NOTES TO LAND USES

- (1) Land Use authority and corresponding regulatory activities are the responsibilities of the government agencies which own this land.
- (2) These governmental agencies are subject to the General Plan requirements contained within the California Government Code sections 65401 and 65402.
- (3) These Land Use categories also allow residential developments noted in the General Plan text.
- (4) The Land Use Element Table A-1 establishes and regulates land use building intensity standards. Building intensity standards are allocated by Planning Area.

ZONE CHANGES

Sec. 3-37-39. 8.1 Lifelong Learning District.

A. *Intent.* A unique urban setting that is intended as a zoning designation in which a wide variety of uses are allowed on the same site consistent with the Great Park land use category as defined in the General Plan. The lifelong learning district allows for a mix of residential, commercial, and educational uses that promotes and supports a synergistic live/learn/work/play environment. Specific uses that serve to enhance the cultural, educational, and recreational environment are especially encouraged in this area.

(8.1) Orange County Great Park (Planning Area 51)

(8.1A) Orange County Great Park (Planning Area 51)

B. *Intensity standard.*

1. 10.0 to 50.0 dwelling units per net acre.
2. Total maximum development intensity shall not exceed the building intensities described in Section 9-51-6(C) and shall not cause the total maximum Average Daily Trips (ADT) in PA 51 to exceed 117,047 ADT, based on the socio-economic-based trip generation average daily trips (ADT) rates used to analyze the Orange County Great Park traffic impacts.

C. *Permitted uses.*

1. Accessory use (including clubhouses and recreational amenities for the residential community).
2. Agriculture (interim use).
3. Caretaker's quarters.
4. Commercial recreation (under 1,500 square feet).
5. Department store.
6. Financial institution (except drive-thru).
7. Home care.
8. Home occupation permit.
9. Information center.
10. Manufactured structure (up to two years).
11. Model home complex.
12. Office, administrative, business professional.
13. Office, design professional.
14. Office, headquarters.
15. Office, medical.
16. Outdoor vendor.
17. Park.
18. Public park facility (only in public parks).
19. Pushcart.
20. Residential, second unit.
21. Research and development.
22. Restaurant.
23. Restaurant, fast food (except drive-thru).
24. Retail and/or service business, general (except drive-thru).
25. Reverse vending machine.
26. School, public.
27. Stable, private (only within agriculture area).
28. Supermarket.

29. Wireless communication. (May require a wireless communication facility permit, a minor conditional use, a major conditional use, or may be prohibited, depending on the type of installation and the location of the installation site, pursuant to the review procedures matrix in Section 2-37.5-3).

D. *Conditional uses.*

1. Ambulance service.
2. Arcade, game.
3. Bar, tavern, cocktail lounge.
4. Boarding house.
5. Car wash.
6. Cemetery/mausoleum/crematory (only in 8.1A).
7. Child care center.
8. Church.
9. Commercial recreation (over 1,500 square feet).
10. Community facility.
11. Composting facility. (In conjunction with demolition, removal and recovery of existing buildings, structures and landscaping associated with the former military use of the property).
12. Concrete recycling facility. (In conjunction with demolition, removal and recovery of existing buildings, structures and landscaping associated with the former military use of the property).
13. Conference/convention facility.
14. Congregate care facility.
15. Convalescent home.
16. Convenience or liquor store.
17. Drive-thru.
18. Financial institutions (drive-thru).
19. Equipment rental.
20. Fraternal and service club.
21. Funeral home/mortuary.
22. Gas station/fuel dispenser.
23. Government facility.
24. Health club.
25. Heliport.
26. Hospital.
27. Hotel, extended stay.
28. Hotel/motel.
29. Industry, service.
30. Manufactured structure (over two (2) years).
31. Massage establishment and related business.
32. Materials recovery facility. (In conjunction with demolition, removal and recovery of existing buildings, structures and landscaping associated with the former military use of the property).
33. Outdoor sales.
34. Outdoor storage.
35. Recreational vehicle storage, private.
36. Residential care facility.
37. Residential, attached.
38. Residential, single family detached.
39. Residential shelter.

40. Restaurant, "type 47" ABC license.
41. Restaurant, fast food (drive-thru).
42. Retail business, home improvement related.
43. School, commercial.
44. School, private.
45. Senior housing.
46. Small collection facility.
47. Sober living facilities.
48. Stable, public (only within agriculture area).
49. Utility building and facility.
50. Vehicle leasing and rental.
51. Vehicle repair.
52. Veterinary service, domestic.
53. Warehouse and sales outlet.

E. Introduction of unique land uses that are not specified in the permitted and conditionally permitted uses but fit within the intent of the GP-LLD (Section 3-37-38) shall be encouraged subject to an initial determination by the Director of Community Development and subsequently, subject to a conditional use permit for consideration by the Planning Commission.

F.	<i>Minimum site size</i>	0.25 acre (all uses except single-family detached).
		2,400 square feet (single-family detached only)
G.	<i>Maximum site coverage</i>	50% single-use developments
		65% mixed-use developments
H.	<i>Maximum building height</i>	70 feet
I.	<i>Minimum site landscaping</i>	15%
J.	<i>Building setbacks from:</i>	
	Major highways:	45 feet
	Primary highways:	45 feet
	Secondary highways:	
	In nonresidential areas	35 feet (Alternate setbacks may be approved through a master plan).
	In residential areas	25 feet
	Commuter highways and local	

streets:

Adjacent to nonresidential areas	15 feet
Adjacent to residential areas	To be determined at time of master plan review
Great Park edge	To be determined at time of master plan review
Interior boundary adjacent to residential or nonresidential uses:	
Side	To be determined at time of master plan or conditional use permit review
Rear	To be determined at time of master plan or conditional use permit review
Building to building	10 feet

(Ord. No. 06-18, § 4, 10-24-06)

Sec. 9-30-3. Statistical analysis.

Planning Area: 30 Base Zone

Orange County Great Park Land Use Category	Zoning	Zoning Number	Acres in Area	Maximum Square Feet

Agriculture*	Exclusive Agriculture	1.1	13	
Wildlife Corridor	Preservation	1.4	61	
Transit Oriented Development	Transit Oriented Development	3.2	129	53,500 Also see Special Development Requirements**
Auto	Vehicle-Related Commercial	4.3	34	102,000
Research and Development	General Industrial	5.4B	121	1,600,000
Major Roadways			40	
	Total		398	1,755,500*

* Not shown is the portion of the Transit Oriented Development intensity that will be allocated through the master plan process (See Section 9-30-6(B))

Notes on Maximum Intensities: In order to develop the overlay zone uses and intensities for Planning Area 30, the property-owners has entered into a development agreement, which requires the dedication of land and the development or funding of infrastructure improvements in excess of the City's standard requirements and the commitment to long term maintenance of public facilities (Section 9-30-2).

(Code 1976, § V.E-830.3; Ord. No. 96-18, § 4, 12-10-96; Ord. No. 00-03, § 4, 2-22-00; Ord. No. 03-18, § 4, 6-10-03; Ord. No. 06-18, § 4, 10-24-06)

Sec. 9-30-6. Special development requirements.

A. *Affordable Housing.* See Chapter 2-3 Affordable Housing Implementation Procedures.

B. *Transit Oriented Development.* The 3.2 Transit Oriented Development district within the overlay zone extends between Planning Areas 30 and 51. The intensity of development will be divided between the two planning areas through the implementation of a Master Plan for 3.2 Transit-Oriented Development, as defined in E below. The maximum intensity of development of the 3.2 Transit-Oriented Development district within the Orange County Great Park shall not exceed 1,500 residential dwelling units, 75,000 square feet of office, and 75,000 square feet of retail development. A remote airport terminal and maintenance facility with a maximum intensity of 53,500 square feet will also be developed within the 3.2 Transit Oriented Development district in Planning Area 30.

The following planning standards shall apply throughout the 3.2 Transit Oriented Development district:

1. The majority of the allowable residential units shall be located within one-quarter mile of the Irvine Transportation Center. Clustering of residential units shall be encouraged to provide for neighborhood parks as well as public and private open space areas within the project.
2. Total Average Daily Trips (ADT) shall not exceed the trip budget established for the development within the Orange County Great Park (C below). The developer shall provide additional traffic analysis for the review and approval of the Director of Community Development to support the consideration of trip reduction design standards and integration with mass transit systems.
3. Vertical and horizontal integration of commercial office and retail land uses into the residential development shall be required.
4. Pedestrian connections within and between the Transit Oriented Development district, the Irvine Transportation Center and the public areas of the Great Park shall be provided. An emphasis on pedestrian, way-finding signage and graphics, and the integration of the approved commercial retail and office uses shall facilitate pedestrian access in lieu of automobile access to the site amenities.
5. Neighborhood parks requirements shall be provided in accordance with City of Irvine standards. Community park requirements shall be met through participation in the cost of the Great Park through the Development Agreement.
6. Prior to approval of the master plan for development of the Transit Oriented Development site (F below), the Planning Commission shall make a specific finding that the master plan meets the intent of the Transit Oriented Development planning standards.

C. *Trip Budget.* Based on the socioeconomic-based trip generation average daily trip (ADT) rates used to analyze the Orange County Great Park traffic impacts, the total trips for the entire Orange County Great Park project area are not to exceed 90,963 ADT for the base zone or 148,910 ADT for the overlay zone.

Total trips for this Planning Area may not exceed 7,942 ADT for the base zone or 31,863 ADT for the overlay zone except as follows. Dwelling units and square footage allocated to the 3.2 Transit Oriented Development zoning district in the overlay zone will be divided between Planning Areas 30 and 51 through the

implementation of a master plan for Transit Oriented Development. A total of 3,183 ADT (ten percent of the vehicle trips allocated to Planning Area 30 in the overlay zone) may be transferred between Planning Area 51 and Planning Area 30 in conjunction with the approval of the master plan. Any transfer of vehicle trips between planning areas will be subject to review in accordance with the approval of the master plan. Any transfer of vehicle trips between planning areas will be subject to review in accordance with the requirements of the City's Traffic Study Guidelines.

D. *Development Tracking and Monitoring Report.* The development in Planning Area 30 is subject to specific limits as follows:

- Maximum square footage – see Section 9-30-3 Statistical Analysis Overlay Zone
- Maximum residential units – see Section 9-30-3 Statistical Analysis Overlay Zone
- Maximum daily vehicle trips - 31,863 ADT

Building permits which would cause one or more of these maximums to be exceeded shall not be issued.

Building permits and discretionary applications: Prior to the approval of any discretionary application and prior to the issuance of each building permit for new development, the applicant shall submit to the Community Development Department a table documenting the cumulative total of approved development within Planning Area 30, in a manner meeting the approval of the Community Development Director.

A project traffic study (Urban Crossroads Inc. dated December 2002) was prepared for development of the entire Orange County Great Park project area. A subsequent traffic study (Austin Foust & Associates dated September 2006) was prepared for the inclusion of the Lifelong Learning District. Based upon this study a post-2025 vehicle trip limit has been established for Planning Area 30. The study establishes a trip cap of 7,942 ADT for the base zone or 31,863 ADT for the overlay zone. Refer to Table A-1 of the September 2006 traffic study for the established land use trip rates for development monitoring purposes. Land use trip generation rates for undefined land uses will be determined by the Director of Public Works.

