comment BB5

Refer to Responses to Comments BB6 through BB18 for a response to each of these issues.

Response to Comment BB6

A portion of PAZ 4 is sage scrub habitat that will be designated as agriculture under the OCGP. Habitat preservation is a permitted use in the agricultural land use designation. The EIR did quantify an impact to this area. The City of Irvine is a participant in the NCCP/HCP program and will ensure that adequate protections are implemented in accordance with those programs.

Response to Comment BB7

Comment noted. Original biological surveys have not indicated the presence of the sensitive species identified by the commentor. No development is proposed within the Habitat Preserve portion of the Great Park plan; therefore, sensitive resources that may be located in this area would not be impacted by proposed development activities.

Any future development activity within the project area will be reviewed to ensure potential impacts have been adequately addressed. In order to ensure that potential biological impacts of proposed development are addressed, Mitigation Measure Bio.1 has been modified as follows:

“Prior to approval of a subdivision map for each project area, a focused survey for the southern tarplant, mountain plover, and burrowing owl, shall be conducted. Prior to approval of a subdivision map for development within, or in proximity to Serrano Creek a focused survey shall be conducted for the least Bell’s vireo and southwestern willow flycatcher. Should the focused survey identify a significant population of southern tarplant or mountain plover, or the presence of burrowing owl, least Bell’s vireo, or southwestern willow flycatcher, of this species in an area proposed for development, impacts shall be avoided through incorporation of the species into an open space easement, or if impacts cannot be avoided, then mitigation shall be negotiated through consultation with the United States Fish and Wildlife Service (USFWS) and the California Department of Fish and Game (CDFG).”

Response to Comment BB8

Comment noted. As described in the EIR, a significant amount of open space and foraging areas will remain under the project's proposed land use plan.

Response to Comment BB9

Refer to Response to Comment BB7.

Response to Comment BB10

Refer to Response to Comment BB7.

Response to Comment BB11

Refer to Response to Comment BB7.

Response to Comment BB12

Mitigation Measure Bio 1 is proposed to address potential impacts to sensitive species potentially occurring onsite, and not covered by the NCCP. Any subsequent development project within the project area will be reviewed as to its potential environmental impacts, including biological resources. The City of Irvine will require additional biological surveys as appropriate to address any potential impacts to biological resources as a result of subsequent development activity.

Response to Comment BB13

Comment noted.

Response to Comment BB14

The comment pertains to a separate report entitled *Draft Wildlife Corridor Plan*. The City of Irvine appreciates the input from the US Fish and Wildlife Service and the California Department of Fish and Game and will evaluate and address these comments as it proceeds to process the *Draft Wildlife Corridor Plan* separately from this EIR.

Response to Comment BB15

Refer to Response to Comment B14.

Response to Comment BB16

Comment noted. Refer to Response to Comment B14.

Response to Comment BB17

Refer to Response to Comment B14. It is anticipated that these details related to the proposed wildlife corridor will be resolved after the general wildlife corridor concept has been adopted, and more detailed aspects of implementation are initiated.

Response to Comment BB18

Response to Comment CC1

Under the Overlay Plan, the Agriculture designation is proposed within PAZ 1 and PAZ 4. As stated on page 5.8-10 of the EIR, the proposed project will help to implement the City's proposed Agricultural Legacy Program by proposing agricultural land uses in the portion of PA 51 that is identified by the Irvine Agricultural Legacy Program Preliminary Sites Assessment (City of Irvine 26 November 2002). The City of Irvine recently amended its General Plan Objective L-10 with the purpose of addressing the cumulative loss of agricultural resources in Irvine and Orange County as a whole. The amendment shifts the emphasis from retention of agriculture for open space relief, to retention of smaller scale agricultural operations for heritage value. To that extent, the City of Irvine has committed to preservation of agriculture in these areas of the project site both by designating these areas for agriculture use and through the recently amended General Plan policy, which commits the City of Irvine to implementation of the Agricultural Legacy Program.

Response to Comment CC2

An Agricultural Preservation Program, as described in this comment, has been determined to be infeasible. No agricultural preserves or Williamson Act contracts exist within the City of Irvine or the project site. As stated in the EIR, (page 5.8-15), the County of Orange has not yet initiated the evaluation of such a program, and has no plans to implement such a program.

Response to Comment CC3

Comment noted.

Response to Comment DD1

Section 3.0 *Project Description Actions and Approvals of Other Agencies* has been amended to reflect the requirement that DTSC approve the acquisition and/or development of property for public schools. The added additional language reads as follows:

“California Department of Toxic Substances Control (DTSC) – Approval of acquisition and/or development of property for public schools based on hazardous materials evaluation.”

Response to Comment DD2

Section 5.5 *Public Health and Safety Environmental Setting* has been amended with the following wording:

“Certain LBP abatement and hazard disclosure requirements must be complied with prior to the transfer of the former MCAS El Toro site from federal responsibility. Housing units constructed prior to 1960 must be abated of LBP and LBP hazards. The presence of LBP and LBP hazards must be disclosed for housing units constructed between 1960 and 1978. Occupation of housing units scheduled for demolition due to the presence of LBP or LBP hazards is prohibited. Post-demolition sampling and response actions for any hazards due to lead in soil shall be conducted, consistent with regulatory requirements, prior to the occupancy of any newly constructed housing units to ensure public health and safety.”

This language has also been added to Section 5.5.3.

Response to Comment DD3

Per the regulations outlined in 40 CFR 300.430(e)(2)(i), “remediation goals shall establish acceptable exposure levels that are protective of human health and the environment and shall be developed by considering the following...for known or suspected carcinogens, acceptable exposure levels are generally concentration levels that represent an excess upper bound lifetime cancer risk to an individual of between 10^{-4} and 10^{-6} using information on the relationship between dose and response.” The DON will be responsible for remediation of the former MCAS El Toro to these exposure levels. The DON has publicly stated that it will indemnify new land owners of former air station property in order to mitigate potential soil contamination that is attributable to historic DON operations.

Response to Comment DD4

Comment noted. Revisions will be made as referenced.

Response to Comment DD5

Section 5.5 *Public Health and Safety Environmental Regulations Affecting MCAS El Toro* has been amended to reflect the comment. Added wording is as follows:

“The Resource Conservation and Recovery Act (RCRA), adopted in 1976, provides the basic framework for federal regulation of hazardous waste. The State of California Department of Toxic Substances Control (DTSC) is authorized to implement the state hazardous waste program in lieu of federal RCRA regulations.”

Response to Comment DD6

Section 5.5 *Public Health and Safety Compliance Program Sites and Other Locations of Concern* has been amended with the following language:

"The DTSC states that the former MCAS El Toro contains two hazardous waste management units (HWMU). The HWMUs include a hazardous waste container storage area and an open burn/open detonation (OB/OD) hazardous waste treatment unit. A hazardous waste facility permit (a RCRA-equivalent permit) to operate the hazardous waste container storage area designated as Building 673-T3 was issued in August 1993 by the DTSC. The permit allowed the storage of hazardous wastes for longer than 90-days at Building 673-T3. In March 1996, the closure certification report was accepted by the DTSC and the container storage area was considered closed."

Response to Comment DD7

Refer to Response to Comment DD6.

Response to Comment DD8

Comment noted. The City of Irvine has coordinated with the DON and concurs with the DON's determination that corrective action at the former MCAS El Toro can overlap with other remediation or response actions. EIR text will be amended to read:

"The State of California considered any site from which hazardous constituents may migrate to be a SWMU, but corrective action can be addressed through the Federal Facilities Agreement for MCAS EL Toro or responses to petroleum releases with oversight provided by the Regional Water Quality Control Board."

Response to Comment DD9

The EIR clearly states that Site 24 contains VOC contaminated soil; Site 18 is a groundwater plume, contaminated by VOCs leaching from Site 24, that is located both on- and off-site. Language has been added to the referenced section to read:

"In addition to an interim Record of Decision (ROD) for the contaminated soil of Site 24, a final ROD for groundwater contamination at Sites 18 and 24 was signed in June 2002. Please refer to the Final Record of Decision, Operable Unit 1, Site 18 - Regional Volatile Organic Compound Groundwater Plume, Operable Unit 2A, Site 24 - VOC Source Area, Former MCAS El Toro, California (Bechtel National, Inc. 2002) for additional information."

Response to Comment DD10

The referenced section has been amended with the following added language:

"An interim ROD was signed in July 2000 for Site 2 and 17 to allow for the design of the landfill caps to proceed. However, construction of the landfill caps will not proceed until radiological survey/sampling is complete and the data have been evaluated to determine potential impact on the remedial design. Please refer to the Final Interim ROD, Operable Unit 2B, Landfill Sites 2 and 17, MCAS El Toro, California (Bechtel National, Inc. 2000) for additional information."

Response to Comment DD11

The referenced section has been amended with the following added language:

"The draft version of the ROD for Sites 3 and 5 was issued in March 1999. The draft final ROD will be issued following evaluation of the results from radiological survey/sampling. Please refer to the Draft ROD, Operable Unit 2C, Landfill Sites 3 and 5, MCAS El Toro, California (Bechtel National, Inc. 1999) for additional information."

Response to Comment DD12

The referenced section has been amended with the following added language:

"Site 7, Drop Tank Drainage Are No.2, and Site 14, Battery Acid Disposal Area, received concurrence for no further action in the final ROD signed June 2001. Please refer to the Final ROD, Operable Unit 3B, No Action Sites 7 and 14, MCAS El Toro, California (Bechtel National, Inc. 2001) for additional information."

Response to Comment DD13

The referenced section has been amended with the following added language:

"Monitored natural attenuation is the selected remediation procedure for Site 16. A ROD is being prepared to document the selected remediation process. Please refer to the Proposed Plan for Site 16, Crash Crew Training Pit No.2 at MCAS El Toro (Bechtel National, Inc. 2002a) for additional information."

Response to Comment DD14

The referenced section has been amended with the following added language:

"The DON is in the process of completing a remedial investigation to determine the nature and extent of contamination at Site 1. Please refer to the Final Work Plan, Phase II Remedial Investigation, IRP Site 1, Explosive Ordinance Disposal Range, MCAS El Toro, California (Earth Tech, Inc. 2001) for additional information."

Response to Comment EE1

The Traffic Impact Analysis has been reviewed and revised in accordance with the new significance thresholds provided by the City of Laguna Hills. The additional analysis is provided as it confirms that the initial analysis adequately assesses the project's traffic impacts. A total of 16 intersections are located within the jurisdiction of the City of Laguna Hills or are shared with other local jurisdictions, including the City of Irvine.

Table EE-1 summarizes the 2007 intersection capacity utilization (ICU) analysis for the City of Laguna Hills intersections. As shown on Table EE-1, two intersections are impacted. Table EE-2 summarizes the 2025 intersection capacity utilization (ICU) analysis for the City of Laguna Hills intersections. As shown on Table EE-2, six intersections are impacted by either the Base Plan or the Overlay Plan. Table EE-3 summarizes the post-2025 intersection capacity utilization (ICU) analysis for the City of Laguna Hills intersections. As shown on Table EE-3, eight intersections are impacted for post-2025 conditions. Table EE-4 summarizes the proposed improvements at the intersections that are impacted by the Base Plan project alternative. Table EE-5 summarizes the proposed improvements at the intersections that are impacted by the Overlay Plan project alternative. The only intersection where additional impacts have been identified based on the revised impact criteria is Laguna Hills Drive at Paseo De Valencia, where very minimal mitigation improvements (modifying the traffic signal to provide an eastbound right turn overlap concurrent with the northbound left turns) would be required. (Note: All of the following referenced tables are included in the Appendix to this Response to Comments document.)

Response to Comment EE2

(Note: All of the following referenced tables are included in the Appendix to this document.) Cost estimates and the plan for funding the project fair share of improvements are included in the implementing mechanism (the NITM program) currently being developed by the City of Irvine as the next logical step in the development process. Funding for right of way acquisition, engineering, and construction is included in the NITM program. The City of Irvine recognizes that as the agency with jurisdiction over the intersections and as the lead agency for the construction of intersection improvements, the City of Laguna Hills must concur with the proposed mitigation measures if those mitigation measures are to be implemented. Table EE-6 summarizes the fair share traffic contributions and resulting cost share related to mitigation at the one intersection not specifically addressed in the NITM Program (Laguna Hills Drive at Paseo De Valencia). Table EE-7 then summarizes the project fair share traffic contribution at all of the locations impacted by the Base Plan alternative, along with the estimated cost contribution attributable to all NITM projects. Table EE-8 provides a similar summary for the Overlay Plan alternative.

Response to Comment FF1

Comment noted.

Response to Comment GG1

The comment regarding Irvine's urban water management plan is assumed to be in reference to the Irvine Ranch Water District's water supply assessment. The water supply assessment (WSA) contained in Appendix C complies with the most recent statutory requirements and concludes that adequate supplies are available to serve the proposed project. As noted in Response to Comment G2, the EIR is amended to reflect the statutory compliance of the water supply assessment prepared by the Irvine Ranch Water District.

Response to Comment GG2

The mitigation for loss of agricultural lands within the City of Irvine and surrounding areas was analyzed on a cumulative basis by the City when the General Plan agricultural policies contained in Objective L-10 were amended on 4 June 2002. The Great Park plan is full consistent with Objective L-10.

The EIR provides a comprehensive analysis of the feasibility of Mitigation Measures designed to reduce the project's impact to agricultural resources (see EIR pages 5.8-7 through 5.8-15). The EIR also identifies three feasible Mitigation Measures that will be implemented as part of the project (see Mitigation Measures AG 1 through AG 3 on pages 5.8-15 and 5.8-16). In this discussion, a variety of Mitigation Measures have been thoroughly analyzed including retention of agricultural uses. EIR pages Page 5.8-7 and 5.8-8 provide economic data to support the basis of conclusion of infeasibility of Mitigation Measures. Additionally, the City of Irvine's Legacy Program (as described in EIR page 5.8-14) promotes the preservation of agricultural resources city-wide, acreage from the Great Park of which are included in this program. On-site preservation of all existing agricultural lands on the Great Park property, to the exclusion of other City goals such as the provision of new open space through the park, job opportunities, and new housing would be inconsistent with the Objective L-10 as amended by the City of Irvine.

Response to Comment GG3

On page 5.13-9 of the EIR, the sections on long-term impacts for both the Base Plan and Overlay Plan indicate that the imbalance between jobs and housing will worsen and the impact is considered significant and unavoidable. This conclusion is repeated on pages 5.13-12 and 5.13-17. Also refer to Response to Comment KK1.

Response to Comment GG4

The base projections for the RHNA were completed in 1998 and assumed federal/military ownership of the site and it is likely that no RHNA allocation specific to the El Toro property was assigned. However, it is assumed that the upcoming 2004 RHNA, required under Government Code Section 65584 to allow the City of Irvine (and other jurisdictions) to undertake its required Housing Element updates, will reflect an appropriate allocation of future and existing regional housing need to the project site.

Response to Comment GG5

The City of Irvine has striven to integrate the Great Park with other planned development in the region, including the extension of public services. Preparation and planning with environmental documents such as this EIR is an important step in ensuring that this integration is seamless and coordinated. Section 5.14, *Public Services and Utilities*, considers potential impacts related to the extension of public services to the proposed project. Specific examples of planned development integration are considered in Section 7.1 *Cumulative Impacts*. The City of Irvine's Urban Services Plan will be made available to LAFCO as part of the annexation process undertaken with the Great Park. All impacts

discussions in the EIR assume growth and development in the Northern Sphere as allocated in the Orange County Projection 2000 prepared by the Center for Demographic Research. (Note: The Urban Services Plan is included in the Appendix to this Response to Comments document).

Response to Comment HH1

Section 5.15.3 *Population and Housing Environmental Impacts* (5.13-12) states:

“Since the Orange County Subregion is anticipated to become increasingly jobs-rich over the next 20 years, the project-related employment would exacerbate the subregional jobs/housing imbalance. As a result, the proposed project will not improve and would only exacerbate the Orange County’s overall jobs/housing imbalance and the impact is considered significant and unavoidable.”

No mitigation is available to rectify conflicts with the numerical objectives of regional planning documents including the jobs/housing ratio. The imbalance between jobs and housing in Orange County may result in increased vehicle miles traveled since part of the work force consists of commuters who are drawn to the County for employment purposes. The EIR supports the SCAG objectives to reduce VMT and related congestion and air pollution. A CARB-commissioned report, entitled *Transportation-Related Land Use Strategies to Minimize Motor Vehicle Emissions: An Indirect Source Research Study*, analyzes the efficiency of numerous land use planning factors that have the greatest potential for reducing VMT and mobile source emissions. The study is outlined in the EIR, contains a list of recommended strategies, many of which have been incorporated into the Base Plan and Overlay Plan.

A portion of the project’s housing growth will be absorbed in residential projects currently being developed or planned in the surrounding area. Substantial new areas of residential development will be opened for development with the completion of several planned transportation improvement in the County. Housing projects developed under the Base Plan or Overlay Plan will be consistent with the City of Irvine’s Housing Element Affordable Housing Goal.

The Base Plan and the Overlay Plan were developed to reflect the intent of the voters of Orange County through the passage of Measure W. A higher development intensity alternative was analyzed (Alternative 6.5) in the EIR which evaluated 4,635 housing units. Alternative 6.5 concludes that a greater impact would occur on the following environmental elements: traffic/circulation; air quality; noise; geology and seismicity; hydrology and water quality; aesthetics; public services and facilities and utilities. Refer to the Alternatives (Section 6.0) in the EIR for further discussion. Moreover, the selection of an alternative that would include more housing and less commercial development would be infeasible since it would be in conflict with the City’s fiscal balance requirement for new planning areas and prevent the City from having the financial resources to implement the Great Park plan.

Response to Comment HH2

Under the proposed Base Plan 225 multi-family housing units would be developed; implementation of the Overlay Plan would result in the construction of 3,625 housing units. Implementation of either plan would be consistent with the affordable housing goals stated in the City of Irvine’s General Plan Housing Element.

Response to Comment HH3

The EIR provides for a mix of housing densities in the residentially zoned areas. Implementation of the Base Plan would result in the construction of 225 multi-family housing units. It is beyond the scope of this EIR to “set-aside (future) City-owned sites for affordable housing sooner rather than later,” increase densities in the transit areas from 40- to 60-units per acre, all farm-worker housing on or near agricultural areas, and include

housing as an allowable use in all commercial, institutional, and industrial areas. These are policy matters that must be considered by the City of Irvine. Also refer to Response to Comment KK2.

Response to Comment II1

The Highway Capacity Manual (HCM) methodologies are most appropriate for near-term engineering and operational analysis. The many input data and factors required by HCM methodologies are not available for the long-range planning horizon addressed in this Traffic Impact Analysis. The planning level analysis in the Great Park Traffic Impact Analysis is an appropriate approach that has been utilized in various other traffic studies that have also been submitted to Caltrans.

The ITAM tool used to develop the future forecasts is consistent with the OCTAM travel demand forecasting tool, which is the regionally (County of Orange) adopted tool for developing future traffic forecasts on the regional roadway system, including the freeways and transportation corridors. The OCTAM model has been validated at both the peak hour and daily traffic volume levels of detail for freeway and transportation corridor mainline conditions. Use of a consistent modeling tool is a mandatory requirement, based on state and federal legislation.

Response to Comment II2

The lane assumptions for the I-5 Freeway corridor are correct and are based on existing field inventory and anticipated long-range improvements. The analysis may be inconsistent with OCTAM 3.1 because of the more accurate lane assumptions compared to the generalized OCTAM 3.1 inputs. The lane assumptions utilized in the Traffic Impact Analysis for the transportation corridors are based on the long-range capital improvement program (CIP) developed by the Transportation Corridor Authority(ies) (TCA).

Response to Comment II3

The analysis contained in the EIR and supporting Traffic Impact Analysis is unaffected by the status of the projects referenced in the comment. The ITAM model used in the Traffic Impact Analysis is based on a year 2000 validation scenario; therefore, all of the future forecasts included in the Traffic Impact Analysis accurately reflect the validation year conditions.

Response to Comment II4

The HOV lanes are identified in the TCA CIP. Ms. Macie Cleary-Milan of the Transportation Corridor Agency provided the following information on 7 May 2003 regarding the funding for HOV lanes on the transportation corridors:

The TCA has a list of all the projects that have been identified as part of the long-range concept plans for the various transportation corridors. Improvements are funded as the money is available, and as the need for the improvements is identified to provide acceptable traffic operations for the system. Priorities are set based on congestion or operational issues. If future traffic volumes result in a deterioration of levels of service, the TCA is dedicated to providing the improvements needed to provide the levels of service their patrons expect.

Therefore, it is reasonable to assume that the TCA would fund HOV improvements necessary to provide acceptable levels of service.

Response to Comment II5

Refer to Response to Comment S5.

Response to Comment II6

As demonstrated in the EIR and supporting Traffic Impact Analysis, adequate access to the Great Park is being provided. Major roadway improvements within and outside of the proposed park area include the widening of Trabuco Road, Bryan Avenue, Irvine Boulevard, and Sand Canyon Avenue. In addition, the Great Park project roadway system proposes a number of new arterial roadways, including Marine Way, College Road, and Y Street. The project also proposes substantial new or modified freeway/transportation corridor interchange improvements, including the I-5 Freeway/Bake Parkway interchange, the I-5 Freeway/Sand Canyon Avenue interchange, and the SR133 tollway/Trabuco Road interchange.

Concurrently with the proposed project, the City of Irvine is considering adoption of the North Irvine Transportation Improvement (NITM) program. The NITM program does two things: it prioritizes and schedules the construction of traffic improvements needed to address development in the Great Park, and other undeveloped areas of North Irvine; also, it imposes a nexus fee program to ensure the timely construction of these improvement events. The NITM program also includes numerous other ramp improvements commensurate with other cumulative project impacts. In summary, the project has adequate access.

The EIR and supporting Traffic Impact Analysis have addressed both the changes in land use and the circulation system as a result of the proposed project. The issue raised in this comment is addressed either by the EIR analysis itself, or through the proposed mitigation measures. The key mitigation measure with respect to this comment is the requirement to enter into a cooperative Master Plan of Arterial Highways amendment study per the Orange County Transportation Authority (OCTA).

The portion of the comment related to the extension of Marine Way to Bake Parkway at the I-5 Freeway northbound ramps is noted. The City of Irvine is working closely with Caltrans to resolve the design issues related to the I-5 Freeway/Bake Parkway interchange.

Response to Comment II7

Refer to Response to Comment S6. The programs referenced in the comment will address ongoing regional traffic growth and are not related to the anticipated project impacts. The EIR mitigation measures address all project impacts that were identified in the Traffic Impact Analysis, subject to constraints such as those identified in Response to Comment S5 (TCA non-compete agreements).

The second part of the comment relates to the detailed implementation mechanism for mitigating project impacts. The City of Irvine is actively developing an implementation mechanism (NITM) for proposed Great Park (and other nearby) project mitigation measures/improvements. The NITM program includes conceptual engineering, cost estimates, and fair share contribution calculations as requested in this comment.

Response to Comment II8

Refer to Response to Comment II7. The City has created a pro rata fair share program (NITM program) that includes projects that mitigate impacts to the State facilities, including freeway mainline and ramp improvements.

Response to Comment II9

Refer to Responses to Comments II7 and II8.

Response to Comment II10

The comment pertains to a separate report entitled *Draft Wildlife Corridor Plan*. The City appreciates Caltrans input and will evaluate and address these comments as it proceeds to process the *Draft Wildlife Corridor Plan* separately from this EIR.

Response to Comment KK1

Section 5.15.3 *Population and Housing Environmental Impacts* (5.13-12) states:

“Since the Orange County Subregion is anticipated to become increasingly jobs-rich over the next 20 years, the project-related employment would exacerbate the subregional jobs/housing imbalance. As a result, the proposed project will not improve and would only exacerbate the Orange County’s overall jobs/housing imbalance and the impact is considered significant and unavoidable.”

No mitigation is available to rectify conflicts with the numerical objectives of regional planning documents including the jobs/housing ratio. A portion of the project’s housing growth will be absorbed in residential projects currently being developed or planned in the surrounding area. Substantial new areas of residential development will be opened for development with the completion of several planned transportation improvement in the County. Housing projects developed under the Base Plan or Overlay Plan will be consistent with the City of Irvine’s Housing Element Affordable Housing Goal.

The Base Plan and the Overlay Plan were developed to reflect the will of the voters per Measure W. A higher development intensity alternative was analyzed (Alternative 6.5) in the EIR which evaluated 4,635 housing units. Alternative 6.5 concludes that a greater impact would occur on the following environmental elements: traffic/circulation; air quality; noise; geology and seismicity; hydrology and water quality; aesthetics; public services and facilities and utilities. Refer to the Alternatives (Section 6.0) in the EIR for further discussion.

Response to Comment KK2

While the number of multi-use residential units has been reduced from 2,313 to 1,500, the overall level of multi-use residential development has been increased from 3,261 to 3,625. The EIR examines two formulated plans: the Base Plan and the Overlay Plan. The EIR analyzes the environmental impacts from these plans and proposes mitigation measures to reduce impacts to levels less than significant. The current General Plan allows a maximum 3,261 dwelling units in Planning Areas 30 and 51 combined. Under the proposed Base Plan 225 multi-family housing units would be developed; implementation of the Overlay Plan would result in the construction of 3,625 housing units. Implementation of either plan would be consistent with the affordable housing goals stated in the City of Irvine’s General Plan Housing Element. As a result, the project provides for a mix of housing densities in the residentially zoned areas.

Section 5.13.3 *Population and Housing Environmental Impact* states:

“...housing project developed on the site under either the Base Plan or Overlay Plan will be required to be consistent with the City’s Housing Element Affordable Housing Goal, which states that:

- Five percent of units should be affordable to households earning less than 50 percent of the County Median Family Income through rental housing.
- Five percent of the actual number of units built should be affordable as either rental or ownership housing for households earning between 51 and 80 percent of the County Median Family Income.

- Five percent of the units should be affordable to household earning between 81 and 121 percent of the County Median Family Income, satisfied through the development of ownership housing.”

Response to Comment KK3

Refer to Response to Comment KK2.

Response to Comment A1

This letter acknowledges that the City has complied with the State Clearinghouse review requirements for the EIR pursuant to the California Environmental Quality Act. No further response is required.

Response to Comment B1

The EIR is the environmental document pursuant to CEQA that identifies, analyzes and discloses potential environmental impacts and mitigation measures for the Orange County Great Park Plan. The Orange County Great Park Plan is consistent with the intent of Measure W since it allocates approximately 84 percent of the total land area of the former MCAS El Toro to open space, recreational, institutional, educational, cultural, and other public uses. Measure B was an advisory measure passed by the voters in November of 2002. The EIR does not analyze the impacts of the provisions of Measure B. Furthermore, because Measure B was passed as a County initiative, it does not have any legal effect with respect to actions taken by the City of Irvine with respect to lands within, or annexed to, the City. Section 5.5 of the EIR *Public Health and Safety* discusses the issues related to contamination on the base property and the various determinations and actions taken and planned to be taken by the responsible parties and regulatory agencies. Further, arguments for or against ballot measures published in voter pamphlets are not part of the language of the ballot measures subject to voters' action and therefore, are not in any way binding if the ballot measure passes. As such, the proponent's arguments for Measure B are not a binding mandate.

Response to Comment B2

The meteorological station used in the EIR is administered by the AQMD with wind velocity data generated, verified, and published by that public agency. The station referenced in Section 5.3 *Air Quality* is located on the project site, and is consequently represents the best source of on-site wind velocity data for air quality purposes. According to the website maintained by the AQMD (and referenced in the EIR on page 5.3-1), this data is neither erroneous nor obsolete.

Response to Comment B3

The proposed zoning regulations will allow for development on a similar scale as existing residential, industrial, office, and commercial buildings in the City of Irvine.

The objectives of the proposed project are defined on page 3-29 of the EIR. The project objectives are not to develop an aviation use at the former MCAS El Toro. As described in the EIR, the voter-approved Measure W initiative amended the County General Plan for the area of the base north of the Southern California Regional Rail Authority (SCRRA) Metrolink rail line (PA 51) to designate the unincorporated land for park, open space and other uses, removing the designation of the site as a commercial airport from the County General Plan (EIR, p. 1-2). Therefore, a detailed analysis of an aviation reuse alternative is not permitted under the Orange County General Plan and is not required under CEQA because an aviation reuse of the site does not meet the basic objectives of the project. Furthermore, on 25 February 2003, the Orange County Board of Supervisors, acting as the El Toro Local Redevelopment Authority, rescinded the

Airport System Master Plan, thus removing an airport at the former MCAS El Toro from all County plans.

Response to Comment B4

As stated in Response to Comment B3, Measure W amended the County General Plan to remove the designation of the site as a commercial airport. Therefore, implementation of a commercial airport at this location is not consistent with the County General Plan nor is it consistent with most of the basic objectives of the project.

Section 6.0 Alternatives of the EIR addresses a reasonable range of alternatives to the proposed project as required by the CEQA Guidelines.

Response to Comment B5

This comment does not address the adequacy of the EIR nor does it raise an environmental issue with respect to the proposed project. While the City recognizes there are heightened security concerns regarding airports in general, there is no evidence to indicate that construction of a new airport, at any location, would alleviate security concerns at the existing John Wayne Airport.

Response to Comment B6

It is beyond the scope of the EIR to consider potential impacts of a non-aviation plan on existing residential communities contiguous to the Los Angeles International Airport, Ontario International Airport, Long Beach International Airport and Santa Ana (John Wayne) International Airport. As stated in Response to Comment B3, the proposed project objectives meet the spirit and intent of Measure W, which changed the County General Plan designation for the former MCAS El Toro from airport to non-aviation uses. This EIR analyzes the potential impacts of Annexation, General Plan Amendment and Zoning of the former base property and not those of Measure W. Furthermore, on 25 February 2003, the Orange County Board of Supervisors, acting as the El Toro Local Redevelopment Authority, rescinded the Airport System Master Plan, thus removing an airport at the former MCAS El Toro Airport from all County plans.

Refer to Final Environmental Impact Report No. 573 *For the Civilian Reuse of MCAS El Toro and the Airport System Master Plan for John Wayne Airport and Proposed Orange County International Airport* for information pertaining to reports and supporting data from studies conducted for that EIR.

Response to Comment B7

The Orange County Great Park plan proposes several features that will address on-site water quality control and flood protection. These project features provide a unique opportunity for water quality and flood protection to be addressed on a regional level and in a comprehensive manner. The proposed water quality and flood control concept plan is shown on Figure 5.7-2 of the EIR. A description of the concept plan is provided on pages 5.7-16 through 5.7-22 of the EIR. The EIR

identifies future potential permit requirements for project implementation, including Section 404 Permit(s) from the U.S. Army Corps of Engineers (EIR, p. 3-30). A Section 404 permit(s) will be obtained as necessary, as future projects are proposed within the project area. In the context of the size of the entire site, there is a relatively small amount of existing wetland habitat which is generally limited to the Borrego channel and San Diego Creek. The mitigation of potential impacts to wetland habitat as a result of project implementation will be addressed through the Section 404 permit process. The construction of the proposed 179-acre wildlife corridor will provide significant opportunity for the creation and enhancement of viable wetland habitats within the project area. Drainage improvements and flood control facilities will also be created on-site through the daylighting of the Bee Canyon and Agua Chinon channels.

Response to Comment C1

Page 3-31 of the EIR has been revised to include the California Public Utilities Commission under "Actions and Approvals of Other Agencies." The modified text reads:

- California Department of Fish and Game-Approvals related to wildlife corridor and habitat areas
- Federal Department of the Interior (DOI) Fish and Wildlife Agency
- Southern California Regional Rail Authority (SCRRA)
- Orange County Transportation Authority (OCTA) – Revisions to the County Master Plan of Arterial Highways (MPAH)
- Irvine Unified School District
- Saddleback Unified School District
- *California Public Utilities Commission – Highway Rail Crossings*

Response to Comment C2

Comment noted. The City will notify and coordinate with the CPUC as appropriate, with respect to any future trails planning on or adjacent to the railroad right-of-way.

Response to Comment D1

The traffic analysis is based on the most current regional growth projections that have been adopted by the County of Orange which incorporates the most current projections for all the cities in the County. The concept of trip banking in Laguna Woods, related to available trips on Moulton Parkway, was not considered, as the traffic model addresses regional traffic impacts.

Response to Comment D2

The difference in daily traffic volumes cited in this comment is most likely due to the collection of traffic count data at different times. The 20 percent variation is quite possibly due to day to day variation in traffic conditions or changes in traffic patterns that occur as various roadway improvements are implemented. It does not affect the findings and conclusions of the Traffic Impact Analysis because project impacts and resulting mitigation are all based on more detailed analysis of peak hour conditions.

Response to Comment D3

The traffic analysis is based on the most current regional growth projections that have been adopted by the County of Orange which incorporates the most current projections for all the cities in the County. No roadway or intersection improvements attributable to the Laguna Hills Mall were included in the Great Park traffic study. Therefore, the analysis is inherently conservative, as any additional improvements may result in a decrease in the Great Park project traffic impacts that were identified. Mitigation Measure Trans. 6 is consistent with the El Toro Roadway and Landscape Improvement project.

Response to Comment D4

Concurrently with the proposed project, the City of Irvine is considering adoption of the North Irvine Transportation Improvement (NITM) program. The NITM program does two things: it prioritizes and schedules the construction of traffic improvements needed to address development in the Great Park, and other undeveloped areas of North Irvine; also, it imposes a nexus fee program to ensure the timely construction of these improvement events. Traffic mitigation improvements within the City of Laguna Woods and other areas outside of Irvine will receive fair-share funding from the NITM program.

The City of Irvine recognizes that as the agency with jurisdiction over the intersections and as the lead agency for the construction of intersection improvements must concur with the proposed mitigation measures if those mitigation measures are to be implemented.

Response to Comment D5

The DON intends to incorporate temporary institutional controls in remediating IRP Sites 16 and 24 on the base. The Record of Decision for Site 24 states that “the Environmental Restriction Covenant and Agreement(s) will include information summarizing the remedial actions at Site 24 and provisions for

terminating or modifying the Environmental Restriction Covenant and Agreement(s) when cleanup levels established in this ROD have been achieved and the remedial equipment has been removed.” Refer to the *Final Record of Decision, Operable Unit 1, Site 18 – Regional Volatile Organic Compound Groundwater Plume, Operable Unit 2A, Site 24 – VOC Source Area, Former MCAS El Toro, California* (Bechtel National, Inc. 2002) for additional information. The Record of Decision for Site 16 is expected to contain a similar process for removal of temporary restrictions. Responsibility for development and enforcement of the temporary restrictions rests exclusively with the DON and the applicable state agencies depending on the nature of the controls. The City has no authority over the federal process to implement Institutional Controls at the former MCAS El Toro regardless of mitigation measures proposed in the EIR. See also the attached letter from the DON dated 25 April 2003, describing the public sale plan, including Findings of Suitability to Transfer and Lease in Furtherance of Conveyance processes as well as the methodology of imposing, monitoring, and removing environmental remediation restrictions.

Response to Comment D6

The City will adopt rules, policies, and regulations as needed that will supplement the implementation of the temporary institutional controls by the DON and other agencies. The City’s approach will be similar to and consistent with rules, policies, and regulations in use to control development and construction activities and enforced in a similar manner. Until the institutional controls are adopted by the DON via an Environmental Restriction Covenant and Agreement(s), the City cannot identify with certainty the specific rules, policies, and regulations that will be needed. Refer to Response to Comment D5 for an example of regulations that control development and construction activities.

Response to Comment D7

The City is cognizant of the potential for stormwater impacts from contaminated sites. However, at both Sites 16 and 24, the remediation activities are focused on treating contaminated groundwater. Because hazardous materials are not present at the surface of the site, there is minimal potential for stormwater to create a hazardous materials runoff. At Site 16, remediation of subsurface soil may be required, but it is expected to be completed prior to a fee conveyance to another party. Also refer to Response to Comment D8.

Response to Comment D8

Individual projects within the project area will be responsible for the development and implementation of specific Storm Water Pollution Prevention Plans (SWPPPs) and Water Quality Management Plans (WQMPs) to address the potential pollutants of concern based on the location, size, and type of development and proposed operations. Site specific BMPs and structural controls will be identified for each individual project based on the need to target specific potential sources of pollution. Implementation of Mitigation Measures

H/WQ 1 and H/WQ 2 (EIR, pages 5.7-24, 25) will ensure that these uses are implemented in accordance with local and state regulatory requirements.

Response to Comment D9

The City of Irvine agrees that implementation of a regional approach to stormwater management is preferred. To further this goal, the City's proposed Orange County Great Park drainage plan concept provides for the creation of large, natural drainage features that are designed to address regional water quality and flood control in a comprehensive manner. The proposed natural drainage corridors will function in a manner so as to control surface water flows and maintain and/or improve surface water quality, for stormwaters that emanate from both on-site development and development that occurs in surrounding areas. As described in the EIR, the drainage corridor concept is consistent with and facilitates the regional flood control master plan adopted by the Orange County Public Facilities and Resources Department, The Irvine Company, and the cities of Tustin and Irvine. In addition, regional water quality issues are proposed to be addressed by the project through the construction of "natural treatment system" (NTS) basins within the proposed natural drainage corridors. The IRWD has issued a draft Master Plan and draft EIR on this program. Figure 5.7-2 of the EIR identifies the location of the proposed drainage corridors and potential NTS water quality basins.

Response to Comment E1
Comment noted.

Response to Comment F1

This comment does not note any specific sections or tables requiring revision. The references to appendices and volumes identified in the EIR Section 5.2 *Traffic/Circulation* have been reviewed and revised appropriately. Additionally, the other EIR sections have been updated to correspond the correct lettering of appendices, as appropriate.

Response to Comment F2

The Jeffrey Road extension is not part of this project. Both the Jeffrey Road extension and the SR 133/Trabuco Road interchange are included in the North Irvine Transportation Model (NITM) program and are prioritized for construction in the NITM program based on the comprehensive NITM program traffic study. The NITM program does two things: it prioritizes and schedules the construction of traffic improvements needed to address development in the Great Park, and other undeveloped areas of North Irvine; also, it imposes a nexus fee program to ensure the timely construction of these improvement events.

Response to Comment F3

The normal practice in the City of Irvine has been a threshold criterion of 0.02 for major arterials, not 0.01 as stated in the comment. The 0.03 threshold is used for Congestion Management Plan (CMP) roadways to ensure consistency with the Orange County Congestion Management Plan.

Response to Comment F4

The freeway mainline and ramp peak hour analysis is included in the EIR pages 5.2-35, 5.2-36 and Appendix G. Furthermore, freeway congestion does in fact influence the traffic volume forecasts in the Traffic Impact Analysis. The Irvine Transportation Analysis Model (ITAM) takes congestion effects into account and distributes traffic to the most desirable/least congested route. Also refer to Response to Comment F24.

Response to Comment F5

Improvements associated with Trabuco Road and Irvine Boulevard have been included in the Great Park Traffic Impact Analysis and the NITM program, along with the Northern Sphere development itself. The mitigation measures for the Northern Sphere have been adopted by the City of Irvine as required mitigation measures. These improvements will also be conditions of approval for subdivisions processed within the Northern Sphere.

The financial difficulties of the State do not affect the funding source for the I-5 Freeway/Culver Drive interchange improvements. The funding source is Measure "M" funds derived from County tax revenue resulting from a sales tax increase approved by Orange County voters; as a result, the Measure M funds are not controlled by the State.

Response to Comment F6

The phasing listed is correct. The Portola Parkway to SR-241 segment should not be included. Refer to Response to Comment F2. Since the Trabuco Road/SR-133 interchange is funded but may not be completed until after 2025, it is appropriate to show the improvement operational in the post-2025 timeframe.

Response to Comment F7

The EIR correctly states that unfunded buildout roadway segment improvements are summarized in Table 4-3 of Appendix G. Regardless of the title of the table, the table accurately identifies unfunded future roadway improvements.

Response to Comment F8

The traffic associated with the unfunded, full expansion of the Musick Jail site is not included in the City of Irvine's current ITAM. However, based on the Musick Jail final EIR traffic analysis, the proposed expansion is expected to generate 4,253 additional trips on a daily basis. The additional 4,253 trips represent an increase of less than one percent compared to the other known development projects (e.g., Northern Sphere and Planning Area 40/Spectrum 8) that were explicitly included in the traffic analysis. The percentage is even smaller when all development anticipated within the study area (both within the City of Irvine and adjacent jurisdictions) is considered. Therefore, these additional trips are not considered significant. In addition, the Musick Jail expansion project is also required to mitigate any significant traffic impacts it may cause or contribute to.

Response to Comment F9

The segment of the I-5 Freeway referenced in the comment carries seven percent of the project traffic, not 10 percent as stated in the comment. The results contained in the Figure 5.2-17 take into account traffic redistribution effects. For instance, trips that leave the project site may be balanced by the South County work trips that now go to project provided employment opportunities rather than further north to the Irvine Business Complex.

Response to Comment F10

Within the EIR Section 5.2 *Traffic/Circulation*, references to Volume III Appendix K have been updated to references to Volume II Appendix G, where appropriate.

Response to Comment F11

The assumption that other mitigation measures are possible and not undesirable is based upon information from Caltrans, OCTA, and SCAG as embodied in the Regional Transportation Plan, wherein alternative improvements such as enhanced traffic service, TGM programs, etc. will serve to reduce freeway congestion. An example of an alternative improvement would be to provide additional mainline capacity.

Response to Comment F12

As shown in the EIR and supporting Traffic Impact Analysis (Appendix G, Tables 7-12 through 7-25), the project related traffic drops below the significance threshold at the Jeffrey Road interchange.

Response to Comment F13

The NITM Program includes engineering concept plans for freeway and corridor improvements. The engineering and right of way analysis completed as part of the NITM program has determined that the proposed mitigation measures are feasible.

Response to Comment F14

The comment suggests that Irvine Boulevard or Bryan Road might be impacted further west than the western limit of the study area. The traffic study analysis shows that neither the Culver Drive at Irvine Boulevard nor the Culver Drive at Bryan Avenue intersections are impacted by the project as shown on Tables 7-34, 7-37, and 7-40 of Appendix G of the EIR.

Response to Comment F15

The Traffic Impact Analysis includes all of the locations identified in the comment. The I-5 Freeway Northbound on- and off-ramps at Trabuco Road are analyzed as a single intersection in the traffic study rather than two separate locations as implied in the comment. The second intersection is located at Trabuco Road/Culver Drive.

Response to Comment F16

Irvine Center Drive and Irvine Boulevard within the study area are examples of CMP roadways. Exhibit 9-A in Appendix G of the EIR specifically identifies CMP facilities within the study area.

Response to Comment F17

Irvine Boulevard within the study area is a CMP roadway and was analyzed using a significance threshold of three percent in the traffic study.

Response to Comment F18

The performance threshold for Irvine Boulevard is LOS "E" rather than LOS "D". Using the 2000 Highway Capacity Manual, the additional roadway performance increase in delay allowed is up to 25-seconds in the peak hour.

Response to Comment F19

The City of Irvine's approved analysis methodology is the intersection capacity utilization (ICU) methodology. Although the ICU methodology does not specifically include any provision for the effects of pedestrian activities, the assumed capacity of 1,700 vehicles per lane per hour (vphpl) is less than the ideal capacity of 1,900 vphpl that are used in more detailed analysis

methodologies. One factor that could account for the more conservative capacity per lane is the effect of pedestrian activities.

Response to Comment F20

There is no Table 2-23 in the Traffic Impact Analysis (Appendix G of this EIR). It is assumed that the comment refers to Table 2-1 (Daily Roadway Capacity Assumptions). The capacities for freeways greater than 10 lanes were not explicitly listed on Table 2-1. However, the following capacities were identified in the analysis contained in Section 7:

<u>Lanes</u>	<u>Capacity (vehicles per day)</u>
12	250,000
14	290,000
16	330,000
18	370,000

Response to Comment F21

The traffic count data throughout the City of Irvine was collected in 2002. Only a small amount of traffic count data in the already developed areas of the adjacent cities to the east of the City of Irvine utilized existing conditions data from 2000 or 2001. Furthermore, such daily data has no effect on the future conditions traffic volume forecasts or analysis. Finally, the project impacts are identified and mitigation has been developed on the basis of the more detailed peak hour traffic data and analysis.

Response to Comment F22

The volume refers to the segment from the I-5 Freeway northbound on- and off-ramps to Yale Avenue.

Response to Comment F23

The capacity listed is a general planning capacity and reflects three northbound lanes and four southbound lanes (for a total of seven lanes). It is appropriate to use this capacity in the analysis, as the fourth southbound through-lane has most likely been constructed in response to actual traffic patterns and presumably serves the requirements of the greatest traffic volume. The Traffic Impact Analysis peak hour assessment of conditions at the actual intersection of Culver Drive at Trabuco Road takes into account merging into three southbound lanes.

Response to Comment F24

The traffic forecasts have been developed using the Irvine Transportation Analysis Model (ITAM), Version 3.01. The ITAM takes congestion effects into account, and congestion influences the assignment of traffic to the freeway and surrounding roadway system. It should be noted the generalized planning level freeway mainline capacities in the ITAM model are far lower than the volumes (exceeding 2,300 vehicles per hour) that have been observed on busy freeways in southern California.

Response to Comment F25

This data was inadvertently omitted from the existing conditions summary table only. The analysis results are included in Appendix F of the Traffic Impact Analysis (Page F-5) which is included as Appendix G of this EIR and indicate that the existing ICU values at this location are 0.58 in the AM peak hour and 0.82 (LOS "D") in the PM peak hour.

Response to Comment F26

The footnote means that the SR-133/Trabuco Road interchange was not treated as a funded 2007-2025 improvement in the EIR and was not included in the primary Traffic Impact Analysis. A special issues analysis examining the benefits/impacts of including this interchange for 2025 conditions was also included in the Traffic Impact Analysis.

Response to Comment F27

There is no change in the number of lanes shown on the I-5 Freeway north of Sand Canyon on the exhibits in the EIR or the supporting Traffic Impact Analysis. The segment of the I-5 Freeway north of Sand Canyon is shown as a 14-lane freeway ("14F") for existing conditions (Exhibit 3-A in the Traffic Impact Analysis and Figure 5.2-4 in the EIR); 2007 Conditions (Exhibit 4-A in the Traffic Impact Analysis and Figure 5.2-10 in the EIR); 2025 Conditions (Exhibit 4-C in the Traffic Impact Analysis and Figure 5.2-12 in the EIR); and Post-2025 Conditions (Exhibit 4-E in the Traffic Impact Analysis and Figure 5.2-15 in the EIR).

Response to Comment F28

It is incorrect to assume that the use of socioeconomic data (SED) rates results in generally lower traffic volumes. Traffic models validated using land use data or SED have both been shown to match (validate to) existing traffic volumes quite well. The adopted ITAM, version 3.01, uses socioeconomic data as a basis for analysis.

Response to Comment F29

The students included in the Great Park Traffic Impact Analysis were all treated as commuter students, thus generating the highest possible number of trips to and from the project. The model can handle both commuter students and resident (non-institutionalized group quarters) students. The analysis assumed 4,000 students in the 2007 analysis for both the Base Plan and the Overlay Plan. The analysis assumed 7,637 students in 2025 for the Base Plan and 7,800 students in 2025 for the Overlay Plan. This represents a change of 3,637 (Base Plan) to 3,800 (Overlay Plan) students from 2007 to 2025. The source of this data is the Great Park project description.

Response to Comment F30

The types of activities described in the comment are accounted for in the trip rates for residential land uses (see Table 5-10). These types of activities are

potentially included as non-home based productions (Other-to-Other or O-O) or as attractions (Home-to-Work/H-W or Other-to-Other/O-O).

Response to Comment F31

The numbers of students are based on the Great Park project description. The hours of travel have been derived from the regional travel demand model and correspond closely to home-work trips, which exhibit a heavy concentration in the peak hours of traffic. Staff and maintenance workers were derived directly from the number of students (see Table 5-9 of Appendix G to the EIR, land use to socioeconomic data conversion factors). There is no distinction between residents and commuter students made in the ITE Trip Generation Manual. ITAM does differentiate between commuter and resident students, and the Traffic Impact Analysis assumed the worse case scenario of all commuter students.

The trip generation rate for students is reasonable. The project was assumed to include only commuter students. Not every student travels to a college campus everyday. Nor does every student drive a single occupant vehicle to school. Finally, the data being referenced is land use based student trip generation, which was provided for informational purposes only and does not relate to the primary traffic impact analysis.

Response to Comment F32

The comment refers to the trip distribution exhibits. These exhibits present the percentage of project traffic, not actual traffic volumes. The percentage of trips oriented to the west is likely to drop over time, as the largest undeveloped areas of Orange County are located east of the project and will be more likely to interact with the Great Park project further out in time (e.g., 2025 versus 2007). The second part of the comment also mistakes the project trip distribution percentages for actual project volumes.

Response to Comment F33

The extents of the study area are appropriate. The study clearly identifies areawide congestion on the freeway system. The Traffic Impact Analysis has verified that the project's potentially significant impacts extend no further west than Jeffrey Road. The Traffic Impact Analysis (Appendix G of the EIR) informs the reader of the project impacts. The ITAM model, version 3.01, takes into account on-going development.

Response to Comment F34

Although the Great Park traffic study included all Northern Sphere roadway improvements identified as mitigation measures, improvements that were "project features" (including the referenced improvement) were inadvertently omitted. This does not affect the findings and conclusions of the Great Park traffic study, other than to potentially reduce the required mitigation. The NITM Program does take the referenced improvement into account.

Response to Comment F35

In accordance with the adopted City Traffic Study Guidelines, the subject roadway segment is not long enough to warrant separate analysis as a roadway segment. The more detailed peak hour analysis completed for the intersections of Culver Drive at Trabuco Road and Culver Drive at the I-5 Freeway southbound ramps more accurately depicts the actual lane requirements for the segment of Culver Drive between these two intersections. The reason no peak hour segment analysis was performed for Culver Drive from Trabuco Drive to Walnut is that the daily roadway segment analysis for the subject segments was below the 0.02 impact significance criteria.

Response to Comment F36

The mainline freeways are already deficient under existing conditions. It is the responsibility of the regional agencies to address these deficiencies. Pursuant to City policy, the City of Irvine is working in close coordination with Caltrans regarding the improvements needed to mitigate identified project impacts. The City of Irvine does not control freeway improvements and cannot guarantee the implementation of the identified mitigation measures. For that reason, the EIR conservatively concludes that the impacts remain significant and unmitigated. Refer to Response to Comment F24 regarding the impact of freeway congestion on trip distribution.

Response to Comment F37

In accordance with the Caltrans standards, the Type 7 ramp most accurately defines the subject ramp. The Traffic Impact Analysis has identified a deficiency and mitigation to reduce the project impact to insignificant levels has also been identified, regardless of the initial ramp configuration.

Response to Comment F38

The geometric configuration referred to in the comment is actually shown in the ITAM model as Walnut Avenue. The ramp itself conforms to Caltrans standards and the analysis has been completed at an appropriate level of detail and accuracy. The movement of trucks is explicitly considered in Caltrans design standards.

Response to Comment F39

Refer to Response to Comment F24. The NITM Program is the implementing mechanism for the freeway ramp mitigation at the proposed SR-133/Trabuco Road interchange. This improvement will reduce traffic congestion at the I-5 Freeway/Sand Canyon Avenue interchange by providing an alternative means of freeway access. Therefore, no additional traffic diversions as theorized in the comment are anticipated.

Response to Comment F40

Refer to Response to Comment F36. The City of Irvine is working with Caltrans to implement mitigation related to the Great Park project where project impacts

have been identified. The commentor is addressing areawide congestion issues. Because the City of Irvine does not control freeway improvements and cannot guarantee the implementation of the identified mitigation measures, the impacts remain significant and unmitigated, as described in the Traffic Impact Analysis.

Response to Comment F41

Comment noted. In accordance with the City's adopted traffic study guidelines, the threshold for significance of traffic impacts is a 0.02 increase in the volume-to-capacity ratio caused by the project. The identified roadway segment was measured to have a volume-to-capacity increase of less than 0.02 and thus no further analysis was required.

Response to Comment F42

No mitigation is required because the project does not worsen the ICU value by 0.02 or more. In fact, the Great Park project actually results in a decrease in ICU in some instances.

Response to Comment F43

Comment noted. The discussion in the Great Park traffic study is intended to address pedestrian and bicycle circulation issues directly related to the project site. Future bicycle connections through PA9A or within the SCRRA right-of-way are not a part of this project. Refer to Response to Comment F59.

Response to Comment F44

Although the westbound approach (Bryan Avenue) currently has two lanes in each direction, the table referenced in the comment (Table 3 in Appendix G of the EIR) incorrectly indicates three westbound through lanes and will be corrected in the final EIR. The City's Traffic Impact Analysis for existing and buildout conditions assumed the existing two lanes in each direction. The attached table (F44-1) shows that the corrected 2007 and 2025 traffic conditions and indicates that no significant traffic impacts occur.

Response to Comment F45

The comment is correct, the ">" symbol indicates a right turn "overlap" or green arrow that allows simultaneous movement with the associated left turn movement (e.g., northbound right turns and westbound left turns, etc.).

Response to Comment F46

Based on the NITM Program engineering concept drawings, the east-side of Yale Avenue would be widened by 6 feet or less to accommodate the proposed improvement. No widening on the west-side of Yale Avenue, where the landscape is located, is anticipated.

Response to Comment F47

The NITM analysis has further investigated this location and the improvement noted in the EIR has been modified. The improvement required will be funded by

NITM. The current engineered proposal to provide acceptable levels of service at this location would not include a free westbound right turn lane at this location. A dual westbound right turn lane configuration would be accomplished by widening the north side of Trabuco Road approximately 12 feet. Slight widenings of Culver Drive will also be required to accommodate the 3rd northbound through lane. The improvement required will be funded by NITM.

Response to Comment F48

The third EB-through lane identified for Irvine Boulevard at Jeffrey Road could be accomplished by widening the north side of Irvine Boulevard.

Response to Comment F49

Comment noted. The timing of these improvements may in fact occur in conjunction with the PA-8A development, but is not related to the Great Park impacts or mitigation requirements.

Response to Comment F50

Based on the Orange County Public Library (OCPL) capacity standards and an anticipated population of 7,681, under the Great Park overlay an additional 1,536 square feet of floor space and 11,522 volumes will be required to serve the project. Since the average size of a library facility is 10,000, construction of a new facility would not be warranted. To meet the demand the Heritage Park facility could possibly be expanded in conjunction with demand created by other projects. The project area will continue to be served by the El Toro Branch facility and the new Foothill Ranch facility. Since a portion of property taxes are specifically allocated for capital improvement and operating costs for the County public library system, additional residents will make a financial contribution to expand and/or construct new library facilities.

Response to Comment F51

The Foothill and Eastern Transportation corridors are currently used by a substantial number of commuters. It is expected that tolls will be removed from the Foothill and Eastern Transportation Corridors in the future (i.e., post 2025). Also, buildout of the region would not occur for another 20-25 years. Regardless of whether or not tolls are collected, the completion of the Foothill and Eastern Transportation corridors will improve accessibility to new distant residential developments. Traffic impacts are addressed in the Traffic Impact Analysis in Appendix G of this EIR.

Response to Comment F52

New development within the surrounding area, including but not limited to, the Spectrum 8 and Northern Sphere projects, will include the development of additional residential dwelling units and provide housing opportunities. Therefore, a portion of future housing demand will be absorbed by these developments. The EIR does not premise the conclusions regarding population and housing impacts on the ability of other developments to provide housing.

The EIR has concluded that the proposed project will result in a significant unavoidable impact associated with jobs/housing balance. Also refer to Response to Comment HH1.

The City agrees that, in general, residential uses create a greater demand on city services while generating less revenue, whereas non-residential uses (commercial and employment based uses) create less of a demand on services and generate more revenue for the City. These basic fiscal principles are evaluated for each General Plan amendment proposed within the City, including the Orange County Great Park plan and the information is provided to the City Council.

A white paper was developed to further evaluate key issues raised by the Spectrum 8 draft EIR population and housing analysis. The *Population/Housing Issues in Planning Area 40* (Carla Walecka, March 2003) concludes that, in a broader context, southern Orange County is a housing-rich community and the jobs/housing imbalance is not the only methodology that applies to regional growth forecasts. Growth impacts resulting from the proposed project have been substantially anticipated by adopted city, county, and regional growth forecasts. The referenced document states that:

“Professional literature and research customarily examine jobs/housing relationships at a subregional or county scale, not at the project or city scale...the [Spectrum 8] project is very beneficial because it balances the housing-rich nature of southern Orange County. Without jobs [in central Orange County], south Orange County residents would have to travel farther north or east for job opportunities. This would result in greater imbalance between jobs and housing opportunities, and exacerbate congestion and associated air pollution.”

The City of Irvine concurs with the conclusions stated in the Spectrum 8 EIR and further evaluated in the *Population/Housing in Planning Area 40* document (Carla Walecka, March 2003).

Response to Comment F53

As stated on page 5.14-2 of this EIR, the standard response times promoted by the City of Irvine Police Department are considered appropriate for the community. As stated in the EIR on page 5.14-2, the City of Irvine's Police Department response guidelines state:

- Responding to “emergency” events within six minutes, 85 percent of the time.
- Responding to “crimes in progress” events within 10 minutes, 85 percent of the time.
- Responding to “less serious crimes occurring now” events within 20 minutes, 90 percent of the time.

- Responding to “routine calls for service” events within 60 minutes, 85 percent of the time.

These response times are established by the City’s Strategic Business Plan to ensure that appropriate resource levels are required for the Public Safety Department.

Response to Comment F54

Estimates of police personnel required for the Great Park are based upon current demand levels coupled with anticipated call for service based on the specific land uses in the plan rather than an officer-per-resident standard. Based on the City of Irvine’s Police Department current staffing formula, the proposed project would require between 17 and 22 sworn police officers, three to five sworn police supervisors, and eight to 11 non-sworn support staff. Funding required for these new police personnel would be provided through a special assessment levied against the property owners within the project area.

Response to Comment F55

Following annexation, the entire project area will be within the City’s corporate boundary and within the jurisdiction of the City of Irvine Police Department. Sharing the cost of policing the Great Park with the County of Orange is a policy issue. The fiscal plan for the OCGP Plan proposes fees and assessments to fund police services for the public park portions (i.e., Sportspark, Meadows Park, Exposition Area South, and the drainage and wildlife corridors). Special assessments will be applied to new development within the project area remaining on the tax rolls after the dedication of public use areas identified in the Great Park Plan.

Response to Comment F56

Refer to Response to Comment F53. Proposed additional police personnel numbers are based on the City of Irvine Police Department’s staffing formula; anticipated calls for service to the project area are determined by the Police Department based on historical data regarding the proposed land uses.

Response to Comment F57

The comment regarding “mitigation measures” refers to the construction and/or operation of public facilities within the project area. Construction impacts related to the development of public facilities within the project area are likely to be short-term events; operation impacts are considered long-term events. Construction and operation impacts associated with public facilities are considered under in Sections 5.1 *Land Use*; 5.2 *Traffic and Circulation*; 5.3 *Air Quality*; and 5.4 *Noise*.

Response to Comment F58

Comment noted. Section 5.14.2.1 *Public Services and Facilities Environmental Setting* has been amended to read:

“OCFA is planning two additional fire stations. Station No. 55 will be located in Northwood on the north side of Portola Parkway between Yale and Jeffrey, and Station No. 47 will be located near Sand Canyon and Interstate 405.”

Response to Comment F59

The final alignment of the Venta Spur connection through PA9, specifically in the area east of Sand Canyon, has not been determined. Figure 3-7 has been corrected to show a Class I trail along the north side of Trabuco Road, from the Eastern Transportation Corridor to the Meadows Loop Road.

Response to Comment F60

Comment noted. The actual parkland dedication requirement will be calculated during the review of subdivision maps for future residential developments, using the most current City of Irvine standard. It should be noted that community parkland dedication requirements will be deemed satisfied with the commitment to participate in the Development Agreement. The total amount of parkland in the project far exceeds the minimum required by the existing or proposed standard.

Response to Comment F61

Refer to Response to Comment F50. The square footage assigned to PAZ13 for museum/library facilities is necessary to determine traffic and other environmental impacts of the proposed project. The determination of how that square footage will ultimately be developed is dependent upon future opportunities and funding sources for these types of public facilities.

Response to Comment F62

The EIR bases its water demand analysis on the greatest demand, which is the Overlay Plan, as it proposes the greatest level of development under the proposed project. Refer to the attached IRWD comment letter (specifically comment G4) which confirms that the water district would utilize the Overlay Plan as representing the “worst case scenario” for water demand. Refer also to the IRWD Water Supply Assessment (Appendix C of the EIR) for further information about water supply.

Response to Comment F63

The Orange County IWMD’s CIWMP was approved in 1996 and shows that sufficient solid waste disposal capacity is available in the County for approximately 25 years, based on population projections for the area. Considering the potential for expansion by the County does not imply that current and near-future capacity is lacking.

The Regional Landfill Options for Orange County (RELOOC) is a long-term 40-year plan that is part of the County’s effort to assure that the countywide landfill system remains adequate, solvent, and efficient in the long term. Sufficient local

capacity for Irvine at Bowerman Landfill and the other County disposal sites is not in doubt in the short to mid-term even without implementation of RELOOC. In the longer term, RELOOC provides sufficient contingencies should they become necessary to manage additional solid waste from future anticipated countywide development. Refer to Response to Comment H49.

Response to Comment F64

Refer to Responses to Comments F63 and H48. Although the IWMD system has capacity for approximately 25 years, the District anticipates that the Bowerman Landfill will reach capacity by 2022. The ability to accommodate waste at other facilities is being planned by the IWMD.

Response to Comment F65

Comment noted. A primary goal of City policy will continue to be maintaining compliance with the California Integrated Waste Management Act (AB939), requiring good faith effort to divert 50 percent of total solid waste from landfills. Contrary to the assertion that recycling goals for the project are “unambitious and meaningless,” the specific goal of this project to recycle 75 percent of construction and demolition debris commits the City to a much more ambitious effort than the minimum required by state law.

Regarding recycling (diversion) rate calculations, the City cannot exclude any materials generated by the project that, if landfilled, would be counted as disposal and therefore detrimental to the City’s overall diversion rate and its compliance with AB939. Any material that would be counted as disposal at the landfill should be calculated and credited to the City as diversion if it is recycled.

Response to Comment F66

Comment noted. Mitigation Measure SW 5 (page 5.15-24 of the EIR) has been amended to read:

“For green waste, the project applicant must submit a written plan to the City and implement such a plan to ensure that the green waste material generated by landscape maintenance operations is collected by a City-authorized waste hauler or recycling agent, *that the maximum feasible amount of that collected green waste is recycled*, and that a minimum of 50 percent of the green waste from the project is diverted from landfills by recycling, as that term is defined by California Public Resources Code Section 40180.”

Response to Comment F67

As with the development of any new project, modifications to existing electric systems would be necessary. Such is the case with the proposed project. As stated in Section 5.15.5.3 *Utilities Environmental Impact*:

“...the proposed project would consume 59.1 million kilowatt hours per year....The proposed project would have a peak load of 14,771 kilowatts. Sufficient available capacity exists at the Irvine and Limestone Substations to serve the proposed project’s load estimates. However, the existing overhead 4 kilovolt distribution system currently serving the former MCAS El Toro would be replaced with an underground 12 kilovolt distribution system....The additional electrical load imposed by the proposed project is within the capacity of SCE.”

The EIR states on page 5.15-27 that the Base and Overlay Plans propose to replace the existing electrical system in its entirety, complying with modern design methods, performance standards, and specifications. The new system will be installed to generally coincide with the routing of new and existing roadways. Electrical lines will be required to be underground pursuant to City standards. The specifics of the new electric distribution system and the necessary environmental evaluation will be determined as site specific plans for the installation are prepared.

Response to Comment F68

The proposed project will be served from the 12kV distribution lines that interconnect with the existing SCE 66/12kV Irvine Substation, directly outside the gate of the former MCAS El Toro. This substation has sufficient capacity to serve the proposed project. Sub-transmission lines interconnect this substation to the existing SCE 230/66kV Santiago substation and the 66/12 kV Bryan Substation. SCE has indicated that no additional sub-transmission lines are planned to increase the capacity at the Irvine substation.

Refer to Response to Comment F67 for information pertaining to the modification of existing electrical systems resulting from implementation of the proposed project. Modifications deemed necessary to the electrical system will be considered as specific development proposals are initiated. Section 5.15.5.3 *Utilities Environmental Impact* states:

“...new [electrical] system will be installed to generally coincide with the routing of new and existing roadways circulating throughout the project. Electrical lines will be required to be underground pursuant to City standards.”

The EIR states on page 5.15-29 that sufficient available capacity exists at the substations serving the proposed project and “that the existing overhead 4kV distribution system currently serving the MCAS El Toro would be replaced with an underground 12 kV distribution system.” No analysis has indicated that a new transmission line greater than 12 kV will be required to serve the proposed project. The specifics of the new electric distribution system and the necessary environmental evaluation will be determined as site specific plans for the installation are prepared.

Response to Comment F69

SCE generally uses a peak load standard of 50,000 kW for "significant impact". The proposed project's maximum estimated electrical demand is 35,000 kW.

The CEQA Environmental Checklist, Appendix G, outlines the Thresholds for Determining Significance for energy. As stated in Section 5.15.5.2 Utilities Threshold for Determining Significance:

"Would the project result in substantial adverse physical impacts associated with the provision of new or physically altered energy and communication transmission facilities, need for new or physically altered energy and communication transmission facilities, the construction of which would cause significant environmental impacts, in order to maintain acceptable levels of service?"

The City defines a significant impact to the current level of electric service for the project to be requiring more electrical energy than SCE has the stated ability to provide. The Threshold for Determining Significance is answered in full in Section 5.15.5.3 *Utilities Environmental Impact*.

Section 5.15.5.3 *Utilities Electrical Facilities and Service* discusses the expansion of the electrical system to serve the project. The EIR states on page 5.15-30 that the proposed project's consumption of electricity is 0.05 percent and peak demand is 0.06 percent of the California Energy Commission's forecast for Southern California Edison (SCE) in 2012. Furthermore, SCE has indicated its ability to serve the projected project in accordance with all applicable tariff schedules.

Response to Comment F70

Section 5.15.5.3 *Utilities Electrical Facilities and Service* discusses the expansion of the electrical system to serve the project. The comment discusses the adequacy of generation and transmission systems and incentives and disincentives to investment in electrical system infrastructure on a statewide basis. These comments are considered beyond the scope of the proposed project. SCE indicates that there is no transmission congestion within the project area.

Response to Comment F71

SCE has sufficient transmission capacity to provide power to the project. Refer to Responses to Comments F67 through F69 for information pertaining to the modification of existing electrical systems resulting from implementation of the proposed project. Analysis indicates that a new transmission line greater than 12 kV will not be required to serve the proposed project. Any other SCE system enhancements would be required to obtain the necessary licensing/regulatory approvals and would not impact the proposed project.

Response to Comment G1

Comment noted.

Response to Comment G2

The first paragraph on EIR page 5.15-5 is amended to read:

“The proposed project’s impact on water supply and the ability of the water provider to provide a water source to the project site has been assessed by the IRWD in accordance with the requirement of ~~SB904~~ SB610 and SB221, both effective 2 January 2002, and the water supply assessment (WSA) contained in Appendix C complies with the most recent statutory requirements and concludes that adequate supplies are available to serve the proposed project.”

Response to Comment G3

Comment noted. The record is hereby incorporated by reference.

Response to Comment G4

Comments noted.

Response to Comment G5

Comment noted.

Response to Comment G6

Comment noted.

Response to Comment G7

Comment noted.

Response to Comment G8

The assumption should be clarified that only existing infrastructure that meets IRWD standards will be preserved for future use.

Response to Comment G9

The EIR is amended to correctly indicate that potable water is and will be used to irrigate the IRWD parcel.

Response to Comment G10

Comments noted.

Response to Comment G11

Comment noted.

Response to Comment H1

The proposed zoning for the property consisting of the Base Plan and the Overlay Plan is fully described in the “Introduction”, “Project Description” and “Land Use” sections of the EIR. As described in those sections, the proposed zoning consists of a Base Plan which provides a lower intensity and density of development and a higher proportion of land dedicated to open space and public uses. The Overlay Plan provides a higher intensity and density of development if the property owners enter into a Development Agreement with the City of Irvine (Appendix D of the EIR) requiring, among other provisions, dedication of land for open space and public uses and payment of fees for the provision and maintenance of the public infrastructure.

The parcels to be dedicated to the County of Orange through the Development Agreement are labeled as PAZ23 with General Plan and zoning designation of Institutional (Inst/Inst – 6.1/6.1) and PAZ4 with General Plan and zoning designation of Agriculture in both Base and Overlay plans. The development intensity for these sub-areas is also identical under both Base and Overlay plans. This information is provided in Tables 3-3 and 3-4 of the EIR.

The EIR provides a clear description of the “project” stating that the commonly used overlay zoning tool has been utilized for the project site. The EIR also clearly states that the Overlay Plan represents the maximum density and intensity of development proposed. All sections of the EIR analyze the potential impacts of both the Base Plan and the Overlay Plan and identify mitigation measures for each plan.

Response to Comment H2

The Great Park EIR assesses potential impacts of proposed uses for the entire former MCAS El Toro owned by the federal government and administered by the DON. The DON has been supplied with the proposed land plan and the EIR. The DON agreed that the land plan is consistent with their Record of Decision and their intent to sell the property at public auction. The DON has also agreed with the provision of the Great Park Development Agreement that requires, among other things, the dedication of 100-acres of property from the property owner to the County upon the election of receiving the development rights of the Overlay Plan. The EIR assumes certain development intensities that are consistent with the intentions of the landowner (DON) and the expectations of the City of Irvine. The EIR also assumes development intensities for the 100-acres that may be dedicated to the County, consistent with the list of uses provided in the Property Tax Transfer and Pre-Annexation Agreement in Section 2.2.4. Although the County refers to previously proposed land plans and the County’s 1996 EIR, these documents are not consistent with the current intentions of the landowner (DON) or the City of Irvine and are not relevant to this EIR. If the County becomes the owner of the 100-acres, it can then assess development intensities provided in the program EIR and evaluate its specific development plans for the site. No specific development plans for the site by the County have

been provided to the City, nor is the County a landowner of the property. Any development proposed by the County, if it becomes a landowner in the future, which is not consistent with the proposed plan and EIR, will require additional environmental evaluation.

The City recognizes that the County's development of governmental uses on the 100-acres is not subject to City zoning or building controls. The City also recognizes that its land use assumptions for the 100-acres are an estimate based upon no current County plan, and that any trip limits used in the Traffic Impact Analysis for the Great Park project do not restrict the County's use of the 100-acres for governmental purposes. Finally, the City recognizes that, as the County defines its project and proposed uses for the 100-acres, the County will analyze traffic and other impacts from this project as required by law.

Response to Comment H3

Comment noted. While the EIR evaluated the Musick Jail Facility for its contribution of impacts to the project, the Final EIR will reflect that the Musick Jail Facility will not be included in the City of Irvine's annexation proposal.

Response to Comment H4

Comment noted. Mitigation Measure H/WQ 3 (EIR page 5.7-26) has been amended to read:

"Prior to approval of the first tentative tract or parcel map in the project area, detailed hydrology and hydraulic analysis shall be conducted. Studies and analysis shall be prepared in accordance with OCFCD methodologies and standards and the Flood Control Master Plan for San Diego Creek, as well as any additional guidelines in effect at the time of project design. Recommendations contained in the hydrology studies and/or hydraulic analysis to address drainage/flooding issues related to proposed development shall be implemented. Compliance with this measure shall be verified by the Community Development Department."

Response to Comment H5

The hydrologic and hydraulic analysis referenced in Mitigation Measure H/WQ 3 are to be performed in "accordance with OCFCD Methodologies...as well as any additional guidelines in effect at the time of the project design" which includes utilizing the appropriate Manning's "n" value for the conveyance type. Approval from the OCFCD will be obtained prior to any construction activity on the proposed drainage corridors.

Response to Comment H6

The hydrologic and hydraulic analysis referenced in Mitigation Measure H/WQ 3 are to be performed in "accordance with OCFCD Methodologies, as well as any additional guidelines in effect at the time of the project design" would include analyzing as applicable the effects of sediment deposition, meandering, scour,

erosion and bank stability with appropriate recommendations for slope protection. Approval from the OCFCD will be obtained prior to any construction activity on the proposed drainage corridors.

Response to Comment H7

The hydrologic and hydraulic analysis referenced in Mitigation Measure H/WQ 3 are to be performed in “accordance with OCFCD Methodologies, as well as any additional guidelines in effect at the time of the project design” includes addressing drainage/flooding issues related to proposed development. Approval from the OCFCD will be obtained prior to any construction activity on the proposed Bee Canyon and Agua Chinon drainage corridors.

Response to Comment H8

The hydrologic and hydraulic analysis referenced in Mitigation Measure H/WQ 3 are to be performed in “accordance with OCFCD Methodologies, as well as any additional guidelines in effect at the time of the project design” would include studying diversions with appropriate justification and mitigation. Approval from the OCFCD will be obtained prior to any construction activity on the proposed Agua Chinon drainage corridor and the proposed Borrego wildlife corridor.

Response to Comment H9

The hydrologic and hydraulic analysis referenced in Mitigation Measure H/WQ 3 are to be performed in “accordance with OCFCD Methodologies, as well as any additional guidelines in effect at the time of the project design” would include addressing the concerns raised in this comment. Approval from the OCFCD will be obtained prior to any construction activity on the proposed Borrego Channel and Serrano Creek corridors.

Response to Comment H10

Comment noted. Prior to concept design or preliminary engineering it will be necessary to receive approval from the Manager, Flood Control Division. Initial meetings have occurred regarding the drainage plan.

Response to Comment H11

Maintenance responsibility for the proposed flood control facilities has not been determined. The question of maintenance responsibility will need to be addressed during the preliminary design process. Maintenance will be, in part, the County of Orange’s responsibility for some facilities, and the City of Irvine’s responsibility for other facilities, depending on the ultimate design solution implemented.

Response to Comment H12

Mitigation Measure H/WQ 3 addresses preparing detailed studies in accordance with...“the Flood Control Master Plan for San Diego Creek (FCMPSD).” Refer to Response to Comment H4.

Response to Comment H13

Refer to Response to Comment H11.

Response to Comment H14

Refer to Response to Comment H11.

Response to Comment H15

Mitigation Measure H/WQ 4 addresses the potential impact of project construction and flood control improvements occurring in tandem. Approval from the OCFCD will be obtained prior to any construction activity.

Response to Comment H16

The Natural Treatment System (NTS) basin proposed to be placed in Marshburn Basin is a part of the Irvine Ranch Water District NTS system and not of this proposed project. Because the basin will be upstream of the development area, the basin is not a part of the project design.

Response to Comment H17

The hydrologic and hydraulic analysis referenced in mitigation measure H/WQ 03/B3 are to be performed in “accordance with OCFCD Methodologies, as well as any additional guidelines in effect at the time of the project design” includes reconciling Master Plan facilities (e.g., raceway stormdrain) in relationship to the project requirements.

Response to Comment H18

Adequacy of existing facilities should be analyzed based on ultimate discharges as provided by the OCFCD. Mitigation Measure H/WQ 3 would include this type of analysis. Refer to Response to Comment H4.

Response to Comment H19

Mitigation Measure H/WQ 4 addresses the LOMR process.

Response to Comment H20

Any work within OCFCD or County of Orange right of way will require encroachment permits. The submittal process for an encroachment permit would occur at the time construction drawings are available for submittal.

Response to Comment H21

A significant amount of open space and recreational opportunities comparable to the type of activities associated with County regional parks will be provided within PA 51 of the project site. As described in Section 3.0 and illustrated on Figure 3-1 of the EIR, PA 51 is proposed to be annexed into the City. Upon annexation, this portion of the project area will be subject to City of Irvine General Plan land use and zoning designations. There is no equivalent “regional park” land use designation or zoning district in the City. Therefore, no portion of the project site has been designated as “regional park” although the functionality of proposed

park areas will be very similar to various existing parks in the County's regional parks system. Tables 3-3 and 3-4 of the EIR provide a statistical summary of open space and recreational acreage proposed within the project area.