For the purpose of this section, "Applicant" shall mean the developer who will actually develop the land. In conjunction with issuance of any building permit, the applicant shall submit a Planning Area Development Monitoring Report for review and approval of the Director of Community Development. The Planning Area Development Monitoring Report shall include the allocation of trips to the proposed discretionary case or building permit to ensure that the aggregate projected traffic does not exceed the vehicle trip limits established for PA 30. The Planning Area Development Monitoring Report shall include, but not limited to, the accounting of trips (average daily) used in each discretionary case application or building permit application. Approval by the Director of Community Development shall be based upon the determination that the allocations shown do not exceed the maximum trips established for Planning Area 30; and that the allocation is generally consistent with the General Plan, zoning and other applicable regulatory documents. The Planning Area Development Monitoring Report may be updated by the Applicant and is subject to review and approval by the Director of Community Development. The purpose of the Great Park Planning Area 30 Development Monitoring Report is to monitor the growth and update the project's components.

E. *Additional Traffic Analysis.* With the submittal of future discretionary applications for specific development proposals, the Director of Public Works (DPW) may determine that additional traffic studies are required if the DPW determines that the proposed project is not in substantial conformance with the most recent traffic study for the project area. Notwithstanding the North Irvine Transportation Mitigation requirement that only an Interim Year analysis is required for Map level traffic studies, the applicant shall conduct an Interim, Long Term, and Buildout analysis for the required traffic study.

F. *Review Process.* Prior to the commencement of any private development in the 1.5 Recreation, 3.2 Transit Oriented Development, 4.3 Vehicle-Related Commercial, 5.4B General Industrial, or 6.1 Institutional zoning district within the Planning Area 30, the Planning Commission shall review and approve a master plan, containing the following information:

1. Location, acreage, types of land use and estimated square footages or number of dwelling units for each area within the zoning district.
2. A community design program, which characterizes the design features of the development, including signage design, fencing design, landscape themes, architectural theme, and other community design features. The location for a future City entry statement shall be reserved in the 4.3 Vehicle-Related Commercial zoning district near the Bake Parkway/I-405 interchange.
3. Landscape treatments, consistent with the Orange County Great Park Streetscape Plan, including:
 - a. Planning Area edge and entry widths and general character
 - b. Special landscaping themes, if any.
 - c. Palette of plant materials, walls, and hardscape for areas in and adjacent to the public rights-of-way.
 - d. Ownership of landscape areas.
4. Wildlife corridor edge condition treatments, consistent with the Irvine Wildlife Corridor Plan, including:
 - a. Light and noise mitigation programs and techniques.
 - b. Palette of compatible plant materials.
 - c. Walls, fences, and /or barrier mechanisms to protect the wildlife corridor from unwanted intrusions.
5. Existing and planned uses on adjoining properties and transition from surrounding areas to the mixed use Transit Oriented Development.
6. Access to the project site and on-site pedestrian and vehicular patterns. The use of pedestrian bridges to cross Alton, Barranca, and/or Marine Way is especially encouraged.
7. Other information as required by Chapter 2-17 or the Director of Community Development.

The master plan application shall be accompanied by maps, text, or other documentation to satisfy the above requirements. The form and content of such submittals shall be made to the satisfaction of the Director of Community Development.

G. *Changes in boundaries and/or intensities:*

1. Boundaries and acreages in the Orange County Great Park plan are approximate and shall be established by master plan approval (F above).

2. The trip budget for the Planning Area may be increased by ten percent, subject to the transfer provisions of C above.

H. *Trails Plan.* In conjunction with the submittal of the master tract map the applicant shall submit a conceptual master landscape and trails plan or a detailed exhibit depicting potential trail connections on site to the City's existing or planned regional trail network.

In addition, in conjunction with subsequent tract maps, master plans or building permit submittals, whichever comes first, the applicant shall provide a specific and detailed trails plan depicting the exact location, alignment and connectivity of on-site trails to the City's existing or planned regional trail network.

I. *Child Care.* The need for child care facilities shall be recognized in the development of Heritage Fields. Prior to the approval of the first residential tentative tract map that causes the total combined approved residential dwelling units, excluding senior housing units, to reach 1,400 in Planning Areas 30 and 51, the developer shall submit a child care needs study to the Director of Community Services for approval. Based on the presumption that generally need for private child care facilities will be triggered at 3,500 dwelling units (units with children), the purpose of the study will be to identify any unmet need for child care as a result of residential development within Planning Areas 30 and 51. Upon approval of the Study by the Director of Community Services which demonstrates that an unmet need exists, the developer shall identify ways to provide unmet private child care needs. Any private sector child care center(s) shall:

1. Accommodate the determined number of slots, which shall be based on the actual number of residential units to be built and on a determination of child care need within the project.
2. Be located at a site that is compatible with adjacent uses. Development of a child care center in conjunction with proposed elementary schools and public neighborhood parks, residential development and/or neighborhood commercial center shall be encouraged.
3. Be located at a site that has been evaluated with regard to factors that might be detrimental to public health, safety, or welfare, including but not limited to proximity to high-traffic volume roadways, hazardous material, and major generators of traffic.
4. Be a minimum site size for the child care center, which is 1.3 acres and accommodates a minimum of 150 children, per the Table G-2 of the City's General Plan, although larger sites are encouraged to accommodate larger number of children.

(Code 1976, § V.E-830.6; Ord. No. 96-18, § 4, 12-10-96; Ord. No. 00-03, § 4, 2-22-00; Ord. No. 03-18, § 4, 6-10-03; Ord. No. 06-18, § 4, 10-24-06)

Editor's note: Ord. No. 03-18, § 4, adopted June 10, 2003, amended the Code by repealing former § 9-30-06, and renumbering § 9-30-7 as § 9-30-6. Former § 9-30-6 pertained to the Sports and Entertainment Sector, South, and derived from Ord. No. 00-03, adopted February 22, 2000.

Sec. 9-51-3. Statistical analysis.

** Not shown is the portion of the Transit Oriented Development intensity that will be allocated through the master plan process. See Section 9-51-6(B). Included in the total are residential and non-residential intensities in the 8.1 LLD.

*** A total of 73 acres of cemetery use shall be a conditionally permitted use in 8.1A LLD Zoning District.

**** This acreage does not include 27 acres of the Marshburn Basin which is included in the 1.1 Exclusive Agriculture zoning district.

*****Includes 122,500 square feet for OCTA facilities, 300,000 square feet for County facilities, and 263,000 square feet of "McKinney Act" warehousing.

Notes on Maximum Intensities: In order to develop the overlay zone uses and intensities for Planning Area 51, the property owner has entered into a development agreement, which requires the dedication of land and the development of funding of infrastructure improvements in excess of the City's standard requirements, and the commitment to long-term maintenance of public facilities (Section 9-51-2).

(Code 1976, § V.E-851.3; Ord. No. 92-3, 4-14-92; Ord. No. 95-4, 5-9-95; Ord. No. 95-22, § 3, 11-28-95; Ord. No. 96-18, § 4, 12-10-96; Ord. No. 00-02, § 4, 2-8-00; Ord. No. 00-03, § 4, 2-22-00; Ord. No. 03-18, § 4, 6-10-03; Ord. No. 06-18, § 4, 10-24-06)

Sec. 9-51-6. Special development requirements.

A. *Affordable housing.* See Chapter 2-3 Affordable Housing Implementation Procedures.

B. *Transit oriented development.* The 3.2 Transit Oriented Development district within the overlay zone extends between Planning Areas 30 and 51. The intensity of development will be divided between the two planning areas through the implementation of a Master Plan for 3.2 Transit-Oriented Development, as defined in G below. The maximum intensity of development of the 3.2 Transit-Oriented Development district within the Orange County Great Park shall not exceed 1,500 residential dwelling units, 75,000 square feet of office, and 75,000 square feet of retail development.

The following planning standards shall apply throughout the 3.2 Transit Oriented Development district:

1. The majority of the allowable residential units shall be located within one-quarter mile of the Irvine Transportation Center. Clustering of residential units shall be encouraged to provide for neighborhood parks as well as public and private open space areas within the project.
2. Total Average Daily Trips (ADT) shall not exceed the trip budget established for the development within the Orange County Great Park (D below). The developer shall provide additional traffic analysis for the review and approval of the Director of Redevelopment to support the consideration of trip reduction design standards and integration with mass transit systems.
3. Vertical and horizontal integration of commercial office and retail land uses into the residential development shall be required.
4. Pedestrian connections within and between the Transit Oriented Development district, the Irvine Transportation Center and the public areas of the Great Park shall be provided. An emphasis on pedestrian, way-finding signage and graphics, and the integration of the approved commercial retail and office uses shall facilitate pedestrian access in lieu of automobile access to the site amenities.
5. Neighborhood parks requirements shall be provided in accordance with the City of Irvine standards. Community park requirements shall be met through participation in the cost of the Great Park through the Development Agreement.

6. Prior to approval of the master plan for development of the Transit Oriented Development site (G below), the Planning Commission shall make a specific finding that the master plan meets the intent of the Transit Oriented Development planning standards.

C. *Lifelong Learning District.* A unique urban setting that is intended as a zoning designation in which a wide variety of uses are allowed on the same site consistent with the Great Park Land use category as defined in the General Plan. The lifelong learning district allows for a mix of residential, commercial, and educational uses that promotes and supports a synergistic live/learn/work/play environment. Specific uses that serve to enhance the cultural, educational, and recreational environment are especially encouraged in this area.

8.1 Great Park Lifelong Learning District Development Intensity.

The maximum intensity of development of the 8.1 Lifelong Learning District within the Orange County Great Park shall not exceed 1,025 residential dwelling units, 1,452,600 Institutional (education), 708,000 square feet of Commercial Recreation, 1,000,000 square feet of Medical and Science, 225,000 square feet of Community Commercial and 50,000 square feet of cemetery-related building development.

Development intensity shall be recorded in a LLD Development Intensity Database and monitored administratively by the Director of Community Development following the master plan approval by the Planning Commission (G below).

The following planning standards shall apply throughout the 8.1 Lifelong Learning District:

1. The allowable residential units shall be mixed with other uses providing choices in location, type and size based on compatibility with surrounding uses. Clustering of residential units shall be encouraged to provide for greater opportunities to develop neighborhood parks as well as public and private open spaces within the development.
2. The residential development shall have an emphasis on alternative housing types to include at least homes targeted to active adult families, assisted living and congregate housing for seniors, student rental and for-sale housing, faculty and staff housing, extended stay business transient lodging, and housing focusing on young professionals, empty nesters and alternative family types.
3. Total Average Daily Trips (ADT) shall not exceed the trip budget established for the development within the Orange County Great Park (D below). The developer shall provide additional traffic analysis for the review and approval of the Director of Community Development to support the consideration of trip reduction design standards and integration with mass transit systems.
4. Neighborhood parks requirements shall be provided in accordance with City of Irvine Park Code. Community park requirements shall be met through participation in the cost of the Great Park through the Development Agreement (recorded on July 12, 2005).
5. The inclusion of alternative educational, vocational, R&D, business and office facilities in the form of high technology research and vocational centers, business incubators, community outreach partnership centers, conference and group presentation facilities within a "campus commons" framework shall be encouraged.

6. The introduction of unique land uses that are not specified in the permitted and conditionally permitted uses but fit within the intent of the LLD (Section 3-37-39) shall be encouraged subject to an initial determination by the Director of Community Development and subsequently, subject to a conditional use permit approved by the Planning Commission.
 7. Prior to approval of the master plan for development of the Lifelong Learning District site (F below), the Planning Commission shall make a specific finding that the master plan meets the intent of the Lifelong Learning District planning standards.
- D. *Trip budget.* Based on the socioeconomic-based trip generation average daily trip (ADT) rates used to analyze the Orange County Great Park traffic impacts, the total trips for the entire Orange County Great Park project area are not to exceed 90,963 ADT for the base zone or 148,910 ADT for the overlay zone.

Total trips for this Planning Area may not exceed 83,021 ADT for the base zone or 117,047 ADT for the overlay zone except as follows. Dwelling units and square footage allocated to the 3.2 Transit Oriented Development zoning district in the overlay zone will be divided between Planning Areas 30 and 51 through the implementation of a master plan for Transit Oriented Development. A total of 3,183 ADT (ten percent of the vehicle trips allocated to Planning Area 30 in the overlay zone) may be transferred between Planning Area 51 and Planning Area 30 in conjunction with the approval of the master plan. Any transfer of vehicle trips between planning areas will be subject to review in accordance with the approval of the master plan. Any transfer of vehicle trips between planning areas will be subject to review in accordance with the requirements of the City's Traffic Study Guidelines.

- E. *Development tracking and monitoring report.* The development in Planning Area 51 is subject to specific limits as follows:
- Maximum square footage - see Section 9-51-3 Statistical Analysis Overlay Zone
 - Maximum residential units - See Section 9-51-3 Statistical Analysis Overlay Zone
 - Maximum daily vehicle trips - 117,047 ADT

Building permits which would cause one or more of these maximums to be exceeded shall not be issued.

Building permits and discretionary application: Prior to the approval of any discretionary application and prior to the issuance of each building permit for new development, the applicant shall submit to the Community Development Department a table documenting the cumulative total of approved development within Planning Area 51, in a manner meeting the approval of the Director of Community Development.

A project traffic study (Urban Crossroads Inc. dated December 2002) was prepared for development of the entire Orange County Great Park project area. A subsequent traffic study (Austin Foust & Associates dated September 2006) was prepared for the inclusion of the Lifelong Learning District. Based upon these studies, a post-2025 vehicle trip limit has been established for Planning Area 51 (the project area). The AFA study establishes a trip cap of 83,021 ADT for the base zone or 117,047 for the overlay zone. Refer to Table A-1 of the September 2006 traffic study for the established land use trip rates for development monitoring purposes. Land use trip

generation rates for undefined land uses will be determined by the Director of Public Works.

For the purpose of this section, "Applicant" shall mean the developer who will actually develop the land. In conjunction with issuance of any building permit, the applicant shall submit a Planning Area Development Monitoring Report for review and approval of the Director of Community Development. The Planning Area Development Monitoring Report shall include the allocation of trips to the proposed discretionary case or building permit to ensure that the aggregate projected traffic does not exceed the vehicle trip limits established for PA 51. The Planning Area Development Monitoring Report shall include, but not limited to, the accounting of trips (average daily) used in each discretionary case application or building permit application. Approval by the Director of Community Development shall be based upon the determination that the allocations shown do not exceed the maximum trips established for Planning Area 51; and that the allocation is generally consistent with the General Plan, zoning and other applicable regulatory documents. The Planning Area Development Monitoring Report may be updated by the Applicant and is subject to review and approval by the Director of Community Development. The purpose of the Great Park Planning Area 51 Development Monitoring Report is to monitor the growth and update the project's components.

- F. *Additional traffic analysis.* With the submittal of future discretionary applications for specific development proposals, the Director of Public Works (DPW) may determine that additional traffic studies are required if the DPW determines that the proposed project is not in substantial conformance with the most recent traffic study for the project area. Notwithstanding the North Irvine Transportation Mitigation requirement that only an Interim Year analysis is required for Map level traffic studies, the applicant shall conduct an Interim, Long Term, and Buildout analysis for the required traffic study.
- G. *Review process.* Prior to the commencement of any private development in the 1.5 Recreation, 2.2 Low Density Residential, 3.2 Transit Oriented Development, 8.1 and 8.1A Lifelong Learning District or 6.1 Institutional zoning districts within the Planning Area 51, the Planning Commission shall review and approve a master plan, containing the following information:
 - 1. Location, acreage, types of land use and estimated square footages or number of dwelling units for each area within the zoning district.
 - 2. A community design program, which characterizes the design features of the development, including signage design, fencing design, landscape themes, architectural theme, and other community design features.
 - 3. Landscape treatments, consistent with the Orange County Great Park Streetscape Plan, including:
 - a. Planning Area edge and entry widths and general character
 - b. Special landscaping themes, if any.
 - c. Palette of plant materials, walls, and hardscape for areas in and adjacent to the public rights-of-way.
 - d. Ownership of landscape areas.
 - 4. Wildlife corridor edge condition treatments, consistent with the Irvine Wildlife Corridor Plan, including:
 - a. Light and noise mitigation programs and techniques.
 - b. Palette of compatible plant materials.

- c. Walls, fences, and/or barrier mechanisms to protect the wildlife corridor from unwanted intrusions.
 - 5. Existing and planned uses on adjoining properties and transition from surrounding areas to the mixed use Transit Oriented Development and Lifelong Learning District.
 - 6. Access to the project site and on-site pedestrian, bicycle and vehicular patterns.
 - 7. Other information as required by Chapter 2-17 or the Director of Community Development. The application for said master plan shall be accompanied by maps, text, or other documentation to satisfy the above requirements. The form and content of such submittals shall be made to the satisfaction of the Director of Community Development.
- H. *Changes in boundaries and/or intensities.*
- 1. Boundaries and acreages in the Orange County Great Park plan are approximate and shall be established by master plan approval (G above).
 - 2. The Statistical Analysis (Section 9-51-3) shall be administratively adjusted to reflect the allocation of Transit Oriented Development intensity and any transfer of residential density in the overlay zone following Planning Commission approval of a master plan (B and G above).
 - 3. The trip budget for the Planning Area may be increased by ten percent, subject to the transfer provisions of D above.
- I. *Reuse of existing facilities.* The former MCAS El Toro site has a number of facilities suitable for civilian reuse, including barracks, recreational facilities, golf course, warehouses, hangars, and commercial facilities. The zoning accommodates a number of these existing facilities, encouraging adaptive reuse wherever possible. Some existing facilities can possibly be adapted for civilian use on a long-term, permanent basis; others can serve interim uses during development of the site.

Following is a summary of the existing on the base and their potential for reuse. Prior to the issuance of occupancy permits for any existing structure, a fire life-safety evaluation of the structure, including recommendations for improvements required for compliance with current Building Codes adopted by the City for the use of existing structures, and plans for any required improvements shall be submitted to the Chief Building Official for review and approval.

- 1. *Residential.* Individual single-family and multi-family residential units appropriate for temporary reuse are generally located north of Irvine Boulevard. Permanent reuse may require substantial renovation.
- 2. *Barracks.* Twenty-five barracks in varying degrees of condition are located on the former MCAS El Toro. Most of the structures need substantial renovation or are condemned due to earthquake damage. Some barracks structures could be appropriate for reuse as student dormitory housing related to the education campus.
- 3. *Recreational facilities.* The recreational facilities on the base appropriate for reuse include two swimming pools, indoor racquetball courts, indoor handball courts, a gymnasium, a bowling alley, a golf course with club house, riding stables, and various playing fields.
- 4. *Equestrian center.* The equestrian center south of Irvine Boulevard could be appropriate for civilian reuse and linked to other open space areas with the Orange County Great Park. Should equestrian uses be pursued, the developer

will be required to provide trail connections to regional riding/hiking trails, consistent with the Orange County Great Park Streetscape Plan.

5. *Hangars.* Aviation hangars located in the southern portion of Planning Area 51 could be appropriate for reuse as warehousing, manufacturing, or motion picture production studios. Close proximity to the permanent open space areas may also facilitate reuse of the hangars as museum, sports, cultural facilities, or other uses consistent with the zoning of the site.

- J. *Recycling operations.* Existing runways are located on a substantial portion of the site planned for open space and related uses. Runways, aprons, and associated taxiways exist on the site reflecting its prior usage as a Marine Corps air station. In order to use the site for urban purposes, the runways must be removed. Concrete and asphalt from the runways will be crushed and then used as aggregate base or recycled for other roadway uses.

The runways will be removed in a sequential manner. The removal of most, if not all, of the runway paving is anticipated. Some portion of runway may be preserved for use as playing surfaces and parking areas or for historic purposes. Demolition of the runways may occur either in a single effort or may occur in conjunction with the phasing program to be developed as part of the park development plan. Stockpiled material will be placed in designated areas and distributed as required to provide aggregate for development projects. Once the material has been used, the land will become available for development. Concrete recycling facilities and stockpiling of demolished or recycled material are considered an appropriate interim land use, subject to the approval of a conditional use permit.

- K. *Senior housing.* The 800 residential units developed within the Lifelong Learning district in the overlay plan shall be age restricted housing with the minimum age of the principal occupant of any dwelling unit required to be 55 years of age or older.
- L. *Trails plan.* In conjunction with the submittal of the master tract map the applicant shall submit a conceptual master landscape and trails plan or a detailed exhibit depicting potential trail connections on site to the City's existing or planned regional trail network.

In addition, in conjunction with subsequent tract maps, master plans or building permit submittals, whichever comes first, the applicant shall provide a specific and detailed trails plan depicting the exact location, alignment and connectivity of on-site trails to the City's existing or planned regional trail network.

- M. *Child care.* The need for child care facilities shall be recognized in the development of Heritage Fields. Prior to the approval of the first residential tentative tract map that causes the total combined approved residential dwelling units, excluding senior housing units, to reach 1,400 in Planning Areas 30 and 51, the developer shall submit a child care needs study to the Director of Community Services for approval. Based on the presumption that generally need for private child care facilities will be triggered at 3,500 dwelling units (units with children), the purpose of the study will be to identify any unmet need for child care as a result of residential development within Planning Areas 30 and 51. Upon approval of the Study by the Director of Community Services which demonstrates that an unmet need exists, the developer shall identify

ways to provide unmet private child care needs. Any private sector child care center(s) shall:

1. Accommodate the determined number of slots, which shall be based on the actual number of residential units to be built and on a determination of child care need within the project.
2. Be located at a site that is compatible with adjacent uses. Development of a child care center in conjunction with proposed elementary schools and public neighborhood parks, residential development and/or neighborhood commercial center shall be encouraged.
3. Be located at a site that has been evaluated with regard to factors that might be detrimental to public health, safety, or welfare, including but not limited to proximity to high-traffic volume roadways, hazardous material, and major generators of traffic.
4. Be a minimum site size for the child care center, which is 1.3 acres and accommodates a minimum of 150 children, per the Table G-2 of the City's General Plan, although larger sites are encouraged to accommodate larger number of children.