Response to Comment H22

Refer to Response to Comment T1. As described in Section 5.9 *Biological Resources*, a wildlife corridor is proposed where one currently does not exist. Figures 1-2, 1-3 and 5.9-2 of the EIR depict the proposed wildlife corridor alignment. As shown, a majority of the wildlife corridor traverses passive uses, such as the golf course and park uses which are not anticipated to generate significant noise levels. In fact, the alignment of the wildlife corridor was shifted west, away from existing industrial uses located immediately east of the base, in part with consideration of potential indirect effects from these existing off-site uses. Within PA 30, the alignment of the corridor is fixed between the underpass of the SCRRA railroad tracks and the I-5 Freeway/I-405 Freeway undercrossing. In this area, indirect effects are likely to be of more concern to the functionality of the wildlife corridor.

The EIR describes guidelines that will be incorporated into the implementation of the corridor. Specifically, as described in Section 5.9 *Biological Resources*:

“The revegetation/restoration plan would need to address various issues to increase the viability of the proposed corridor and will need to be prepared based on the following criteria:

- **Reduce the amount of noise pollution and urban influence.** Sight and sound barriers need to be constructed at the edges of the corridor to help create a secluded, natural setting. Barriers may range from artificial sound walls to natural diversions such as hedges and tree lines.” (EIR, p. 5.9-22)

With respect to Planning Area Zone 2, under the proposed Overlay Plan PAZ 2 is proposed for residential development; however, this portion of the project site is currently developed with residential uses associated with the former base (refer to Figure 1-4 of the EIR). Any reuse or redevelopment of PAZ 2 with residential uses would not likely increase the level of noise impacts on the adjacent habitat preserve.

Response to Comment H23

Implementation of the proposed project will not create an impact to any existing wildlife corridors. Therefore, the provision of a linear corridor through Planning Area Zone 2 (PAZ 2) is not a mitigation measure required to mitigate any significant impact associated with the proposed project.

The City agrees that maintaining connectivity to regional habitat preserve areas is desirable. As such, the City has proposed the wildlife corridor as a major

feature of the proposed project. The primary goal of the wildlife corridor is to provide a viable connection between the Habitat Preserve Area (which, in turn, is connected to the NCCP Preserve Area) with the Laguna Coast Wilderness Park to the south. The alignment of the corridor has been carefully planned with significant input from various wildlife entities and stakeholders.

Response to Comment H24

With respect to Planning Area Zone 2, under the proposed Overlay Plan PAZ 2 is proposed for residential development; however, this portion of the project site is currently developed with residential uses associated with the former base (refer to Figure 1-4 of the EIR). Any reuse or redevelopment of PAZ 2 with residential uses would not likely increase the level of lighting impacts on the adjacent habitat preserve.

Response to Comment H25

The proposed Conservation Zone widths have been planned to achieve the maximum widths feasible. However, the proposed wildlife corridor is constrained in several areas as a result of many factors including existing development, roadways, and topographical conditions. The functionality of the wildlife corridor is not solely dependent upon width, and in areas where the width becomes more restrictive more care would need to be taken to implement measures to reduce the potential for edge effects and ensure that the corridor is attractive for wildlife.

Response to Comment H26

Tables 3-3 and 3-4 of the EIR depict a statistical summary of potential project development, including park acreages. Page 5.9-16 of the EIR has been corrected as follows:

“In addition, under the Base Plan, low to moderate quality foraging habitat (comparable to the existing agricultural fields) in the form of the approximately 576 acres of proposed golf course, ~~988~~ 716 acres of parkland, 438 acres of agriculture, 179 acres of wildlife corridor, and 229 acres of drainage/riparian corridor (~~2,410~~ 2,138 acres total) will be available after the completion of the project.”

Response to Comment H27

Tables 3-3 and 3-4 of the EIR depict a statistical summary of potential project development, including park acreages. Page 5.9-16 of the EIR has been corrected as follows:

“Under the Overlay Plan, low to moderate quality foraging habitat (comparable to existing agricultural fields) in the form of approximately 526 acres of proposed golf course, ~~547~~ 382 acres of parkland, 303 acres of agriculture, 179 acres of wildlife corridor, and 229 acres of drainage/riparian corridor (~~1,784~~ 1,619 acres total) will be available after the completion of the project.”

Response to Comment H28

Page 5.9-18 of the EIR has been corrected as follows:

“The wildlife corridor provides connection to the ~~995~~ 975-acre habitat preserve, as well as the Limestone-Whiting Wilderness Park.”

Response to Comment H29

The City has a policy of encouraging alternative modes of transportation, including bicycling. The City of Irvine General Plan Circulation Element Policies establish various goals and implementation measures for this purpose. As such, the City of Irvine has one of the most advanced bike trails systems in Orange County. The proposed plan links the entire Planning Area 51 through Class I and II bicycle trails as well as a hiking and riding trail system. The Class I trails have been designed to link the recreational, educational and culture uses within the Great Park. In addition, the City's Bicycle Transportation Plan is scheduled to be updated in 2005. Bike trail alignments, amenities, and grade separations will be discussed in that update.

Response to Comment H30

The County Master Plan of Regional Riding and Hiking Trails does not show the connection between the Serrano Creek and Hicks Canyon Trails alluded to in the comment. The Riding and Hiking Trail link that is being deleted is shown on the City of Irvine Trails Network Plan only. The link being deleted has been determined to be infeasible due to existing industrial development along the proposed route through PA 35, the inability to use the existing flood control improvement at Bake Parkway for the trail undercrossing, and other route specific impediments.

Response to Comment H31

The County of Orange's proposed Borrego Canyon bikeway traverses the NCCP/HCP that remains in federal control and is considered to be habitat for sensitive and endangered species. As such, the City has chosen not to show the proposed connection. The project does not propose to add this trail connection. A Class I off-street bikeway will be located in the proposed drainage swale that carries Agua Chionon drainage between Irvine Boulevard and the Irvine Transportation Center. The County should consider realigning its proposed Borrego Canyon bikeway to join this trail or using the proposed Class II bikeway along the future Alton Parkway extension as an alternate route for bicyclists.

Response to Comment H32

Page 5.14-18 of the EIR has been revised as follows:

Both on-road (~~Class I~~ Class II) and off-road (Class I ~~Class II~~) bikeways are planned for the site, linking the site with the regional bikeway system.

Refer to Responses to Comments H35 through H38 with respect to regional trail connections.

Response to Comment H33

The EIR does address policies and programs supporting alternative modes of transportation. This EIR has followed CEQA Guidelines (Appendix G) as the guide to select Significance Thresholds. While the proposed trail system may differ in some areas with other plans, it does propose an extensive bike trail system that links the project internally and to the regional system. On page 5.2-63, the EIR presents the opportunities offered by the proposed project's recreational, educational, and transit-oriented uses for an enhanced bike trail network. The EIR also states that connections should be considered to Portola Parkway as well as encouraging additional trails for a more extensively linked network. As the project reaches its implementation stages, there will be opportunities for these considerations. Refer to Responses to Comments H29 through H31.

Response to Comment H34

The subheading "Trails and Bikeways" has been added between the fourth and fifth paragraphs on page 5.2-62 of the EIR.

Response to Comment H35

Cyclists of all levels will be able to use the proposed trail system for recreational and transportation purposes within the opportunities that the network will provide. As a community with an extensively designed and used bike trail system, the City of Irvine continually plans and develops additional trails, as well as linkages and amenities to enhance these opportunities. As stated in the EIR, the City of Irvine will continue to encourage such enhancements through the planning and implementation stages of the project. Refer to Response to Comment H29.

Response to Comment H36

Comment noted. The design of the Irvine Transportation Center includes the opportunity to link to Barranca and ultimately Alton Parkway via bicycle.

Response to Comment H37

The City of Irvine General Plan Circulation Element has established policies to connect the City's trails to the regional trail network. The Great Park plan will provide opportunities for the expansion of the trail system. As stated in the EIR, the City will continue to encourage such enhancements throughout the planning and implementation stages of the project.

Response to Comment H38

Figure 3-7 (EIR page 3-23) represents the trail system envisioned in the proposed project. The Great Park Plan includes vast areas of open space, recreational uses, as well as institutional and educational uses which will require detailed planning and design during the subsequent phases of the project. The

enhancement of the trail system will be part of the detailed planning process for those land uses, and can be integrated with the opportunities offered by those plans.

Response to Comment H39

Comment noted. Refer to Responses to Comments H29 and H38.

Response to Comment H40

The suggestion for inclusion of the Class I bikeway network into the Transportation Management Plan (TMP) will be considered. The TMP is not, however, intended to construct or maintain bikeways. The City of Irvine will coordinate with the County of Orange's Harbors, Beaches, and Parks during the implementation phase of the project for information about the bike trails that could be included in the TMP.

Response to Comment H41

Comment noted. The potential for grade-separated crossings will be identified during the later phases of more specific planning and implementation of the project.

Response to Comment H42

Figure 3-7 (EIR page 3-23) depicts the Great Park Plan Trail Network. Staging areas and details will be identified during the later phases of more specific planning and implementation of the project.

Response to Comment H43

The EIR addresses the proposed General Plan and zoning for the project site. At this time, the Equestrian Center is a permitted land use within the proposed General Plan and zoning designation for the existing site. The property will transfer to private ownership through the DON sale. The future property owner will determine the viability of an equestrian use at that time.

Response to Comment H44

The City of Irvine appreciates the offer to make a presentation on bikeways and trails planning to the County of Oranges, Harbors, Beaches, and Parks and the Orange County Regional Recreational Trails Advisory Committee.

Response to Comment H45

Mitigation Measures C1 through C4 address cultural resources; Mitigation Measure P1 (see Section 5.10 Paleontological Resources) addresses the potential for paleontological resource finds.

Any cultural resources discovered as a result of implementation of Mitigation Measures C1 through C3 would be curated at an acceptable archaeological repository within the County. Fees for storage and curation would be the responsibility of the developer/applicant for individual projects.

Response to Comment H46

Because 95 percent of PA 30 has not been surveyed, Mitigation Measure C1 requires an initial survey report which would include a records search, literature review, and walkover survey. A testing report will be required if the results of the initial survey report indicate the potential for cultural resources to be present on that portion of the project site subject to the cultural survey.

Response to Comment H47

Refer to Response to Comment H45.

Response to Comment H48

As described in the EIR, the County of Orange IWMD owns and operates three landfills to serve the solid waste disposal needs of the County. The City disposes the majority of its solid wastes at the Bowerman landfill. When the daily tonnage limit of one of the three IWMD landfills is exceeded, waste imported to that facility is reduced accordingly, and the excess tonnage is disposed of at one of the other facilities. The IWMD accepts wastes from outside of Orange County. Project refuse can be disposed of within any one of the three landfills in the County landfill system. The currently permitted maximum daily tonnage at the Bowerman landfill is 7,263, which is adjusted to increase by 1.75 percent per year with a maximum of 8,500 tons per day. Currently, the landfill accepts approximately 6,700 tons per day. Under the proposed Overlay Plan, the project would generate approximately 35 tons per day of solid waste. Thus the project would increase the tonnage received by the Bowerman landfill to approximately 6,735 tons per day, which is well below the existing 7,263 tons per day and the future 8,500 tons per day limit of the landfill.

Response to Comment H49

The Bowerman currently accepts additional landfill waste from outside Orange County. Should the cumulative effect of development within the Central Region watershed cause the daily tonnage ceiling to be exceeded, the waste being imported will be reduced by an amount sufficient to stay within tonnage limits.

Additionally, the California Integrated Waste Management Board requires that all counties have an approved Countywide Integrated Waste Management Plan (CIWMP). To be approved, the CIWMP must demonstrate sufficient solid waste disposal capacity for at least 15 years, or identify additional available capacity outside the County's jurisdiction. Orange County's CIWMP, approved in 1995, estimates future solid waste disposal demand based on countywide population projections adopted by the Board of Supervisors. IWMD's database estimates that the Orange County landfill system has capacity for approximately 25-years; therefore no significant cumulative solid waste impacts are anticipated. Continuation of local government efforts required under AB 939 to divert wastes from the County's landfills will also reduce the magnitude of cumulative impacts.

RELOOC is an acronym for “Regional Landfill Options for Orange County.” The RELOOC program is a 40-year strategic plan under preparation by the County IWMD, and is proposed to ensure that waste generated by the County is safely disposed of and that the County’s future disposal needs are met. The County IWMD is currently in the process of conducting the environmental review for the RELOOC program, with the EIR anticipated to be released in spring 2003.

The County’s waste disposal system includes three landfills, 20 former refuse disposal stations, and four household regional hazardous waste collection centers. The RELOOC implementation strategy is based on a “Phased Option” approach to managing solid waste disposal in the County, consisting of Phase 1 Short Term Strategies and Phase 2 Long-Term Strategies. Phase 1 strategies include, among others, fully utilizing the capacity of existing landfills files before seeking new site or alternative waste disposal methods. This would be achieved by maximizing operational efficiency at existing landfills (e.g., compacting refuse), increasing landfill capacity of the Frank R. Bowerman and Olinda Alpha landfills, and proactively encouraging recycling. Phase 2 strategies include determining if there is a need to increase the daily amount of solid waste permitted at the Prima Deschecha landfill, identification of strategies, including new technology, to maximize solid waste disposal capacity, and completion of a feasibility study of expanding the Bowerman landfill into the adjacent Round Canyon after the Bowerman landfill reaches capacity.

Response to Comment H50

Refer to Response to Comment H49.

Response to Comment H51

Refer to Responses to Comments F65, F66, and H49.

Response to Comment H52

Refer to Response to Comment H49.

Response to Comment H53

For both the Base Plan and Overlay Plan, only future roadway improvements with an identified funding source have been included for 2007 and 2025 conditions. Only the post-2025 (General Plan buildout) scenario includes unfunded improvements. This reflects circulation needs and development levels consistent with and required for General Plan buildout conditions only and is appropriate in this context.

Response to Comment H54

All of the intersections identified in the comment were in fact included in the Great Park Traffic Impact Analysis.

Response to Comment H55

Refer to Response to Comment H2. The “trip cap” approach is an appropriate mechanism for ensuring that future development conforms to the Great Park project description. As part of the North Irvine Transportation Improvement Program (NITM), each development proposal must submit a traffic analysis demonstrating consistency with the planned trip cap. The NITM program does two things: it prioritizes and schedules the construction of traffic improvements needed to address development in the Great Park, and other undeveloped areas of North Irvine; also, it imposes a nexus fee program to ensure the timely construction of these improvement events.

Response to Comment H56

This is unnecessary since the minor differences in the ICU assumptions between the City of Irvine and other jurisdictions, if any, would not affect the findings and conclusions of the Great Park Traffic Impact Analysis.

Response to Comment H57

Refer to Response to Comment H55.

Response to Comment H58

The Traffic Impact Analysis evaluates peak hour mainline freeway conditions for all land use scenarios. The peak hour mainline freeway conditions are presented in the EIR on pages 5.2-35 and 5.2-36 (Base Plan) and pages 5.2-53 and 5.2-54 (Overlay Plan) (see specific references to Appendix G).

Response to Comment H59

Ongoing studies and analysis (monitoring) in accordance with the NITM program will continue to ensure that mitigation measures are implemented in a timely and appropriate manner.

Response to Comment H60

Comment noted. The MPAH amendment process has been specifically identified as a required project mitigation measure. The City of Irvine has initiated a request to OCTA for the review of the proposed MPAH amendments.

Response to Comment H61

Although an industrial reuse was contemplated during the initial efforts to clean up the base, the remediation strategies put in place allow for other reuses. The DON, with the concurrence of the other members of the Base Cleanup Team, considers all “no further action” sites and all remediated sites at the base to be available for unrestricted uses. Therefore, the use of such sites is consistent with the land uses proposed in the Great Park Plan. At locations that are to be used for schools (K-12), additional evaluation of the sites by DTSC is required by law.

Considerations for remedial actions objectives are provided in 40 CFR 300.430(e)(2)(i) that states, “remediation goals shall establish acceptable

exposure levels that are protective of human health and the environment and shall be developed by considering the following...for known or suspected carcinogens, acceptable exposure levels are generally concentration levels that represent an excess upper bound lifetime cancer risk to an individual of between 10^{-4} and 10^{-6} using information on the relationship between dose and response.” The Department of the Navy (DON) will be responsible for remediation of the former MCAS El Toro to these exposure levels. The DON has stated that some land-use controls (i.e., easements, covenants, institutional controls, ordinances, etc.) will be required in order to restrict public access on approximately seven Installation Restoration Plan (IRP) sites. The DON will employ limited land use controls at IRP sites 2, 3, 5, 16, 17, 18, 24; the use of such controls has yet to be determined for IRP sites 1, 8, 11, and 12. This action has been deemed necessary until the IRP sites in question can be remediated to the above mentioned acceptable exposure levels.

Section 3.0 *Project Description Actions and Approvals of Other Agencies* has been amended to reflect the requirement that DTSC approve the acquisition and/or development of property for public schools. The added additional language reads as follows:

“California Department of Toxic Substances Control (DTSC) – Approval of acquisition and/or development of property for public schools based on hazardous materials evaluation.”

Response to Comment H62

In the April 2003 Draft Final EBS, the DON identifies approximately 84 percent of the base as suitable for transfer through a fee conveyance. The DON considers areas that are suitable for transfer to be available for unrestricted uses. The percentage of transferable property has increased since 1995 due to additional investigation and sampling performed in 2002 and 2003 as part of the EBS update. Additionally, numerous areas have received “no further action” concurrence from the site regulators since 1995, thus increasing the acreage suitable for transfer from the original estimate of 67 percent. Refer to the *Final Environmental Baseline Survey, Former MCAS El Toro, California* (Earth Tech, Inc. April 2003) for additional information.

Approximately 84 percent of the former air station property is suitable for transfer by deed without remediation or land-use controls. Most of the remaining 16 percent of the former air station consists of areas with subsurface groundwater contamination and may be transferred to private control through a lease in furtherance of conveyance until the remediation is complete and fee title can be conveyed. Land-use controls, as defined in Response to Comment H61, for such groundwater contamination will be limited to prohibitions on the extraction and use of groundwater and limited surface controls to protect monitoring and remediation equipment.

Response to Comment H63

Additional remediation plans are not required, as specific land use designations (i.e., residential, industrial, park, or recreation) are irrelevant. Per 40 CFR 300.430(e)(2)(i), "remediation goals shall establish acceptable exposure levels that are protective of human health and the environment and shall be developed by considering the following...for known or suspected carcinogens, acceptable exposure levels are generally concentration levels that represent an excess upper bound lifetime cancer risk to an individual of between 10^{-4} and 10^{-6} using information on the relationship between dose and response." The DON is required to remediate the site to these exposure levels. Analysis of supplemental remediation costs, if any, are not required by CEQA. The cost and responsibility of remediation rests with the DON. Refer to Response to Comment H61.

Response to Comment H64

Refer to Responses to Comments H61 and H63.

Response to Comment H65

The City of Irvine's Solvent Study identified a potential conduit of contamination, the base sanitary sewer system, and analyzed the maximum potential releases that could have occurred based on a review of historical records and engineering practices. The City submitted the report to the DON for consideration of alternate sources for contamination on the base. In response, the DON gave careful consideration to the rationale and logic of the report, conducted extensive testing of a likely source (Building 307, the base laundry and dry cleaning facility located within IRP Site 24), and concluded that the potential releases were most likely very limited. While the City of Irvine concurs with the DON's conclusions, based on its evaluation of Building 307, the City recognizes that there is a potential, albeit small, for hidden releases of solvents and other hazardous substances. Mitigation Measure HH 5 puts in place a process for responding to potential unidentified contamination when it is encountered during any construction activities on the base. The April 2003 Draft Final EBS released by the DON addresses concerns brought up in the City of Irvine's Solvent Study. Refer to the City of Irvine's letter of response dated 21 March 2003 attached in the Appendix.

Response to Comment H66

It is the responsibility of the DON along with the rest of the members of the Base Cleanup Team (including USEPA, DTSC, and RWQCB) to review evidence of contamination presented by any and all parties, including those identified by the commentor. In the April 2003 Draft Final EBS, the DON reviews all of the evidence presented by other parties for potential additional locations of concern, including the City of Irvine's Solvent Study. The DON performed studies to address issues raised in the Solvent Study and the conclusions are presented in the April 2003 Draft Final EBS. While many potential locations of concern do not warrant further investigation, the DON considers 76 locations to require evaluation for potential releases. Those sites that pose a significant risk to health

and safety will be subject to remediation sufficient to allow a fee conveyance of the site for unrestricted uses.

Response to Comment H67

Refer to Response to Comment H65. The EIR will be revised to note that the DON evaluated potential soil contamination adjacent to runways and under certain runway extensions in the April 2003 Draft Final EBS. There date is no evidence that there are significant levels of unknown contaminants in these areas. The City of Irvine believes that the DON's April 2003 Draft Final EBS addresses all concerns brought up in the GeoSyntech report and the City of Irvine's Solvents Study. Refer to the City of Irvine's letter of response dated 21 March 2003 attached in the Appendix.

Response to Comment H68

The April 2003 Draft Final EBS released by the DON addresses and responds to concerns brought up in the County's environmental site assessment (the GeoSyntech report). Per the Base Realignment and Closure Business Plan for MCAS El Toro (March 2000) and the April 2003 Draft Final EBS, the DON states that approximately 84 percent of the former air station is environmentally suitable for transfer by deed without remediation or land use restriction. Most of the remaining 16 percent consists of areas with subsurface groundwater contamination and may be transferred through a lease in furtherance of conveyance. Some portions of the land area remaining to be remediated will have restricted public access via land use controls until remediation is complete. The DON does not propose to remediate the site to a specific land use designation (i.e., industrial, residential, park, or recreation) as the federal regulations codified under 40 CFR 300.430(e)(2)(i) designate acceptable exposure levels regardless of proposed land use. Refer to Response to Comment H66.

Response to Comment H69

At the time of the review of the County's EIR 563 and 573 processes, the clean-up of the former MCAS El Toro was not far along, therefore the City identified a number of issues that it believed should be addressed prior to going forward with reuse. Subsequently, the DON completed a substantial portion of its investigations and decisions about remediation such that there are relatively few unknowns regarding contamination at this time. Consequently, it is not necessary to revisit issues that the DON has addressed.

Response to Comment H70

The DON recently released an updated baseline environmental analysis of the former air station (Draft Final EBS April 2003). There is no evidence to date indicating the presence of pools of solvents in the bedding of the existing sewer alignments. Refer to Response to Comment H65.

Response to Comment H71

Refer to Responses to Comments H65 and H70. Air quality and traffic impacts attributable to construction activities for both the Base Plan and Overlay Plan, including grading activities, were modeled using the URBEMIS 2001 and the Irvine Transportation Analysis Model (presented in Section 5.3 *Air Quality* and Section 5.4 *Traffic/Circulation*), respectively.

Response to Comment H72

Comment noted. Mitigation Measure HH5 requires that applicants for grading permits within the boundaries of Site 24 prepare a worker health and safety plan that acknowledges the presence of residual VOCs in soil and groundwater at Site 24 and provides adequate measures to protect worker health and safety. Land use controls, as outlined in Response to Comment H61, will be employed at IRP Site 24 in order to prevent extraction or use of contaminated groundwater without prior approval, to protect the integrity of the remedial actions (e.g., protect extraction and treatment equipment and monitoring wells), and to allow access to the site for equipment operation, maintenance, and monitoring. Also refer to Responses to Comments H65 and H77.

Response to Comment H73

The DON evaluated the potential for contamination associated with the piping that ran between an on-base plating shop and an industrial wastewater treatment facility and determined that contamination did not exist. Refer to Responses to Comments H65 and H66.

Response to Comment H74

The vast majority of tanks have been removed under the supervision of the appropriate regulatory agencies. The few tanks that have been or will be abandoned in place will be rendered inert under the supervision of the appropriate regulatory agencies. The information on the status of the storage tanks located on the project site has been updated to reflect the April 2003 Draft Final EBS. Section 5.5.1 *Public Health and Safety Environmental Setting* (5.5-9) has been amended to read:

“Based on the April 2003 Draft Final EBS, a total of 404 USTs were in use at the former air station. Of these USTs, 357 have been remediated and received findings of “no further action.” Of a total of 39 ASTs used in support of the military mission at the former MCAS El Toro, 36 have been remediated and received findings of “no further action.”

Response to Comment H75

Comment noted. Access to monitoring wells will be protected by restrictions placed on the property prior to sale by the DON. Mitigation Measure HH 6 will be added to Section 5.5.5 *Public Health and Safety Mitigation Measures* to read as follows:

“The City of Irvine shall develop and maintain the location and status, as well as other pertinent information, of all monitoring wells located on the former MCAS El Toro in a geographic information systems database (GIS). The City will review all permit applications on the former air station for well locations that may be affected by a permit, and require applicants to maintain appropriate access. Access to wells will be limited to authorized personnel.”

Response to Comment H76

The use of significant quantities of CFC/HCFC refrigerants is not required for implementation of the proposed project. Compliance with SCAQMD rule 1415 requires the capture and recovery of refrigerants resulting in insignificant impacts to the environment.

Response to Comment H77

Although grading operations are not expected to result in the release or disturbance of asbestos or lead, demolition of existing structures may result in such releases. Section 5.5.5 *Public Health and Safety Mitigation Measures* (5.5-27) states:

“Prior to the issuance of a grading permit, the applicant shall prepare and the Director of Community Development shall approve a protocol plan (including but not limited to worker training, health and safety precautions, additional testing requirements, and emergency notification procedures) in the event of unknown hazardous materials are discovered during grading, construction, and/or related development activities.”

Response to Comment H78

The DON is required to complete all necessary remedial actions before fee title to the former MCAS El Toro is transferred from federal ownership. The DON may transfer control of those portions of the property not found suitable for transfer of fee title through a lease in furtherance of conveyance. Even after the fee title is transferred, the federal government is required to conduct further remediation if additional contamination caused by DON actions is discovered or if a remedy fails to perform adequately. Federal law also provides that the DON may be required to indemnify the new owners or certain other parties for liabilities arising from claims for personal injury or property damage resulting from the release or threatened release of any hazardous substances, pollutants or contaminants, or petroleum or petroleum derivatives attributable to DON activities on military installations. Refer to the following letters that are attached in the Appendix to this Response to Comments document: H.T. Johnson, Assistant Secretary of the Navy, Installations and Environment, Letter to the Editor, Los Angeles Times, 5 August 2002; and the letter to the City of Irvine from the DON dated 25 April 2003. Also see the “DOD Policy on Responsibility for Additional Environmental Cleanup after Transfer of Real Property” electronically at:

[http://www.dtic.mil/envirodod/Policies/BRAC/brac_flu.htm].

Response to Comment H79

All hazardous wastes generated in the course of the proposed project will be managed in compliance with regulatory requirements and sent to a licensed hazardous waste facility, thereby minimizing risks and rendering impacts to public health and safety less than significant.

Response to Comment H80

Section 5.3 *Air Quality* and Section 5.4 *Traffic/Circulation* of the EIR address the issue of human health impacts resulting from diesel exhaust particulates.

Response to Comment H81

Existing users of pesticides and fertilizers at the base, agricultural leaseholders and landscape maintenance staff, must meet regulatory requirements for the storage, application, and disposal of registered pesticides. Proposed uses will be similar. Compliance with regulatory requirements will minimize both exposures to pesticides and the potential risk of accidental releases resulting in less than significant impacts to public health and safety.

Response to Comment H82

Only SCAQMD-compliant paints and coatings are legally available for use in the proposed project. Compliant coatings minimize the use and release of VOCs resulting in less than significant impacts to public health and safety.

Response to Comment H83

Non-point source pollution and related TMDLs are addressed in Section 5.7 *Hydrology/Water Quality*. Mitigation Measures H/WQ 1 states:

“A Storm Water Pollution Prevention Plan and Water Quality Management Plan are to be prepared [prior to project implementation]. A Notice of Intent for coverage of projects under the General Construction Activity Storm Water Runoff Permit will be submitted to the State Water Resources Control Board prior to issuance of grading permits in the project areas. This requirement will be met to the satisfaction of the City Engineer for: a) any disturbance of one-acre or more of soil...b) General Dewatering NPDES Permit of the Santa Ana RWQCB, and c) provisions of the Countywide Permit....As future projects are planned, designed, and constructed in the project area, specific BMPs and other water quality control methods will be utilized to reduce water quality degradation in the Newport Bay watershed.”

Monitoring protocols implemented as part of the BMPs and other Permits identified in this Mitigation Measure would require quantification of non-point source pollution loading as part of the TMDLs identified for the Newport Bay watershed.

Response to Comment H84

Refer to Response to Comment H83.

Response to Comment H85

Air quality emissions are presented and analyzed in Section 5.3 *Air Quality*. Growth inducement due to the proposed project is addressed in Section 7.2 *Growth Inducing Impacts*.

Response to Comment H86

Information pertaining to the consistency between the proposed project and the SCAQMD's AQMP and SIP is presented in Section 5.3 *Air Quality*.

Response to Comment I1

This comment recites the primary components of the proposed project.

Response to Comment I2

Refer to Responses to Comments I3 through I13.

Response to Comment I3

Page 3-30 of the EIR has been corrected as follows:

Orange County Airport Land Use Commission (ALUC) for Orange County – Amendment Revision of the Airport Environs Land Use Plan (AELUP), dated 1995.

This correction has also been made in other applicable sections of the document.

Response to Comment I4

Page 5.1-5 of the EIR has been modified to include the text of Policy J-1.d as follows:

Policy J-1.d address hazards associated with aircraft operations. Policy J-1.d states, “Use the most current available Airport Environs Land Use Plan (AELUP) as a planning resource for evaluating aircraft operations, land use compatibility and land use intensity.”

Response to Comment I5

Page 5.1-6 of the EIR has been modified as follows:

The Airport Land Use Commission for Orange County Airport Land Use Commission (ALUC) prepares a comprehensive land use plan and regulates land uses for each public and military airport. The ALUC adopted the has Airport Environs Land Use Plans for (AELUP) covering the former MCAS El Toro, the former MCAS Tustin, John Wayne Airport (JWA) (adopted 2002), Armed Forces Reserve Center Los Alamitos, and Fullerton Municipal Airport (2002), Joint Forces Training Base Los Alamitos (2002), Heliports projects (2002) and for MCAS El Toro (adopted 1995) ... Figures found in Appendix D of the 1995 AELUP depict the noise and safety zones for MCAS El Toro. Figure 5.1-1 depicts the APZs for the former MCAS El Toro as shown in the 1995 AELUP.

The MCAS El Toro property is still owned by the Federal government. The 1995 AELUP applicable to that property remains in effect and has not been amended. California Public Utilities Code Section 21670, et. seq. requires that local General Plans and Zoning be consistent with the land use compatibility plan (AELUP). The Public Utilities Code provides a method whereby a local jurisdiction may override an Airport Land Use Commission finding of inconsistency with the AELUP.

Response to Comment I6

Page 5.1-15 of the EIR has been revised as follows:

The land use, safety, and noise restricted areas as identified in the AELUP, AICUZ, and the PIL for the former MCAS El Toro facility are no longer impacted by aircraft noise from military air operations now that the base has closed for military use. The MCAS El Toro property is still owned by the Federal government. The 1995 AELUP applicable to that property remains in effect and has not been amended. California Public Utilities Code Section 21670, et. seq. requires that local General Plans and Zoning be consistent with the land use compatibility plan (AELUP). The Public Utilities Code provides a method whereby a local jurisdiction may override an Airport Land Use Commission (ALUC) finding of inconsistency with the AELUP.

Response to Comment I7

Refer to Responses to Comments I9 and I10.

Response to Comment I8

Reference 6 on page 5.1-27 of the EIR has been revised as follows:

Orange County Airport Land Use Commission for Orange County. Airport Environs Land Use Plan, adopted November 1995. 1975-90.

Response to Comment I9

Page 5.1-15 of the EIR states that the proposed project, “would not result in a significant land use compatibility impact, even though it would conflict with the adopted AELUP.” This language is consistent with the language contained in Section 6.0 Alternatives.

Response to Comment I10

On 17 April 2003, the ALUC formally acknowledged that the ALUC has no statutory jurisdiction over the proposed project. Further, according to the ALUC’s 17 April 2003 staff report, ALUC staff has reviewed the project and finds no AELUP issues.

In the 17 April 2003 staff report the ALUC has also stated that the ALUC does have jurisdiction within the AELUP surrounding the former military airfield. The Orange County Great Park EIR recognizes the potential for growth-inducing impacts as a result of the removal of development restrictions within the AELUP areas surrounding the former base (e.g., EIR, page 7-13). However, Measure W changed the County of Orange’s General Plan to delete any airport development opportunity at the former MCAS El Toro and the DON, in its Record of Decision, chose a non-aviation reuse plan. Consequently, changes in land use restrictions are based on that voter-approved initiative and subsequent DON decisions, not on this project, which modifies the Irvine General Plan designations from a more

intensive non-aviation use (known as “Millennium Plan II, adopted in February 2000) to the less intensive, park-oriented non-aviation use proposed by the Great Park project. Many of the areas referenced by the commentor are located within other jurisdictions (primarily the City of Lake Forest and newly incorporated Aliso Viejo). The City of Lake Forest is currently in the preliminary stages of preparing a land use study of the subject area. The City of Aliso Viejo has just recently initiated preparation of a General Plan. It is anticipated that any future proposal by any jurisdiction with lands currently located within the AELUP would be required to evaluate, with specificity, the potential environmental impacts associated with adoption of any proposed land use changes. This information would then be available to the ALUC when amending the AELUP as it relates to that jurisdiction.

Response to Comment I11

Refer to Response to Comment I10. There is no need to include growth-inducing impacts as a significant unavoidable impact of the proposed project.

Response to Comment I12

Page 8-5 of the EIR has been corrected as follows:

~~Orange County~~ Airport Land Use Commission for Orange County, Airport Environs Land Use Plan, 1995. ~~1975-1990~~.

Response to Comment I13

The documentation referenced by the commentor will be provided to the Airport Land Use Commission as requested.

Response to Comment J1

Comment noted.

Response to Comment J2

Coordination between project developers and the Fire Authority, as with other service providers, is a requirement of development of this type and magnitude. Any necessary agreements regarding fire protection services will occur in accord with established procedures.

Response to Comment J3

Refer to Response to Comment J2.

Response to Comment J4

Comment noted.

Response to Comment J5

Comment noted. See Section 5.5 *Public Health and Safety* for information pertaining to hazardous materials related to agricultural and military activities.

Response to Comment J6

Comments noted. See Section 5.5 *Public Health and Safety* for information pertaining to wildland fires.

Response to Comment J7

Development standards of the type noted are either legal requirements or will be negotiated and established during the review and approval process for the master development plans or other approvals given by the City.

Response to Comment J8

Any further reduction of the surplus area will be determined by the General Services Administration. The effect of future government ownership and operations in areas proposed to remain in government control will need to be assessed once the specific areas are established.

Response to Comment J9

Refer to Response to Comment H65. The commitment by the DON is to convey land based on the federal regulations codified under 40 CFR 300.430(e)(2)(i); the regulations designate acceptable exposure levels suitable for the proposed reuse of the former air station. If an unknown hazard appears during construction, appropriate responses will be taken by the City in coordination with the DON and the Fire Authority and other responsible agencies. Refer to the April 2003 Draft Final EBS for additional information on the status of underground storage tanks, pipelines, and other specified information. See Section 5.5 *Public Health and Safety* for information pertaining to hazardous materials and wastes. Mitigation Measure HH 5 states:

“Prior to the issuance of a grading permit, the applicant shall prepare and the Director of Community Development shall approve a protocol plan (including but not limited to worker training, health and safety precautions, additional testing requirements, and emergency notification procedures) in the event of unknown hazardous materials are discovered during grading, construction, and/or related development activities. The applicant and/or property owner that discovers contamination due to past military operations not previously identified by the DON shall be responsible for notifying the DON, appropriate regulatory agencies, and the Director Community Development of the City of Irvine in a timely manner.”

The location of IRP sites are identified on Figure 5.5-1 (EIR page 5.5-8).

Response to Comment J16

The project is a General Plan amendment, zone change, development agreement, and annexation. The detailed information discussed in the comment will be available in the design phase.

Response to Comment J17

Coordination with OCFA will occur during the design phase and during the project approval process, consistent with City standard procedures.

Response to Comment J18

Refer to Response to Comment J17.

Response to Comment J19

Comment unclear due to partial sentence provided as comment.

Response to Comment J20

Regulation of agricultural chemicals application and storage will continue for land proposed to be retained for agricultural use.

Response to Comment J21

Comment noted.

Response to Comment J22

Fire protection agreements are a requirement prior to development. This issue is also referenced in the Urban Services Plan (provided as an attachment to this document).

Response to Comment J23

Comment noted. Fire service was considered in establishing maximum water demand and subsequent backbone infrastructure sizing.

Response to Comment J24

OCFA will be listed as an Action Agency in the EIR on pages 3-30/3-31.

Response to Comment J25

Corrections will be made in the final EIR as noted.

Response to Comment J26

Refer to Responses to Comments J1 through J25.

Response to Comment K1

The elements and development characteristics of the proposed project are specifically defined in Section 3.0 *Project Description*. The analysis of potential environmental impacts is based on the development and operation of the project as defined in Section 3.0.

The City has proposed a concept plan that will meet the spirit and intent of Measure W while maintaining a fiscally-balanced plan. Annexation of PA 51 is proposed in order to ensure the City can control the logical development of the property, and to maintain high service levels for public service and utility providers. Although the project site will be incorporated into the City of Irvine, the proposed uses are regional in nature and are intended to benefit and serve all residents of the County.

Response to Comment K2

This comment references the adequacy of the DON's Environmental Impact Statement (EIS) and the Record of Decision for the Disposal of the former MCAS El Toro issued by the DON and co-signers of the Federal Facilities Agreement. This comment does not address the adequacy of the Orange County Great Park EIR.