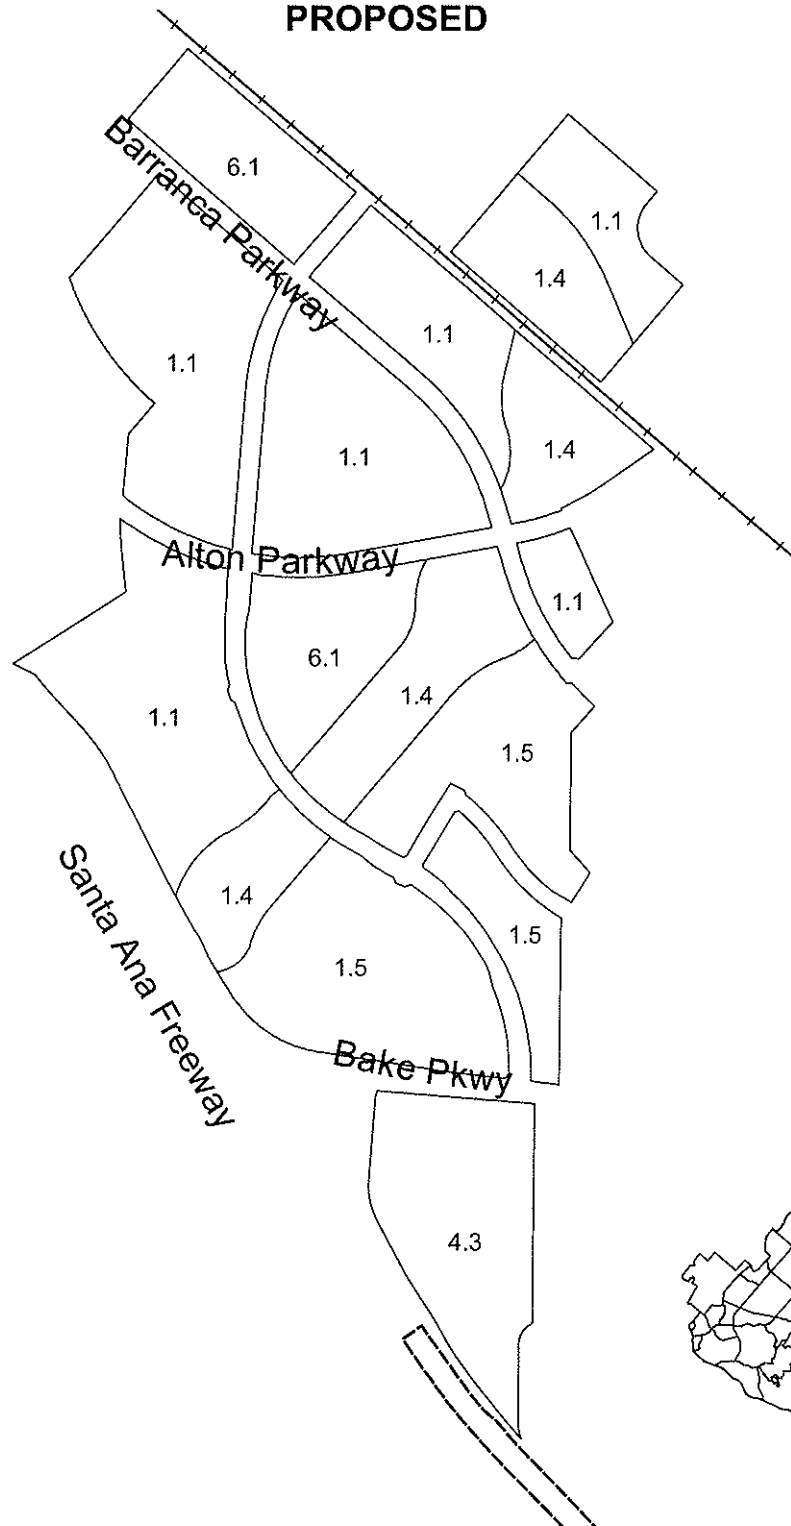

(Ord. No. 00-03, § 4, 2-22-00; Ord. No. 03-18, § 4, 6-10-03; Ord. No. 06-18, § 4, 10-24-06)

Editor's note: Ord. No. 03-18, § 4, adopted June 10, 2003, amended the Code by repealing former § 9-51-6 and renumbering § 9-51-7 as § 9-51-6. Former § 9-51-6 pertained to planning area sectors, and derived from Ord. No. 00-03, adopted February 22, 2000.

**ORANGE COUNTY GREAT PARK
FINAL EIR (FEIR)
CITY OF IRVINE
MITIGATION MONITORING AND REPORTING PROGRAM CHECKLIST**

1.0 INTRODUCTION

Section 21081.6 to the State of California Public Resources Code requires a lead or responsible agency that approves or carries out a project where an environmental impact report (EIR) has identified significant environmental effects to adopt a “reporting or monitoring program for adopted or required changes to mitigate or avoid significant environmental effects.” The City of Irvine is the lead agency for the Great Park Plan EIR, and therefore is responsible for implementation of the mitigation monitoring program. An EIR has been prepared for this project which addresses potential environmental impacts and, where appropriate, recommends measures to mitigate these impacts. As such, a mitigation reporting or monitoring program is required to ensure that adopted mitigation measures are implemented.

The project is located in the center of Orange County and includes land within the City or Irvine as well as unincorporated area. The project area encompasses approximately 4,701 acres, or 7.5 square miles. The total area proposed for annexation is 4,287 acres.

The project area is bounded by the City of Lake Forest to the south and southeast, the City of Irvine to the west and southwest, and the County of Orange to the north. The former MCAS El Toro is generally located north of the Santa Ana (I-5) Freeway, east of the Eastern Transportation Corridor (SR-133), and south of the Foothill Transportation Corridor (SR-241). Major roadways bordering the project area include Barranca Parkway to the south, Sand Canyon Avenue to the west, Portola Parkway and Irvine Boulevard to the north, and Alton Parkway to the east. The James A. Musick Jail Facility is located on a 105-acre site northwest of existing Bake Parkway and east of the future extension of Alton Parkway. The northern boundary of the Musick Jail abuts the former MCAS El Toro. Existing buildings of the Irvine Spectrum abut the Musick Jail site to the west/southwest. An eight-acre parcel west of the Musick Jail contains the IRWD East Irvine Pumping Station, Zone III 5-million gallon potable water reservoir, and a 7-million gallon potable water reservoir.

The project consists of the following actions: 1) Annexation, General Plan Amendment, Pre-Zoning (prior to annexation), and Zoning of the unincorporated portion of Planning Area 51; 2) Annexation of the unincorporated portion of Planning Area 35 (the Irvine Ranch Water District Parcel); 3) General Plan Amendment and Zone Change for Planning Area 30 with is presently in the City of Irvine; and, 4) Approval in the form of a Development Agreement vesting approval of higher intensity overlay uses in consideration of dedication of land for public purposes and for funding certain infrastructure improvements and maintenance of the public uses by the

purchaser/developer and subsequent landowners and funds for specified park, roadways, and other circulation facilities and infrastructure. The proposed project also includes the dedication of approximately 21 acres to be used for the Jeffrey Pine Open Space Spine (JOSS). The JOSS acreage will serve as a connector to the regional open space system and will provide recreational opportunities in the Northern Sphere.

2.0 PROGRAM MANAGEMENT

The mitigation monitoring and reporting program (MMRP) for the Great Park Plan will be in place through all phases of project approval. Enforcement of the MMRP will be the responsibility of a Project Manager (PM) at the City of Irvine.

2.1 Roles and Responsibilities: Project Manager

The role is assigned by the Community Development Director. The PM assigned to the proposed project will supervise the MMRP during design, construction, and operation of the project and is responsible for the overall management of the MMRP. The PM is thoroughly familiar with the project and qualified to determine if an adopted measure is being properly implemented. The PM oversees the MMRP and reviews the Reporting and Implementation (R&I) Forms to ensure they are filled out correctly and proper action is being taken on each measure. The PM and/or an assignee will also be responsible for the filling and updating of the R&I Forms during all phases of the project. The PM will determine the need for a measure to be modified and ensure the use of a mitigation specialist if technical expertise beyond the PM's is required. If it is found that an adopted mitigation measure is not being properly implemented, the PM will require corrective actions to ensure adequate implementation. The responsibilities of the PM include the following:

1. An MMRP Reporting Form will be prepared for each potential significant impact and its corresponding mitigation, as identified in the list of significant impacts and mitigation measures attached hereto.
2. Appropriate specialists will be retained, as needed, to monitor specific mitigation activities and provide appropriate written approvals to the PM.
3. The PM and/or an assignee will approve, by signature and date, the completion of each action item that was identified on the MMRP Reporting Form.
4. All MMRP Reporting Forms for an impact issue requiring no further monitoring will be signed off as completed by the PM and/or an assignee at the bottom of the MMRP Reporting Form.

5. Unanticipated circumstances may arise requiring the refinement or addition of mitigation measures. The PM is responsible for approving any such refinements or additions. An MMRP Reporting Form will be completed by the PM and/or an assignee. The completed form will be provided to the appropriate design, construction, or operational personnel.
6. The PM has the authority to stop the work of construction contractors if compliance with any aspects of the MMRP is not occurring after written notification has been issued. The PM also has authority to hold certificates of occupancies if compliance with a mitigation measure attached herein is not occurring. The PM also has authority to hold the issuance of a building permit until all mitigation measures are implemented. Should the applicant/contractor disagree with the findings and actions of the PM, an appeal to the Community Development Director can be submitted.

2.2 General Procedures

MMRP Program Definitions

The MMRP consists of key program elements. The elements are summarized below.

MMRP Files

Files are established to document and retain records of the MMO. The file organization is established by the PM according to mitigation measures and project phases.

R&I Forms

R&I Forms are designed to record the monitoring activity in a consistent manner with appropriate approvals. The R&I Forms are placed in the MMRP files.

Environmental Compliance Verification

At the completion of construction contracts that are part of the overall development of the project, a verification of environmental compliance is executed by the PM. The verification concludes the construction monitoring process for the contract.

Mitigation Monitoring and Reporting Program Procedures

The policies and procedures for the MMRP described herein are intended to provide focused, yet flexible guidelines for monitoring the implementation of the mitigation measures discussed in the final EIR. The Mitigation Monitoring and Reporting Checklist lists each mitigation measure, the method of verification for each mitigation measure, and the party responsible for monitoring efforts. The Mitigation Monitoring and Reporting Checklist also provides the PM a verification of compliance for each mitigation measure during each applicable phase of the project. An R&I form is prepared for each potential significant impact and its corresponding mitigation measure. After each measure is

verified for compliance, no further action is required for the specific phase. The PM shall initial and date the measure on Mitigation Monitoring and Reporting Checklist.

Disposition of Monitoring Forms

All actions and completed R&I Forms are kept in the MMRP file with the City of Irvine during the pre-design, design, construction, and operational phases of the project. Reports will be available from the city upon request at the following address:

City of Irvine (Lead Agency)
Community Development Department
One Civic Center Plaza
Irvine, California 92623-9575

MITIGATION MONITORING AND REPORTING PROGRAM

ORANGE COUNTY GREAT PARK

NO.	MITIGATION MEASURE	METHOD OF VERIFICATION	TIMING OF VERIFICATION	RESPONSIBLE PERSON	DATE OF COMPLETION/ INITIALS
5.1 LAND USE (Base Plan and Overlay Plan)					
	No mitigation measures are required.				
5.2 TRAFFIC/CIRCULATION (Base Plan and Overlay Plan)					
TRAN1	<p>Prior to the approval of any final map (other than a financing and conveyance map) within the Great Park project, and prior to issuances of any building permits for permanent improvements within the Great Park property, the landowner or subsequent project applicant shall apply for annexation of any areas within the final map to the Irvine Spectrum Transportation Management Association (TMA) ("Spectrumotion") in accordance with Article X of the recorded Declaration of Covenants, Conditions and Restrictions (CC&Rs) for the Irvine Spectrum TMA, including any supplementary or amended CC&Rs. The primary purpose of this mitigation measure is to reduce traffic, air quality and noise impacts. Should annexation into Spectrumotion not be approved, the landowner or subsequent project applicant shall develop and implement a similar transportation management plan containing the elements and meeting the criteria described below:</p> <p>Transportation Management Plan (TMP)</p> <p>The development and implementation of a Transportation Management Plan is an identified mitigation measure to manage transportation access for the Great Park Project. This document summarizes the key elements of the TMP.</p>	<p>Requires submittal of annexation plans by project applicant in accordance with the Irvine Spectrum TMA. Failure to obtain approval of such plans requires project applicant to develop and implement a TMP as described in TRAN1.</p>	<p>Prior to the approval of any final map (other than a financing and conveyance map) within the Great Park project, and prior to issuances of any building permits for permanent improvements within the Great Park property.</p>	<p>Director of Community Development or designee.</p>	

NO.	MITIGATION MEASURE	METHOD OF VERIFICATION	TIMING OF VERIFICATION	RESPONSIBLE PERSON	DATE OF COMPLETION/ INITIALS
	<p>1.0 Introduction</p> <p>The purpose of this document is to provide an outline for a comprehensive TMP for the Great Park. This report is not intended to provide the specific details of the plan, but rather to highlight the key components and provide direction for subsequent detailed planning and implementation activities. When preparation of the TMP is undertaken, all of the agency and stakeholders will be invited to provide input.</p> <p>It is the intent to annex Planning Area 51 and a portion of Planning Area 35 into the Irvine Spectrum Transportation Management Association (Spectrumotion). Spectrumotion is a private, non-profit Transportation Management Association (TMA) formed to reduce traffic congestion in Irvine Spectrum. Spectrumotion promotes, markets, and subsidizes alternatives to solo-commuting and assists the business community in complying with trip reduction related requirements. Membership is mandatory to property owners with deed restrictions requiring participation in the TMA. Membership dues provide the funding for the Association and its programs, which offer a variety of employer and commuter services focused on reducing vehicular trip generation.</p> <p>In the event that annexation of PAs 51 and 35 into Spectrumotion is not approved, a TMP similar to that provided by Spectrumotion will be implemented. This document sets forth the components of the TMP should it be necessary.</p> <p>2.0 Transportation Management Plan Framework</p> <p>The key elements of the Great Park TMP are set forth below:</p> <p>New Hire Orientation: Inform newly hired employees of commuting services available to them.</p>				

NO.	MITIGATION MEASURE	METHOD OF VERIFICATION	TIMING OF VERIFICATION	RESPONSIBLE PERSON	DATE OF COMPLETION/ INITIALS
	<p>Public Transportation Pass Sales: Provide a central location for purchase of passes to available transit services ((i.e., OCTA buses, Metrolink, Amtrak, etc.).</p> <p>Vanpool and Carpool Formation Assistance: Perform all of the administrative work necessary to establish van pools and car pools.</p> <p>On-site Promotions: Hold rideshare promotions at work sites and assist in employer assistance promotions.</p> <p>Telecommuting/Alternative Work Schedule Consulting: Assist employers in developing and implementing a telecommuting or alternative work schedule program.</p> <p>Personalized Commute Consulting: Provide a personalized commute profile to any commuter, which includes carpool match list containing the names of other commuters in the North Irvine Sphere that live and work near each other.</p> <p>Website: Maintain a website with all of their program information available.</p> <p>Rideshare Promotions: Conduct high visibility rideshare promotions as a means to advertise its services.</p> <p>Subsidies: To the extent financially feasible, offer subsidies to assist in the formation of vanpools, the formation of carpools, and to encourage the trying of transit services.</p> <p>Public Agency Coordination: Work closely with various public and quasi-public agencies to improve bus and commuter rail service to the Spectrum and North Irvine Sphere areas.</p>				

NO.	MITIGATION MEASURE	METHOD OF VERIFICATION	TIMING OF VERIFICATION	RESPONSIBLE PERSON	DATE OF COMPLETION/ INITIALS
	3.0 Transportation Management Plan Implementation As part of the TMP, a process will be established to monitor its effectiveness in reducing peak hour trip generation in the Great Park. Provision shall be made for the Plan to be modified as appropriate to enhance its effectiveness.				
TRAN2	Prior to the issuance of the first building permit, City shall establish, and the landowner or subsequent project applicant shall commit to participate in, a transportation system/infrastructure fee program to fund improvements identified as mitigation measures listed in Tables 5.2-16 and 5.2-17 of the OCGP FEIR.	Requires contractual agreement between the City of Irvine and project applicant to fund improvement listed in the EIR.	Prior to the issuance of the first building permit.	Director of Community Development or designee.	
TRAN3	Prior to issuance of any building permits for permanent improvements within Planning Areas 30 and 51, the landowner or subsequent project applicant shall implement or contribute its percentage funding responsibility for traffic improvements as identified in the NITM Ordinance.	Requires contractual agreement between the City of Irvine and project applicant to fund improvement listed in the EIR.	Prior to issuance of any building permits for permanent improvements in the project area.	Director of Community Development or designee.	
TRAN4	Prior to approval of each Master Tentative Map or equivalent, the landowner or subsequent project applicant shall prepare, subject to City review and approval, an updated traffic study consistent with the City of Irvine Traffic Study Guidelines inclusive of a phasing plan for traffic improvements associated with the subject Master Tentative Map. The phasing plan will specify the timing, funding, construction, and responsibilities for all traffic improvements identified in the updated traffic study. The updated traffic study will determine whether any additional or alternative traffic improvements are necessary based on updated traffic forecasts. The updated traffic study will evaluate the cumulative impact of the subject map and all previously approved or concurrently submitted maps. The methodology for the study area, applicable land use and circulation modifications, and standards for assessing and mitigating impacts employed in the updated traffic study shall be consistent with a City approved traffic study scope of work. The landowner or subsequent project applicant shall construct, bond for, or enter into a funding agreement for necessary	Requires the separate submission of updated traffic study developed in accordance with City of Irvine Traffic Study Guidelines.	Prior to the approval of each Master Tentative Map or equivalent document.	Director of Community Development or designee.	

NO.	MITIGATION MEASURE	METHOD OF VERIFICATION	TIMING OF VERIFICATION	RESPONSIBLE PERSON	DATE OF COMPLETION/ INITIALS
	<p>improvements identified in the updated traffic study and/or participate in the City fee program (Tran 2 above) to the extent that the improvements identified in the updated traffic study are listed in Tables 5.2-16 and 5.2-17 of the OCGP FEIR.</p> <p>Traffic signals that are on-site or directly related to the Great Park development will be installed as warranted through the mitigation implementation plan process.</p>				
TRAN5	<p>In conjunction with the preparation of any updated traffic study as required in Mitigation Measure Tran 4 for each master tentative map or equivalent, and assuming that a regional transportation agency has not already programmed and funded the warranted improvements to the impacted freeway mainline or freeway/tollway ramp locations in conjunctions with fulfilling its regional role, the landowner or subsequent project applicant and the City will take the following actions:</p> <ol style="list-style-type: none"> 1. The City shall ensure that the updated traffic study identifies the project's proportionate impact on the specific freeway mainline and/or freeway-tollway ramp locations and its percentage responsibility for mitigating these impacts (assuming tolled conditions on the Transportation Corridors) based on thresholds of significance, performance standards and methodologies used in the OCGP FEIR and established in the Orange County Congestion Management Program and City of Irvine Traffic Study Guidelines. 2. The City shall estimate the cost of the project's percentage responsibility in cooperation with Caltrans and the Transportation Corridor Agency. 3. The landowner or subsequent project applicant shall enter into an agreement with the City prior to recordation of the first final map for each Master Tentative Map or equivalent to establish the method 	Requires the separate submission of updated traffic study developed in accordance with City of Irvine Traffic Study Guidelines.	Prior to the approval of each Master Tentative Map or equivalent document.	Director of Community Development or designee.	

NO.	MITIGATION MEASURE	METHOD OF VERIFICATION	TIMING OF VERIFICATION	RESPONSIBLE PERSON	DATE OF COMPLETION/ INITIALS
	and timing of payment of the identified percentage responsibility. 4. The City shall allocate landowner or subsequent project applicant's percentage contribution to traffic improvements that result in improved traffic flow on the impacted mainline and ramp locations, including but not limited to construction of physical or operational improvements, contributions to mandated trip reduction or transit programs, or funding participation in a regional transportation improvement fee program, if adopted.				
TRAN6	The project shall mitigate to insignificant levels all project impacts at significantly impacted study area intersections. Tables 5.2-16 and 5.2-17 in the OCGP FEIR show the mitigation program for each phase. With regard to impacts that require improvements in other jurisdictions, the City of Irvine shall cooperate with the affected jurisdiction to ensure that the improvements are constructed in a timely manner.	Requires the separate submission of updated traffic study developed in accordance with City of Irvine Traffic Study Guidelines. May require additional documentation and/or submission to other jurisdictions, depending on location of proposed improvement.	Prior to the approval of each Master Tentative Map or equivalent document.	Director of Community Development or designee.	
TRAN7	Assuming that a regional transportation agency has not already programmed and funded the improvements, the City of Irvine shall coordinate with Caltrans and the Transportation Corridor Agencies, and submit for their approval, proposed plans for modifications to the state highway system and the transportation corridors, as required to provide ramp connections to Trabuco Road. If needed, the City shall prepare a Project Study Report, a New Connection Request, and a Detailed Traffic Revenue Study for review by Caltrans and the Transportation Corridor Agency for the proposed connection of Trabuco Road to the Eastern Transportation Corridor. The City shall perform toll and revenue impact	Requires the development and submission of a Project Study Report, a New Connection Request, and a Detailed Traffic Revenue Study by the City of Irvine.	Prior to the approval of each Master Tentative Map or equivalent document.	Director of Community Development for submission to Caltrans and potentially effected TCA's.	