Response to Comment K3

The DON has analyzed a non-aviation alternative in its EIS for the Disposal and Reuse of the former MCAS El Toro. The Orange County Great Park project, however, is proposed by the City of Irvine. The City is designated as the "lead agency" under CEQA, and in this capacity, is responsible for preparation and certification of an EIR that addresses the potential environmental impacts associated with implementation of the proposed project as defined in Section 3.0 of the EIR. The DON is not required to prepare an EIR for the proposed project as a range of alternatives were previously addressed in the DON's EIS for the federal action. The Orange County Great Park project is proposed by the City of Irvine and does not involve a federal action beyond the disposal of the property which is addressed in the federal EIS.

Response to Comment K4

Section 7.1 *Cumulative Impacts* of the EIR analyzes the potential environmental impacts associated with the development of the proposed project in conjunction with the projected growth in the region, including the Northern Sphere. This cumulative impact analysis includes analyses of impacts to traffic, air quality and energy.

With respect to aviation, implementation of the proposed project does not involve a use that would impact existing airports and aviation activity. The proposed project is the reuse of a former military air base which is currently not utilized for any type of aviation use. The Measure W initiative changed the County of Orange's General Plan and deleted the airport designation for the former MCAS

El Toro. Furthermore, on 25 February 2003 the Orange County Board of Supervisors, acting as the El Toro Local Redevelopment Authority, rescinded the El Toro Airport System Master Plan, thus removing an airport at MCAS El Toro from all County plans.

Response to Comment K5

This comment addresses the adequacy of the Final Environmental Impact Statement and Record of Decision issued by the DON for the closure of the former MCAS El Toro. This comment does not address the adequacy of the Orange County Great Park EIR and no further response is necessary.

Response to Comment K6

As described in Section 5.5 *Public Health and Safety* of the EIR, the DON will be responsible for clean-up and remediation activities on the base. Page 5.5-11 of the EIR states, "Under CERCLA, contaminated federal property cannot be transferred until all necessary remedial actions have been taken or a remediation system is operating properly and successfully. Cleanup responsibility remains with the DOD until the property is fully remediated. Therefore, some of the former air station property cannot be transferred immediately." Additionally, "As established by BRAC III, the DON will continue its environmental restoration activities after installation disposal. Sites that require continuing monitoring and remediation will receive continuing investigation/remediation beyond installation closure, which occurred in July 1999." (EIR, page 5.5-15) Additionally, Mitigation Measures HH1 through HH5 are proposed to ensure that no significant impact associated with the presence of hazardous materials or contamination occurs with implementation of the proposed project. Refer to Responses to Comments H61 and M26 for information pertaining to the DON's remediation requirements.

Response to Comment K7

Refer to Response to Comment K1.

Response to Comment L1

Refer to Responses to Comments DD1 through DD14, which respond to the Department of Toxic Substances Control comment letter on the EIR.

Response to Comment M1

Refer to Responses to Comments M2 through M95 which respond to each comment raised by the commentor.

Response to Comment M2

This comment correctly summarizes the primary components of the proposed project, as described in the EIR. However, the City does not agree with the commentor's statement that the Great Park is not a feasible reuse of the project site and that the magnitude of the proposed land uses are understated. The proposed uses are considered feasible in terms of constructability as well as a fiscal standpoint. Proposed uses have been carefully considered so as to achieve a fiscally balanced plan while maintaining the spirit and intent of Measure W.

The proposed project characteristics are described in detail in Section 3.0 *Project Description*. The EIR focuses on the Overlay Plan as it presents the highest level of potential impact in order to ensure mitigation at the highest level. Tables 3-3 and 3-4 provide a detailed summary of the potential maximum development potential of the project according to both the Base Plan and Overlay Plan.

Response to Comment M3

The proposed Orange County Great Park land uses are proposed within City of Irvine Planning Areas (PAs) 30 and 51. Lands within PA 51 are not subject to Measure W while they remain under the jurisdiction of the County of Orange. To the extent that these lands are not annexed under the Great Park Plan, there will be no impact to the County's General Plan and zoning. However, PA 30 is located within the jurisdictional boundary of the City, and is not subject to Measure W. Generally, the more intensive land uses are proposed within PA 30. Comparatively, the Overlay Plan is more intense than the Base Plan, which are clearly depicted in Tables 3-3 and 3-4 of the EIR. However, the Overlay Plan allows for a similar amount of the open space, park, recreational and public uses within PA 51 as could occur under the Base Plan.

The City does not concur that the Overlay Plan constitutes "massive development" as inferred by the commentor. Regardless of whether land uses are developed according to the Base Plan or the Overlay Plan, the spirit and intent of Measure W will be met with implementation of the proposed project, for that portion of the project site currently subject to Measure W. In either case, the development potential of the Base Plan and the Overlay Plan are clearly illustrated in Tables 3-3 and 3-4 of the EIR.

Response to Comment M4

As stated in the EIR, "the purpose of the project is to assure that reuse of El Toro is consistent with the intent of Measure W approved by the voters in March, 2002 while responding to the decision of the federal government to sell the land". The proposed zoning with the Base Plan and Overlay Plan assures the fulfillment of

this purpose, regardless of the option chosen by the buyers of the property. While the option of the Overlay Plan provides a potential higher return to the developers in exchange for providing the land and infrastructure for the public uses, the Base Plan, through the regulation of the permitted land uses, also assures that the land will be developed for open space, recreation, educational, and cultural facilities, agriculture, and other park-like uses. Project applicants may opt to develop under the Base Plan and forego the increased intensity and development rights that are available through the Development Agreement and Overlay Plan.

Response to Comment M5

The former air station will be divided into four parcels for sale by the DON. The requirement through the Development Agreement for land dedication and maintenance fee participation under the Overlay Plan option assures that the public uses are implemented. Conversely, under the Base Plan the land use regulations will be the mechanism for the implementation of the park and open space uses. Under the Base Plan, public funding is not required because park and open space lands are not required to be dedicated.

Response to Comment M6

The zoning allows the development of the Great Park under both options. With the Overlay Plan the Great Park will be implemented through land dedication and fee contributions, and the City (or its designee), in turn, will be the developer of those public uses. Under the Base Plan, the owner of the property will develop the land based on the designated land uses, including the open space, recreational, educational and cultural facilities, agriculture, and other park-like uses, since those are the permitted land uses provided by the Base Plan option.

Response to Comment M7

The EIR analyzed the potential impacts of the Overlay Plan as the maximum buildout of the Plan, including the Development Agreement as an integral part of the Overlay Plan option. If a buyer declines to enter into the Development Agreement, the property would have the General Plan and zoning designation provided in the Base Plan. Any subsequent increase in the density and intensity would require the preparation of a General Plan Amendment, zone change, and the required environmental documentation addressing both project-specific and cumulative impacts.

Response to Comment M8

The City of Irvine is not involved with the sale of land parcels; the DON has publicly stated that it will sell all parcels of the former MCAS El Toro concurrently. As the owner of the property, the DON has indicated that it will divide the land into the four parcels as indicated on the attached figures. The EIR provides an analysis of the project's potential impacts based upon the maximum amount of development allowed under the Base Plan and Overlay Plan regardless of the

manner in which the DON sells the property. (Note: The four referenced parcel figures are included in the Appendix to this Response to Comments document).

Response to Comment M9

The proposed maximum development intensity of the project is defined in Section 3.0 *Project Description*. The City does not propose to exceed the level of development beyond that defined in Section 3.0 and analyzed in the EIR. The development potential is based on densities and intensities achievable under the proposed General Plan land uses and zoning designations, subject to the specific density and intensity caps that are explicit in the proposed project. Any proposed increase in the level of development beyond that described and analyzed in the EIR would require the preparation of subsequent or supplemental environmental documentation to address the potential environmental impacts of such a proposal. The land use densities of the proposed project, as with land use densities for all similar proposed projects in Irvine, are based on and controlled by the maximum allowable development intensity. As such, the density range establishes the framework for analysis within the limits of the maximum development intensity.

Response to Comment M10

The proposed project sets specific maximum levels of density and intensity and the City of Irvine has no intention of changing these levels. Refer to Response to Comment M9.

Response to Comment M11

Comment noted.

Response to Comment M12

The EIR discusses all potential environmental effects of the Overlay Plan which is the maximum buildout scenario as defined in the project description. The City of Irvine has no intention of adding development intensity beyond that which is presented in the EIR. Refer to Responses to Comments M9 and M10.

Response to Comment M13

Refer to Responses to Comments M9 and M10

Response to Comment M14

Per the Overlay Plan, the maximum number of dwelling units in PAZ2 is set at 850, notwithstanding the number of units that could be calculated using the maximum range of the zoning designation. The maximum intensity of development for both the Base and Overlay Plans is specifically depicted in Tables 3-3 and 3-4 of the EIR. Refer to Response to Comment M9.

Response to Comment M15

Refer to Response to Comment M9.

Response to Comment M16

Comment noted.

Response to Comment M17

The air quality impact analysis contained in Section 5.3.3 *Air Quality Environmental Impacts* is adequately assesses the air quality impacts of runway removal as part of the overall project construction. In order to confirm the validity of the initial URBEMIS 2001 model, additional analysis of the airport runway model was completed. As part of this additional analysis, it was determined that the URBEMIS 2001 site grading PM₁₀ fugitive emissions calculations are based on the emission factor prepared by the CARB for construction activities, that include: limited-to-heavy trenching activities; limited-to-heavy earth moving activities by scrapers; road pre-paving activities; paving activities; road grading; scraper excavations; general construction of pads, framing, landscaping, etc.; and drilling, blasting, compaction, and trucking of excavated and fill material. The secondary set of URBEMIS 2001 model runs were performed with the demolition tab enabled. The results of the initial URBEMIS 2001 model run and the secondary URBEMIS 2001 calculations are presented as Table M-1 in the Appendix of this Response to Comments document. The results of the secondary URBEMIS 2001 calculations show that unmitigated PM₁₀ emissions increased to approximately 458-tons per year as compared to 451-tons per year using the initial URBEMIS 2001 data. This represents an increase of less than seven tons, or 1.4 percent of the total unmitigated PM₁₀ emissions. The difference is statistically insignificant and the additional analysis is provided to confirm that the initial analysis adequately assesses the air quality impacts of runway removal as part of the overall project construction. Section 5.3.3 will be amended with the addition of the secondary URBEMIS 2001 calculations and qualitative description.

The Mitigation Measures proposed will apply to all construction activities, including demolition and removal of the runways as well as grading and excavation. Mitigation Measure AQ2 has been amended to read:

“Prior to the commencement of construction activities required to demolish and/or remove existing DON infrastructure, including runways, the Director of Community Development shall receive and approve a construction emissions mitigation plan from the chosen demolition contractor. Prior to the issuance of grading permits, the applicant shall submit, and the Director of Community Development shall approve a construction emissions mitigation plan. The plans ~~plan~~ shall identify implementation procedures for each of the following emission reduction measures and all feasible mitigation measures shall be implemented. If certain measures are determined infeasible, an explanation thereof shall be provided.”

Response to Comment M18

Refer to Response to Comment M17. Section 5.3.3 *Air Quality Environmental Impacts* states:

“Both the Base Plan and Overlay Plan propose the development of the entire 4,693-acre base within a 19-year (2007-2025) time frame. For estimation of air emissions, it was assumed that either plan is subdivided into two phases based on utility and extent of the development...For the estimation of air quality emissions from construction of the various facilities, construction activity is assumed to last for a period of three years during each phase. This assumption conservatively accounts for both demolition and grading/excavation activities as major sources of construction-related emissions. The URBEMIS 2001 model is used for estimating construction emissions for all stages of development...Due to the limited availability of specific data regarding construction activities and equipment requirements, the URBEMIS 2001 model default options were used.”

Response to Comment M19

The DON will not transfer fee title to the property of the former MCAS El Toro until the parcels have been remediated to acceptable exposure levels; property not meeting acceptable exposure levels will not transfer or may be transferred to private control through a lease in furtherance of conveyance until the remediation is complete. The EIR will be revised to note that the DON, in the April 2003 Draft Final EBS, evaluated potential soil contamination adjacent to runways and underneath certain runway extensions. In addition, Mitigation Measure HH 5 puts in place a process for responding to potential unidentified contamination were it to be encountered during any construction activity on the former MCAS El Toro. Also refer to Response to Comment M24.

Response to Comment M20

Refer to Responses to Comments M17 and M19 for potential contamination issues associated with runways. Potential impacts to air quality related to the removal of runways, tarmac, and related infrastructure were modeled using URBEMIS 2001 and is presented in Section 5.3 *Air Quality*.

Response to Comment M21

Refer to Responses to Comments M16 through M20. Referenced analysis has been conducted and findings presented in the EIR.

Response to Comment M22

This comment incorrectly assumes that the proposed project provides the authority to develop an additional 14,000 acres of land. Even if the proposed project is not approved and implemented, based on Measure W, the Orange County General Plan precludes development of an airport on the former MCAS El Toro and thereby removes previous land use restrictions due to aircraft

operations. Even in the absence of the proposed project development would have to adhere to the non-aviation designation of the site based on the provisions of Measure W. The project proposes to change the City of Irvine General Plan and zoning designations for the project site from one non-aviation land use plan (e.g., the Millennium Plan, adopted in February 2000) to another non-aviation land use plan, designated the Great Park Plan.

The cumulative analysis provided in Section 7.1 of the EIR is consistent with the provisions of CEQA and the CEQA Guidelines. As stated in the EIR, the CEQA Guidelines allow for the analysis of cumulative impacts to utilize the Regional Growth Projections Method. According to CEQA Guidelines Section 15130, the Regional Growth Projections Method can be a summary of projections contained in an adopted general plan or related planning document which is designed to evaluate regional or area wide conditions. As described in the EIR (EIR, page 7-1), the Regional Growth Projections Method has been utilized for analysis of cumulative impacts. The cumulative analysis is based on buildout assumptions identified in the Center for Demographic Research's *Orange County Projections 2000*. This cumulative analysis takes into consideration buildout of local and regional general plans as well as population forecasts for the County of Orange and the region as a whole (as shown in Figure 7-1 and Table 7-1) (EIR, page 7-1). The EIR is consistent with the CEQA Guidelines provisions for the use of the Regional Growth Projections Method in the evaluation of cumulative impacts, as the OCP-2000 projections are adopted based on regional growth estimates utilized by various jurisdictions throughout the County.

Furthermore, the commentor appears to confuse the intent of CEQA Guideline Section 15130(b)(1)(B)(2) with respect to "probable future projects." CEQA Guideline Section 15130(b)(1)(B)2 addresses the list approach for analysis of cumulative impacts. As previously stated, the Orange County Great Park EIR does not rely on the list approach for the analysis of cumulative impacts. Also, CEQA Guideline Section 15130(b)(1)(B)2 does not apply to the 14,000 acres of land referenced by the commentor as it does not meet the criteria of the Guideline. Specifically: 1) the 14,000 acres is not the subject of an application requiring an agency approval which has been received at the time the notice of preparation was released; 2) the 14,000 acres is not a project identified in an adopted capital improvements program, general plan, regional transportation plan, or other similar plan; 3) the 14,000 acres is not a project anticipated at a later phase of a previously approved project; and 4) the 14,000 acres is not a public agency project for which money has been budgeted." Also refer to Response to Comment I10.

With respect to the City of Lake Forest, the City's adopted General Plan was both reviewed and has been included in the preparation of the Orange County Great Park EIR. Land use assumptions for cumulative growth include the adopted land uses of the City of Lake Forest General Plan. The City of Lake Forest has recently amended its General Plan to remove references to the aviation-use of

the airport, and to delete references to the noise contours and AICUZ boundaries formerly associated with the base operations. However, no land use changes were adopted as part of this recently approved General Plan amendment. Also, no land use changes have been identified or are proposed by the City at this time. The City has just recently solicited proposals to initiate a land use study that would examine potential land use changes within the areas previously restricted by aviation use of the former base. No formal land use change recommendations are expected until sometime in 2004. Because the nature, extent, and timing of potential land use changes that could occur in this area have not been determined, any additional analysis, beyond that provided in the EIR, would be speculative.

With respect to the City of Aliso Viejo, the City is a newly incorporated City and does not have an adopted General Plan. The City is currently in the preliminary stages of preparing a General Plan, which is expected to be adopted in late 2003 or 2004, well beyond the timeframe associated with the Orange County Great Park EIR. Rather than engage in speculation as to the nature, extent, and timing of potential land use changes that could occur in this newly incorporated jurisdiction, the Orange County Great Park EIR relies upon adopted growth projections as allowed by the CEQA Guidelines for the Regional Growth Projections Method.

The analysis of the 14,000-acres is addressed in the EIR, to the degree that the project would cause growth-inducing impacts in the City of Irvine and surrounding jurisdictions (EIR, page 7-13). The EIR concludes that the growth-inducing impacts are significant.

Response to Comment M23

The EIR describes the project's potential contribution to regional air emissions and provides a comparison of these emissions to the projected air emissions within the basin as a whole. The EIR does not rely upon this comparison as the basis for determining the significance of the project's air quality impacts. Rather, this comparison is made to assess the magnitude of the proposed project's impact on the region as a whole. While the EIR states that the project will have a negligible impact on the overall air quality within the SCAB, the EIR concludes that, "due to the size of the project, certain impacts that result from development will be "unavoidable" as these impacts cannot be completely mitigated and most of these changes are irreversible. This is considered a significant unavoidable impact, although the overall effect on air quality within the Basin for the life of the proposed project is estimated at less than one half of one percent." (EIR, page 5.3-55).

With respect to the EIR's conclusion of cumulative air quality impacts, the EIR's conclusion of significance is based on the cumulative impact associated with the regional growth projected pursuant to OCP-2000. The EIR concludes that area-wide emissions as a result of cumulative development pursuant to OCP-2000

projections are considered significant. As stated in the EIR, “operation emissions in conjunction with related projects and other emissions in the Basin will also coincide. Since air quality in the SCAB does not comply with federal or state standards, these emissions will contribute to a cumulatively significant impact on air quality,” (EIR, page 7-6). The tables provided in the discussion of cumulative air quality impacts provide a quantification of pollutant emissions estimates for the year 2025 based on the adopted 1997 Air Quality Management Plan. Also, regional emissions projections are graphically depicted in Figure 5.3-2 of the EIR.

The potential cumulative impacts with respect to CO hotspots are also quantified and evaluated in Section 5.3 *Air Quality*. Table 5.3-29 depicts the CALINE 4.0 8-hour Carbon Monoxide Modeling Results for Post-2025, and demonstrates that no project-specific or cumulative Carbon Monoxide Hot Spot will result.

Response to Comment M24

The EIR includes data and analysis from the DON and other sources of information and uses these sources to draw conclusions for potential impacts to public health and safety. The federal government is required to remediate the site to acceptable exposure levels. As part of its obligation to remediate, the DON continues to monitor the site and publish results of its monitoring and remediation efforts. The April 2003 Draft Final EBS is the most relevant evaluation of continuing remediation efforts; it identifies an additional 76 new potential release locations, all of which require further evaluation for potential releases to the environment and subsequent remediation, if required. The April 2003 Draft Final EBS catalogs the types of sites and distinguishes between those that require no further action, those that require further evaluation, those that require implementation of response actions, and those that require completion of ongoing response actions. The DON will not transfer fee title to the property of the former MCAS El Toro until the parcels have been remediated to acceptable exposure levels; property not meeting acceptable exposure levels will not transfer or may be transferred to private control through a lease in furtherance of conveyance until the remediation is complete. Property not transferred in fee title by the DON can only be developed with institutional controls established by the DON until remediation is complete and the fee title is complete. The April 2003 Draft Final EBS concludes that of the 3,738-acres of base property that are expected to become available for transfer, approximately 84 percent are environmentally suitable for transfer of fee title at the present time. The EIR will be revised to incorporate the latest information available in the April 2003 Draft Final EBS.

Response to Comment M25

Refer to Response to Comment M24.

Response to Comment M26

There is no indication that recordkeeping by the DON differed significantly from recordkeeping in private industry during the period the base was in operation.

Uses of hazardous materials are well-documented, as are facility plans and operating procedures. While quantities of wastes may not have been well-documented in the period prior to the advent and enforcement of RCRA at the base, that is also the case in the private sector. The extensive process of records reviews, visual inspections, and interviews has created as thorough a record of hazardous materials use and disposal practices as exists. The DON and the regulatory agencies participating in the Federal Facilities Agreement concur that the protocol for investigating the base is sound, that the vast majority of potential contamination locations at the base have been identified, and that significant areas of unidentified contamination are not likely to be found. The City is concerned that there may be small areas of unidentified contamination and that these may be encountered during grading and construction activities. Mitigation Measure HH 5 addresses this potential by requiring applicants for grading permits to prepare a protocol plan that will guide responses to the discovery of unknown contamination. Furthermore, the DON is required to complete all necessary remedial actions before title to the former MCAS El Toro is transferred from federal ownership. Even after the title is transferred, the federal government is required to conduct further remediation if additional contamination caused by DON actions is discovered or if a remedy fails to perform adequately. Federal law also provides that DON may be required to indemnify the new owners or certain other parties for liabilities arising from claims for personal injury or property damage resulting from the release or threatened release of any hazardous substances, pollutants or contaminants, or petroleum or petroleum derivatives attributable to DON activities on military installations. Refer to the following letters that are attached in the Appendix to this Response to Comments document: H.T. Johnson, Assistant Secretary of the Navy, Installations and Environment, Letter to the Editor, Los Angeles Times, 5 August 2002; and the letter to the City of Irvine from the DON dated 25 April 2003. Also see the "DOD Policy on Responsibility for Additional Environmental Cleanup after Transfer of Real Property" electronically at: [http://www.dtic.mil/envirodod/Policies/BRAC/brac_flu.htm].

GeoSyntec based its evaluation on the use of PRGs (preliminary remediation goals) for identified contaminants. As the U.S. Environmental Protection Agency notes:

"Preliminary Remediation Goals (PRGs) are tools for evaluating and cleaning up contaminated sites. They are risk-based concentrations that are intended to assist risk assessors and others in initial screening-level evaluations of environmental measurements. The PRGs contained in the Region 9 PRG Table are generic; they are calculated without site specific information. However, they may be re-calculated using site specific data.

PRGs should be viewed as Agency guidelines, not legally enforceable standards. They are used for site "screening" and as initial cleanup goals if applicable. PRGs are not de facto cleanup standards and should not be

applied as such. However, they are helpful in providing long-term targets to use during the analysis of different remedial alternatives. By developing PRGs early in the decision-making process, design staff may be able to streamline the consideration of remedial alternatives. “ EPA, Region 9, Superfund Program:
[<http://www.epa.gov/region09/waste/sfund/prg/index.htm>]

The City supports the use of PRGs in the screening process, but recognizes that site specific characteristics may result in the adoption and implementation of cleanup goals that protect public health and safety without achieving the PRGs. The City will review the specific sites mentioned in the comment and address them in the final EIR.

Considerations for remedial actions objectives are provided in 40 CFR 300.430(e)(2)(i) that states, “remediation goals shall establish acceptable exposure levels that are protective of human health and the environment and shall be developed by considering the following...for known or suspected carcinogens, acceptable exposure levels are generally concentration levels that represent an excess upper bound lifetime cancer risk to an individual of between 10^{-4} and 10^{-6} using information on the relationship between dose and response.” This means that the DON will be responsible for remediation of the former MCAS El Toro to these exposure levels prior to the transfer of the fee title to the property. The DON has stated that some land-use controls (i.e., easements, covenants, institutional controls, ordinances, etc.) will be required in order to restrict public access on approximately seven Installation Restoration Plan (IRP) sites if those properties are transferred through a lease in furtherance of conveyance. The DON will employ limited land use controls at IRP sites 2, 3, 5, 16, 17, 18, 24; the use of such controls has yet to be determined for IRP sites 1, 8, 11, and 12. This action has been deemed necessary until the IRP sites in question can be remediated to the above mentioned acceptable exposure levels.

Response to Comment M27

Refer to Response to Comment H65. The DON has conducted a revised EBS of the remaining acreage at the former air station (April 2003 Draft Final EBS). The DON has sufficiently analyzed the existing locations of concern and has addressed recommendations for additional potential locations of concern set forth in the City of Irvine’s Solvents Study (January 2000) and the GeoSyntech report commissioned by the County of Orange (November 2001). The Solvents Study and GeoSyntech report predate the March 2003 letter from the City of Irvine; the April 2003 Draft Final EBS conducted by the DON sufficiently addresses environmental concerns at former MCAS El Toro. The City of Irvine has concluded that the assessment of the potential release locations is fair and appropriate.

Response to Comment M28

While the DON did not identify any specific spills or releases prior to 1983 (documentation of waste management practices improved dramatically following the implementation of RCRA beginning in the early 1980s), it acknowledged practices that resulted in releases that most likely caused the contamination problems at the base. These practices included disposal of hazardous materials and wastes to sewers, primarily storm sewer drains, disposal of hazardous wastes in base landfills, use of hazardous materials and wastes in controlling dust on roads and impermeable surfaces, uncontrolled runoff of hazardous wastes, lack of monitoring of underground storage tanks and storage facilities, and the use of hazardous materials and wastes for training of emergency response personnel. The DON's analysis of these practices led to its list of potential locations of concern (LOCs), evaluation of the LOCs, and responses where required. Where other parties, including the City of Irvine, the Restoration Advisory Board, the County of Orange, and the regulatory agencies involved in the base cleanup, have identified other potential locations of concerns, the Navy has responded with additional investigation. In some cases, the Navy, with the concurrence of the regulatory agencies, has concluded that releases did not occur or were not of sufficient magnitude to warrant further evaluation or remediation. For example, in response to the City's Solvent Study, the DON investigated Building 307, the Laundry and Dry Cleaning facility for the base. In its Final Technical Memorandum, the DON concluded that significant releases did not occur at that location and further investigation was not needed. In other cases, the DON has pursued additional evaluation as in the case of the discovery of radium dials at IRP Site 2, which prompted a thorough historical radiological analysis and a radiological survey of much of the base. This evaluation is ongoing. In sum, the City of Irvine considers the DON's process to be responsive to input from interested parties and to be sufficiently comprehensive.

Response to Comment M29

The DON responded to the GeoSyntec report in the April 2003 Draft Final EBS and concurred with seven of the 339 sites recommended for further action or assessment. The remaining 332 sites were either previously assessed, are currently being assessed, or will be assessed in the near future, have closure NFA letters signed by a regulatory agency or are recommended for NFA and are pending regulatory concurrence, or are considered to not require further action or assessment. Regulatory agencies concur with the DON's assessment of the GeoSyntec Report. The DON's April 2003 Draft Final EBS identifies new potential release locations that require further investigation, but does not identify conclusively any significant new risks to public health and safety, nor does it substantially alter conclusions drawn in the EIR.

Response to Comment M30

Refer to Responses to Comments M27 and M29 for information regarding the DON's April 2003 Draft Final EBS and information pertinent to the GeoSyntec report.

Response to Comment M31

Refer to Response to Comment M26. The City of Irvine will continue to review and monitor the base cleanup as it progresses. The City expects the DON to evaluate the seven GeoSyntec recommended new sites with which it concurs regarding the need for further evaluation, along with the other 69 new locations of concern, in a manner that follows regulatory requirements and guidelines and meets the highest of professional standards. At any sites that require remediation to protect public health and safety, the City expects that the DON will meet agreed upon remediation goals that will ultimately result in the transfer of fee title to the property in a condition suitable for unrestricted use.

Response to Comment M32

The DON has publicly stated that it will indemnify new land owners of former air station property in order to mitigate potential soil contamination that is attributable to historic DON operations. Refer to Response to Comment H67. Also refer to Responses to Comments M27 and M29 for information regarding the DON's April 2003 Draft Final EBS and information pertinent to the GeoSyntec report.

Response to Comment M33

Refer to Response to Comment M26. Also refer to Responses to Comments M27 and M29 for information regarding the DON's April 2003 Draft Final EBS and information pertinent to the GeoSyntec report.

Response to Comment M34

Refer to Response to Comment M26. There is no evidence that the Overlay Plan, due to its greater development, will result in greater human contact with contaminated or potentially contaminated soil. For both the Base Plan and the Overlay Plan, the greatest potential impact to public health and safety is the risk of exposure to unidentified contamination, rather than the risk of contact with known contaminated soil or groundwater. Whether currently identified or not, the DON is obligated to remediate the former MCAS El Toro to acceptable exposure levels. Mitigation Measure HH 5 addresses the potential for exposure and reduces the risk to below a threshold of significance.

Response to Comment M35

Refer to Response to Comment M34. The two examples cited in the letter are addressed through Mitigation Measure HH 5. The radiological anomaly found at IRP Site 2 (radium dial) was found on the surface of the site. Perchlorates were identified as part of the required regular groundwater monitoring at the base. In the case of the radiological anomaly, HH 5 requires the preparation of a protocol plan to guide responses to the discovery of unexpected contamination. The plan must include a response to the discovery of a radiological entity as well as more common toxic contaminants. Were the DON to identify additional contaminants of concern in particular geographic locations, protocol plans may be revised. Mitigation Measure HH 5 is amended to read:

“Prior to the issuance of a grading permit, the applicant shall prepare and the Director of Community Development shall approve a protocol plan (including but not limited to worker training, health and safety precautions, additional testing requirements, and emergency notification procedures) in the event of unknown hazardous materials are discovered during grading, construction, and/or related development activities. Additionally, said protocol plan will be revised should the discovery of previously unknown hazardous materials be made during any of the above mentioned development activities.”

While the DON is reasonably certain that they have identified all potential locations of concern at the former MCAS El Toro, they are prepared to respond to any future identification of potential contamination following transfer of the fee title to the property. This is a prudent approach where complete certainty is not possible.

Response to Comment M36

Refer to Responses to Comments H65, H67, and M27 for information regarding the City of Irvine’s Solvents Study. Refer to Response to Comment M26 for information pertaining to protection of human health and the environment from known or suspected carcinogens, including TCE.

Response to Comment M37

Refer to Responses to Comments H65, H67, and M26 for information regarding the City of Irvine’s Solvents Study.

Response to Comment M38

See Response to Comment H65. The DON responded to the City of Irvine Solvent Study in the April 2003 Draft Final EBS. In its response, the DON concludes that the City of Irvine Solvent’s Study methodology was faulty in regards to the magnitude of solvent use and potential releases via the sanitary sewer system and that the likelihood of releases was small. The DON concluded that the lack of significant releases associated with Building 307, the Laundry and Dry Cleaning Facility, supported its prior conclusion that the sanitary sewer system is not a significant conduit of contamination to subsurface soil or groundwater.

Response to Comment M39

See Responses to Comments H65 and M38.

Response to Comment M40

See Responses to Comments H65 and M38. The April 2003 Draft Final EBS specifically evaluated the City of Irvine Solvent’s Study and concluded that the methodology presented in the study was faulty. Upon review of the April 2003 Draft Final EBS, the City of Irvine now accepts this assessment.

Response to Comment M41

See Response to Comment H65, M38, and M40.

Response to Comment M42

There is no evidence to suggest that unknown contaminated soils are likely to be discovered during excavation of the project site. Refer to Response to Comment M26 for information pertaining to the protection of human health and the environment from known or suspected carcinogens. Per the Mitigation Measures outlined in Section 5.6.5 *Geology and Seismicity Mitigation Measures*:

“Prior to issuance of a building permit, as per existing City policies, geotechnical studies shall be prepared at the time specific development projects are proposed to address site specific geotechnical considerations. The scope of each geotechnical study is based on the underlying geotechnical conditions of the individual site...The purpose of the subsurface evaluation is to further evaluate the subsurface conditions in the area...”

In the unlikely event that unidentified contaminants are discovered, the EIR provides an appropriate Mitigation Measure to deal with this scenario. Section 5.5.5 *Public Health and Safety Mitigation Measures* has been amended and read as follows:

“Prior to the issuance of a grading permit, the applicant shall prepare and the Director of Community Development shall approve a protocol plan (including but not limited to worker training, health and safety precautions, additional testing requirements, and emergency notification procedures) in the event of unknown hazardous materials are discovered during grading, construction, and/or related development activities. Additionally, said protocol plan will be revised should the discovery of previously unknown hazardous materials be made during any of the above mentioned development activities.”

Response to Comment M43

Refer to Responses to Comments M35 and M42. There is no evidence to suggest that unknown contaminated soils are likely to be discovered during excavation of the project site. The former MCAS El Toro will be remediated to an exposure level acceptable to human health and the environment. Mitigation Measure HH 5 addresses this potential issue by requiring grading permit applicants to prepare a protocol plan that responds to unidentified contamination. Refer to the document *Reusing Cleaned Up Superfund Sites: Recreational Use of Land Above Hazardous Waste Contaminant Areas* – EPA Office of Emergency Response (March 2001) for technical information on how sites with waste contaminated areas have been safely reused for recreational purposes while ensuring the integrity and protectiveness of the remedy are maintained.

Response to Comment M44

Refer to Responses to Comments H65, M35, M38, M40, M42, and M43.

Response to Comment M45

Refer to Responses to Comments H65, M35, M38, M40, M42, and M43. The City of Irvine accepts the DON's conclusion in the April 2003 Draft Final EBS that widespread unidentified contamination is not likely to exist at the base. However, if unidentified contamination is discovered, Mitigation Measure HH 5 has been amended and responds to the potential for such localized unidentified contamination to exist and be encountered during grading activities.

Response to Comment M46

Refer to Responses to Comments H65, M35, M38, M40, M42, and M43. The DON is required to complete all necessary remedial actions before the fee title to the former MCAS El Toro is transferred from federal ownership. Even after the title is transferred, the federal government is required to conduct further remediation if additional contamination caused by DON actions is discovered or if a remedy fails to perform adequately. Federal law also provides that DON may be required to indemnify the new owners or certain other parties for liabilities arising from claims for personal injury or property damage resulting from the release or threatened release of any hazardous substances, pollutants or contaminants, or petroleum or petroleum derivatives attributable to DON activities on military installations. Refer to the following letters that are attached in the Appendix to this Response to Comments document: H.T. Johnson, Assistant Secretary of the Navy, Installations and Environment, Letter to the Editor, Los Angeles Times, 5 August 2002; and the letter to the City of Irvine from the DON dated 25 April 2003. Also see the "DOD Policy on Responsibility for Additional Environmental Cleanup after Transfer of Real Property" electronically at:

[http://www.dtic.mil/envirodod/Policies/BRAC/brac_flu.htm]. Using the proposed Mitigation Measure GS2 will require geotechnical assessment for specific development prior to construction; construction delays using this methodology will likely not occur.

Response to Comment M47

Refer to Response to Comment M46.

Response to Comment M48

Refer to Responses to Comments H78 and M46. The DON is required to complete all necessary remedial actions before the fee title to the former MCAS El Toro is transferred from federal ownership. Even after the title is transferred, the federal government is required to conduct further remediation if additional contamination caused by DON actions is discovered or if a remedy fails to perform adequately. Federal law also provides that DON may be required to indemnify the new owners or certain other parties for liabilities arising from claims for personal injury or property damage resulting from the release or threatened

release of any hazardous substances, pollutants or contaminants, or petroleum or petroleum derivatives attributable to DON activities on military installations. Refer to the following letters that are attached in the Appendix to this Response to Comments document: H.T. Johnson, Assistant Secretary of the Navy, Installations and Environment, Letter to the Editor, Los Angeles Times, 5 August 2002; and the letter to the City of Irvine from the DON dated 25 April 2003. Also see the “DOD Policy on Responsibility for Additional Environmental Cleanup after Transfer of Real Property” electronically at:
[http://www.dtic.mil/envirodod/Policies/BRAC/brac_flu.htm].

Response to Comment M49

Refer to Response to Comment M46. The comment acknowledges that federal law requires the DON to remediate any contamination attributable to their actions and indemnify the community from its effects; there is no basis to speculate that the DON will not comply with the law. While the purpose of an EIR is to evaluate environmental and not economic impacts, no economic consequences would result due to the DON’s indemnification.

Response to Comment M50

Refer to Responses to Comments H65, M26, M35, M43, and M46.

Response to Comment M51

Refer to Responses to Comments H65, M35, M38, M40, M42, M43, and M46.

Response to Comment M52

Refer to Responses to Comments H65, M26, M35, M43, M44, and M46. The DON’s initial 1995 EBS and April 2003 Draft Final EBS outline specific areas of soil contamination that will require remediation prior to ownership transfer. The DON has stated that some land-use controls (i.e., easements, covenants, institutional controls, ordinances, etc.) will be required in order to restrict public access on approximately seven Installation Restoration Plan (IRP) sites. The DON will employ limited land use controls at IRP Sites 2, 3, 5, 16, 17, 18, 24; the use of such controls has yet to be determined for IRP Sites 1, 8, 11, and 12. This action has been deemed necessary until the IRP Sites in question can be remediated to the above mentioned acceptable exposure levels.

Response to Comment M53

Refer to Responses to Comments M54 through M58.

Response to Comment M54

The study included explicit phase and analysis for 2007 conditions (short-term), 2025 (long-term), and post-2025 (General Plan buildout) conditions. This is consistent with requirements of the City of Irvine Traffic Impact Analysis guidelines. The 2007 analysis was included specifically to identify necessary phasing of short-term and long-term improvements. The City of Irvine has also developed an implementing mechanism in the form of the North Irvine

Transportation improvement Mitigation (NITM) program. Ongoing monitoring of study area conditions, as a feature of the NITM program, is in the form of an interim and 5-year review.

Response to Comment M55

The EIR, in conjunction with NITM, provides significant detail regarding the timing of construction of necessary roadways, and links development to the completion of the roadways. The information regarding the timing of construction of facilities presented in the referenced tables was obtained directly from the agency responsible for each improvement or the environmental document that required associated with each improvement. Construction of those improvements in the subject tables that are related to future development is tied to the development as required mitigation measures, and/or conditions of approval, that must be constructed in conjunction with the specified development. The tables referred to in the comment represent the best knowledge available regarding the timing of future development and anticipated roadway improvements.

Response to Comment M56

Refer to Responses to Comments M54 and M55. The EIR and NITM provide for comprehensive phasing for all necessary traffic improvement. For non-NITM improvements, Mitigation Measure Trans 4 specifically requires their construction by the developers of the Great Park, with construction phased in relation to Great Park development. The non-NITM improvements are designed to mitigate the specific impacts for which these improvements are required in the EIR. With respect to NITM improvements, the NITM program allocates funding responsibility for all improvements on a proportioned basis between Great Park and other properties generating traffic that necessitate the improvement. NITM also sets forth a phasing program for construction.

Response to Comment M57

Refer to Response to Comment M56.

Response to Comment M58

Refer to Response to Comment M56.

Response to Comment M59

The statement that no peak hour impacts were identified is incorrect. The segment of University Drive between the I-405 southbound ramps and Michelson Drive was identified for 2025 conditions as a roadway segment where an additional southbound through lane was required. The results of the daily and peak roadway segment analysis, in conjunction with the peak hour intersection analysis, did in fact accurately and adequately identify potential project impacts and required mitigation measures (mid-block or through travel lanes).

The key difference between the roadway segment daily and peak hour analysis is that the daily capacities assume a variety of impediments to capacity, including

the presence of cross-street intersections that consume a substantial proportion of available capacity. The peak hour capacities are focused on identifying the potential need for mid-block travel lanes based on unimpeded mid-block conditions.

The basic assumptions of the daily segment analysis and the peak hour segment analysis are different, corresponding to the different purposes of the two types of analysis. The daily segment analysis is intended to be utilized as a very general measure of roadway performance and includes the potential capacity reductions due to mid-block intersections. The peak hour segment analysis is intended to evaluate the specific need for mid-block travel lanes in the absence of cross-street interference.

Response to Comment M60

Refer to Response to Comment M59.

Response to Comment M61

The policy addressed in the comment is an already existing rather than proposed General Plan policy. The proposed project merely makes PA 30 subject to Policy B-1 of the General Plan Circulation Element. The application of the existing policy to PA 30 has been specifically analyzed in the EIR and the analysis concludes that the application of this policy allows for LOS E at two intersections (EIR Page 5.2-58). It is the prerogative of the City of Irvine to establish appropriate performance standards within its local jurisdiction.

Response to Comment M62

Refer to Response to Comment M61. The issue of thresholds of significance (impact) is separate from the concept of the local jurisdiction's right to establish the appropriate performance standard for the community.

Response to Comment M63

The comment deals with additional analysis provided by the EIR to examine future conditions if the City approves the General Plan Amendment and Zone Change for PA 40 (the "probably future project"). This project was previously approved but subjected to a litigation challenge. The PA 40 impacts and PA 40's responsibility to fund its proportionate share of traffic mitigation are set forth in the NITM program. Application of the NITM program will generate sufficient fees to timely fund construction of all traffic improvements necessary for the development of the Great Park, PA 40, and the remainder of undeveloped north Irvine.

Response to Comment M64

The Great Park Traffic Impact Analysis does take into account all anticipated growth in traffic for surrounding communities and the entire region, based on adopted growth forecasts for the entire County of Orange and surrounding region. The area model (ITAM) includes existing development and regional

growth projections for Orange County and the relevant portions of Los Angeles County, Riverside County, San Bernardino County, and Ventura County, as well as projected increases in interactions with the surrounding areas via the regional roadway system.

Response to Comment M65

The Traffic Impact Analysis executive summary is simply a summary of the proposed mitigation program; they are discussed in greater detail on page 5.2-71 of the EIR. That analysis concludes that if such programs were not implemented by the responsible regional agencies the cumulative impacts would be significant and unavoidable. Also refer to Responses to Comments F36 and S6.

Response to Comment M66

The sources referenced in the comment represent specific funding sources that are responsible for implementing the roadway improvements identified in the Traffic Impact Analysis developed for the EIR. The funding sources generally fall into two categories; the first funding source category is development projects that have been approved. The implementation mechanism/assurance of funding is the specific condition of approval requiring that the improvement be constructed in conjunction with the approved development project. The second funding source category is local agencies that have included specific improvements within their capital improvement program. Projects are only included in the local agency capital improvement program when they are associated with a specific funding source identified by the local agency.

Response to Comment M67

Land use based trip rates and socioeconomic data (SED) based trip rates simply reflect two different but commonly accepted approaches to evaluating traffic. There are underlying differences in the ways that land use based models and SED based models are used to forecast future traffic. Traffic models validated using land use data or SED have both been shown to match (validate to) existing traffic volumes quite well. Traffic forecasts for the Great Park Traffic Impact Analysis that match the regional SED driven forecasts are now a mandatory modeling consistency requirements based on stated and federal legislation. The ITAM model incorporates the conversion from one approach to the other and has been validated to existing traffic volumes.

Response to Comment M68

A key difference between land use based and SED based models is how they treat "linked" trips. A land use based model treats linked trips as two shorter individual trips. A SED based model treats the same linked trip as a longer single trip. The land use model has higher trip generation because it assumes that longer trips have stops and computes one longer trip as multiple shorter trips. As a result, the 6,256 trips under the land use model is a different way of expressing the same number of trips under the SED because they are both based on the same vehicle miles traveled per day.

Response to Comment M69

Refer Responses to Comments M54 to M58.

Response to Comment M70

Both direct and indirect potentially significant noise impacts are discussed in detail in the EIR. Section 5.4.3 *Noise Environment Impacts* discusses noise impacts relating to project construction activities, post-construction, traffic noise, project land use noise, and off-project area noise. Refer to the EIR, pages 5.3-22 through 5.3-34, as well as the Environmental Noise Assessment technical report (Appendix H of the EIR), for presentation of noise data and a comprehensive discussion of potential noise impacts. Traffic noise impacts were analyzed and determined based on current, accepted FHWA and Caltrans modeling methods, as well as compatibility guidelines established by the local county and city jurisdictions. Beyond this program level analysis, more detailed traffic noise assessments may be conducted as specific projects are developed.

Response to Comment M71

Noise impacts related to traffic generated by the project both on- and off-site are discussed in Section 5.4.3 *Noise Environmental Impacts* from traffic volume data presented in Section 5.2.3 *Traffic/Circulation Environmental Impacts*. The potential traffic noise impacts on noise-sensitive receptors due to the Great Park Plan were evaluated in accordance with methodologies established by the FHWA and CALTRANS, as well as compatibility guidelines established by the local county and city jurisdictions. Beyond this program level analysis, more detailed traffic noise assessments may be conducted as specific projects are developed. Mitigation Measure Trans 1 does not indirectly confirm the conclusion surmised in Comment M71; part of the purpose of requiring a project applicant to apply for annexation to the Irvine Spectrum TMA is to address traffic, air and noise impacts. Mitigation Measure Trans 1 further states that should this annexation application not be approved, a TMA shall be developed and implemented for the project. Additionally, the EIR concludes that traffic impacts resulting from the proposed project would be reduced to a less than significant level with implementation of the identified Mitigation Measures.

Response to Comment M72

The comment is in reference to residential development located in the transit-oriented development area which is designed to be in close proximity to the Urban Transportation Center and railway. Section 5.4.1 *Noise Environmental Setting* states:

“The Irvine Transportation Center, a major multi-modal transit center linking bus, commuter rail, and Amtrak rail services, is located along the southern edge of the project area, adjacent to the Southern California Regional Rail Authority railroad.”

California Building Standards establish uniform minimum noise insulation performance standards to protect persons from the effects of excessive noise in multi-family dwellings. Furthermore, as stated in Section 5.4 *Noise California Building Standards*:

“Interior noise levels attributable to exterior noise source must not exceed 45dBA in an habitable room...When the exterior noise levels cause interior noise levels to exceed 45dBA, the building must be designed to prevent the transmission of exterior noise....The California Building Standards will apply to...habitable dwellings other than detached single-family homes within the project site.”

Response to Comment M73

Refer to Responses to Comments M70 through M72.

Response to Comment M74

Comment 74 is responded to in Responses to Comments M75 through M79.

Response to Comment M75

Refer to Figure 5.7-1 for drainage areas and topography information. Per the EIR, a Flood Control Master Plan has been adopted by the City of Irvine, the City of Tustin, the Irvine Company, and the Orange County Environmental Management Agency and is currently being implemented in phases by these agencies. The phasing of flood control system improvements in PAs 51 and 30 will be coordinated with street-phasing schedule so that stormdrains are installed prior to or in concert with road construction. The City's DAMP requires that BMPs be implemented in order to reduce increased runoff to stormdrains. The EIR concludes that the potential for flooding to occur both on- and off-site as a result of future development of the project area is considered a significant impact. To this end, Mitigation Measure H/WQ4 is provided to reduce that potential impact to one of less than significant.

Response to Comment M76

As described in the EIR, the project site is located within the San Diego Creek watershed. No formal delineation of the 100-year flood plain has been prepared by FEMA for the project site as it has been under federal ownership. However, as described in the EIR, the “Flood Control Master Plan for San Diego Creek” (John M. Tettemer and Associates, 1989) identified a range of flood control improvements for the San Diego Creek watershed that would control flood peaks based on a 100-year flood (EIR page 5.7-4). The proposed project will provide for the construction of drainage improvements that are consistent with the Flood Control Master Plan. While the EIR states that some flood control deficiencies remain in the existing condition, any potential flood control deficiencies would be corrected through the implementation of the drainage improvements identified on Figure 5.7-2 Proposed Drainage System of the EIR and through implementation of Mitigation Measures H/WQ 3 and H/WQ 4.

As described in the EIR, developers with property located in the newly delineated 100-year floodplain will be required to construct such improvements as necessary to remove the property from the 100-year floodplain and to prepare a Letter of Map Revision (LOMR) request to have the FIRMs revised to remove the development areas from the 100-year floodplain upon completion of the flood control facilities.

Response to Comment M77

Refer to Response to Comment M76.

Response to Comment M78

This comment incorrectly recites text from EIR page 5.7-6. The EIR does analyze the potential impacts resulting from stormwater volume, identifies appropriate mitigation measures, and addresses how well they will reduce the impacts to a level less than significant (see EIR pages 5.7-13 through 5.7-26).

As described in the EIR, as part of site planning for the reuse of the former MCAS El Toro, a hydrology study for the 100-year storm event was prepared. Design discharges were developed, and Table 5.7-3 of the EIR provides a quantified summary of the peak flows. (EIR, page 5.7-15, 16) A drainage concept plan has been prepared for the project which addresses stormwater flows on the project site. The locations and sizes of drainage pipes and the proposed drainage channels were determined based upon the level of anticipated runoff from various land uses so as to maintain and improve the existing level of flood control service within the project area.

Response to Comment M79

The requirement for Section 404 Permit and related wetlands and dredge/fill permits are a component of the project; the EIR identifies future potential permit requirements for project implementation, including the potential need to obtain a Section 404 Permit from the US Army Corps of Engineers (EIR, p. 3-30). Issues related to dredge and fill of regulated waters is also addressed on 5.9-17 with specific mitigation cited on page 5.9-25. Permits will be obtained as necessary as future projects are proposed within the project area. There is only a small amount of wetland habitat located on the project site. The provision of large “daylighted” earthen drainage corridors in addition to the proposed wildlife corridor will provide ample opportunity for the development of viable wetland habitats within the project area.

Response to Comment M80

Refer to Response to Comment M22. The development of the 14,000-acres previously contained in the AICUZ is not affected by this project.

Response to Comment M81

Refer to Response to Comment M22.

Response to Comment M82

The proposed project will accommodate regional drainage control facilities. The project does not rely upon flood control systems already in place to mitigate potential impacts; rather, the EIR analyzes water quality impacts and the project proposes a comprehensive approach to addressing drainage control through the provision of drainage and flood control facilities on-site that will accommodate both project-specific runoff volumes as well as provide for regional flood control facilities. Refer to EIR pages 5.7-13 through 5.7-26.

Response to Comment M83

This comment introduces Comments M17 and M87 through M94.

Response to Comment M84

Refer to Response to Comment M17.

Response to Comment M85

Refer to Response to Comment M17. The existing analysis in the EIR evaluates both demolition and construction impacts.

Response to Comment M86

Refer to Responses to Comments M17 and M85.

Response to Comment M87

To provide a reasonable means to estimate air construction emissions in the EIR, it was assumed that either plan (Base and Overlay Plan) is divided into two phases based on the reasonable utility and extent of development being considered at this stage of the project. The first phase is assumed to last ten years (2007-2016) and the second phase is assumed to last the remaining nine years (2017-2025). For each phase, construction activity was assumed to last for a period of three-years, but spread out over a four-year schedule for emission estimation purposes. At this stage of the project, the aforementioned phased methodology of estimating air construction emissions is a reasonable approach considering the level of broad environmental impact analysis. The air quality impact remains the same whether demolition and construction occurs over two, three-year time periods or a single twenty-year time period; the quantity of the construction-related air emissions does not change whether the construction occurs over a shorter or longer timeframe. By analyzing over a shorter time period the EIR evaluates the more intense development scenario for these emissions.

Response to Comment M88

Refer to Response to Comment M87.

Response to Comment M89

The comment misapprehends the restrictions set forth in the proposed General Plan amendment; the numerical limits for allowable uses within the Great Park are the maximum allowed intensity level. Refer to Responses to Comments M9

and M87. The air quality analysis presented in the EIR is based on the buildout limits of the Overlay Plan and the Base Plan.

Response to Comment M90

Refer to Response to Comment M89.

Response to Comment M91

Section 5.3.5 of the EIR outlines several proposed construction and operational air quality impact mitigation measures that are recommended by the South Coast Air Quality Management District (SCAQMD) that may be implemented during the various phases of the project. Mitigation Measures AQ1 through AQ4 are outlined on pages 5.3-53 through 5.3-55 and will be implemented during various phases of the project.

Response to Comment M92

The comment is in error; see Mitigation Measures AQ1 and AQ2 on pages 5.3-53 and 5.3-54 in the EIR. Refer to Response to Comment M91.

Response to Comment M93

Refer to Responses to Comments H67, H77, and M87.

Response to Comment M94

Refer to Responses to Comments H67, H77, and M19.

Response to Comment N1

Comment noted. Traffic studies prepared in conjunction with specific development applications within the project site will be forwarded to the TCA for review as appropriate.

Response to Comment N2

Comment noted.

Response to Comment N3

Comment noted.

Response to Comment N4

Comment noted.

Response to Comment O1

Comment noted. This letter concludes that the EIR includes a discussion of the proposed project's consistency with SCAG policies and applicable regional plans, which were outlined in the SCAG's 6 November 2002 letter on the Notice of Preparation for the EIR.

Response to Comment P1

The City of Irvine proposes the construction of natural drainage corridors as a major project feature in order to achieve drainage control as well as water quality, biological, and aesthetic benefits associated with wetland/riparian restoration. To that extent the City anticipates restoration efforts will involve, among other disciplines, urban stream restoration specialists. The City envisions that these areas will be planted with native species to the extent practicable.

Response to Comment P2

The City of Irvine recognizes that site-specific best management practices (BMPs) implemented for each specific construction project will need to comply with RWQCB NPDES requirements. As required by Mitigation Measure H/WQ 2, prior to issuance of a grading permit for site specific development, evidence shall be provided that demonstrates that all stormwater runoff and dewatering discharges from the project area shall be managed to the extent practicable or treated as appropriate to comply with water quality requirements identified in the Santa Ana Regional Water Quality Control Board Basin Plan, including Total Maximum Daily Load (TMDL) Implementation Plan adopted for this watershed.

Response to Comment P3

The City of Irvine intends to reconstruct the currently underground Bee Canyon Channel and Agua Chinon Channel into natural drainage corridors. However, it is not likely that any new flood plain delineations prepared for the project area will reflect historic zones of flooding, as they will need to reflect the existing and proposed hydrological condition within the project area, not historic conditions.

Response to Comment P4

As depicted in Figure 5.7-2 of the EIR, four potential Irvine Ranch Water District (IRWD) NTS Water Quality Basins are proposed within the project area. One basin is proposed at the northern portion of the project site (PAZ 1) within the Marshburn Basin, while the remaining three are proposed at the “downstream” end of the two drainage corridors, and the wildlife corridor. The placement of the NTS facilities allow for regional water quality to be addressed by the IRWD in its environmental assessment of their NTS project. However, the City of Irvine will also provide, as necessary to meet NPDES requirements, structural and non-structural BMPs on a site-specific basis to ensure that polluted runoff is minimized.

Response to Comment P5

Development is not proposed within the Serrano Creek; however, some drainage improvements are proposed within this area as part of the overall drainage concept plan. While implementation of the proposed project will result in some isolated wetland impacts, the overall quality and value of wetland habitat is anticipated to be significantly enhanced by the proposed natural drainage corridors.

Response to Comment P6

It is anticipated that the "Q" will change as a result of project development. For example, currently undergrounded drainage systems that are proposed to be daylighted and restored as part of the project would experience a change in Q as these areas will become vegetated, with a meandering alignment and varying topographic conditions. Also, these drainages will be designed to accommodate additional runoff created by new development within the project area. However, all drainage facilities are proposed so as to avoid impacts to downstream and/or off-site facilities.

Response to Comment P7

Comment noted.

Response to Comment P8

Comment noted.

Response to Comment Q1

For the Final EIR, the IRWD letter dated 4 April 2003 will be added to Appendix C of the EIR along with the supplemental material provided as part of this document. This supplement confirms the validity and does not materially affect the conclusions reached in the WSA prepared for the subject project.

Response to Comment R1

A traffic study area for the purpose of assessing the project's potential traffic impacts has been defined, and is illustrated in Figure 5.2-1 of the EIR. The limits of the study area are defined by the amount of trips resulting from the proposed project and the potential to impact circulation systems. As shown in Figure 5.2-1, the trip distribution of the proposed project would not extend into areas of Newport Beach and Huntington Beach, and a significant amount of traffic is not expected to utilize Pacific Coast Highway.

Response to Comment R2

Refer to Response to Comment R1.

Response to Comment R3

Estimating the number of airline passengers generated by the proposed project and determining which airports these passengers would utilize is speculative. Additionally, this information does not represent a potential environmental impact.

Response to Comment R4

The amount of urban runoff generated by the project that will be recycled or used for irrigation has not been quantified. Normally, urban runoff is not recycled and directly utilized for irrigation purposes. Reclaimed water, which is sewage that has been substantially treated, is the primary water source utilized for irrigation purposes in the City. However, the proposed project will provide unique project features that will offer opportunity for recharge of groundwater from runoff in the form of the construction of two major natural drainage corridors – the Bee Canyon Channel and Agua Chino Channel. Both of these channels currently traverse the project site underground and do not contribute to recharge in the area. Reclaimed water will be provided to the project area to serve a majority of the landscaping needs on-site.

Response to Comment R5

Analysis of project impacts to public services as well as public health and safety is included in the EIR. There is no evidence to provide a link between homelessness, infectious disease, and lawlessness.

Response to Comment R6

There is no provision in the Orange County Great Park plan that dictates where residents should live and work. The Transit Oriented Development (TOD) land use designation proposed within the project area is intended to encourage the use of alternative modes of transportation by locating housing units in proximity to major public transit systems (e.g., the Metrolink station), employment centers, and shopping. Under the TOD designation, more refined TOD principles will be employed in this area as specific developments are proposed, such as the provision of pedestrian connections, to encourage the use of alternative modes of transportation.

Response to Comment R7

The Orange County Great Park plan does not dictate where employees working within the project site shall live. It is anticipated that persons residing in other communities will commute to the project site. This issue has been factored into the trip generation assumptions of the traffic analysis of the EIR.

Response to Comment R8

It is anticipated that the Orange County Great Park will be visited and used by a variety of people, who both live and work in the area, as well as tourists from other areas. The Orange County Great Park is envisioned to provide a variety of uses that will attract a large cross-section of people.

Response to Comment R9

Public transportation will be available to the project site. No determination has been made as to whether or not there will be a charge for parking in any portion of the project site, and if so, what that amount would be.

Response to Comment R10

The City has not determined the number of picnic tables that will be provided at the Orange County Great Park. This will be determined as site-specific park and recreational improvements are implemented within the various portions of the project site.

Response to Comment R11

No determination has been made whether the Orange County Great Park will provide a petting zoo feature, although this type of use is considered compatible with the type of uses envisioned for the park.

Response to Comment R12

No determination has been made whether the Orange County Great Park will provide a carousel, although this type of use is considered compatible with the type of uses envisioned for the park.

Response to Comment R13

The potential air quality impacts of the proposed are analyzed in Section 5.3 *Air Quality*. Table 5.3-12 depicts the Mitigated Construction Emissions for the development of the project area. These emission estimates conservatively account for demolition and grading/excavation activities as major sources of construction emissions.

Response to Comment R14

Construction noise, including the demolition of runways, is evaluated in Section 5.4 *Noise*. Table 5.4-8 depicts Typical Noise Levels for Construction Equipment. As shown, the noise level associated with the operation of unquieted jack hammers ranges between 75 and 85 dBA measured at 50 feet.

Response to Comment R15

The runway debris is proposed to be recycled onsite for use in constructing roadways and other supporting infrastructure for the project. As described on page 3-28 of the EIR, the runways can be removed in a sequential manner with stockpiling of materials onsite as required to permit maximum economy of scale in the operation.

Response to Comment R16

The runways will not be available for emergency landings once removal activities have been initiated.

Response to Comment R17

The demolition activities and runway removal will be phased with development onsite. Most of the supporting infrastructure will be constructed in the early phases of the development of the project site, which is expected in the first 3 to 5 years of project site development.

Response to Comment R18

Specific activities of any federal agency, including the Federal Aviation Administration (FAA) and Federal Bureau of Investigation (FBI) are subject to federal environmental regulations, including review under the National Environmental Policy Act (NEPA). Potential land use compatibility impacts would need to be evaluated based on the specific activity proposed by the federal agency. There is no information that indicates the FAA will use one-fourth of the former air station for aviation purposes, as such use is inconsistent with the Record of Decision adopted by the DON.

Response to Comment R19

Refer to Response to Comment R18.

Response to Comment S1

The comment states that the assumptions used in the analysis are theoretically within reason. The ITAM tool used to develop the future forecasts is consistent with the OCTAM travel demand forecasting tool, which is the regionally (County of Orange) adopted tool for developing future traffic forecasts on the regional roadway system, including the freeways and transportation corridors. Both ITAM and OCTAM have been validated against existing conditions including the freeways and transportation corridors.

Response to Comment S2

The planning level capacities used in the analysis (2,000 vehicles per hour per lane) are reduced to below their operational level capacities as observed in southern California (2,300 vehicles per hour per lane). It is reasonable to assume that including the additional capacity provided by an additional (truck climbing lane) offsets the loss of capacity that is already reflected in the planning level capacities used in this analysis. Regardless of capacity, the project contributes less than 0.03 to the volume capacity ration on the subject segments and accordingly does not exceed the CMP impact threshold for further analysis.

Response to Comment S3

Caltrans staff was contacted regarding ramp metering practices within the study area. No quantitative ramp metering plan was available for inclusion in the analysis and Caltrans could not provide a consistent schedule of ramp meter operations so it is impossible to determine where ramp metering will occur or when any given ramp meter will be operational. Therefore, it is appropriate to utilize the existing unmetered condition as the basis for projecting future traffic conditions and potential deficiencies. Storage of vehicles for a metered condition would of necessity utilize the arterial roadway system approaching the ramps to provide storage.

Response to Comment S4

The comment does not refer to any specific location(s) such that no site-specific response is possible. The Traffic Impact Analysis indicates that future traffic volumes are generally expected to increase over time. Isolated cases where improved future levels of service are projected to occur are most likely related to planned/funded improvements at the location in question.

Response to Comment S5

Proposed mitigation measures are based on environmental factors; the City of Irvine has no control over agreements entered into between Caltrans and other governmental agencies. The non-compete clause, for example, could result in one or more of the City of Irvine's mitigation measures not being implemented, but this is outside of the City of Irvine's control. The final EIR has been modified on page 5.2-71 to include discussion of the non-compete agreement and its potential effects on mitigating cumulative impacts. To the extent that the non-compete clause interferes with implementation of mitigation measures proposed

by the EIR, cumulative impacts would not be mitigated and thus remain significant and unavoidable. The following text has been added to Mitigation Measure Trans 7 on page 5.2-70 of the EIR:

“The City shall perform toll and revenue impact studies for any mitigation measure (improvement) that may be impacted by the non-compete clause or any similar agreement restricting a public agency’s authority to construct improvement.”

Response to Comment S6

The regional funding programs referenced in the EIR are not used as project mitigation. Rather, these programs are recognized as the regional approach to addressing cumulative impacts. The EIR mitigation measures address all project impacts that were identified in the Traffic Impact Analysis, subject to constraints such as those identified in Response to Comment S5 (TCA non-compete agreements).

Response to Comment S7

Comment noted.

Response to Comment T1

The EIR recognizes that the proposed Great Park project area currently and historically has had some wildlife movement; however, the project area does not currently serve as a significant wildlife movement corridor between the habitat preserve and the coastal habitat preserves. Additionally, by definition, a corridor is a linear habitat whose primary wildlife function is to connect significant habitat areas. Therefore, by definition, no wildlife corridor currently exists within the project area.

The Wildlife Corridor planning efforts are on-going, and the Orange County Great Park Plan land use concepts will accommodate this on-going planning effort to ensure that the proposed route of the new wildlife corridor is a viable one. Previously, as a part of the wildlife corridor feasibility study, preliminary "fatal-flaw" analysis was conducted on 15 August 1999, which has been examined on several subsequent occasions by wildlife biologists. The biologists examined the proposed route and its feasibility as a wildlife movement corridor. Additionally, a focused survey of the biological conditions along the proposed corridor was conducted on 7 September 1999. The biologists surveyed the extent of the route including the adjacent connective habitat at the start and end of the proposed corridor. Serrano Creek and Borrego Canyon Wash were also surveyed for use/potential use as wildlife corridors. Subsequent to these initial surveys, the proposed wildlife corridor has been informally surveyed by wildlife biologists and members of conservation groups.

As depicted in the Section 3.0 *Project Description* Figure 3-7 of this EIR, the riding and hiking trail is proposed to parallel Irvine Boulevard until it reaches the Habitat Preserve. At this point, the riding and hiking trail will extend north toward SR 241 and the Agua Chinon Reservoir. The biking and hiking trail does not enter the Wildlife Corridor.

As described in Figure 5.9-2, the proposed development within Planning Area 18 includes a golf course with a clubhouse and some residential uses. To ensure the compatibility with the Wildlife Corridor, the clubhouse and residential units will be subject to development regulations that will be created as part of a wildlife corridor master plan.

The City of Irvine will continue to work with State and federal agencies to implement the revegetation/restoration plan necessary to create a viable wildlife corridor within the project area.

Response to Comment U1

Considerations for remedial actions objectives are provided in 40 CFR 300.430(e)(2)(i) that states, "remediation goals shall establish acceptable exposure levels that are protective of human health and the environment and shall be developed by considering the following...for known or suspected carcinogens, acceptable exposure levels are generally concentration levels that represent an excess upper bound lifetime cancer risk to an individual of between 10^{-4} and 10^{-6} using information on the relationship between dose and response." The DON will be responsible for remediation of the former MCAS El Toro to these exposure levels regardless of the land use designation or the population that resides there. The DON has publicly stated that it will indemnify new land owners of former air station property in order to mitigate potential soil contamination that is attributable to historic DON operations.

Response to Comment U2

The objectives of the proposed project are defined in Section 3.0 *Project Description* of the EIR. As described, Measure W amended the County of Orange General Plan to remove the designation of the project site as a commercial airport. Therefore, implementation of a commercial airport would not be consistent with Measure W.

Response to Comment V1

Comment noted. Refer to Responses to Comments V2 through V20 for a detailed response to each of the comments raised by the commentor.

Response to Comment V2

Page 5.2-41 of the EIR, under the heading Master Plan of Arterial Highways Amendment, discusses the issues of consistency with the MPAH and the proposed amendments. The EIR also recognizes that typically, a cooperative study would occur prior to the City amending its General Plan. However, since OCTA cannot recognize the City of Irvine's jurisdiction on the former MCAS El Toro until the annexation is complete, the EIR states that the City of Irvine will enter into a cooperative agreement as soon as possible following the annexation of the property to the City of Irvine.

Mitigation Measure Tran 6 addresses this issue:

"Following adoption of a land use plan and circulation plan for the Great Park property and before the issuance of any building permits within the base property, the City of Irvine shall enter into a cooperative study with OCTA and other affected jurisdiction to amend the Orange County Master Plan of Arterial Highways. Marine Way, Trabuco Road from the SR-133 tollway to College Road, and Y Street should be included on the MPAH."

Response to Comment V3

The post year 2025 roadway network is depicted in Figure 5.2-23. The assumed roadway network does not include the extension of Culver Drive north of Portola Parkway.

Response to Comment V4

The discrepancy is a typographical error on Table 5.2-11 (Table 5-15 of the Traffic Impact Analysis). These tables have been amended to reflect the correct figure of 9,732 trips. The figure of 9,732 trips was correctly utilized in both the air quality analysis and the actual traffic impact analysis.

Response to Comment V5

Refer to Response to Comment S6. Although the City of Irvine intends that the project will contribute its fair share towards mitigation/improvements on impacted freeway segment, the City of Irvine does not control the implementation process. Therefore a statement of overriding considerations is necessary if certain mitigation measures are not implemented by the responsible agency (Caltrans). Caltrans comments on the EIR, for instance, specifically identified their non-compete agreement with the Transportation Corridor Agency(ies) (TCA) as a potential impediment. The regional funding programs referenced in the EIR are not used as project mitigation. Rather, these programs are recognized as the regional approach to address cumulative impacts. The impact of OCTA providing extra-peak and off-peak train service was not evaluated in the Traffic

Impact Analysis, thereby making the analysis more conservative with regard to future traffic impacts.

Response to Comment V6

Refer to Responses to Comments H2 and V4. The City of Irvine has made every effort to accurately reflect anticipated project land uses and trip intensities in preparing the Great Park plan. However, in the event that the OCTA facility generates more traffic than was analyzed in the EIR, additional and separate environment analysis may be required for the OCTA facility. Any development proposed by OCTA, if it becomes a landowner in the future, which is not consistent with the proposed plan and EIR will require additional environmental evaluation.

Response to Comment V7

The explanatory variable of employment is intended to capture both actual employee trips and ancillary traffic, such as buses entering and leaving the facility, maintenance vehicles etc. Regarding any traffic not anticipated in the Great Park project description, refer to the Response to Comment V6.

Response to Comment V8

The City of Irvine intends to coordinate closely with OCTA regarding the realignment of Marine Way and any impact to the existing OCTA Bus Operations and Maintenance facility. Meetings have already taken place with regard to the realignment issue.

Response to Comment V9

The City of Irvine standard street design manual specifies transit amenities such as concrete bus pads, bus turnouts, layover areas, benches, and other amenities. All streets in the Great Park will be designed in compliance with the City of Irvine standard street design manual. The specifics of the transit system will be determined prior to the implementation of the project. As stated in Mitigation Measure Tran 7:

"Prior to issuance of any building permits on the Great Park property, the City of Irvine shall coordinate with the Orange County Transportation Authority to restructure transit service plans to provide effective service to the project area."

Mitigation Measure Tran 2 states:

"Prior to the first building permit, the City shall prepare a transit system/infrastructure fee program to fund improvements identified as mitigation measures for the project area."

The implementation of these two Mitigation Measures will provide the necessary detailed transit service and the associated funding which would subsequently be used for detailed identification of transit amenities.

Response to Comment V10

Comment noted. If development of the project requires temporary use of OCTA's right-of-way, appropriate agreements will be entered into prior to entry.

Response to Comment V11

During implementation phases of the proposed project, the City of Irvine will evaluate the demand for additional park and ride facilities to serve the project area. Additional parking area at the Irvine Transportation Center is included in the Overlay Plan.

Response to Comment V12

The various public uses and educational facilities may create the need for an internal shuttle service. This will be addressed during the implementation phases of the project as more detail on the operational aspects of the various land uses are known and the ability to finance an internal shuttle service is evaluated.

Response to Comment V13

The comment appears to refer to the extension of Marine Way as an at-grade crossing. Marine Way is intended to be a grade-separated over-crossing of the SCRRA rail lines.

Response to Comment V14

The traffic analysis of the EIR has addressed the Level of Service of the entire network serving the Great Park Plan, including all the streets mentioned in the comment.

Response to Comment V15

Refer to Responses to Comments C1 and V13.

Response to Comment V16

Use of the term "major event" in the comment is unclear. The operators of facilities located in the referenced location would be required to submit traffic and parking management plans as part of their master plans for the City of Irvine's approval. This EIR addresses the impacts and identifies mitigation measures for the Great Park Plan and zoning designations for the proposed project. Operational issues will be part of the future permit processing of those facilities.

Response to Comment V17

Comment noted.

Response to Comment V18

The City of Irvine General Plan Circulation Element has established policies to connect the City's trails to the regional trail network. The Great Park Plan will provide opportunities for the expansion of the trail system. As stated in the EIR, the City will continue to encourage such enhancement throughout the planning and implementation stages of the project. The Class II bike trail will remain along Irvine Boulevard and link to the Class I bike trails in the drainage corridors that traverse the Great Park.

Response to Comment V19

Refer to Responses to Comments C2 and H29. The City of Irvine is adding the County of Orange's proposed bike trail to its Trail Network. Were funding to become available through the County, or were the City to initiate the specific design of the Class I bike trail mentioned in the comment, coordination with OCTA would be required.

Response to Comment V20

Comment noted.

Response to Comment W1

Measure W was drafted in response to evidence that the citizens of Orange County opposed a commercial airport at El Toro and preferred a non-aviation reuse of the base property with public benefit uses such as open space, recreational, educational and cultural amenities. In order to change the airport designation of the former MCAS El Toro in the County's General Plan, Measure W also had to specifically override Measure A which had established the airport designation for the former MCAS El Toro in the Orange County General Plan. Until the annexation of the former MCAS El Toro is completed, the base property remains within the County jurisdiction. A ballot measure amending the County's General Plan does not apply to the City of Irvine.

Response to Comment W2

The first two websites cited dealt with the estimated number of homes during plan preparation; the third website deals with the actual project in the EIR of which 3,625 is the correct number in the Overlay Plan.

Response to Comment W3

The maximum number of dwelling units allowed under the Overlay Plan is 3,625.

Response to Comment W4

The maximum number of dwelling units (3,625) is established by the proposed General Plan and zoning standards within the project area. Any increase in the total number of residential units would require a General Plan amendment, zone change, and associated environmental review.

Response to Comment W5

Refer to Responses to Comments M3 and M4. It should also be noted that the majority of development intensity is located in PA30, the portion of the project area already in the City of Irvine and not affected by Measure W.

Response to Comment W6

The Measure W land use plan did not show a lake. Some conceptual drawings published by the proponents of Measure W included a lake in the Great Park. This EIR covers the annexation, General Plan Amendment and Zoning of the El Toro property. The detail design of the Great Park and its amenities, including landscaping, water features, hardscape design and materials and other such details will be prepared in the subsequent phases of the implementation of the project, subject to all applicable development and environmental policies and standards.

Response to Comment W7

The advertisements and commercials discussed in this comment were disseminated by the proponents of Measure W and not by the City of Irvine. Those materials depicted a conceptual representation of a future countywide park with an array of natural and manmade amenities. Neither Measure W nor

the Orange County Great Park Plan identify or specify any particular species of animals to be included in their project description.

Response to Comment W8

The comment does not address environmental issue relating to the EIR.

Response to Comment W9

The comment does not address environmental issue relating to the EIR.

Response to Comment W10

As required by CEQA, this EIR identifies, analyzes and discloses the potential environmental impacts of the proposed project and identifies feasible mitigation measures to minimize those impacts. CEQA does not require an economic analysis or a financing plan as a component of an EIR. Projections for economic and financial fluctuations are beyond the scope of this EIR.

Response to Comment W11

Refer to Response to Comment W10. The funding and financing strategy for the implementation of the proposed project are discussed in Section 3.0 *Project Description* and in the draft Development Agreement.

Response to Comment W12

The comment represents anecdotal information which is not relevant to the subject matter and scope of this EIR.

Response to Comment W13

The issues related to population, employment, and housing affordability are discussed extensively in Section 5.13 *Population and Housing*. As stated in Section 5.13.4, the jobs to housing imbalance will remain a significant impact and a statement of overriding consideration will have to be developed.

Response to Comment W14

Refer to Response to Comment W13.

Response to Comment W15

The future traffic impacts of the proposed project are based on the Irvine Transportation Analysis Model (ITAM 3.01). This model provides a quantitative and objective framework for projecting and analyzing future traffic conditions in the City of Irvine and roadways immediately adjacent to the City. The ITAM databases have been continually updated as new knowledge about development patterns and the circulation network has become available. The model is derived from the Orange County Transportation Analysis Model (OCTAM), which is a travel demand forecasting tool used by OCTA to evaluate circulation system needs throughout the County. The ITAM structure allows for the analysis of land use and roadway network alternatives using the data provided as input. For more information regarding land use assumptions and other parameters used in

the traffic model, refer to ITAM 3.01 Technical Documentation and ITAM 3.01 Primary Study Area Database Expansion Technical Supplement.

Response to Comment W16

Refer to Responses to Comments H71, H77, and M18. The air quality impact analysis is contained in Section 5.3 of the EIR.

Response to Comment W17

Refer to Responses to Comments H71, H77, and M20.

Response to Comment W18

Per page 5.4-24 of the EIR:

“The main noise producing activities are anticipated to occur primarily during the early phases of construction. Portions of the infrastructure construction activities and runway demolition may occur simultaneously. The sound levels associated with this worst case scenario were evaluated at the nearest off-project area residences. The combined sound level was estimated for: 20 pieces of large mobile equipment operating at a distance of 5,000 feet; five concrete breakers operating at a distance of 6,000 feet; and two crusher plants operating at a distance of 10,000 feet. These distances represent the closest possible location of the construction equipment to the nearest off-project area residences. Based on these equipment types and quantities, the combined effect of this equipment would result in a sound level of approximately 56dBA at the nearest off-project area residential locations during the heaviest construction period.”

General construction noise impacts, including runway demolition, are discussed in Section 5.4.3 of the EIR based on the program level analysis. As specific projects are developed and specific construction activities are planned, more detailed analysis of potential construction noise impacts may be conducted.

Response to Comment W19

Refer to Response to Comment M91. Per Section 5.3.4 *Air Quality Mitigation Measures*, prior to the start of demolition and construction within the project area adjacent sensitive receptors shall be informed of the planned demolition and construction activities. The erection of fences around construction areas, staggered use of equipment near sensitive receptors, diversion of trucks away from sensitive receptors shall be employed. Additional mitigation measures will be used as determined appropriate and necessary when greater detail is known regarding the exact construction phasing methodology and logistics are determined.