NO.	MITIGATION MEASURE	METHOD OF VERIFICATION	TIMING OF VERIFICATION	RESPONSIBLE PERSON	DATE OF COMPLETION/ INITIALS
	studies for any mitigation measure (improvement) that may be impacted by the non-compete clause or any similar agreement restricting a public agency's authority to construct improvement.				
TRAN8	Following adoption of a land use plan and circulation plan for the Great Park property and before the issuance of any building permits within the base property, the City of Irvine shall enter into a cooperative study with OCTA and other affected jurisdictions to amend the Orange County Master Plan of Arterial Highways (MPAH). Marine Way, Trabuco Road from the SR-133 tollway to College Road, and Y Street should be included on the MPAH.	Requires cooperate study and subsequent amendment to Orange County Master Plan of Arterial Highways.	Following adoption of a land use plan and circulation plan for the project site and before the issuance of any building permits.	Director of Community Development, OCTA, and other affected jurisdictions.	
5.3 AIR QUALITY (Base Plan and Overlay Plan)					
AQ1	Prior to the start of demolition and construction within the project area, adjacent sensitive receptors shall be informed of the planned demolition and construction activities. Measures to avoid significantly impacting these receptors shall be developed and implemented by the project proponent in coordination with these uses. Other applicable mitigation measures such as erection of fences around construction areas; staggered use of equipment near sensitive receptors; diversion of truck trips away from receptors; etc.; shall be employed as necessary. Compliance with this measure shall be verified by the Director of Community Development.	Requires written notification to potentially affected sensitive receptors (residents and landowners).	Prior to the start of demolition and construction within the project area.	Director of Community Development or designee.	
AQ2	Prior to the commencement of construction activities required to demolish and/or remove existing DON structures, including runways, the Director of Community Development shall receive and approve a construction emissions mitigation plan from the chosen demolition contractor. Prior to the issuance of grading permits, the applicant of any future development project shall submit, and the Director of Community Development shall approve a construction emissions mitigation plan. The plan shall identify implementation procedures for each of the following emissions reduction measures and all feasible mitigation measures shall be implemented. If certain	Requires the development, submission, and approval of a construction emissions mitigation plan by project applicant.	Prior to the start of demolition and construction within the project area.	Director of Community Development or designee.	

NO.	MITIGATION MEASURE	METHOD OF VERIFICATION	TIMING OF VERIFICATION	RESPONSIBLE PERSON	DATE OF COMPLETION/ INITIALS
	<p>measures are determined infeasible, an explanation thereof shall be provided.</p> <p>X Evaluate the availability and use, if available, of low-emission (i.e., methanol- or natural gas-powered) construction equipment instead of diesel for each construction phase.</p> <p>X Water exposed soils at least twice daily and maintain equipment and vehicle engines in good condition and in proper tune.</p> <p>X Wash off trucks leaving the site.</p> <p>X Replace ground cover on construction sites when it is determined that the site will be undisturbed for lengthy periods.</p> <p>X Reduce speeds on unpaved roads to less than 15 miles per hour.</p> <p>X Halt all grading and excavation operations when wind speeds exceed 25 miles per hour.</p> <p>X Suspend all emission generating activities during smog alerts.</p> <p>X Use propane- or butane-powered on-site mobile equipment instead of diesel/gasoline, whenever feasible.</p> <p>X Properly maintain diesel-powered on-site mobile equipment.</p> <p>X Sweep streets at the end of the day if substantial visible soil material is carried over to the adjacent streets.</p> <p>X Use electricity from power poles rather than temporary on-site diesel- or gasoline-powered generators, whenever feasible.</p> <p>X Use of low-VOC asphalt.</p> <p>X Cover all trucks hauling dirt, sand, soil or other loose material to and from the site.</p> <p>X Provide temporary traffic controls (e.g., flag persons) during all phases of construction to ensure minimum disruption of traffic.</p> <p>X Schedule construction activities that affect traffic flow on</p>				

NO.	MITIGATION MEASURE	METHOD OF VERIFICATION	TIMING OF VERIFICATION	RESPONSIBLE PERSON	DATE OF COMPLETION/ INITIALS
	adjoining streets to off-peak hours to the extent possible. X Reroute construction trucks away from congested streets, whenever feasible. X Provide dedicated turn lanes for movement of construction trucks and equipment on- and off-site, whenever feasible.				
AQ3	<p>Prior to the issuance of building permits for any future development, the applicant shall submit, and the Director of Community Development shall have approved, an operation-emissions mitigation plan. The plan shall identify implementation procedures for each of the following emissions reduction measures and all feasible mitigation measures shall be implemented. If certain measures are determined infeasible, an explanation thereof shall be provided.</p> <p>X Utilize built-in energy-efficient appliances to reduce energy consumption and emissions.</p> <p>X Utilize energy-efficient and automated controls for air conditioners and lighting to reduce electricity consumption and associated emissions.</p> <p>X Install special sunlight-filtering window coatings or double-paned windows to reduce thermal loss, whenever feasible.</p> <p>X Utilize light-colored roofing materials as opposed to dark roofing materials to conserve electrical energy for air-conditioning.</p> <p>X Provide shade trees in residential subdivisions as well as public areas, including parks, to reduce building heating and cooling needs, whenever feasible.</p> <p>X Ensure that whenever feasible, commercial truck traffic is diverted from local roadways to off-peak periods.</p> <p>X Centralize space heating and cooling for multiple-family dwelling units and commercial space.</p> <p>X Orient buildings north/south for reducing energy-related combustion emissions.</p> <p>X Use solar energy, when feasible.</p> <p>X Use high rating insulation in walls and ceilings.</p>	Requires the development, submission, and approval of an operation-emissions mitigation plan by project applicant.	Prior to the issuance of building permits within the project area.	Director of Community Development or designee.	
AQ4	At the time of residential and commercial lease and sales	Requires written	On-going (at the	Director of

	agreements, future sales information on available housing and employment opportunities within the project area shall be provided to employees and residents of the project area, so as to encourage employees to live within the residential developments planned on-site and future residents to find employment nearby.	notification to employees and residents within the project area.	time of residential and commercial lease and sales agreements).	Community Development or designee.	
AQ5	At the time of residential and commercial lease and sales agreements, the applicant shall demonstrate to the satisfaction of the Director of Community Development that future employment generating non-residential development shall include measures to reduce vehicle trips including carpool incentives, easy access to public transit systems, trail linkages between uses, low-emissions vehicle fleets, and the provision of on-site facilities such as banking and food courts, and bicycle parking facilities, and other transportation demand management measures, as deemed appropriate.	Requires submission of potential measures to reduce vehicle trips, as identified in AQ5.	On-going (prior, during and upon completion of development of the project area).	Director of Community Development or designee.	
5.4 NOISE (Base Plan and Overlay Plan)					
	No mitigation measures are required.				
5.5 PUBLIC HEALTH AND SAFETY (Base Plan and Overlay Plan)					
HH1	<p>a. Prior to the conveyance of the property and issuance of subsequent grading permits, where the presence of ACMs is identified, the DON or its transference shall ensure that all available information concerning ACMs has been provided to the City of Irvine, and the purchasers of the property, including:</p> <p>X The type, location and condition of ACMs</p> <p>X The results of any asbestos testing</p> <p>X Description of asbestos control measures taken, if any</p> <p>X The costs or time necessary to remove existing ACMs</p> <p>X The results of any site-specific asbestos inventory updates</p>	Requires submission of Record of Decision (ROD) or similar applicable federal/state documentation to verify information provided to the City of Irvine by the DON.	Prior to the conveyance of the former MCAS El Toro property; prior to the occupation of existing structures on the former MCAS El Toro property.	Manager of Building and Safety; Director of Community Development.	

NO.	MITIGATION MEASURE	METHOD OF VERIFICATION	TIMING OF VERIFICATION	RESPONSIBLE PERSON	DATE OF COMPLETION/ INITIALS
	<p>b. For any structures known to contain ACMs that will be renovated and/or demolished prior to transfer, the DON shall ensure that all asbestos is removed and disposed of in accordance with applicable federal, state and local regulatory requirements.</p> <p>c. Prior to transfer of any structure constructed before October 1988, scheduled for renovation and/or demolition, and in which the presence of ACMs is unknown, an asbestos survey shall be conducted by the DON. This requirement can be waived if an architect or project engineer responsible for the construction of the structure or an accredited asbestos inspector signs a statement that no ACM was specified as a building material, and to the best of their knowledge, no ACMs were used as a building material.</p> <p>d. Any existing structures in which ACMs have been identified and which will remain in use shall be addressed in an Operation and Maintenance Plan and must be managed in accordance with applicable laws.</p> <p>e. Any renovation and/or LBP abatement activities on residential units at former MCAS El Toro shall be conducted in accordance with all applicable federal, state and local regulatory requirements.</p>				
HH2	a. Prior to transfer, the City of Irvine shall receive from the DON, with the concurrence of the appropriate regulatory agencies, a statement that the "Action Required" IRP Site 3 is to be conveyed for restricted use and that all institutional controls have been identified and implemented. The City of Irvine will adopt appropriate rules, policies, and regulations	Requires submission of Record of Decision (ROD) or similar applicable federal/state documentation to	Prior to the conveyance of the former MCAS El Toro property; prior to the use of Locations of Concern on the	Manager of Building and Safety; Director of Community Development; City Council.	

NO.	MITIGATION MEASURE	METHOD OF VERIFICATION	TIMING OF VERIFICATION	RESPONSIBLE PERSON	DATE OF COMPLETION/ INITIALS
	<p>necessary to avoid actions that compromise the integrity of the remediated sites and that uphold the institutional controls. The actions of the City of Irvine shall be in accordance with the General Development Standards for the zone, which requires the Planning Commission to approve a master plan for the entire Planning Area indicating location, acreage, and types of land use within the Planning Area. As stated under Sec. 9-51-5 General Development Standards, boundaries and acreages are approximate and shall be established by master plan approval.</p> <p>b. Prior to transfer, if the DON chooses to impose temporary restrictions on the use of Sites 16 and 24 pending adequate remediation of groundwater, the City of Irvine shall receive from the DON a statement of temporary restrictions on the use of the sites and the release of the sites for restricted use following implementation of adequate remediation of groundwater. The City of Irvine shall adopt appropriate rules, policies, and regulations necessary to avoid actions that compromise the integrity of the remediated sites and that uphold the institutional controls. The actions of the City of Irvine shall be in accordance with the General Development Standards for the zone, which requires the Planning Commission to approve a master plan for the entire Planning Area indicating location, acreage, and types of land use within the Planning Area. As stated under Sec. 9-51-5 General Development Standards, boundaries and acreages are approximate and shall be established by master plan approval.</p>	verify information provided to the City of Irvine by the DON.	former MCAS El Toro property.		
HH3	The Community Development Department, in coordination with the Orange County Fire Authority (OCFA), will be responsible for review of all development plans, which would include evaluation of very high fire severity zones, special fire protection plans, and any requirements for fuel modification	Requires submission of development plans by potential project applicants for review	Prior to the approval of development plans.	Manager of Building and Safety ; Orange County Fire Authority.	