Response to Comment W20

Erection of fences such as wind fences or partial temporary barriers and enclosures provide a wind-sheltered region in the vicinity of the disturbed area.

The wind-shelter area reduces the mechanical turbulence generated by ambient winds, thus reducing the entrainment and wind erosion of small particulate matter.

Response to Comment W21

Construction would not be allowed to occur until contaminated soils are remediated to acceptable levels; therefore, it is not anticipated that the use of wash off stations for construction trucks will result in the generation of toxic water runoff.

Response to Comment W22

City inspectors, using professional judgment, will determine if the quantity of soil carried over to the streets constitutes substantial material. Street sweeping will be regularly practiced during construction activity to ensure soils are not washed into storm drains.

Response to Comment W23

Soil materials collected as a result of street sweeping will be recycled and disposed of on-site.

Response to Comment W24

Refer to Response to Comment H48. As described on page 5.15-20 of the EIR, demolition activities, including the removal of existing runways and buildings, at PA 51 will generate debris materials that will need to be disposed at local landfills. Additionally, green waste will be produced as a result of on-going park and landscaping maintenance. The City requires construction and demolition debris recycling for new development projects. This will allow the reuse of building materials and reduce waste volume requiring disposal. Additionally, Mitigation Measure SW2 is proposed that requires 75 percent reduction of solid waste of those materials that cannot be recycled. Mitigation Measure SW2 states:

“For solid waste which is determined to be inappropriate for recycling (as that term is defined by California Public Resources Code Section 40180), the project applicant must submit a written plan to the City and implement such plan to ensure that 75 percent of the material, or the maximum amount feasible as determined by the technical evaluation, is diverted from the landfill through other methods that comply with state statutes and regulations.”

The construction waste is anticipated to consist primarily of green waste and recyclable concrete. There will be very little solid waste sent to landfills; furthermore it is anticipated that this material will be significantly less when the project has been fully implemented.

Response to Comment W25

A substantial portion of the runway materials are proposed to be recycled on-site to the maximum extent feasible. It is anticipated that the remainder will be recycled in development projects located within the region. As a result, the truck hauling from the former MCAS El Toro will displace other truck hauling that would occur with no anticipated net increase in materials hauling.

Response to Comment W26

Refer to Response to Comment W25. Local construction hauling is assumed in the Traffic Impact Analysis. The anticipated quantity of traffic resulting from material hauling, which would only occur for materials not used on-site, is expected to be less than the volume of traffic resulting from the project itself.

Response to Comment W27

Refer to Responses to Comments M17 and M87. The total emission estimates from construction of the proposed project are presented in Tables 5.3-19 and 5.3-20 (page 5.3-25) of the EIR. As compared to the total projected emissions for the SCAB, the mitigated emissions after Base Plan implementation constitutes 0.05 percent (for ROG) to 0.20 percent (for CO) of the total SCAB emissions. The mitigated emissions after implementation of the Overlay Plan would constitute from 0.09 percent (for NOx) to 0.39 percent (for CO) for the total SCAB emissions.

Response to Comment W28

AQMD Rule 1196(d) lists the requirements for new fleet vehicles. A link to the AQMD fleet vehicles rule is: [http://www.aqmd.gov/news1/fleet_rule_home.htm].

These rules do not impose any emission limits but rather require the use of alternative fuel vehicles, dual-fuel vehicles and use of low emission vehicles. AQMD Rule 1620 provides emission credits for clean off-road mobile equipment.

The AQMD is seeking to gradually shift to low emissions and alternative fuel vehicles in order reduce air pollution from motor vehicles pursuant to air quality management plans. Overall program direction for managing and reducing motor vehicle emissions is based on technology needs identified in AQMD's Air Quality Management Plan; state and federal rules and regulations; annual research and development coordination meetings with the California Air Resources Board; periodic meetings with various technology, clean fuel, and industry working groups, and annual meetings with the Technology Advancement Advisory Group.

Response to Comment W29

Although there is ample opportunity for a substantial amount of recycled runway materials to be utilized on-site, there will be some recycled runway materials that will be sold for construction purposes outside of the project area. The effect on the concrete recycling market cannot be predicted as the quantity and timing of

sales is not known. CEQA requires analysis of environmental not economic impacts.

Response to Comment W30

Refer to Response to Comment W29.

Response to Comment W31

Base Plan intersections were included in the EIR Traffic Impact Analysis and considered in the CO air quality impact analysis based on the following criteria (refer to Table 5.3-26 in the EIR). Since localized CO air quality impacts generally reach their peak in the vicinity of traffic congestion, only those intersections and roadways with the highest traffic congestion level of service (LOS) designations were considered in the air quality analysis. The high congestion intersections naturally represent the highest potential for localized air quality impact resulting from the project.

Roadway system performance with respect to traffic and congestion is generally described in terms of a LOS scale that ranges from designations of "A" to "F". Level of Service "A" represents the highest or best LOS, while LOS "F" represents the lowest or worst LOS. During peak hours, LOS A, B, C, and D are generally (at a minimum) considered acceptable, while LOS E and F represent degrees of deteriorating traffic system performance. Intersections with LOS designations of D, E, and F were included in the CO air quality impact analysis, while intersections and road way systems with LOS designations of A, B, and C were not.

Response to Comment W32

Refer to Response to Comment W31.

Response to Comment W33

Section 5.5 *Public Health and Safety* states:

"The Norwalk Pipeline was used as a jet fuel distribution system in support of the military mission at the former MCAS El Toro. The pipeline originates in Norwalk, California, enters the project site near the existing commissary located adjacent to Irvine Boulevard, and runs through the former air station housing to the former storage tank facilities. In May 1999, all the jet fuel was purged from the pipeline from Norwalk to the former air station using a pigging process and replaced with inert gas (nitrogen). The Defense Energy Support Center currently maintains the pipeline."

Response to Comment W34

Section 5.5 *Public Health and Safety* states:

“The County of Orange, in coordination with all other local jurisdictions and emergency response providers in the County, is responsible for the preparation, maintenance, and implementation of emergency response plans...for the County. The Orange County Emergency Plan is the official emergency plan for the County. The plan is a basic reference and training document for emergency preparedness, response, recovery, mitigation, and provides the authority and basis for the development of more detailed departmental and functional standard operating procedures”

Response to Comment W35

New air traffic routes in the vicinity of the former El Toro MCAS due to the lifting of air-space restrictions are not a function of the proposed Great Park Plan but rather the closing of the former air station. It is anticipated that these routes would remain whether or not the Great Park Plan was developed. Noise sampling of existing conditions recorded existing aircraft overflights as part of the existing ambient noise.

Response to Comment W36

The FAA may maintain some existing ancillary facilities within the 4,700-acre base property. The largest presence of the FAA will be in the +/-970-acre habitat area (which will remain in federal ownership) and where the FAA may continue to use some of its communication relay facilities. VORs are used as navigational devices within the National Airspace System (NAS). The VOR purpose is to provide azimuth (direction) and is transmitted in all directions and each signal can be considered a course or route, referred to as a radial. It works much like a road map when you're attempting to get from a departure point to a destination. For example, a hypothetical VOR at El Toro may be used by aircraft traveling from Los Angeles to San Diego, without the aircraft ever flying at such altitudes over the area where the VOR is located to generate additional aircraft noise impacts as a result of the existence of the device. In any event, the discussions about maintaining the existing VOR within the base property are still on-going between the FAA and the DON. However, since the operational closure of El Toro in 1999, that VOR has not been used and currently is not included in the navigational charts used by the FAA. Nor is El Toro's VOR on any approach/departures charts. In addition, historically, the VOR at El Toro was used for aircraft operations for the former MCAS El Toro only. As such, the subject VOR is not used as a navigation aid supporting the current flow of traffic in the Southern California area of operations.

Response to Comment W37

Based on Response to Comment W36, the existing VOR at the former MCAS El Toro is not used as a navigational device within the Southern California Airspace and discussions about its removal or relocation are underway. Radio wave transmissions from other FAA facilities may remain on the former air station. Detailed land use restrictions would accompany any sale that involved lands adjacent to and impacted by FAA radio waves.

Response to Comment W38

Refer to Response to Comment R18. It is likely that there will be use of live ammunition at the FBI training facility.

Response to Comment W39

Refer to Response to Comment R18.

Response to Comment W40

Refer to Response to Comment R18.

Response to Comment W41

The proposed acreage designated for agricultural activities under both the Base Plan and Overlay Plan represents a net decrease in acreage currently available for agricultural activities at the project site. Local water supplies would not be strained by these proposed reductions in agricultural activity; refer to the Irvine Ranch Water District Water Supply Assessment in Appendix C of the EIR.

Response to Comment W42

Refer to Response to Comment W41.

Response to Comment W43

The Irvine Ranch Water District will be the designated provider for domestic, recycled, and wastewater services for the proposed project.

Response to Comment W44

Agricultural producers that hire labors for agricultural activities are required to pay California Minimum Wages.

Response to Comment W45

Refer to Responses to Comments W13 and W14. Assessing the potential impacts to local traffic requires specific information regarding the future commuting options for day laborers; this information is not available and would prove speculative.

Response to Comment W46

The area proposed for agricultural use is currently being utilized for agricultural purposes. Any use of pesticides will need to be in compliance with US Department of Agriculture regulations. The City of Irvine envisions the proposed agricultural areas to become components of the City's Agricultural Legacy Program. To that extent, agricultural farming activities onsite may include organic farming activities, which would also reduce the amount of pesticides and fertilizers utilized in these agricultural areas.

Response to Comment W47

Refer to Response to Comment W46.

Response to Comment W48

Refer to Response to Comment W46.

Response to Comment W49

Refer to Response to Comment W46.

Response to Comment W50

Organic farming is a component of the City of Irvine's proposed agricultural heritage program which may be implemented, in part, in the portions of the project site designated for agricultural use.

Response to Comment W51

The City of Irvine is not aware of any claims by Native Americans as to any ancestral use of any portion of the project site.

Response to Comment W52

No specific development project is proposed; however, there will be opportunity for collaboration and involvement of Native Americans groups, should cultural facilities be constructed that involve Native American heritage.

Response to Comment W53

Comment noted.

Response to Comment W54

The Orange County Great Park will be served by the City of Irvine Police Department at the same level of service as other portions of the City.

Response to Comment X1

Following the passage of Measure W, and the subsequent issuance of a federal Record of Decision (ROD), on 23 April 2002, the Orange County Board of Supervisors acting as the Local Redevelopment Authority (LRA) with a majority vote decided to cease all further planning for El Toro by the County and to defer all further planning for El Toro to the City of Irvine and support the City's annexation of the property. In addition, on 25 February 2003, the Orange County Board of Supervisors adopted a resolution rescinding the Airport System Master Plan for El Toro in recognition of the fact that the future reuse of El Toro would be for non-aviation uses.

In addition to action taken by the County of Orange Board of Supervisors, the DON has been working with the City on the sale of property since April 2002.

Response to Comment X2

The intent of Measure W was to repeal Measure A and amend the Orange County General Plan by eliminating the airport land use designation for El Toro and to redesignate the property for a mix of non-aviation uses with a vast portion allocated to open space, recreational, educational and cultural uses.

Section Two B of Measure W states:

“Purpose. This Initiative will allow for the creation of one of America's greatest parks, with open space, sports and recreation facilities, museums, libraries, arts and cultural attractions, and a home for major universities and research centers. It will also not generate the traffic, congestion, noise, and air pollution associated with the development of a commercial airport.”

Section Two J of Measure W states:

“Replaces the aviation use designation with non-aviation designations to ensure that the property will become a multi-use center for education, park, recreation, cultural and other public-oriented uses. These designations permit the development of El Toro over time, thus allowing future generations to determine specific uses consistent with this Initiative.”

As such, the proposed project is consistent with the intent of Measure W by providing a non-aviation mixed use plan with a substantial portion allocated to open space and public uses.

Response to Comment X3

Measure W is an alternative that was analyzed in Alternative 6.1, the No Project/Measure W in PA 51 and Millennium Plan II in PA 30 alternative. This alternative is considered superior from an environmental analysis perspective.

When Measure W qualified for the ballot, it was assumed that the DON would transfer the property at no cost or very low cost to the public agency conducting the reuse of the property. Shortly after the Measure W election in March 2002, the DON announced its intention to sell virtually all of the former MCAS El Toro to the highest bidder. To the extent that the implementation of Measure W would require substantially greater governmental funding than if the land was provided at no cost, Measure W is less feasible today under the DON's chosen conveyance program.

Response to Comment X4

The Eastern Transportation Corridor is not identified as State Route (SR) 55 on EIR pages 1-5 and 5.1-8.

Response to Comment X5

In Figure 1-3 on page 1-7, Planning Area Zone 6 is proposed as Medium Density Residential development.

Response to Comment X6

Figures 1-2 and 1-3 depict the land use for each of the Planning Area Zone (PAZs). Furthermore, each PAZ has more detailed development data not shown in Figures 1-2 and 1-3. For example, the Project Description Table 3-3 of this EIR describes the development data for the Base Plan. Table 3-3 specifies that 60 Multiple-family residential units are proposed within the PAZ 10, and 165 multiple-family residential units are proposed within the PAZ 17a. Additionally, Table 3-4 describes the development data for the Overlay Plan. Table 3-4 proposes 850 single-family residential units for PAZ 2, 800 senior housing units for PAZ 6, 60 multiple-family residential units for PAZ 10, 165 multiple-residential units for PAZ 17a, 250 single-family residential units for PAZ 18, 635 multiple-family residential units for PAZ 24, 50 multiple-family residential units for PAZ 25, 170 multiple-family residential units for PAZ 27, 345 multiple-family residential units for PAZ 28, and 300 multiple-family residential units for PAZ 29.

Response to Comment X7

The County Counsel's impartial analysis of Measure W published in the voter pamphlets stated:

“This measure would amend the Orange County General Plan (“General Plan”) with respect to unincorporated land within the El Toro Marine Corps Air Station (“MCAS El Toro”), and repeal Measure A, which was adopted by the voters on 8 November 1994, designating much of MCAS El Toro for civil aviation and related uses.”

Therefore, Measure W was a voter approved General Plan Amendment of the County's General Plan via the initiative process. As such, Measure W applies only to the El Toro property while the property remains within the unincorporated county area and under the jurisdiction and land use authority of the County of

Orange. There are no provisions in the Measure W language mandating adherence by any other jurisdiction to the provisions of the measure. The proposed project includes the Annexation, General Plan Amendment, Pre-Zoning and Zoning of the unincorporated portion of the Planning Area 51.

Response to Comment X8

As described on page 5.1-15, the land use, safety, and noise restricted areas as identified in the AELUP, AICUZ, and the PIL for the former MCAS EL Toro facility are no longer impacted by aircraft noise from military operations now that the air station has closed for military use. The military mission at the former air station has been terminated and there are no actual noise or safety hazards generated by aircraft flight which would threaten the proposed development; implementation of the proposed project would not result in a significant land use compatibility impact, even through it would conflict with the adopted AELUP. Implementation of the Base Plan or Overlay Plan would result in a non-aviation reuse of the former MCAS El Toro property. On 17 April 2003 the ALUC formally acknowledged that the ALUC has no statutory jurisdiction over the proposed project.

Response to Comment X9

The Great Park Traffic Impact Analysis demonstrates that no measurable impacts to streets or intersections within the City of Tustin will occur as a result of the proposed Great Park project. The methodology applied to determine the extent of the study area is to examine the increase in intersection capacity utilization (ICU) value and determine whether or not the increase exceeds the impact significance threshold (0.02). This method of determining traffic impacts and hence the study area boundary is employed by jurisdictions throughout California, including many jurisdictions in Orange County. The analysis included in the EIR demonstrates that the increase in ICU value attributable to the project is less than 0.02 west of Culver Drive. Therefore it was not necessary for the EIR to analyze the roadway segments and intersections listed in the comment. The roadway segments and intersections listed in the Response to the NOP were analyzed. The analysis completed in the EIR showed steadily decreasing traffic impacts at an increasingly greater distance from the project. The increase in traffic caused an ICU increase of less than 0.02 prior to reaching the City of Tustin. It should be noted that the Great Park project is several miles from any part of the City of Tustin and no project impacts were identified beyond Culver Drive in the City of Irvine.

Concurrently with the proposed project, the City of Irvine is considering adoption of the North Irvine Transportation Improvement (NITM) program. The NITM program does two things: it prioritizes and schedules the construction of traffic improvements needed to address development in the Great Park, and other undeveloped areas of North Irvine; also, it imposes a nexus fee program to ensure the timely construction of these improvement events. NITM aggregates the traffic mitigation requirements for Northern Sphere, Great Park, and PAs 1, 2,

and 40 and allocates funding proportionately among the projects. The NITM program provides fair share funding for four intersections within or at the border with the City of Tustin; Irvine Boulevard/Tustin Ranch Boulevard, Jamboree Road/Irvine Boulevard, Jamboree Road/El Camino Real, and Red Hill Boulevard/Irvine Boulevard.

Response to Comment X10

All of the projects identified in the comment were incorporated in the Traffic Impact Analysis. PAs 1 and 2 are included in the City's General Plan. As a result, traffic generation from these already approved projects or land uses were analyzed as the future conditions for purposes of analyzing Great Park traffic impacts.

Response to Comment X11

As stated in the comment, the direct contribution of the project to increased traffic on the I-5 Freeway is already minimized by the existing congestion on that roadway, and the resulting impacts to the arterial roadway system have been identified and analyzed.

Response to Comment X12

Refer to Responses to Comments M64 and X9. Application of traditional study area boundary determination methodologies concludes that project traffic is not contributing significantly to future traffic volume increases in the City of Tustin. Increased traffic volumes result from regional growth including, but not limited to, City of Tustin's plan for the reuse and urbanization of MCAS Tustin.

Response to Comment X13

Refer to Responses to Comment X9 and X12.

Response to Comment X14

Substantial improvements to parallel routes (Irvine Boulevard and Trabuco Road), funded by north Irvine developers and the Great Park, are expected to reduce the future traffic volumes on Bryan Avenue.

Response to Comment X15

Refer to Response to Comment X9. The project contributes fair share funding to four intersections that have been identified by the NITM program. No project impacts are anticipated in the City of Tustin. However, the NITM program does identify very small traffic shares (approximately 1.5 percent) towards which the project will be contributing at locations significantly impacted by other projects (e.g., Northern Sphere) located in closer proximity to the City of Tustin.

Response to Comment X16

The ITAM traffic forecasting tool has been developed explicitly in response to modeling consistency requirements and is the most appropriate tool for use in the Great Park traffic study. The OCTAM 2.8 tool referred to in the comment was

“retired” by the Orange County Transportation Authority (OCTA) several years ago and is no longer appropriate for any type of regional or subregional analysis.

Response to Comment X17

Mitigation measures aimed at reducing significant impact to sensitive receptors from air quality impacts are described in Section 5.3.5 *Air Quality Mitigation Measures*. Mitigation Measure AQ1 states:

“Prior to the start of demolition and construction within the project area, adjacent sensitive receptors shall be informed of the planned demolition and construction activities. Measures to avoid significantly impacting these receptors shall be developed and implemented by the project proponent in coordination with these uses. Other applicable mitigation measures such as erection of fences around construction areas; staggered use of equipment near sensitive receptors; diversion of trucks away from receptors; etc., shall be employed as necessary. Compliance with this measure shall be verified by the Director of Community Development.”

Response to Comment X18

Comment noted. Mitigation Measure AQ4 and AQ5 will be located underneath a subheader that reads: “Operational Emissions Mitigation.” Mitigation Measure AQ5 has been amended to read:

“Future employment generating non-residential development shall include measures to reduce vehicle trips, including: the promotion of carpool incentives and alternative work schedules; easy access to public transit systems; trail linkages between uses; low-emissions vehicle fleets; the provision of on-site facilities, such as banking machines, food courts, and bicycle parking facilities, and other transportation demand management measures, as deemed appropriate.”

Response to Comment X19

Refer to Response to Comment M17. Section 5.3.3 *Air Quality Environmental Impacts* states:

“The URBEMIS 2001 model is used for estimating construction emissions for all stages of development. Estimates of land use and acreage absorbed are obtained for the plan proposal and modification for the development. Due to the limited availability of specific data regarding construction activities and equipment requirements, the URBEMIS 2001 model default options were used.”

Response to Comment X20

Disposition of the fuel line outside of PA 51 is not part of the proposed project and beyond the City’s legal authority and jurisdiction. The portion of the pipeline

referenced in the comment is under the authority of the federal government. The EIR discusses information from the DON on that portion of the pipeline. Refer to Section 5.5.1 *Public Health and Safety Environmental Setting* (page 5.5-19) for a detailed discussion of the status of the jet fuel distribution system.

Response to Comment X21

Comment noted.

Response to Comment Y1

The project impacts to Jeffrey Road have been thoroughly and completely evaluated in the Great Park Traffic Impact Analysis and EIR and all project impacts have been mitigated to a level of insignificance.

Response to Comment Y2

The analysis of the traffic impacts of the Great Park project have been analyzed in the EIR and supporting Traffic Impact Analysis and there has been no reliance on other environmental documents. The North Irvine Transportation improvement Program (NITM) is a mechanism for implementing the required mitigation for the Great Park and other significant development projects located in close proximity to the Great Park.

Response to Comment Y3

Refer to Response to Comment F50.

Response to Comment Y4

Refer to Response to Comment F50.

Response to Comment Y5

Refer to Response to Comment F50.

Response to Comment Y6

Refer to Response to Comment F50.

Response to Comment Z1

The intersection referenced in the comment is not an intersection of two arterial roadways Towne Center Drive is not shown on the Orange County Master Plan of Arterial Highways. The analysis of required lanes at adjacent intersections included in the Great Park Traffic Impact Analysis does not indicate the need for additional through lanes on Alton Parkway at Town Centre Drive.

Response to Comment Z2

The cumulative impacts and resulting roadway infrastructure needs of the Great Park project and surrounding development are analyzed under typical weekday conditions. Substantially lower overall traffic conditions can be expected on a weekend (Saturday). Therefore, no additional weekend analysis is required to evaluate areawide traffic impacts. The Sportspark would be required to prepare and submit traffic and parking management plans as part of their master plans for the City of Irvine's approval. This EIR addresses the impacts and identifies mitigation measures for the Great Park Plan and zoning designations for the proposed project. Operational issues will be part of the future permit processing of those facilities.

Response to Comment Z3

Concurrently with the proposed project, the City of Irvine is considering adoption of the NITM program. This program includes concrete, feasible mitigation measures that, if fully funded, will bring intersections back to the appropriate level of service. The EIR Traffic Impact Analysis includes an entire chapter (Chapter 9 of the Traffic Impact Analysis) devoted to CMP compliance. As part of this analysis, the EIR Traffic Impact Analysis and NITM identified all intersections in the City of Lake Forest to which project traffic contributed to an unacceptable level of service. The NITM program imposes fair share fee obligations on the project and other properties in the City of Irvine and its sphere of influence to fund their proportionate share of the mitigation to bring that intersection to an acceptable or pre-project level of service, based upon the extent of the properties' contribution of traffic. The City of Irvine recognizes that as the agency with jurisdiction over the intersections and as the lead agency for the construction of intersection improvements, the City of Lake Forest must concur with the proposed mitigation measures if those mitigation measures are to be implemented.

Response to Comment Z4

The extensions of Portola Parkway and Alton Parkway have been analyzed in the post-2025 Great Park Traffic Impact Analysis. The extensions were not included in the scenarios analyzing conditions prior to 2025.

Response to Comment Z5

Comment noted.

Response to Comment AA1

Comment noted.

Response to Comment AA2

Per this comment, the following has been added to Section 5.14 *Public Services and Facilities* page 5.14-25:

“Based on Table 5.14-6, the IUSD estimated the cost for typical District elementary, middle, and high schools. According to the District, the estimated acreage needed for an elementary school is 10-acres with a total building area of 45,000 square feet and the estimated acreage for a middle school is 15-acres with a total building area of 65,000 square feet. The District also estimated that an acre of land would cost \$1-1.5million, resulting in a total building cost of \$218 per square foot for elementary and middle schools (not including land for Oak Creek Elementary School in 2000). According to the District, the total building area needed for a high school expansion would be 20,000 to 30,000 square feet, resulting in an estimated total cost of \$3.2million.”

Response to Comment AA3

The EIR states that at this General Plan analysis it is unknown where exactly the housing units will be placed within each individual planning area (i.e., whether the new units will be in IUSD or SVUSD). For analysis purposes, the highest number of potential units was used to estimate the “worse-case” scenario for both districts. As a result, the analysis overestimated the amount of new or expanded school facilities that would be needed to serve the project. Therefore, the number of new students generated by the project is most likely overestimated and the number of new students will most likely be well under the estimated number of 1,525.

In regard to this comment requesting the shifts in the school attendance boundaries, the EIR states the following on page 5.14-26:

“In the event that a new school is not built, IUSD may consider shifts in the school attendance boundaries for existing elementary, middle, and high schools. This could result in existing communities within IUSD to change from their current school assignment to another District school in order to better accommodate new growth within PAs 51 and 30.”

Response to Comment AA4

The following sentence has been added to Section 5.14 *Public Services and Facilities* page 5.14-25:

“The District’s consultants are currently analyzing the land bordering the existing El Toro Elementary site for purposes of realigning the property

lines and/or expanding the site from approximately 10-acres to 13-acres in order to better accommodate a K-8 school."

Response to Comment AA5

The EIR states on page 5.14-25:

"To accommodate the expected student growth from the project during buildout of the proposed project and prior to final construction of the new elementary school, IUSD may re-open the El Toro Marine Elementary School and/or assign students residing in the project area to various schools with available capacity."

Response to Comment AA6

In order to obtain development rights under the Overlay Plan the landowner must enter into a Development Agreement that requires, among other things, the dedication of a 13-acre school site at no cost to IUSD. State law (Government Code Section 65995 and following) establishes the exclusive means of obtaining developer impact mitigation for public school construction.

Response to Comment AA7

Comment noted.

Response to Comment AA8

Comment noted.

Response to Comment BB1

This comment generally recites the major components of the proposed project and the responsibilities of the US Fish and Wildlife Service.

Response to Comment BB2

This comment summarizes the responsibilities of the California Department of Fish and Game.

Response to Comment BB3

Comment noted. The portion of the project site designated for habitat preserve is consistent with the NCCP/HCP. This property will remain under the ownership of the Federal Aviation Administration (FAA).

Response to Comment BB4

The City of Irvine is a participant in the Special Area Management Plan/Master Streambed Alteration Agreement (SAMP/MSAA) process. The City anticipates continued participation and coordination with the wildlife agencies in constructing the proposed natural drainages on-site.

Response to Comment BB5

Refer to Responses to Comments BB6 through BB18 for a response to each of these issues.

Response to Comment BB6

A portion of PAZ 4 is sage scrub habitat that will be designated as agriculture under the OCGP. Habitat preservation is a permitted use in the agricultural land use designation. The EIR did quantify an impact to this area. The City of Irvine is a participant in the NCCP/HCP program and will ensure that adequate protections are implemented in accordance with those programs.

Response to Comment BB7

Comment noted. Original biological surveys have not indicated the presence of the sensitive species identified by the commentor. No development is proposed within the Habitat Preserve portion of the Great Park plan; therefore, sensitive resources that may be located in this area would not be impacted by proposed development activities.

Any future development activity within the project area will be reviewed to ensure potential impacts have been adequately addressed. In order to ensure that potential biological impacts of proposed development are addressed, Mitigation Measure Bio.1 has been modified as follows:

“Prior to approval of a subdivision map for each project area, a focused survey for the southern tarplant, mountain plover, and burrowing owl, shall be conducted. Prior to approval of a subdivision map for development within, or in proximity to Serrano Creek a focused survey shall be

conducted for the least Bell's vireo and southwestern willow flycatcher. Should the focused survey identify a significant population of southern tarplant or mountain plover, or the presence of burrowing owl, least Bell's vireo, or southwestern willow flycatcher, of this species in an area proposed for development, impacts shall be avoided through incorporation of the species into an open space easement, or if impacts cannot be avoided, then mitigation shall be negotiated through consultation with the United States Fish and Wildlife Service (USFWS) and the California Department of Fish and Game (CDFG)."

Response to Comment BB8

Comment noted. As described in the EIR, a significant amount of open space and foraging areas will remain under the project's proposed land use plan.

Response to Comment BB9

Refer to Response to Comment BB7.

Response to Comment BB10

Refer to Response to Comment BB7.

Response to Comment BB11

Refer to Response to Comment BB7.

Response to Comment BB12

Mitigation Measure Bio 1 is proposed to address potential impacts to sensitive species potentially occurring onsite, and not covered by the NCCP. Any subsequent development project within the project area will be reviewed as to its potential environmental impacts, including biological resources. The City of Irvine will require additional biological surveys as appropriate to address any potential impacts to biological resources as a result of subsequent development activity.

Response to Comment BB13

Comment noted.

Response to Comment BB14

The comment pertains to a separate report entitled *Draft Wildlife Corridor Plan*. The City of Irvine appreciates the input from the US Fish and Wildlife Service and the California Department of Fish and Game and will evaluate and address these comments as it proceeds to process the *Draft Wildlife Corridor Plan* separately from this EIR.

Response to Comment BB15

Refer to Response to Comment B14.

Response to Comment BB16

Comment noted. Refer to Response to Comment B14.

Response to Comment BB17

Refer to Response to Comment B14. It is anticipated that these details related to the proposed wildlife corridor will be resolved after the general wildlife corridor concept has been adopted, and more detailed aspects of implementation are initiated.

Response to Comment CC1

Under the Overlay Plan, the Agriculture designation is proposed within PAZ 1 and PAZ 4. As stated on page 5.8-10 of the EIR, the proposed project will help to implement the City's proposed Agricultural Legacy Program by proposing agricultural land uses in the portion of PA 51 that is identified by the Irvine Agricultural Legacy Program Preliminary Sites Assessment (City of Irvine 26 November 2002). The City of Irvine recently amended its General Plan Objective L-10 with the purpose of addressing the cumulative loss of agricultural resources in Irvine and Orange County as a whole. The amendment shifts the emphasis from retention of agriculture for open space relief, to retention of smaller scale agricultural operations for heritage value. To that extent, the City of Irvine has committed to preservation of agriculture in these areas of the project site both by designating these areas for agriculture use and through the recently amended General Plan policy, which commits the City of Irvine to implementation of the Agricultural Legacy Program.

Response to Comment CC2

An Agricultural Preservation Program, as described in this comment, has been determined to be infeasible. No agricultural preserves or Williamson Act contracts exist within the City of Irvine or the project site. As stated in the EIR, (page 5.8-15), the County of Orange has not yet initiated the evaluation of such a program, and has no plans to implement such a program.

Response to Comment CC3

Comment noted.

Response to Comment DD1

Section 3.0 *Project Description Actions and Approvals of Other Agencies* has been amended to reflect the requirement that DTSC approve the acquisition and/or development of property for public schools. The added additional language reads as follows:

“California Department of Toxic Substances Control (DTSC) – Approval of acquisition and/or development of property for public schools based on hazardous materials evaluation.”

Response to Comment DD2

Section 5.5 *Public Health and Safety Environmental Setting* has been amended with the following wording:

“Certain LBP abatement and hazard disclosure requirements must be complied with prior to the transfer of the former MCAS El Toro site from federal responsibility. Housing units constructed prior to 1960 must be abated of LBP and LBP hazards. The presence of LBP and LBP hazards must be disclosed for housing units constructed between 1960 and 1978. Occupation of housing units scheduled for demolition due to the presence of LBP or LBP hazards is prohibited. Post-demolition sampling and response actions for any hazards due to lead in soil shall be conducted, consistent with regulatory requirements, prior to the occupancy of any newly constructed housing units to ensure public health and safety.”

This language has also been added to Section 5.5.3.

Response to Comment DD3

Per the regulations outlined in 40 CFR 300.430(e)(2)(i), “remediation goals shall establish acceptable exposure levels that are protective of human health and the environment and shall be developed by considering the following...for known or suspected carcinogens, acceptable exposure levels are generally concentration levels that represent an excess upper bound lifetime cancer risk to an individual of between 10^{-4} and 10^{-6} using information on the relationship between dose and response.” The DON will be responsible for remediation of the former MCAS El Toro to these exposure levels. The DON has publicly stated that it will indemnify new land owners of former air station property in order to mitigate potential soil contamination that is attributable to historic DON operations.

Response to Comment DD4

Comment noted. Revisions will be made as referenced.

Response to Comment DD5

Section 5.5 *Public Health and Safety Environmental Regulations Affecting MCAS El Toro* has been amended to reflect the comment. Added wording is as follows:

“The Resource Conservation and Recovery Act (RCRA), adopted in 1976, provides the basic framework for federal regulation of hazardous waste. The State of California Department of Toxic Substances Control (DTSC) is authorized to implement the state hazardous waste program in lieu of federal RCRA regulations.”

Response to Comment DD6

Section 5.5 *Public Health and Safety Compliance Program Sites and Other Locations of Concern* has been amended with the following language:

“The DTSC states that the former MCAS El Toro contains two hazardous waste management units (HWMU). The HWMUs include a hazardous waste container storage area and an open burn/open detonation (OB/OD) hazardous waste treatment unit. A hazardous waste facility permit (a RCRA-equivalent permit) to operate the hazardous waste container storage area designated as Building 673-T3 was issued in August 1993 by the DTSC. The permit allowed the storage of hazardous wastes for longer than 90-days at Building 673-T3. In March 1996, the closure certification report was accepted by the DTSC and the container storage area was considered closed.”

Response to Comment DD7

Refer to Response to Comment DD6.

Response to Comment DD8

Comment noted. The City of Irvine has coordinated with the DON and concurs with the DON’s determination that corrective action at the former MCAS El Toro can overlap with other remediation or response actions. EIR text will be amended to read:

“The State of California considered any site from which hazardous constituents may migrate to be a SWMU, but corrective action can be addressed through the Federal Facilities Agreement for MCAS EL Toro or responses to petroleum releases with oversight provided by the Regional Water Quality Control Board.”

Response to Comment DD9

The EIR clearly states that Site 24 contains VOC contaminated soil; Site 18 is a groundwater plume, contaminated by VOCs leaching from Site 24, that is located both on- and off-site. Language has been added to the referenced section to read:

“In addition to an interim Record of Decision (ROD) for the contaminated soil of Site 24, a final ROD for groundwater contamination at Sites 18 and 24 was signed in June 2002. Please refer to the *Final Record of Decision, Operable Unit 1, Site 18 – Regional Volatile Organic Compound*

Groundwater Plume, Operable Unit 2A, Site 24 – VOC Source Area, Former MCAS El Toro, California (Bechtel National, Inc. 2002) for additional information.”

Response to Comment DD10

The referenced section has been amended with the following added language:

“An interim ROD was signed in July 2000 for Site 2 and 17 to allow for the design of the landfill caps to proceed. However, construction of the landfill caps will not proceed until radiological survey/sampling is complete and the data have been evaluated to determine potential impact on the remedial design. Please refer to the *Final Interim ROD, Operable Unit 2B, Landfill Sites 2 and 17, MCAS El Toro, California* (Bechtel National, Inc. 2000) for additional information.”

Response to Comment DD11

The referenced section has been amended with the following added language:

“The draft version of the ROD for Sites 3 and 5 was issued in March 1999. The draft final ROD will be issued following evaluation of the results from radiological survey/sampling. Please refer to the *Draft ROD, Operable Unit 2C, Landfill Sites 3 and 5, MCAS El Toro, California* (Bechtel National, Inc. 1999) for additional information.”

Response to Comment DD12

The referenced section has been amended with the following added language:

“Site 7, Drop Tank Drainage Are No.2, and Site 14, Battery Acid Disposal Area, received concurrence for no further action in the final ROD signed June 2001. Please refer to the *Final ROD, Operable Unit 3B, No Action Sites 7 and 14, MCAS El Toro, California* (Bechtel National, Inc. 2001) for additional information.”

Response to Comment DD13

The referenced section has been amended with the following added language:

“Monitored natural attenuation is the selected remediation procedure for Site 16. A ROD is being prepared to document the selected remediation process. Please refer to the *Proposed Plan for Site 16, Crash Crew Training Pit No.2 at MCAS El Toro* (Bechtel National, Inc. 2002a) for additional information.”

Response to Comment DD14

The referenced section has been amended with the following added language:

“The DON is in the process of completing a remedial investigation to determine the nature and extent of contamination at Site 1. Please refer to the *Final Work Plan, Phase II Remedial Investigation, IRP Site 1, Explosive Ordinance Disposal Range, MCAS El Toro, California* (Earth Tech, Inc. 2001) for additional information.”

Response to Comment EE1

The Traffic Impact Analysis has been reviewed and revised in accordance with the new significance thresholds provided by the City of Laguna Hills. The additional analysis is provided as it confirms that the initial analysis adequately assesses the project's traffic impacts. A total of 16 intersections are located within the jurisdiction of the City of Laguna Hills or are shared with other local jurisdictions, including the City of Irvine.

Table EE-1 summarizes the 2007 intersection capacity utilization (ICU) analysis for the City of Laguna Hills intersections. As shown on Table EE-1, two intersections are impacted. Table EE-2 summarizes the 2025 intersection capacity utilization (ICU) analysis for the City of Laguna Hills intersections. As shown on Table EE-2, six intersections are impacted by either the Base Plan or the Overlay Plan. Table EE-3 summarizes the post-2025 intersection capacity utilization (ICU) analysis for the City of Laguna Hills intersections. As shown on Table EE-3, eight intersections are impacted for post-2025 conditions. Table EE-4 summarizes the proposed improvements at the intersections that are impacted by the Base Plan project alternative. Table EE-5 summarizes the proposed improvements at the intersections that are impacted by the Overlay Plan project alternative. The only intersection where additional impacts have been identified based on the revised impact criteria is Laguna Hills Drive at Paseo De Valencia, where very minimal mitigation improvements (modifying the traffic signal to provide an eastbound right turn overlap concurrent with the northbound left turns) would be required. (Note: All of the following referenced tables are included in the Appendix to this Response to Comments document.)

Response to Comment EE2

(Note: All of the following referenced tables are included in the Appendix to this document.) Cost estimates and the plan for funding the project fair share of improvements are included in the implementing mechanism (the NITM program) currently being developed by the City of Irvine as the next logical step in the development process. Funding for right of way acquisition, engineering, and construction is included in the NITM program. The City of Irvine recognizes that as the agency with jurisdiction over the intersections and as the lead agency for the construction of intersection improvements, the City of Laguna Hills must concur with the proposed mitigation measures if those mitigation measures are to be implemented. Table EE-6 summarizes the fair share traffic contributions and resulting cost share related to mitigation at the one intersection not specifically addressed in the NITM Program (Laguna Hills Drive at Paseo De Valencia). Table EE-7 then summarizes the project fair share traffic contribution at all of the locations impacted by the Base Plan alternative, along with the estimated cost contribution attributable to all NITM projects. Table EE-8 provides a similar summary for the Overlay Plan alternative.

Response to Comment FF1
Comment noted.

Response to Comment GG1

The comment regarding Irvine's urban water management plan is assumed to be in reference to the Irvine Ranch Water District's water supply assessment. The water supply assessment (WSA) contained in Appendix C complies with the most recent statutory requirements and concludes that adequate supplies are available to serve the proposed project. As noted in Response to Comment G2, the EIR is amended to reflect the statutory compliance of the water supply assessment prepared by the Irvine Ranch Water District.

Response to Comment GG2

The mitigation for loss of agricultural lands within the City of Irvine and surrounding areas was analyzed on a cumulative basis by the City when the General Plan agricultural policies contained in Objective L-10 were amended on 4 June 2002. The Great Park plan is full consistent with Objective L-10.

The EIR provides a comprehensive analysis of the feasibility of Mitigation Measures designed to reduce the project's impact to agricultural resources (see EIR pages 5.8-7 through 5.8-15). The EIR also identifies three feasible Mitigation Measures that will be implemented as part of the project (see Mitigation Measures AG 1 through AG 3 on pages 5.8-15 and 5.8-16). In this discussion, a variety of Mitigation Measures have been thoroughly analyzed including retention of agricultural uses. EIR pages Page 5.8-7 and 5.8-8 provide economic data to support the basis of conclusion of infeasibility of Mitigation Measures. Additionally, the City of Irvine's Legacy Program (as described in EIR page 5.8-14) promotes the preservation of agricultural resources city-wide, acreage from the Great Park of which are included in this program. On-site preservation of all existing agricultural lands on the Great Park property, to the exclusion of other City goals such as the provision of new open space through the park, job opportunities, and new housing would be inconsistent with the Objective L-10 as amended by the City of Irvine.

Response to Comment GG3

On page 5.13-9 of the EIR, the sections on long-term impacts for both the Base Plan and Overlay Plan indicate that the imbalance between jobs and housing will worsen and the impact is considered significant and unavoidable. This conclusion is repeated on pages 5.13-12 and 5.13-17. Also refer to Response to Comment KK1.

Response to Comment GG4

The base projections for the RHNA were completed in 1998 and assumed federal/military ownership of the site and it is likely that no RHNA allocation specific to the El Toro property was assigned. However, it is assumed that the upcoming 2004 RHNA, required under Government Code Section 65584 to allow the City of Irvine (and other jurisdictions) to undertake its required Housing Element updates, will reflect an appropriate allocation of future and existing regional housing need to the project site.

Response to Comment GG5

The City of Irvine has striven to integrate the Great Park with other planned development in the region, including the extension of public services. Preparation and planning with environmental documents such as this EIR is an important step in ensuring that this integration is seamless and coordinated. Section 5.14, *Public Services and Utilities*, considers potential impacts related to the extension of public services to the proposed project. Specific examples of planned development integration are considered in Section 7.1 *Cumulative Impacts*. The City of Irvine's Urban Services Plan will be made available to LAFCO as part of the annexation process undertaken with the Great Park. All impacts discussions in the EIR assume growth and development in the Northern Sphere as allocated in the Orange County Projection 2000 prepared by the Center for Demographic Research. (Note: The Urban Services Plan is included in the Appendix to this Response to Comments document).

Response to Comment HH1

Section 5.15.3 *Population and Housing Environmental Impacts* (5.13-12) states:

“Since the Orange County Subregion is anticipated to become increasingly jobs-rich over the next 20 years, the project-related employment would exacerbate the subregional jobs/housing imbalance. As a result, the proposed project will not improve and would only exacerbate the Orange County’s overall jobs/housing imbalance and the impact is considered significant and unavoidable.”

No mitigation is available to rectify conflicts with the numerical objectives of regional planning documents including the jobs/housing ratio. The imbalance between jobs and housing in Orange County may result in increased vehicle miles traveled since part of the work force consists of commuters who are drawn to the County for employment purposes. The EIR supports the SCAG objectives to reduce VMT and related congestion and air pollution. A CARB-commissioned report, entitled *Transportation-Related Land Use Strategies to Minimize Motor Vehicle Emissions: An Indirect Source Research Study*, analyzes the efficiency of numerous land use planning factors that have the greatest potential for reducing VMT and mobile source emissions. The study is outlined in the EIR, contains a list of recommended strategies, many of which have been incorporated into the Base Plan and Overlay Plan.

A portion of the project’s housing growth will be absorbed in residential projects currently being developed or planned in the surrounding area. Substantial new areas of residential development will be opened for development with the completion of several planned transportation improvement in the County. Housing projects developed under the Base Plan or Overlay Plan will be consistent with the City of Irvine’s Housing Element Affordable Housing Goal.

The Base Plan and the Overlay Plan were developed to reflect the intent of the voters of Orange County through the passage of Measure W. A higher development intensity alternative was analyzed (Alternative 6.5) in the EIR which evaluated 4,635 housing units. Alternative 6.5 concludes that a greater impact would occur on the following environmental elements: traffic/circulation; air quality; noise; geology and seismicity; hydrology and water quality; aesthetics; public services and facilities and utilities. Refer to the Alternatives (Section 6.0) in the EIR for further discussion. Moreover, the selection of an alternative that would include more housing and less commercial development would be infeasible since it would be in conflict with the City’s fiscal balance requirement for new planning areas and prevent the City from having the financial resources to implement the Great Park plan.

Response to Comment HH2

Under the proposed Base Plan 225 multi-family housing units would be developed; implementation of the Overlay Plan would result in the construction of

3,625 housing units. Implementation of either plan would be consistent with the affordable housing goals stated in the City of Irvine's General Plan Housing Element.

Response to Comment HH3

The EIR provides for a mix of housing densities in the residentially zoned areas. Implementation of the Base Plan would result in the construction of 225 multi-family housing units. It is beyond the scope of this EIR to "set-aside (future) City-owned sites for affordable housing sooner rather than later," increase densities in the transit areas from 40- to 60-units per acre, all farm-worker housing on or near agricultural areas, and include housing as an allowable use in all commercial, institutional, and industrial areas. These are policy matters that must be considered by the City of Irvine. Also refer to Response to Comment KK2.

Response to Comment II1

The Highway Capacity Manual (HCM) methodologies are most appropriate for near-term engineering and operational analysis. The many input data and factors required by HCM methodologies are not available for the long-range planning horizon addressed in this Traffic Impact Analysis. The planning level analysis in the Great Park Traffic Impact Analysis is an appropriate approach that has been utilized in various other traffic studies that have also been submitted to Caltrans.

The ITAM tool used to develop the future forecasts is consistent with the OCTAM travel demand forecasting tool, which is the regionally (County of Orange) adopted tool for developing future traffic forecasts on the regional roadway system, including the freeways and transportation corridors. The OCTAM model has been validated at both the peak hour and daily traffic volume levels of detail for freeway and transportation corridor mainline conditions. Use of a consistent modeling tool is a mandatory requirement, based on state and federal legislation.

Response to Comment II2

The lane assumptions for the I-5 Freeway corridor are correct and are based on existing field inventory and anticipated long-range improvements. The analysis may be inconsistent with OCTAM 3.1 because of the more accurate lane assumptions compared to the generalized OCTAM 3.1 inputs. The lane assumptions utilized in the Traffic Impact Analysis for the transportation corridors are based on the long-range capital improvement program (CIP) developed by the Transportation Corridor Authority(ies) (TCA).

Response to Comment II3

The analysis contained in the EIR and supporting Traffic Impact Analysis is unaffected by the status of the projects referenced in the comment. The ITAM model used in the Traffic Impact Analysis is based on a year 2000 validation scenario; therefore, all of the future forecasts included in the Traffic Impact Analysis accurately reflect the validation year conditions.

Response to Comment II4

The HOV lanes are identified in the TCA CIP. Ms. Macie Cleary-Milan of the Transportation Corridor Agency provided the following information on 7 May 2003 regarding the funding for HOV lanes on the transportation corridors:

The TCA has a list of all the projects that have been identified as part of the long-range concept plans for the various transportation corridors. Improvements are funded as the money is available, and as the need for the improvements is identified to provide acceptable traffic operations for the system. Priorities are set based on congestion or operational issues. If future traffic volumes result in a deterioration of levels of service, the TCA is dedicated to providing the improvements needed to provide the levels of service their patrons expect.

Therefore, it is reasonable to assume that the TCA would fund HOV improvements necessary to provide acceptable levels of service.

Response to Comment II5

Refer to Response to Comment S5.

Response to Comment II6

As demonstrated in the EIR and supporting Traffic Impact Analysis, adequate access to the Great Park is being provided. Major roadway improvements within and outside of the proposed park area include the widening of Trabuco Road, Bryan Avenue, Irvine Boulevard, and Sand Canyon Avenue. In addition, the Great Park project roadway system proposes a number of new arterial roadways, including Marine Way, College Road, and Y Street. The project also proposes substantial new or modified freeway/transportation corridor interchange improvements, including the I-5 Freeway/Bake Parkway interchange, the I-5 Freeway/Sand Canyon Avenue interchange, and the SR133 tollway/Trabuco Road interchange.

Concurrently with the proposed project, the City of Irvine is considering adoption of the North Irvine Transportation Improvement (NITM) program. The NITM program does two things: it prioritizes and schedules the construction of traffic improvements needed to address development in the Great Park, and other undeveloped areas of North Irvine; also, it imposes a nexus fee program to ensure the timely construction of these improvement events. The NITM program also includes numerous other ramp improvements commensurate with other cumulative project impacts. In summary, the project has adequate access.

The EIR and supporting Traffic Impact Analysis have addressed both the changes in land use and the circulation system as a result of the proposed project. The issue raised in this comment is addressed either by the EIR analysis itself, or through the proposed mitigation measures. The key mitigation measure with respect to this comment is the requirement to enter into a cooperative Master Plan of Arterial Highways amendment study per the Orange County Transportation Authority (OCTA).

The portion of the comment related to the extension of Marine Way to Bake Parkway at the I-5 Freeway northbound ramps is noted. The City of Irvine is working closely with Caltrans to resolve the design issues related to the I-5 Freeway/Bake Parkway interchange.

Response to Comment II7

Refer to Response to Comment S6. The programs referenced in the comment will address ongoing regional traffic growth and are not related to the anticipated project impacts. The EIR mitigation measures address all project impacts that were identified in the Traffic Impact Analysis, subject to constraints such as those identified in Response to Comment S5 (TCA non-compete agreements).

The second part of the comment relates to the detailed implementation mechanism for mitigating project impacts. The City of Irvine is actively developing an implementation mechanism (NITM) for proposed Great Park (and other nearby) project mitigation measures/improvements. The NITM program includes conceptual engineering, cost estimates, and fair share contribution calculations as requested in this comment.

Response to Comment II8

Refer to Response to Comment II7. The City has created a pro rata fair share program (NITM program) that includes projects that mitigate impacts to the State facilities, including freeway mainline and ramp improvements.

Response to Comment II9

Refer to Responses to Comments II7 and II8.

Response to Comment II10

The comment pertains to a separate report entitled *Draft Wildlife Corridor Plan*. The City appreciates Caltrans input and will evaluate and address these comments as it proceeds to process the *Draft Wildlife Corridor Plan* separately from this EIR.

Response to Comment KK1

Section 5.15.3 *Population and Housing Environmental Impacts* (5.13-12) states:

“Since the Orange County Subregion is anticipated to become increasingly jobs-rich over the next 20 years, the project-related employment would exacerbate the subregional jobs/housing imbalance. As a result, the proposed project will not improve and would only exacerbate the Orange County’s overall jobs/housing imbalance and the impact is considered significant and unavoidable.”

No mitigation is available to rectify conflicts with the numerical objectives of regional planning documents including the jobs/housing ratio. A portion of the project’s housing growth will be absorbed in residential projects currently being developed or planned in the surrounding area. Substantial new areas of residential development will be opened for development with the completion of several planned transportation improvement in the County. Housing projects developed under the Base Plan or Overlay Plan will be consistent with the City of Irvine’s Housing Element Affordable Housing Goal.

The Base Plan and the Overlay Plan were developed to reflect the will of the voters per Measure W. A higher development intensity alternative was analyzed (Alternative 6.5) in the EIR which evaluated 4,635 housing units. Alternative 6.5 concludes that a greater impact would occur on the following environmental elements: traffic/circulation; air quality; noise; geology and seismicity; hydrology and water quality; aesthetics; public services and facilities and utilities. Refer to the Alternatives (Section 6.0) in the EIR for further discussion.

Response to Comment KK2

While the number of multi-use residential units has been reduced from 2,313 to 1,500, the overall level of multi-use residential development has been increased from 3,261 to 3,625. The EIR examines two formulated plans: the Base Plan and the Overlay Plan. The EIR analyzes the environmental impacts from these plans and proposes mitigation measures to reduce impacts to levels less than significant. The current General Plan allows a maximum 3,261 dwelling units in Planning Areas 30 and 51 combined. Under the proposed Base Plan 225 multi-family housing units would be developed; implementation of the Overlay Plan would result in the construction of 3,625 housing units. Implementation of either plan would be consistent with the affordable housing goals stated in the City of Irvine’s General Plan Housing Element. As a result, the project provides for a mix of housing densities in the residentially zoned areas.

Section 5.13.3 *Population and Housing Environmental Impact* states:

“...housing project developed on the site under either the Base Plan or Overlay Plan will be required to be consistent with the City’s Housing Element Affordable Housing Goal, which states that:

- 5 percent of units should be affordable to households earning less than 50 percent of the County Median Family Income through rental housing.
- 5 percent of the actual number of units built should be affordable as either rental or ownership housing for households earning between 51 and 80 percent of the County Median Family Income.
- 5 percent of the units should be affordable to household earning between 81 and 121 percent of the County Median Family Income, satisfied through the development of ownership housing.”

Response to Comment KK3

Appendices

Volume I

- Appendix A: Acronyms
- Appendix B: Notice of Preparation/Distribution List and Notice of Preparation Responses
- Appendix C: IRWD Assessment of Water Supply
- Appendix D: Draft Development Agreement and Draft CC&Rs
- Appendix E: Energy Consumption and Load Projections
- Appendix F: Synopsis of the LRA Homeless Agreements: MCAS El Toro

Volume II (Bound under separate cover)

- Appendix G: Orange County Great Park Traffic Impact Analysis (Technical Report). December 2002. Urban Crossroads, Inc.
- Appendix H: Environmental Noise Assessment MCAS El Toro Site, Orange County Great Park Plan. January 16, 2003. Black & Veatch Corporation.
- Appendix I: Air Quality Assessment City of Irvine General Plan Amendment, Pre-Zoning, and Annexation File Nos: 47782-GA, 47785-ZC. January 16, 2003. Black & Veatch.
- Appendix J: Utility Report and Generation Factors, Fuscoe Engineers, 2002.

Volume III (Bound under separate cover)

- Appendix K: Orange County Great Park Traffic Impact Analysis (Appendices 1 of 3). December 2002. Urban Crossroads, Inc.
- Appendix L: Orange County Great Park Traffic Impact Analysis (Appendices 2 of 3). December 2002. Urban Crossroads, Inc.

Appendices (continued)

Appendix M: Orange County Great Park Traffic Impact Analysis
(Appendices 3 of 3). December 2002. Urban
Crossroads, Inc.

Volume I – Appendix A

Acronyms

The following list of acronyms has been prepared for reference.

ACM	Asbestos Containing Materials
ADT	Average Daily Traffic
AELUP	Airport Environs Land Use Plan
AICUZ	Air Installation Compatibility Use Zones
ALUC	Airport Land Use Commission
APZ	Accidental Potential Zone
AQMP	Air Quality Management Plan
ARB	California Air Resources Board
ASMP	Airport System Master Plan
BCP	Base Realignment and Closure Cleanup Plan
BCT	BRAC Cleanup Team
BMP	Best Management Practices
BRAC	Base Realignment and Closure
BRAC-III	Base Realignment and Closure Act of 1993
CAA	Clean Air Act
CAA	Community Analysis Area
CAAQS	California Ambient Air Quality Standards
Cal-EPA	California Environmental Protection Agency
CALOSHA	California Division of Occupation Safety and Health
CALTRANS	California Department of Transportation
CMP	Congestion Management Plan
CARB	California Air Resources Board
CC&R	Covenants, Conditions and Restrictions
CCAA	California Clean Air Act
CDFG	California Department of Fish and Game
CESA	California Endangered Species Act
CEQA	California Environmental Quality Act
CERCLA	Comprehensive Environmental Response, Cleanup and Liability Act
CERFA	Community Environmental Facilitation Act
cfs	Cubic Feet per Second
CIWMP	Countywide Integrated Waste Management Plan
CNEL	Community Noise Equivalent Level
CNPS	California Native Plant Society
CO	Carbon Monoxide
ACOE	U.S. Army Corps of Engineers
CRP	Community Reuse Plan
CSS	Coastal Sage Scrub
DAMP	Drainage Area Management Plan
dB or dBA	Decibel(s)
DBH	Diameter at Breast Height
DEIR	Draft Environmental Impact Report
DOD	Department of Defense

DOI	Department of the Interior
DON	Department of the Navy
DTSC	Department of Toxic Substances Control
EIR	Environmental Impact Report
EIS	Environmental Impact Statement
EOC	Emergency Operations Center
EOD	Explosive Ordinance Disposal
EPA	Environmental Protection Agency
ETC	Eastern Transportation Corridor
ETRPA	El Toro Reuse Planning Authority
FAA	Federal Aviation Administration
FEIR	Final Environmental Impact Report
FEMA	Federal Emergency Management Agency
FESA	Federal Endangered Species Act
FHWA	Federal Highway Administration
FIRM	Flood Insurance Rate Map
FMMP	Farmland Mapping and Monitoring Program
FTC	Foothill Transportation Corridor
FTA	Federal Transit Agency
GMP	Growth Management Plan
GPA	General Plan Amendment
GPA/ZC	General Plan Amendment/Zone Change
HCP	Habitat Conservation Program
HOA	Home Owners Association
HRA	Historical Radiological Assessment
HRS	Hazard Ranking System
HVAC	Heating and Ventilation and Air Conditioning Systems
HUD	Department of Housing and Urban Development
I-5	Interstate 5 (Santa Ana Freeway)
I-405	Interstate 405 (San Diego Freeway)
ICU	Intersection Capacity Utilization
IRP	Installation Restoration Program
IRWD	Irvine Ranch Water District
ITAM	Irvine Transportation Analysis Model
IUSD	Irvine Unified School District
IWMD	Integrated Waste Management Department
JWA	John Wayne Airport
LAFCO	Local Agency Formation Commission Orange County
LBP	Lead Based Paint
LOMR	Letter of Map Revision
LOS	Level of Service

I. INTRODUCTION

A. Findings of Fact and Statement of Overriding Considerations

The California Environmental Quality Act (CEQA) (Pub. Res. Code §§ 21000, *et seq.*) and the State CEQA Guidelines (Guidelines) (14 Cal. Code Regs §§ 15000, *et seq.*) promulgated thereunder, require that the environmental impacts of a project be examined before a project is approved. Specifically, regarding findings, Guidelines Section 15091 provides:

- (a) No public agency shall approve or carry out a project for which an EIR has been completed which identifies one or more significant environmental effects of the project unless the public agency makes one or more written findings for each of those significant effects, accompanied by a brief explanation of the rationale for each finding. The possible findings are:
 - 1. Changes or alterations have been required in, or incorporated into, the project which mitigate or avoid the significant environmental effects on the environment.
 - 2. Those changes or alterations are within the responsibility and jurisdiction of another public agency and have been, or can or should be, adopted by that other agency.
 - 3. Specific economic, legal, social, technological, or other considerations, including considerations for the provision of employment opportunities for highly trained workers, make infeasible the mitigation measures or alternatives identified in the EIR.
- (b) The findings required by subsection (a) shall be supported by substantial evidence in the record.
- (c) The finding in subsection (a)(2) shall not be made if the agency making the finding has concurrent jurisdiction with another agency to deal with identified feasible mitigation measures or alternatives.
- (d) When making the findings required in subsection (a)(1), the agency shall also adopt a program for reporting on or monitoring the changes which it has either required in the project or made a condition of approval to avoid or substantially lessen significant environmental effects. These measures must be fully enforceable through permit conditions, agreements, or other measures.

- (e) The public agency shall specify the location and custodian of the documents or other materials which constitute the record of the proceedings upon which its decision is based.

The “changes or alterations” referred to in Section 15091(a)(1) above, that are required in, or incorporated into, the project which mitigate or avoid the significant environmental effects of the project, may include a wide variety of measures or actions as set forth in Guidelines Section 15370, including:

- (a) Avoiding the impact altogether by not taking a certain action or parts of an action.
- (b) Minimizing impacts by limiting the degree or magnitude of the action and its implementation.
- (c) Rectifying the impact by repairing, rehabilitating, or restoring the impacted environment.
- (d) Reducing or eliminating the impact over time by preservation and maintenance operations during the life of the action.
- (e) Compensating for the impact by replacing or providing substitute resources or environments.

Regarding a Statement of Overriding Considerations, Guidelines Section 15093 provides:

- (a) CEQA requires the decision maker to balance the benefits of a proposed project against its unavoidable environmental risks in determining whether to approve the project. If the benefits of a proposal project outweigh the unavoidable adverse environmental effects, the adverse environmental effects may be considered "acceptable".
- (b) Where the decision of the public agency allows the occurrence of significant effects which are identified in the final EIR but are not at least substantially mitigated, the agency shall state in writing the specific reasons to support its action based on the final EIR and/or other information in the record. This statement may be necessary if the agency also makes a finding under Section 15091(a)(2) or (a)(3).
- (c) If an agency makes a statement of overriding considerations, the statement should be included in the record of the project approval and should be mentioned in the notice of determination.

Having received, reviewed and considered the Final Environmental Impact Report (FEIR) for the Orange County Great Park, State Clearinghouse No. 2002101020 (FEIR), as well as all other information in the record of proceedings on this matter, the following Findings of Fact and Statement of Overriding Considerations (Findings) are hereby adopted by the City of Irvine (City) in its capacity as the CEQA Lead Agency. These Findings set forth the environmental basis for current and subsequent discretionary actions to be undertaken by the City and responsible agencies for the implementation of the Orange County Great Park (Project).

B. Record of Proceedings

For purposes of CEQA and these Findings, the Record of Proceedings for the proposed Project consists of the following documents and other evidence, at a minimum:

- The Notice of Preparation (NOP) and all other public notices issued by the City in conjunction with the proposed Project;
- The Final Environmental Impact Report for the proposed Project (FEIR);
- The Draft EIR;
- All written comments submitted by agencies or members of the public during the public review comment period on the Draft EIR;
- All responses to written comments submitted by agencies or members of the public during the public review comment period on the Draft EIR;
- All written and verbal public testimony presented during a noticed public hearing for the proposed Project at which such testimony was taken;
- The Mitigation Monitoring and Reporting Program (MMRP);
- The reports and technical memoranda included or referenced in Responses to Comments in the FEIR;
- All documents, studies, EIRs, or other materials incorporated by reference in the Draft EIR;
- The Ordinances and Resolutions adopted by the City in connection with the proposed Project, and all documents incorporated by reference therein;
- Matters of common knowledge to the City, including but not limited to federal, state and local laws and regulations;
- Any documents expressly cited in these Findings; and

- Any other relevant materials required to be in the record of proceedings by Public Resources Code Section 21167.6(e).

C. Custodian and Location of Records

The documents and other materials which constitute the administrative record for the City's actions related to the Project are located at the City of Irvine, 1 Civic Center Plaza, Irvine, California, 92623. The City Community Development Department is the custodian of the administrative record for the Project. Copies of these documents, which constitute the record of proceedings, are and at all relevant times have been and will be available upon request at the offices of the Community Development Department. This information is provided in compliance with Public Resources Code § 21081.6(a)(2) and Guidelines § 15091(e).

II. PROJECT SUMMARY

A. Project Location

The project is located in the center of Orange County and includes land within the City of Irvine and unincorporated area. The project area is northeast of the intersection of Interstate 5 and the Eastern Transportation Corridor Toll Road. Figure 1-1 (Project Location) depicts the location of the project area in a regional and local context, respectively. The total project area encompasses approximately 4,701 acres or 7.5 square miles. The total area proposed for annexation is 4,287 acres.

The project area is generally bounded by the cities of Irvine and Lake Forest on the south and east, and unincorporated area in the County of Orange on the north. Other nearby local jurisdictions include the cities of Laguna Hills, Laguna Niguel, Laguna Woods, Mission Viejo, Aliso Viejo and Tustin.

Major roadways bordering the project area include I-5 to the southwest, Sand Canyon Avenue to the northwest, Portola Parkway and Irvine Boulevard to the north, and Bake Parkway to the northeast. John Wayne Airport is located seven miles to the west of the project area. The Irvine Transportation Center, a major multi-modal transit center linking Orange County Transportation Authority (OCTA) bus, Metrolink commuter rail, and Amtrak rail services, is adjacent to the SCRRA tracks which traverse the site and separate Planning Areas 51 and 30.

An eight-acre (IRWD) parcel west of the Musick Jail contains the IRWD East Irvine Zone IV Pumping Station, Zone III 5.0 million gallon potable water reservoir, and a 7.0 million gallon potable water reservoir.

B. Project Description

The project land area involves approximately 4,701 acres. At present, 414 acres are within the City of Irvine and the balance are unincorporated area. Of this acreage, 4,693 represent the former MCAS El Toro base property.

The project consists of the following actions: 1) Annexation, General Plan Amendment, Pre-Zoning (prior to annexation), and Zoning of the unincorporated portion of Planning Area 51; 2) Annexation of the unincorporated portion of Planning Area 35 (the Irvine Ranch Water District Parcel); and 3) General Plan Amendment and Zone Change for Planning Area 30 which is presently in the City of Irvine; and 4) Approval of the form of a Development Agreement vesting approval of higher intensity overlay uses in consideration for dedication of land for public purposes and for funding certain infrastructure improvements and maintenance of the public uses by the purchaser/developer and subsequent landowners and funds for specified park, roadways, and other circulation facilities and infrastructure.

The major components that are part of the proposed Project are as follows:

Area	Proposed Actions
PLANNING AREA 51 Portion of MCAS El Toro in unincorporated County	<ol style="list-style-type: none"> 1. Annexation of the majority of Planning Area 51 into City of Irvine. A small portion of Planning Area 51 is already in the City of Irvine. 2. General Plan Amendment to establish a land use category consistent with the Orange County Great Park Plan land use designations.* General Plan Amendments (Circulation Element) to realign Millennium Parkway as Marine Way and eliminate a portion of the extension of Trabuco Road, as well as modify the trails network. General Plan Amendment (Parks and Recreation and the Conservation and Open Space Elements) to establish land use policies consistent with the Orange County Great Park Plan land use designations. This amendment includes broadening the types of activities permitted in City park facilities, as well as modifying the location of recreational facilities and conservation/open space lands. 3. Pre-zoning prior to annexation and rezoning to permit implementation of the Orange County Great Park Plan designations. Creation of new or expanded zoning categories and overlay zones to implement the OCGP General Plan designation.
Portion of PA 51 located within City Limits	<ol style="list-style-type: none"> 1. General Plan Amendment to establish a land use category consistent with the Orange County Great Park Plan land use designations.* 2. Zone Changes in Planning Area 51 to permit implementation of the Orange County Great Park Plan designations and zoning overlay. Creation of new of expanded zoning categories and overlay zones to

Area	Proposed Actions
	address other components of the Great Park land use designations.
PLANNING AREA 35	<ol style="list-style-type: none"> 1. Annexation of a portion of Planning Area 35 (the IRWD parcel) to prevent creation of an unincorporated County island. 2. No General Plan amendment or zoning change is proposed.
PLANNING AREA 30 Portion of MCAS El Toro located within City limits	<ol style="list-style-type: none"> 1. General Plan Amendment to establish a land use category consistent with the Orange County Great Park Plan land use designations.* Circulation element revisions to realign Marine Way and Rockfield Boulevard and the trails network. Modification of the Parks and Recreation Element to relocate certain recreation facilities. 2. Zone changes in Planning Area 30 to permit implementation of the OCGP designations for the base zoning and the Overlay. Creation of new or expanded zoning categories and overlay zones to address the other components of the Great Park land use designations.

* The General Plan designation permits a base intensity of development with additional intensity available through compliance with criteria spelled out in a Development Agreement with the City and implemented through the City Zoning Ordinance.

C. Discretionary Actions

The discretionary actions to be taken by the City of Irvine at (or as part of) the completion of the EIR may include, but are not limited to the following:

- CEQA related actions and approvals;
- Annexation related approvals;
- General Plan amendments (including amendments made to conform to actions by other agencies related to the project);
- Approval of Development Agreements and Covenants, Conditions and Restrictions (CC&Rs) governing the property;
- Ordinance actions, including zone changes and zoning code amendment;
- Actions to approve interim use activities;
- Approval of master plan for development;
- Actions related to real and personal property acquisition, leases, management and other approvals;
- Regulatory or other actions implementing mitigation measures or actions identified in the final EIR;
- Approval of master plans and subdivisions for development; and
- Approval of community facilities districts or other assessment districts.

State and local agencies in addition to the City of Irvine may use the EIR in connection with any discretionary actions required to implement or otherwise assure development of

the Great Park Plan including, but not limited to actions of the following types. Federal agencies may also use the document as a basis for providing environmental review and clearance in accord with the National Environmental Policy Act.

The agencies which may use this Program EIR and types of actions that these agencies may take in connection with the EIR include, but are not limited to the following:

- Local Agency Formation Commission (LAFCO) – Approval of annexation
- The United States Department of Defense/Department of the Navy (DOD/DON) and the General Services Administration —Sale and conveyance of property
- Orange County Airport Land Use Commission (ALUC) - Revision of the Airport Environs Land Use Plan (AELUP)
- County of Orange – Revision of the County’s General Plan
- Southern California Association of Governments (SCAG) – Revisions to regional models related to growth, development and airport plans.
- Transportation Corridor Agency (TCA)
- South Coast Air Quality Management District (SCAQMD)
- Regional Water Quality Control Board (RWQCB) – National Pollutant Discharge Elimination System (NPDES) Permit
- Army Corps of Engineers (Corps) – Section 404 (Dredge and Fill) Permit
- California Department of Transportation (Caltrans)
- California Department of Fish and Game-Approvals related to streambed alterations and wildlife corridor and habitat areas
- Federal Department of the Interior (DOI) Fish and Wildlife Agency
- Southern California Regional Rail Authority (SCRRA)
- Orange County Transportation Authority (OCTA) – Revisions to the County Master Plan of Arterial Highways (MPAH)
- Irvine Unified School District
- Saddleback Unified School District

D. Use of the EIR

The EIR is intended to provide information to public agencies, the general public, and decision makers, regarding the environmental impacts from the construction and operation of the proposed project. Under CEQA, “The purpose of the Environmental Impact Report is to identify the significant effects of a project on the environment, to identify alternatives to the proposed project, and to indicate the manner in which significant environmental effects can be mitigated or avoided.” (Public Resources Code 21002.1(a)).

According to the CEQA Guidelines (Section 15168), a Program EIR may be prepared on a series of actions that can be characterized as one large project, are related geographically, and as logical parts in a chain of contemplated actions in connection with

issuance of rules, regulations or plans. The Program EIR allows for a more exhaustive consideration of effects and alternatives than would be practical in an EIR on separate individual actions, and ensures consideration of cumulative impacts that might not otherwise be addressed on a case-by-case basis. The proposed project involves several land use actions covering approximately 4,806 acres of land.

Full development of the project area in accordance with the Orange County Great Park Plan is estimated to take over 20 years. As such, the Program EIR provides a first-tier analysis of the proposed project by analyzing broad environmental effects. Subsequent activities in the project area must be examined in light of the Program EIR to determine whether additional environmental document must be prepared. If a subsequent project or later activity would have effects that were not examined in this Program EIR, or not examined at an appropriate level of detail to be used for the later activity, an initial study would need to be prepared, leading to a negative declaration, mitigated negative declaration, or an EIR. If the City finds that pursuant to Section 15152 of the CEQA Guidelines, no new effects could occur or new mitigation measures would be required for a subsequent project, the City can approve the activity as being within the scope of the project covered by this Program EIR, and no new environmental documentation would be required.

E. Statement of Objectives

A number of Project-specific objectives have been formulated for the Project. These objectives include, but are not limited to, the following:

1. Annex the former MCAS El Toro site and adjacent lands within the City's Sphere of Influence.
2. Convert MCAS El Toro to a Great Park with regional open space, cultural and recreational facilities.
3. Amend the Irvine General Plan and Zoning Ordinance to implement proposed Orange County Great Park land use designations.
4. Coordinate location and development of roadways and transportation systems in the project area with the local and regional circulation and transportation systems.
5. Create a wildlife corridor connection through the property which may potentially connect the Cleveland National Forest to the north and the coastal open space preserves to the south.
6. Respond positively and effectively to the DON's decision to sell the property to private interests by allowing private development of some land while ensuring the implementation of park and open space amenities.

III. ENVIRONMENTAL REVIEW AND PUBLIC PARTICIPATION

A. Environmental Impact Report

On October 2, 2002, in accordance with Section 15082 of the Guidelines, the City distributed a Notice of Preparation (NOP) of an Environmental Impact Report to the State Clearinghouse, local and regional responsible agencies and other interested parties. A number of agencies and other interested parties responded to the NOP. The NOP, the NOP distribution list, and NOP comments received during the 30-day public review period are included in Appendix B and C of the FEIR. The comment letters to the NOP are on file at the City of Irvine, Community Development Department, One Civic Center Plaza, Irvine, California 92623-9575, contact Glen Worthington (949) 724-6370.

On October 29, 2002, the City of Irvine held a scoping session at the Irvine City Hall to answer questions and permit discussion on the project. The University Village alternative land use plan was developed in response to public comments made at the meeting and subsequently provided in written responses to the NOP. Comments received during the public involvement process and the NOP scoping period were considered in the preparation of the Draft EIR.

The Draft EIR for the proposed Project was then prepared and circulated for review and comment by the public, agencies and organizations for a 45-day public review period that began on February 19, 2003 and concluded on April 4, 2003. A Notice of Completion of the Draft EIR was sent to the State Clearinghouse and the Draft EIR was circulated to State agencies for review through the State Clearinghouse, Office of Planning and Research (SCH No. 2002101020). A notice of availability on the Draft EIR was published in Orange County Register on February 18, 2003. During the public review period, numerous comment letters on the Draft EIR were received. Following the public review period, the City of Irvine Planning Commission held a public hearing on the proposed project on April 17, 2003.

IV. GENERAL FINDINGS

The City hereby finds as follows:

- The City is the “Lead Agency” for the proposed Project evaluated in the FEIR;
- The Draft EIR and the FEIR were prepared in compliance with CEQA and the Guidelines;
- The City has independently reviewed and analyzed the Draft EIR and the FEIR, and these documents reflect the independent judgment of the City Council and the City of Irvine.

- An MMRP has been prepared for the proposed Project, which the City has adopted or made a condition of approval of the proposed Project. That MMRP is incorporated herein by reference and is considered part of the record of proceedings for the proposed Project;
- The MMRP designates responsibility and anticipated timing for the implementation of mitigation. The City will serve as the MMRP Coordinator;
- In determining whether the proposed Project has a significant impact on the environment, and in adopting these Findings pursuant to Section 21081 of CEQA, the City has complied with CEQA Sections 21081.5 and 21082.2;
- The impacts of the proposed Project have been analyzed to the extent feasible at the time of certification of the FEIR;
- The City has reviewed the comments received on the Draft EIR, and FEIR, and the responses thereto and has determined that neither the comments received nor the responses to such comments add significant new information regarding environmental impacts to the Draft EIR and FEIR. The City has based its actions on full appraisal of all viewpoints, including all comments received up to the date of adoption of these Findings, concerning the environmental impacts identified and analyzed in the FEIR;
- The responses to the comments on the Draft EIR, which are contained in the FEIR, clarify and amplify the analysis in the Draft EIR;
- Having reviewed the information contained in the Draft EIR and FEIR and the record of proceedings, as well as the requirements of CEQA and the Guidelines regarding recirculation of Draft EIRs, and having analyzed the changes in the Draft EIR which have occurred since the close of their respective public review periods, the City finds that there is no new significant information in the FEIR and finds that recirculation is not required.
- The City has made no decisions that constitute an irretrievable commitment of resources toward the proposed Project prior to certification of the FEIR, nor has the City previously committed to a definite course of action with respect to the proposed Project;
- Copies of all the documents incorporated by reference in the FEIR are and have been available upon request at all times at the offices of the City, custodian of record for such documents or other materials;
- Having received, reviewed and considered all information and documents in the record, the City hereby conditions the proposed Project and finds as stated in these Findings.

V. SUMMARY OF IMPACTS

The FEIR concludes that impacts of the proposed Project with respect to the following issues either will not be significant or will be mitigated to below a level of significance by existing regulations/standard conditions, project design features/special development requirements and/or mitigation measures that will be made conditions of Project approval: Land Use, Noise, Traffic/Circulation, Public Health and Safety, Geology and Seismicity, Hydrology/Water Quality, Biological Resources, Paleontological Resources, Cultural Resources, Aesthetics, Public Services and Facilities, and Utilities (including Potable Water, Recycled Water, Sewer and Energy and Communications). Impacts related to project-level Air Quality, Agricultural Resources, Population and Housing, and cumulative Air Quality, Traffic/Circulation, Agricultural Resources, and Population and Housing remain significant despite the adoption of all feasible mitigation measures.

VI. IMPACTS DETERMINED TO BE SIGNIFICANT AND MITIGABLE

The following describes the impacts determined to be significant and mitigable in the Final EIR (FEIR).