NO.	MITIGATION MEASURE	METHOD OF VERIFICATION	TIMING OF VERIFICATION	RESPONSIBLE PERSON	DATE OF COMPLETION/ INITIALS
	zones. Projects potentially impacted by wildland fire hazards will be subject to OCFA Guidelines for "Development Within and Exclusion from Very High Fire Severity Zones" and "Fuel Modification Plans and Maintenance." Additionally, all demolition, renovation, and construction activities in the project area will be subject to review by OCFA to ensure adequate fire protection, water flow, emergency access, design features, etc., according to the standards of the Uniform Fire Code and the California Fire Code. Due to the implementation of these standard fire protection procedures, the proposed project is not anticipated to result in significant short- or long-term adverse impacts related to fire hazards.	and approval.			
HH4	Prior to issuance of occupancy permits of any existing structure at the former MCAS El Toro, a fire life-safety evaluation of the structure including recommendations for improvements required for compliance with current Building Codes for use of existing structures adopted by the City of Irvine and plans for any required improvements shall be submitted to the Chief Building Official for review and approval.	Requires submission of development plans for existing structures for review and approval of required improvements.	Prior to the occupation of existing structures located on the former MCAS El Toro property.	Manager of Building and Safety; Orange County Fire Authority.	
HH5	Prior to the issuance of a grading permit, the applicant shall prepare and the Director of Community Development shall approve a protocol plan (including but not limited to worker training, health and safety precautions, additional testing requirements, and emergency notification procedures) in the event of unknown hazardous materials are discovered during grading, construction, and/or related development activities. Additionally, said protocol plan will be revised should the discovery of previously unknown hazardous materials be made during any of the above mentioned development activities. The applicant and/or property owner that discovers contamination due to past military operations not previously identified by the DON shall be responsible for notifying the DON, appropriate regulatory agencies, and the Director of Community Development of the City of Irvine in a timely manner. Additionally, said protocol plan shall be revised should the discovery of previously unknown hazardous	Requires the development, submission, and approval of a protocol plan by the potential project applicant.	On-going (prior to the issuance of a grading permit within the project area; in the event of the discovery of unknown hazardous materials).	Director of Community Development or designee; the DON.	

NO.	MITIGATION MEASURE	METHOD OF VERIFICATION	TIMING OF VERIFICATION	RESPONSIBLE PERSON	DATE OF COMPLETION/ INITIALS
	materials be made during any of the above mentioned development activities.				
HH6	The City of Irvine shall develop and maintain the location and status, as well as other pertinent information, of all monitoring wells located on the former MCAS El Toro in a geographic information systems database (GIS). The City will review all permit applications on the former air station for monitoring well locations that may be affected by a permit, and require applicants to maintain appropriate access. Access to monitoring wells will be limited to authorized personnel.	Requires the development and maintenance of a GIS database by the City of Irvine.	On-going (prior to the issuance of grading permits; during construction activities).	Department of Public Works.	
4.6 GEOLOGY AND SEISMICITY (Base Plan and Overlay Plan)					
GS1	Prior to issuance of a building permit, the City of Irvine shall require that all development be designed in accordance with the seismic design provisions outlined in future proposed development geotechnical reports and specified in the latest Building Codes adopted by the City of Irvine. Compliance with this measure shall be verified by the Community Development Department.	Requires potential project applicant to address seismic design provisions in geotechnical reports per adopted Building Codes.	Prior to the issuance of a building permit.	Director of Community Development.	
GS2	<p>Prior to issuance of a building permit, as per existing City policies, geotechnical studies shall be prepared at the time specific development projects are proposed to address site specific geotechnical considerations. The scope of each geotechnical study is based on the underlying geotechnical conditions of the individual site. These reports will provide measures to prevent settlement.</p> <p>1. Prior to design and construction of any future developments within the project area, a comprehensive geotechnical evaluation, including development-specific subsurface exploration and laboratory testing, shall be conducted. The purpose of the subsurface evaluation is to:</p> <ol style="list-style-type: none"> Further evaluate the subsurface conditions in the area of the proposed structures. Provide specific data on potential geologic and 	Requires potential project applicant to prepare geotechnical studies in support of specific development plans.	Prior to the issuance of a building permit.	Director of Community Development.	

NO.	MITIGATION MEASURE	METHOD OF VERIFICATION	TIMING OF VERIFICATION	RESPONSIBLE PERSON	DATE OF COMPLETION/ INITIALS
	<p>geotechnical hazards.</p> <p>c. Provide information pertaining to the engineering characteristics of earth materials in the project area.</p> <p>From this data, recommendations for grading/earthwork, surface, and subsurface drainage, temporary and/or permanent dewatering, foundations, pavement structural sections, and other pertinent geotechnical design considerations may be formulated and shall be included in the grading and building plans for individual developments. General recommendations are as follows:</p> <p>X Seismic Ground Shaking - Measures to prevent risk of loss, injury or death involving seismic ground shaking include constructing new development to the latest adopted building codes. In addition, new development should not be located near active earthquake faults.</p> <p>X Erosion or Loss of Topsoil – Erosion and sediment control measures shall be implemented as required by the City's Grading and Water Quality ordinances.</p> <p>X Where Expansive Soils Exist – Measures for the design of foundations, slabs, flatwork and other improvements subject to drainage from expansive soils.</p> <p>Compliance with this measure shall be verified by the Community Development Department.</p>				
GS3	Prior to issuance of building permits for the occupancy of any existing structure at the former MCAS El Toro, or occupancy of any existing structure if a building permit is not issued, a seismic evaluation of the structure including recommendations	Requires potential project applicant to develop and submit a seismic evaluation	Prior to the issuance of a building permit for the occupation of	Manager of Building and Safety.	

NO.	MITIGATION MEASURE	METHOD OF VERIFICATION	TIMING OF VERIFICATION	RESPONSIBLE PERSON	DATE OF COMPLETION/ INITIALS
	for seismic improvements required for compliance with current Building Codes for use of existing structures adopted by the City of Irvine and plans for any required seismic improvements shall be submitted to the Chief Building Official for review and approval.	in accordance with adopted Building Codes.	any existing structure at the former MCAS El Toro.		
GS4	Prior to issuance of a grading permit, detailed geotechnical and hydrology reports shall be prepared prior to any development approval or grading activities. These reports shall specifically address erosion control and surface runoff for both construction and long-term operations on the site. Recommendations contained in these reports to prevent soil erosion, siltation, and debris influx into the drainage system shall be implemented. Compliance with this measure shall be verified by the Community Development Department.	Requires potential project applicant to develop and submit geotechnical and hydrology reports in accordance with adopted local/state/federal regulations.	Prior to the issuance of a grading permit.	Director of Community Development.	
5.7 Hydrology/Water Quality (Base Plan and Overlay Plan)					
H/WQ1	<p>Prior to issuance of a grading permit, the applicant shall provide evidence that the development of the project area shall comply with City of Irvine adopted Grading and Water Quality Ordinances to ensure that the potential for soil erosion is minimized on a project-by-project basis. Specifically, the NPDES discharge permitting requirements to which the City is obligated will ensure that construction activities reduce, to the maximum extent feasible, the water quality impacts of construction activities. The NPDES permit guidance states that "industrial/commercial construction operations that result in a disturbance of one acre or more of total land area . . . and residential construction sites that result in the disturbance of five acres or more . . . shall be required to develop and implement BMPs . . . to control erosion and siltation and contaminated runoff from the construction sites." Note: In March 2003 this provision will apply to residential construction sites that result in the disturbance of one acre or more.</p> <p>The City's standard conditions of approval indicate that a Storm Water Pollution Prevention Plan (SWPPP) shall be prepared prior to the approval of grading permits for any</p>	<p>Potential project applicant must show compliance with City of Irvine Grading and Water Quality Ordinances via approval of a NPDES permit, SWPPP, and WQMP.</p> <p>Notices of Intent (NOIs) for coverage of potential projects under the General Construction Activity Storm Water Runoff Permit must be submitted to the State Water Resources Control</p>	Prior to the issuance of a grading permit.	Director of Community Development; Manager of Building and Safety; City Engineer; State/Regional Water Quality Control Boards.	

NO.	MITIGATION MEASURE	METHOD OF VERIFICATION	TIMING OF VERIFICATION	RESPONSIBLE PERSON	DATE OF COMPLETION/ INITIALS
	<p>project site in order to reduce sedimentation and erosion. The SWPPP shall include the adoption of erosion and sediment control practices such as desilting basins and construction site chemical control management measures.</p> <p>Additionally, prior to the issuance of a grading permit, project applicants must submit, and the Director of Community Development or designee must have approved, a Water Quality Management Plan (WQMP). The WQMP must identify the Best Management Practices (BMPs) that will be used on the site to control predictable pollutant runoff after the site is occupied. Ongoing operations after construction would be subject to the Countywide Municipal NPDES Stormwater Permit, for which the City is a Co-Permittee. This WQMP shall identify, at a minimum, the routine, structural, and non-structural measures specified in the Countywide NPDES DAMP Appendix which details implementation of BMPs whenever they are applicable to a project, the assignment of long-term maintenance responsibilities (specifying the developer, parcel owner, maintenance association, leasee, etc.), and shall reference the location(s) of structural BMPs. (Completed with the WQMP (Fusco, June 28, 2006, Revised September 15, 2006).</p> <p>Also in accordance with standard City project permitting and approval procedures, Notices of Intent (NOIs) for coverage of projects under the General Construction Activity Storm Water Runoff Permit will be submitted to the State Water Resources Control Board prior to issuance of grading permits in the project area. This requirement will be met to the satisfaction of the Director of Community Development for any disturbance of one acre or more of soil in the project area. Also in force during the period of construction would be the General Dewatering NPDES Permit of the Santa Ana RWQCB, as well as the provisions of the Countywide Permit.</p> <p>The Mitigation Measures will be implemented in accordance</p>	Board.			