A. PROJECT-LEVEL LAND USE

Base Plan and Overlay Plan

No significant impact associated with land use has been identified.

B. PROJECT-LEVEL NOISE

Base Plan and Overlay Plan

No significant impact associated with noise has been identified.

C. PROJECT-LEVEL TRAFFIC/CIRCULATION

Base Plan

B1. Significant Impact:

Implementation of the Base Plan will cause an increase in traffic which is substantial in relation to the existing traffic load and capacity of the street system (i.e., result in a substantial increase in either the number of vehicle trips, the volume to capacity ratio on road, or congestion at intersections) in the 2007, 2025, and Post 2025 scenarios as follows (EIR page 5.2-64):

ROADWAY/FREEWAY/TOLLWAY/RAMP SEGMENTS

Year 2007

I-5 Freeway Southbound off ramp at Alton Parkway

Year 2025

I-5 Freeway at Jeffrey Road – southbound on ramp (AM/PM)

I-5 Freeway at Sand Canyon Avenue – northbound on ramp (PM)

I-5 Freeway at Sand Canyon Avenue – southbound off ramp (AM)

I-5 Freeway at Bake Parkway – southbound off ramp (AM)

I-405 Freeway at Jeffrey Road – northbound off ramp (PM)

I-405 Freeway at Sand Canyon Avenue – northbound direct on ramp (PM)

I-405 Freeway at Sand Canyon Avenue – southbound off ramp (AM)

Post 2025

I-5 Freeway from Jeffrey Road to Sand Canyon Avenue – southbound (AM)

I-405 Freeway from Jeffrey Road to Sand Canyon Avenue – southbound (AM)

I-5 Freeway at Jeffrey Road – southbound on ramp (AM/PM)

I-5 Freeway at Sand Canyon Avenue – northbound on ramp (PM)

I-5 Freeway at Sand Canyon Avenue – southbound off ramp (AM)

I-5 Freeway at Bake Parkway – southbound off ramp (AM)

I-405 Freeway at Sand Canyon Avenue – northbound direct on ramp (PM)

I-405 Freeway at Sand Canyon Avenue – southbound off ramp (AM)

INTERSECTIONS

Year 2007

Please refer to Table 5.2-6.

Year 2025

Please refer to Table 5.2-7.

Post 2025

Please refer to Table 5.2-8.

Mitigation Measures

- Tran 1.** Prior to the approval of any final map (other than a financing and conveyance map) within the Great Park project, and prior to issuances of any building permits for permanent improvements within the Great Park property, the landowner or subsequent project applicant shall apply for annexation of any areas within the final map to the Irvine Spectrum Transportation Management Association (TMA) (“Spectrumotion”) in accordance with Article X of the recorded Declaration of Covenants, Conditions and Restrictions (CC&Rs) for the Irvine Spectrum TMA, including any supplementary or amended CC&Rs. The primary purpose of this mitigation measure is to reduce traffic, air quality and noise impacts. Should annexation into Spectrumotion not be approved, the landowner or subsequent project applicant shall develop and implement a similar transportation management plan containing the elements and meeting the criteria described below:

Transportation Management Plan (TMP)

The development and implementation of a Transportation Management Plan is an identified mitigation measure to manage transportation access for the Great Park Project. This document summarizes the key elements of the TMP.

1.0 Introduction

The purpose of this document is to provide an outline for a comprehensive TMP for the Great Park. This report is not intended to provide the specific details of the plan, but rather to highlight the key components and provide direction for subsequent detailed planning and implementation activities. When preparation of the TMP is undertaken, all of the agency and stakeholders will be invited to provide input.

It is the intent to annex Planning Area 51 and a portion of Planning Area 35 into the Irvine Spectrum Transportation Management Association (Spectrumotion). Spectrumotion is a private, non-profit Transportation

Management Association (TMA) formed to reduce traffic congestion in Irvine Spectrum. Spectrumotion promotes, markets, and subsidizes alternatives to solo-commuting and assists the business community in complying with trip reduction related requirements. Membership is mandatory to property owners with deed restrictions requiring participation in the TMA. Membership dues provide the funding for the Association and its programs, which offer a variety of employer and commuter services focused on reducing vehicular trip generation.

In the event that annexation of PAs 51 and 35 into Spectrumotion is not approved, a TMP similar to that provided by Spectrumotion will be implemented. This document sets forth the components of the TMP should it be necessary.

2.0 Transportation Management Plan Framework

The key elements of the Great Park TMP are set forth below:

New Hire Orientation: Inform newly hired employees of commuting services available to them.

Public Transportation Pass Sales: Provide a central location for purchase of passes to available transit services ((i.e., OCTA buses, Metrolink, Amtrak, etc.).

Vanpool and Carpool Formation Assistance: Perform all of the administrative work necessary to establish van pools and car pools.

On-site Promotions: Hold rideshare promotions at work sites and assist in employer assistance promotions.

Telecommuting/Alternative Work Schedule Consulting: Assist employers in developing and implementing a telecommuting or alternative work schedule program.

Personalized Commute Consulting: Provide a personalized commute profile to any commuter, which includes carpool match list containing the names of other commuters in the North Irvine Sphere that live and work near each other.

Website: Maintain a website with all of their program information available.

Rideshare Promotions: Conduct high visibility rideshare promotions as a means to advertise its services.

Subsidies: To the extent financially feasible, offer subsidies to assist in the formation of vanpools, the formation of carpools, and to encourage the trying of transit services.

Public Agency Coordination: Work closely with various public and quasi-public agencies to improve bus and commuter rail service to the Spectrum and North Irvine Sphere areas.

3.0 Transportation Management Plan Implementation

As part of the TMP, a process will be established to monitor its effectiveness in reducing peak hour trip generation in the Great Park. Provision shall be made for the Plan to be modified as appropriate to enhance its effectiveness.

- Tran 2.** Prior to the issuance of the first building permit, City shall establish, and the landowner or subsequent project applicant shall commit to participate in, a transportation system/infrastructure fee program to fund improvements identified as mitigation measures listed in Tables 5.2-16 and 5.2-17 of this EIR.
- Tran 3.** Prior to issuance of any building permits for permanent improvements within the Great Park property, the landowner or subsequent project applicant shall implement or contribute its percentage funding responsibility for traffic improvements as identified in the project traffic study (Urban Crossroads, December 2002) to maintain satisfactory levels of service as defined by the City's General Plan, based on thresholds of significance, performance standards, and methodologies used in this EIR, Orange County Congestion Management Program, and established in the transportation system/infrastructure fee program described in Mitigation Measure Tran 2 above.
- Tran 4.** Prior to approval of each Master Tentative Map or equivalent, the landowner or subsequent project applicant shall prepare, subject to City review and approval, an updated traffic study consistent with the City of Irvine Traffic Study Guidelines inclusive of a phasing plan for traffic improvements associated with the subject Master Tentative Map. The phasing plan will specify the timing, funding, construction, and responsibilities for all traffic improvements identified in the updated traffic study. The updated traffic study will determine whether any additional or alternative traffic improvements are necessary based on updated traffic forecasts. The updated traffic study will evaluate the cumulative impact of the subject map and all previously approved or concurrently submitted maps. The methodology for the study area, applicable land use and circulation modifications, and standards for assessing and mitigating impacts employed in the updated traffic

study shall be consistent with a City approved traffic study scope of work. The landowner or subsequent project applicant shall construct, bond for, or enter into a funding agreement for necessary improvements identified in the updated traffic study and/or participate in the City fee program (Tran 2 above) to the extent that the improvements identified in the updated traffic study are listed in Tables 5.2-16 and 5.2-17 of this EIR.

Traffic signals that are on-site or directly related to the Great Park development will be installed as warranted through the mitigation implementation plan process.

Tran 5. In conjunction with the preparation of any updated traffic study as required in Mitigation Measure Tran 4 for each master tentative map or equivalent, and assuming that a regional transportation agency has not already programmed and funded the warranted improvements to the impacted freeway mainline or freeway/tollway ramp locations in conjunctions with fulfilling its regional role, the landowner or subsequent project applicant and the City will take the following actions:

1. The City shall ensure that the updated traffic study identifies the project's proportionate impact on the specific freeway mainline and/or freeway-tollway ramp locations and its percentage responsibility for mitigating these impacts (assuming tolled conditions on the Transportation Corridors) based on thresholds of significance, performance standards and methodologies used in this EIR and established in the Orange County Congestion Management Program and City of Irvine Traffic Study Guidelines.
2. The City shall estimate the cost of the project's percentage responsibility in cooperation with Caltrans and the Transportation Corridor Agency.
3. The landowner or subsequent project applicant shall enter into an agreement with the City prior to recordation of the first final map for each Master Tentative Map or equivalent to establish the method and timing of payment of the identified percentage responsibility.
4. The City shall allocate landowner or subsequent project applicant's percentage contribution to traffic improvements that result in improved traffic flow on the impacted mainline and ramp locations, including but not limited to construction of physical or operational improvements, contributions to mandated trip reduction or transit programs, or funding participation in a regional transportation improvement fee program, if adopted.

- Tran 6.** The project shall mitigate to insignificant levels all project impacts at significantly impacted study area intersections. Tables 5.2-16 and 5.2-17 show the mitigation program for each phase. With regard to impacts that require improvements in other jurisdictions, the City of Irvine shall cooperate with the affected jurisdiction to ensure that the improvements are constructed in a timely manner.
- Tran 7.** Assuming that a regional transportation agency has not already programmed and funded the improvements, the City of Irvine shall coordinate with Caltrans and the Transportation Corridor Agencies, and submit for their approval, proposed plans for modifications to the state highway system and the transportation corridors, as required to provide ramp connections to Trabuco Road. If needed, the City shall prepare a Project Study Report, a New Connection Request, and a Detailed Traffic Revenue Study for review by Caltrans and the Transportation Corridor Agency for the proposed connection of Trabuco Road to the Eastern Transportation Corridor. The City shall perform toll and revenue impact studies for any mitigation measure (improvement) that may be impacted by the non-complete clause or any similar agreement restricting a public agency's authority to construct improvement.

Finding

Pursuant to CEQA Section 21081(a)(1) and Guidelines Section 15091(a)(1), changes or alterations have been required in, or incorporated into, the project which avoid or substantially lessen the significant environmental effect as identified in the EIR.

Facts in Support of Finding

Mitigation Measure Trans 1 requires that prior to the approval of any final map (other than a financing and conveyance map) within the Great Park project, and prior to issuances of any building permits for permanent improvements within the Great Park property, the landowner or subsequent project applicant shall apply for annexation of any areas within the final map to the Irvine Spectrum Transportation Management Association (TMA) ("Spectrumotion") in accordance with Article X of the recorded Declaration of Covenants, Conditions and Restrictions (CC&Rs) for the Irvine Spectrum TMA, including any supplementary or amended CC&Rs. The primary purpose of this mitigation measure is to reduce traffic, air quality and noise impacts. Should annexation into Spectrumotion not be approved, the landowner or subsequent project applicant shall develop and implement a similar transportation management plan containing the elements and meeting the criteria described in the Transportation Management Plan (TMP). Mitigation Measure Trans 2 requires that prior to the issuance of the first building permit, City shall establish, and the landowner or subsequent project applicant shall commit to participate in, a transportation system/infrastructure fee program to fund improvements identified as mitigation measures listed in Tables 5.2-16 and 5.2-17 of the EIR.

Mitigation Measure Trans 3 requires that prior to issuance of any building permits for permanent improvements within the Great Park property, the landowner or subsequent project applicant shall implement or contribute its percentage funding responsibility for traffic improvements as identified in the project traffic study (Urban Crossroads, December 2002) to maintain satisfactory levels of service as defined by the City's General Plan, based on thresholds of significance, performance standards, and methodologies used in the EIR, Orange County Congestion Management Program, and established in the transportation system/infrastructure fee program described in Mitigation Measure Tran 2 of the EIR. Mitigation Measure Trans 4 requires that prior to approval of each Master Tentative Map or equivalent, the landowner or subsequent project applicant shall prepare, subject to City review and approval, an updated traffic study consistent with the City of Irvine Traffic Study Guidelines inclusive of a phasing plan for traffic improvements associated with the subject Master Tentative Map. Mitigation Measure Trans 5 requires that in conjunction with the preparation of any updated traffic study as required in Mitigation Measure Tran 4 for each master tentative map or equivalent, and assuming that a regional transportation agency has not already programmed and funded the warranted improvements to the impacted freeway mainline or freeway/tollway ramp locations in conjunctions with fulfilling its regional role, the landowner or subsequent project applicant and the City will take the actions as specified in Mitigation Measure Trans 5. Mitigation Measure Trans 6 requires that the project shall mitigate to insignificant levels all project impacts at significantly impacted study area intersections. Tables 5.2-16 and 5.2-17 show the mitigation program for each phase. Mitigation Measure Trans 7 requires that the City of Irvine shall coordinate with Caltrans and the Transportation Corridor Agencies, and submit for their approval, proposed plans for modifications to the state highway system and the transportation corridors, as required to provide ramp connections to Trabuco Road. If needed, the City shall prepare a Project Study Report, a New Connection Request, and a Detailed Traffic Revenue Study for review by Caltrans and the Transportation Corridor Agency for the proposed connection of Trabuco Road to the Eastern Transportation Corridor. Implementation of Mitigation Measures Trans 1 through Trans 7 will reduce the impacts associated with traffic/circulation to a level less than significant (EIR page 5.2-67).

Concurrently with the proposed project, the City of Irvine is considering adoption of the North Irvine Transportation Improvement (NITM) program. The NITM program does two things: it prioritizes and schedules the construction of traffic improvements needed to address development in the Great Park, and other undeveloped areas of North Irvine; also, it imposes a nexus fee program to ensure the timely construction of these improvement events. The NITM program is consistent with and implements Mitigation Measure Tran 2. Traffic mitigation improvements within the City of Irvine as well as areas outside of the City will receive fair-share funding from the NITM program.

B2. Significant Impact:

Implementation of the Base Plan will result in inconsistencies with the adopted Orange County Master Plan of Arterial Highways (MPAH). These inconsistencies are associated with Marine Way and Rockfield Boulevard (EIR page 5.2-65).

Mitigation Measures

Tran 8. Following the approval of the Orange County Great Park and annexation of the project by the City of Irvine, the City will submit a request to the OCTA to initiate a cooperative study, involving the OCTA and other affected agencies, for the purpose of bringing the Orange County's Master Plan of Arterial Highways into conformity with the City of Irvine's Master Plan of Arterial Highways.

Finding

Pursuant to CEQA Section 21081(a)(1) and Guidelines Section 15091(a)(1), changes or alterations have been required in, or incorporated into, the project which avoid or substantially lessen the significant environmental effect as identified in the EIR.

Facts in Support of Finding

Implementation of Mitigation Measure Tran 8 requires the City of Irvine to take action to bring its Master Plan of Arterial Highways and the Orange County's Master Plan of Arterial Highways into mutual conformance. As stated in the EIR (page 5.2-41) the City or Irvine will amend both the Land Use Element and the Circulation Element contained in its General Plan. Following this action, the City will pursue a cooperative study with the OCTA and other affected agencies. The City will request that the realignment of Rockfield Boulevard west of Bake Parkway and the inclusion of Marine Way between Sand Canyon Avenue and Bake parkway be included in the MPAH. This mitigation measure is added in order to clarify concerns raised by the OCTA during the public comment period for the draft EIR. The MPAH inconsistency is a short-term impact that will be reduced to a level less than significant with the implementation of Mitigation Measure Tran 8.

B3. Significant Impact:

Implementation of the Base Plan will exceed, either individually or cumulatively, a level of service standard established by the county congestion management agency for designated roads or highways in the 2025 scenario. The Base Plan will impact the following (EIR page 5.2-64):

INTERSECTION

Year 2025

El Toro Road/Avenida de la Carlota

Mitigation Measures

Tran 1. Prior to the approval of any final map (other than a financing and conveyance map) within the Great Park project, and prior to issuances of any building permits for permanent improvements within the Great Park property, the landowner or subsequent project applicant shall apply for annexation of any areas within the final map to the Irvine Spectrum Transportation Management Association (TMA) (“Spectrumotion”) in accordance with Article X of the recorded Declaration of Covenants, Conditions and Restrictions (CC&Rs) for the Irvine Spectrum TMA, including any supplementary or amended CC&Rs. The primary purpose of this mitigation measure is to reduce traffic, air quality and noise impacts. Should annexation into Spectrumotion not be approved, the landowner or subsequent project applicant shall develop and implement a similar transportation management plan containing the elements and meeting the criteria described below:

Transportation Management Plan (TMP)

The development and implementation of a Transportation Management Plan is an identified mitigation measure to manage transportation access for the Great Park Project. This document summarizes the key elements of the TMP.

1.0 Introduction

The purpose of this document is to provide an outline for a comprehensive TMP for the Great Park. This report is not intended to provide the specific details of the plan, but rather to highlight the key components and provide direction for subsequent detailed planning and implementation activities. When preparation of the TMP is undertaken, all of the agency and stakeholders will be invited to provide input.

It is the intent to annex Planning Area 51 and a portion of Planning Area 35 into the Irvine Spectrum Transportation Management Association (Spectrumotion). Spectrumotion is a private, non-profit Transportation Management Association (TMA) formed to reduce traffic congestion in Irvine Spectrum. Spectrumotion promotes, markets, and subsidizes alternatives to solo-commuting and assists the business community in complying with trip reduction related requirements. Membership is mandatory to property owners with deed restrictions requiring participation in the TMA. Membership dues provide the funding for the Association and its programs, which offer a variety of employer and commuter services focused on reducing vehicular trip generation.

In the event that annexation of PAs 51 and 35 into Spectrumotion is not approved, a TMP similar to that provided by Spectrumotion will be

implemented. This document sets forth the components of the TMP should it be necessary.

2.0 Transportation Management Plan Framework

The key elements of the Great Park TMP are set forth below:

New Hire Orientation: Inform newly hired employees of commuting services available to them.

Public Transportation Pass Sales: Provide a central location for purchase of passes to available transit services ((i.e., OCTA buses, Metrolink, Amtrak, etc.).

Vanpool and Carpool Formation Assistance: Perform all of the administrative work necessary to establish van pools and car pools.

On-site Promotions: Hold rideshare promotions at work sites and assist in employer assistance promotions.

Telecommuting/Alternative Work Schedule Consulting: Assist employers in developing and implementing a telecommuting or alternative work schedule program.

Personalized Commute Consulting: Provide a personalized commute profile to any commuter, which includes carpool match list containing the names of other commuters in the North Irvine Sphere that live and work near each other.

Website: Maintain a website with all of their program information available.

Rideshare Promotions: Conduct high visibility rideshare promotions as a means to advertise its services.

Subsidies: To the extent financially feasible, offer subsidies to assist in the formation of vanpools, the formation of carpools, and to encourage the trying of transit services.

Public Agency Coordination: Work closely with various public and quasi-public agencies to improve bus and commuter rail service to the Spectrum and North Irvine Sphere areas.

3.0 Transportation Management Plan Implementation

As part of the TMP, a process will be established to monitor its effectiveness in reducing peak hour trip generation in the Great Park. Provision shall be made for the Plan to be modified as appropriate to enhance its effectiveness.

- Tran 2.** Prior to the issuance of the first building permit, City shall establish, and the landowner or subsequent project applicant shall commit to participate in, a transportation system/infrastructure fee program to fund improvements identified as mitigation measures listed in Tables 5.2-16 and 5.2-17 of this EIR.
- Tran 3.** Prior to issuance of any building permits for permanent improvements within the Great Park property, the landowner or subsequent project applicant shall implement or contribute its percentage funding responsibility for traffic improvements as identified in the project traffic study (Urban Crossroads, December 2002) to maintain satisfactory levels of service as defined by the City's General Plan, based on thresholds of significance, performance standards, and methodologies used in this EIR, Orange County Congestion Management Program, and established in the transportation system/infrastructure fee program described in Mitigation Measure Tran 2 above.
- Tran 4.** Prior to approval of each Master Tentative Map or equivalent, the landowner or subsequent project applicant shall prepare, subject to City review and approval, an updated traffic study consistent with the City of Irvine Traffic Study Guidelines inclusive of a phasing plan for traffic improvements associated with the subject Master Tentative Map. The phasing plan will specify the timing, funding, construction, and responsibilities for all traffic improvements identified in the updated traffic study. The updated traffic study will determine whether any additional or alternative traffic improvements are necessary based on updated traffic forecasts. The updated traffic study will evaluate the cumulative impact of the subject map and all previously approved or concurrently submitted maps. The methodology for the study area, applicable land use and circulation modifications, and standards for assessing and mitigating impacts employed in the updated traffic study shall be consistent with a City approved traffic study scope of work. The landowner or subsequent project applicant shall construct, bond for, or enter into a funding agreement for necessary improvements identified in the updated traffic study and/or participate in the City fee program (Tran 2 above) to the extent that the improvements identified in the updated traffic study are listed in Tables 5.2-16 and 5.2-17 of this EIR.

Traffic signals that are on-site or directly related to the Great Park development will be installed as warranted through the mitigation implementation plan process.

Tran 5. In conjunction with the preparation of any updated traffic study as required in Mitigation Measure Tran 4 for each master tentative map or equivalent, and assuming that a regional transportation agency has not already programmed and funded the warranted improvements to the impacted freeway mainline or freeway/tollway ramp locations in conjunctions with fulfilling its regional role, the landowner or subsequent project applicant and the City will take the following actions:

1. The City shall ensure that the updated traffic study identifies the project's proportionate impact on the specific freeway mainline and/or freeway-tollway ramp locations and its percentage responsibility for mitigating these impacts (assuming tolled conditions on the Transportation Corridors) based on thresholds of significance, performance standards and methodologies used in this EIR and established in the Orange County Congestion Management Program and City of Irvine Traffic Study Guidelines.
2. The City shall estimate the cost of the project's percentage responsibility in cooperation with Caltrans and the Transportation Corridor Agency.
3. The landowner or subsequent project applicant shall enter into an agreement with the City prior to recordation of the first final map for each Master Tentative Map or equivalent to establish the method and timing of payment of the identified percentage responsibility.
4. The City shall allocate landowner or subsequent project applicant's percentage contribution to traffic improvements that result in improved traffic flow on the impacted mainline and ramp locations, including but not limited to construction of physical or operational improvements, contributions to mandated trip reduction or transit programs, or funding participation in a regional transportation improvement fee program, if adopted.

Tran 6. The project shall mitigate to insignificant levels all project impacts at significantly impacted study area intersections. Tables 5.2-16 and 5.2-17 show the mitigation program for each phase. With regard to impacts that require improvements in other jurisdictions, the City of Irvine shall cooperate with the affected jurisdiction to ensure that the improvements are constructed in a timely manner.

Tran 7. Assuming that a regional transportation agency has not already programmed and funded the improvements, the City of Irvine shall coordinate with Caltrans and the Transportation Corridor Agencies, and submit for their approval, proposed plans for modifications to the state highway system and the transportation corridors, as required to provide ramp connections to

Trabuco Road. If needed, the City shall prepare a Project Study Report, a New Connection Request, and a Detailed Traffic Revenue Study for review by Caltrans and the Transportation Corridor Agency for the proposed connection of Trabuco Road to the Eastern Transportation Corridor. The City shall perform toll and revenue impact studies for any mitigation measure (improvement) that may be impacted by the non-complete clause or any similar agreement restricting a public agency's authority to construct improvement.

Finding

Pursuant to CEQA Section 21081(a)(1) and Guidelines Section 15091(a)(1), changes or alterations have been required in, or incorporated into, the project which avoid or substantially lessen the significant environmental effect as identified in the EIR.

Facts in Support of Finding

Mitigation Measure Trans 1 requires that prior to the approval of any final map (other than a financing and conveyance map) within the Great Park project, and prior to issuances of any building permits for permanent improvements within the Great Park property, the landowner or subsequent project applicant shall apply for annexation of any areas within the final map to the Irvine Spectrum Transportation Management Association (TMA) ("Spectrumotion") in accordance with Article X of the recorded Declaration of Covenants, Conditions and Restrictions (CC&Rs) for the Irvine Spectrum TMA, including any supplementary or amended CC&Rs. The primary purpose of this mitigation measure is to reduce traffic, air quality and noise impacts. Should annexation into Spectrumotion not be approved, the landowner or subsequent project applicant shall develop and implement a similar transportation management plan containing the elements and meeting the criteria described in the Transportation Management Plan (TMP). Mitigation Measure Trans 2 requires that prior to the issuance of the first building permit, City shall establish, and the landowner or subsequent project applicant shall commit to participate in, a transportation system/infrastructure fee program to fund improvements identified as mitigation measures listed in Tables 5.2-16 and 5.2-17 of the EIR. Mitigation Measure Trans 3 requires that prior to issuance of any building permits for permanent improvements within the Great Park property, the landowner or subsequent project applicant shall implement or contribute its percentage funding responsibility for traffic improvements as identified in the project traffic study (Urban Crossroads, December 2002) to maintain satisfactory levels of service as defined by the City's General Plan, based on thresholds of significance, performance standards, and methodologies used in the EIR, Orange County Congestion Management Program, and established in the transportation system/infrastructure fee program described in Mitigation Measure Tran 2 of the EIR. Mitigation Measure Trans 4 requires that prior to approval of each Master Tentative Map or equivalent, the landowner or subsequent project applicant shall prepare, subject to City review and approval, an updated traffic study consistent with the City of Irvine Traffic Study Guidelines inclusive of a phasing

plan for traffic improvements associated with the subject Master Tentative Map. Mitigation Measure Trans 5 requires that in conjunction with the preparation of any updated traffic study as required in Mitigation Measure Tran 4 for each master tentative map or equivalent, and assuming that a regional transportation agency has not already programmed and funded the warranted improvements to the impacted freeway mainline or freeway/tollway ramp locations in conjunctions with fulfilling its regional role, the landowner or subsequent project applicant and the City will take the actions as specified in Mitigation Measure Trans 5. Mitigation Measure Trans 6 requires that the project shall mitigate to insignificant levels all project impacts at significantly impacted study area intersections. Tables 5.2-16 and 5.2-17 show the mitigation program for each phase. Mitigation Measure Trans 7 requires that the City of Irvine shall coordinate with Caltrans and the Transportation Corridor Agencies, and submit for their approval, proposed plans for modifications to the state highway system and the transportation corridors, as required to provide ramp connections to Trabuco Road. If needed, the City shall prepare a Project Study Report, a New Connection Request, and a Detailed Traffic Revenue Study for review by Caltrans and the Transportation Corridor Agency for the proposed connection of Trabuco Road to the Eastern Transportation Corridor. Implementation of Mitigation Measures Trans 1 through Trans 7 will reduce the impacts associated with traffic/circulation to a level less than significant (EIR page 5.2-67).

Concurrently with the proposed project, the City of Irvine is considering adoption of the North Irvine Transportation Improvement (NITM) program. The NITM program does two things: it prioritizes and schedules the construction of traffic improvements needed to address development in the Great Park, and other undeveloped areas of North Irvine; also, it imposes a nexus fee program to ensure the timely construction of these improvement events. The NITM program is consistent with and implements Mitigation Measure Tran 2. Traffic mitigation improvements within the City of Irvine as well as areas outside of the City will receive fair-share funding from the NITM program.

Overlay Plan

O1. Significant Impact:

Implementation of the Overlay Plan will cause an increase in traffic which is substantial in relation to the existing traffic load and capacity of the street system (i.e., result in a substantial increase in either the number of vehicle trips, the volume to capacity ratio on road, or congestion at intersections) in the 2007, 2025, and Post 2025 scenarios as follows (EIR 5.2-66):

ROADWAY/FREEWAY/TOLLWAY/RAMP SEGMENTS

Year 2007

I-5 at Alton Parkway – southbound offramp (AM)

I-405 at Irvine Center Drive – southbound offramp (AM)

Year 2025

University Drive from the I-405 Freeway to Michelson Drive (AM)

I-5 Freeway from Sand Canyon Avenue to Jeffrey Road – northbound (PM)

I-5 Freeway from Jeffrey Road to Sand Canyon Avenue – southbound (AM)

I-405 Freeway from Jeffrey Road to Sand Canyon Avenue – southbound (AM)

I-5 Freeway at Jeffrey Road – southbound on ramp (AM)

I-5 Freeway at Sand Canyon Avenue – northbound on ramp (PM)

I-5 Freeway at Sand Canyon Avenue – southbound off ramp (AM)

I-5 Freeway at Alton Parkway - southbound off ramp (AM)

I-5 Freeway at Bake Parkway – southbound off ramp (AM)

I-405 Freeway at Sand Canyon Avenue – northbound direct on ramp (PM)

I-405 Freeway at Sand Canyon Avenue - southbound off ramp (AM)

I-405 Freeway at Irvine Center Drive - southbound off ramp (AM)

SR-241 Tollway at Lake Forest Drive – southbound off ramp (AM)

SR-133 Freeway at Barranca Parkway – northbound direct on ramp (PM)

Post 2025

I-5 Freeway from Sand Canyon Avenue to Jeffrey Road – northbound (PM)

I-5 Freeway from Jeffrey Road to Sand Canyon Avenue – southbound (AM)

I-405 Freeway from Jeffrey Road to Sand Canyon Avenue – southbound (AM)

I-5 Freeway at Jeffrey Road – southbound on ramp (AM)

I-5 Freeway at Sand Canyon Avenue - northbound on ramp (PM)

I-5 Freeway at Sand Canyon Avenue - southbound off ramp (AM)

I-5 Freeway at Alton Parkway - southbound off ramp (AM)

I-5 Freeway at Bake Parkway - southbound off ramp (AM)

I-5 Freeway at El Toro Road – southbound off ramp (PM)

I-405 Freeway at Jeffrey Road – northbound off ramp (PM)

I-405 Freeway at Sand Canyon Avenue - northbound direct on ramp (AM/PM)

I-405 Freeway at Sand Canyon Avenue - southbound off ramp (AM)

I-405 Freeway at Irvine Center Drive – southbound off ramp (AM)

Mitigation Measures

Tran 1. Prior to the approval of any final map (other than a financing and conveyance map) within the Great Park project, and prior to issuances of any building permits for permanent improvements within the Great Park property, the landowner or subsequent project applicant shall apply for annexation of any areas within the final map to the Irvine Spectrum Transportation Management Association (TMA) (“Spectrumotion”) in accordance with Article X of the recorded Declaration of Covenants, Conditions and Restrictions (CC&Rs) for the Irvine Spectrum TMA, including any supplementary or amended CC&Rs. The primary purpose of this mitigation measure is to reduce traffic, air quality and noise impacts. Should annexation into Spectrumotion not be approved, the landowner or subsequent project applicant shall develop and implement a similar transportation management plan containing the elements and meeting the criteria described below:

Transportation Management Plan (TMP)

The development and implementation of a Transportation Management Plan is an identified mitigation measure to manage transportation access for the Great Park Project. This document summarizes the key elements of the TMP.

1.0 Introduction

The purpose of this document is to provide an outline for a comprehensive TMP for the Great Park. This report is not intended to provide the specific details of the plan, but rather to highlight the key components and provide direction for subsequent detailed planning and implementation activities. When preparation of the TMP is undertaken, all of the agency and stakeholders will be invited to provide input.

It is the intent to annex Planning Area 51 and a portion of Planning Area 35 into the Irvine Spectrum Transportation Management Association (Spectrumotion). Spectrumotion is a private, non-profit Transportation Management Association (TMA) formed to reduce traffic congestion in Irvine Spectrum. Spectrumotion promotes, markets, and subsidizes alternatives to solo-commuting and assists the business community in complying with trip reduction related requirements. Membership is mandatory to property owners with deed restrictions requiring participation in the TMA. Membership dues provide the funding for the Association and its programs, which offer a variety of employer and commuter services focused on reducing vehicular trip generation.

In the event that annexation of PAs 51 and 35 into Spectrumotion is not approved, a TMP similar to that provided by Spectrumotion will be implemented. This document sets forth the components of the TMP should it be necessary.

2.0 Transportation Management Plan Framework

The key elements of the Great Park TMP are set forth below:

New Hire Orientation: Inform newly hired employees of commuting services available to them.

Public Transportation Pass Sales: Provide a central location for purchase of passes to available transit services ((i.e., OCTA buses, Metrolink, Amtrak, etc.).

Vanpool and Carpool Formation Assistance: Perform all of the administrative work necessary to establish van pools and car pools.

On-site Promotions: Hold rideshare promotions at work sites and assist in employer assistance promotions.

Telecommuting/Alternative Work Schedule Consulting: Assist employers in developing and implementing a telecommuting or alternative work schedule program.

Personalized Commute Consulting: Provide a personalized commute profile to any commuter, which includes carpool match list containing the names of other commuters in the North Irvine Sphere that live and work near each other.

Website: Maintain a website with all of their program information available.

Rideshare Promotions: Conduct high visibility rideshare promotions as a means to advertise its services.

Subsidies: To the extent financially feasible, offer subsidies to assist in the formation of vanpools, the formation of carpools, and to encourage the trying of transit services.

Public Agency Coordination: Work closely with various public and quasi-public agencies to improve bus and commuter rail service to the Spectrum and North Irvine Sphere areas.

3.0 Transportation Management Plan Implementation

As part of the TMP, a process will be established to monitor its effectiveness in reducing peak hour trip generation in the Great Park. Provision shall be made for the Plan to be modified as appropriate to enhance its effectiveness.

- Tran 2.** Prior to the issuance of the first building permit, City shall establish, and the landowner or subsequent project applicant shall commit to participate in, a transportation system/infrastructure fee program to fund improvements identified as mitigation measures listed in Tables 5.2-16 and 5.2-17 of this EIR.
- Tran 3.** Prior to issuance of any building permits for permanent improvements within the Great Park property, the landowner or subsequent project applicant shall implement or contribute its percentage funding responsibility for traffic improvements as identified in the project traffic study (Urban Crossroads, December 2002) to maintain satisfactory levels of service as defined by the City's General Plan, based on thresholds of significance, performance standards, and methodologies used in this EIR, Orange County Congestion Management Program, and established in the transportation system/infrastructure fee program described in Mitigation Measure Tran 2 above.
- Tran 4.** Prior to approval of each Master Tentative Map or equivalent, the landowner or subsequent project applicant shall prepare, subject to City review and approval, an updated traffic study consistent with the City of Irvine Traffic

Study Guidelines inclusive of a phasing plan for traffic improvements associated with the subject Master Tentative Map. The phasing plan will specify the timing, funding, construction, and responsibilities for all traffic improvements identified in the updated traffic study. The updated traffic study will determine whether any additional or alternative traffic improvements are necessary based on updated traffic forecasts. The updated traffic study will evaluate the cumulative impact of the subject map and all previously approved or concurrently submitted maps. The methodology for the study area, applicable land use and circulation modifications, and standards for assessing and mitigating impacts employed in the updated traffic study shall be consistent with a City approved traffic study scope of work. The landowner or subsequent project applicant shall construct, bond for, or enter into a funding agreement for necessary improvements identified in the updated traffic study and/or participate in the City fee program (Tran 2 above) to the extent that the improvements identified in the updated traffic study are listed in Tables 5.2-16 and 5.2-17 of this EIR.

Traffic signals that are on-site or directly related to the Great Park development will be installed as warranted through the mitigation implementation plan process.

Tran 5. In conjunction with the preparation of any updated traffic study as required in Mitigation Measure Tran 4 for each master tentative map or equivalent, and assuming that a regional transportation agency has not already programmed and funded the warranted improvements to the impacted freeway mainline or freeway/tollway ramp locations in conjunctions with fulfilling its regional role, the landowner or subsequent project applicant and the City will take the following actions:

1. The City shall ensure that the updated traffic study identifies the project's proportionate impact on the specific freeway mainline and/or freeway-tollway ramp locations and its percentage responsibility for mitigating these impacts (assuming tolled conditions on the Transportation Corridors) based on thresholds of significance, performance standards and methodologies used in this EIR and established in the Orange County Congestion Management Program and City of Irvine Traffic Study Guidelines.
2. The City shall estimate the cost of the project's percentage responsibility in cooperation with Caltrans and the Transportation Corridor Agency.
3. The landowner or subsequent project applicant shall enter into an agreement with the City prior to recordation of the first final map for each Master Tentative Map or equivalent to establish the method and timing of payment of the identified percentage responsibility.

4. The City shall allocate landowner or subsequent project applicant's percentage contribution to traffic improvements that result in improved traffic flow on the impacted mainline and ramp locations, including but not limited to construction of physical or operational improvements, contributions to mandated trip reduction or transit programs, or funding participation in a regional transportation improvement fee program, if adopted.

Tran 6. The project shall mitigate to insignificant levels all project impacts at significantly impacted study area intersections. Tables 5.2-16 and 5.2-17 show the mitigation program for each phase. With regard to impacts that require improvements in other jurisdictions, the City of Irvine shall cooperate with the affected jurisdiction to ensure that the improvements are constructed in a timely manner.

Tran 7. Assuming that a regional transportation agency has not already programmed and funded the improvements, the City of Irvine shall coordinate with Caltrans and the Transportation Corridor Agencies, and submit for their approval, proposed plans for modifications to the state highway system and the transportation corridors, as required to provide ramp connections to Trabuco Road. If needed, the City shall prepare a Project Study Report, a New Connection Request, and a Detailed Traffic Revenue Study for review by Caltrans and the Transportation Corridor Agency for the proposed connection of Trabuco Road to the Eastern Transportation Corridor. The City shall perform toll and revenue impact studies for any mitigation measure (improvement) that may be impacted by the non-complete clause or any similar agreement restricting a public agency's authority to construct improvement.

Finding

Pursuant to CEQA Section 21081(a)(1) and Guidelines Section 15091(a)(1), changes or alterations have been required in, or incorporated into, the project which avoid or substantially lessen the significant environmental effect as identified in the EIR.

Facts in Support of Finding

Mitigation Measure Trans 1 requires that prior to the approval of any final map (other than a financing and conveyance map) within the Great Park project, and prior to issuances of any building permits for permanent improvements within the Great Park property, the landowner or subsequent project applicant shall apply for annexation of any areas within the final map to the Irvine Spectrum Transportation Management Association (TMA) ("Spectrumotion") in accordance with Article X of the recorded Declaration of Covenants, Conditions and Restrictions (CC&Rs) for the Irvine Spectrum