NO.	MITIGATION MEASURE	METHOD OF VERIFICATION	TIMING OF VERIFICATION	RESPONSIBLE PERSON	DATE OF COMPLETION/ INITIALS
	with local and State regulatory requirements. As future projects are planned and designed in the project area, specific BMPs and other water quality control methods will be utilized to reduce water quality degradation in the Newport Bay watershed. Future projects in the proposed project area will acknowledge and implement those additional requirements that may be imposed by RWQCB in the future. Compliance with these measures shall be verified by the Community Development Department.				
H/WQ2	Prior to issuance of a grading permit, evidence (e.g., in the form of a construction management plan) shall be provided that demonstrates that all stormwater runoff and dewatering discharges from the project area shall be managed to the maximum extent practicable or treated as appropriate to comply with water quality requirements identified in the Santa Ana Regional Water Quality Control Board Basin Plan, including Total Maximum Daily Load (TDML) Implementation Plan adopted for this watershed.	Submission of a construction management plan required by the potential project applicant.	Prior to the issuance of a grading permit.	Director of Community Development; City Engineer; State/Regional Water Quality Control Boards.	
H/WQ3	Prior to approval of the first tentative tract or parcel map in the project area, detailed hydrology studies and hydraulic analysis shall be conducted. Studies and analysis shall be prepared in accordance with OCFCD methodologies and standards and the Flood Control Master Plan for San Diego Creek, as well as any additional guidelines in effect at the time of project design. Recommendations contained in the hydrology studies and/or hydraulic analysis to address drainage/flooding issues related to proposed development shall be implemented. Compliance with this measure shall be verified by the Community Development Department.	Requires the submission of a hydrology study and hydraulic analysis by the potential project applicant.	Prior to the approval of the first tentative tract or parcel map in the project area.	Director of Community Development; City Engineer.	
H/WQ4	Prior to issuance of a building permit, developers with property located in the newly delineated 100-year floodplain shall be required to construct such improvements as necessary to remove the property from the 100-year floodplain. Additionally, the developer shall prepare a Letter of Map Revision (LOMR) request to have the FIRMs revised to remove the development areas from the 100-year floodplain upon completion of the approved flood control facilities. The LOMR request shall be	Requires the development, review, and approval of a Letter of Map Revision; physical improvement of property located in	Prior to the issuance of a building permit.	Director of Community Development; City Engineer.	

NO.	MITIGATION MEASURE	METHOD OF VERIFICATION	TIMING OF VERIFICATION	RESPONSIBLE PERSON	DATE OF COMPLETION/ INITIALS
	<p>filed upon completion of design of the flood control improvements to contain or redirect the 100-year flood flows away from the property.</p> <p>After the improvements are constructed, Record Drawings and a maintenance agreement with, or letter from, a public agency shall be submitted to FEMA to complete the LOMR process.</p>	100-year floodplain by project applicant.			
5.8 AGRICULTURAL RESOURCES (Base Plan and Overlay Plan)					
AG1	<p>In order to encourage agriculture as an interim land use pending development on the project site by warning future residents that they are buying or renting a house adjacent to existing agricultural operations, City Of Irvine Standard Discretionary Case Condition B.4 and City Of Irvine Standard Subdivision Condition 3.4 regarding disclosure statements shall be amended to include the following for subdivisions proposed adjacent to existing agricultural operations:</p> <p>Prior to issuance of building permits, the applicant shall submit, and the Director of Community Development shall have approved, a completed occupancy disclosure form for the project. The approved disclosure form, along with its attachments, shall be included as part of the rental/lease agreement and as part of the sales literature for the project. The disclosure statement shall include the following information:</p> <p>X Continuation of agricultural operations adjacent to the site and their potential effects (spraying of pesticides, noise, dust, odor, etc.) on future residents or tenants.</p>	Project applicant shall complete and receive approval for an occupancy disclosure form per the standards stated in Mitigation Measure AG1.	Prior to the issuance of a building permit.	Director of Community Development.	
AG2	Heritage and community service/educational farming operations shall be encouraged within utility easements and other lands. Heritage farming is defined as small-scale specialty farming operations that can be accommodated in an urban environment. An example would be the Edible Landscape project located adjacent to Harvard Avenue within the Edison right-of-way.	May require development of a cooperative agreement.	On-going (prior to and during development of the project area).	Director of Community Development.	

NO.	MITIGATION MEASURE	METHOD OF VERIFICATION	TIMING OF VERIFICATION	RESPONSIBLE PERSON	DATE OF COMPLETION/ INITIALS
AG3	Future landowners and the City shall work cooperatively with farmers to minimize conflicts between agricultural operations and adjacent urban uses.	May require development of a cooperative agreement.	On-going (prior to and during development of the project area).	Director of Community Development.	
5.9 BIOLOGICAL RESOURCES (Base Plan and Overlay Plan)					
BIO1	Prior to approval of a subdivision map for each project area, a focused survey for the southern tarplant, mountain plover, and burrowing owl shall be conducted. Prior to approval of a subdivision map for development within, or in proximity to Serrano Creek, a focused survey shall be conducted for the least Bell's vireo and southwestern willow flycatcher. Should the focused survey identify a significant population of southern tarplant or mountain plover, or the presence of burrowing owls, least Bell's vireo, or southwestern willow flycatcher in an area proposed for development, impacts shall be avoided through incorporation of the species into an open space easement or if impacts cannot be avoided, then mitigation shall be negotiated through consultation with the United States Fish and Wildlife Service (USFWS) and the California Department of Fish and Game (CDFG).	Requires the development and submission of focused biological surveys for resources indicated in BIO1.	Prior to the approval of a subdivision map.	Director of Community Development; US Fish and Wildlife Service; California Department of Fish and Game.	
BIO2	Prior to approval of a subdivision map for each project area, a wetland delineation shall be performed for all areas within the master plan sub-area that contain the potential for wetland habitat and/or jurisdictional waters. The loss of impacted wetlands shall be mitigated through the implementation of a wetland mitigation plan prepared and accepted by the appropriate agency (i.e., U.S. Army Corps of Engineers, U.S. Fish and Wildlife Service, California Department of Fish and Game). Wetlands impacted on-site shall be mitigated through on-site or off-site replacement, re-creation (i.e. within the proposed wildlife corridor), and/or revegetation as deemed acceptable by the appropriate jurisdictional agencies.	Requires the development and submission of wetland survey for potential wetland resources.	Prior to the approval of a subdivision map.	Director of Community Development; US Army Corps of Engineers; US Fish and Wildlife Service; California Department of Fish and Game.	
BIO3	The City shall continue to work with State and federal agencies during the implementation of the proposed project to implement the revegetation/restoration plan for the wildlife	May require development of a revegetation and/or	On-going (prior to and during development of	Director of Community Development; US	

NO.	MITIGATION MEASURE	METHOD OF VERIFICATION	TIMING OF VERIFICATION	RESPONSIBLE PERSON	DATE OF COMPLETION/ INITIALS
	corridor. Measures such as sight and sound barriers, including artificial sound walls and natural diversions (e.g. hedges and tree lines) shall be incorporated into corridor design to ensure the viability of the corridor. The City shall implement the corridor consistent with the design criteria and viability analysis established in the OCGP FEIR.	restoration plan for the identified wildlife corridor.	the project area).	Fish and Wildlife Service; California Department of Fish and Game.	
BIO4	Prior to issuance of a grading permit for each project area, a complete inventory of all trees of trunk diameter at breast height (DBH) greater than six inches and any significant (as determined by a certified arborist selected by the City) plants on the project site, excluding those within the habitat preserve shall be prepared. This inventory shall be prepared by an arborist certified by the International Society of Arboriculture and shall include (but not be limited to) data for each tree such as species, variety, DBH, condition (excellent, good, fair, poor, dead), and any recommendations. All trees in this inventory shall be considered "Significant Trees" under the City of Irvine's Urban Forestry Ordinance (UFO) (Section 5-7-401 et al) and the UFO shall apply to all trees included in this inventory.	Requires the development and submission of a tree inventory per the regulations outlined in the City of Irvine Urban Forestry Ordinance.	Prior to the issuance of a grading permit.	Director of Community Development; International Society of Arboriculture.	
5.10 PALEONTOLOGICAL RESOURCES (Base Plan and Overlay Plan)					
P1	Prior to issuance of a grading permit for any portion of the project area, a qualified paleontologist shall be retained by the City or designee to carry out an appropriate paleontology investigation of the area proposed for grading. (A qualified paleontologist is defined as an individual with an M.S. or Ph.D. in paleontology or geology who is familiar with paleontological procedures and techniques.) The City of Irvine has standard conditions applied prior to the issuance of grading permits when a project site includes potentially significant paleontological sites, and paleontological monitoring conditions have not been attached to the previous map approval. These standard conditions include retaining a qualified paleontologist, establishing procedures for cultural and scientific resource surveillance, and protection of any resources discovered during the grading process.	Submittal of resource recovery and disposition plans to the Community Development Department; qualified paleontologists' attendance at pre-grading conference(s) and field observation.	Prior to issuance of a grading permit and during site grading.	Director of Community Development or designee.	

NO.	MITIGATION MEASURE	METHOD OF VERIFICATION	TIMING OF VERIFICATION	RESPONSIBLE PERSON	DATE OF COMPLETION/ INITIALS
	<p>When fossils are discovered, the paleontologist (or paleontological monitor) shall recover them. In most cases, this fossil salvage can be completed in a short period of time. However, some fossils specimens (such as a complete large mammal skeleton) may require an extended salvage period. In these instances the paleontologist (or paleontological monitor) shall be allowed to temporarily direct, divert or halt grading to allow recovery of fossil remains in a timely manner. Because of the potential for the recovery of small fossil remains, such as isolated mammal teeth, it may be necessary in certain instances to set up a screen-washing operation on-site.</p> <p>Fossil remains collected during the monitoring and salvage portion of the mitigation program shall be cleaned, repaired, sorted, and cataloged. Compliance with this measure shall be verified by the Community Development Department.</p>				
5.11 CULTURAL RESOURCES (Base Plan and Overlay Plan)					
CULT1	<p>Prior to subdivision for development, a detailed archaeological report(s) shall be prepared within PAs 51 and 30. This report(s) shall specifically address the potential for encountering archaeological resources at the time specific development is proposed. The report(s) shall provide recommendations to prevent degradation of archaeological resources such as site avoidance and data recovery. Recommendations contained in the report shall be implemented. Compliance with this measure shall be verified by the Community Development Department.</p>	Requires development and submission of an archaeological resources report for PAs 51 and 30 by project applicant.	Prior to the issuance of subdivision maps.	Director of Community Development or designee.	September 2006 DL
CULT2	<p>Monitoring of excavation and grading activities associated with future development in PAs 51 and 30 shall be conducted by a certified archaeologist in accordance with the report required in Mitigation Measure Cult1. If resources are encountered in the course of ground disturbance, the archaeological monitor shall be empowered to halt grading and to initiate an archaeological testing program. The testing shall include recordation of</p>	Requires field inspection and monitoring by qualified archaeologist implementing recommendations	Field inspection and monitoring required during grading activities.	Director of Community Development or designee.	

NO.	MITIGATION MEASURE	METHOD OF VERIFICATION	TIMING OF VERIFICATION	RESPONSIBLE PERSON	DATE OF COMPLETION/ INITIALS
	artifacts, controlled removal of the materials, and an assessment of their importance under CEQA and the City's local guidelines. Compliance with this measure shall be verified by the Community Development Department.	outlined in the report noted above.			
CULT3	Prior to the issuance of grading permits and/or building permits for any future development in PAs 51 and 30, a detailed mitigation program shall be submitted by the applicant to the City of Irvine to address archaeological resources discovered during grading. Provisions of the program shall include an immediate evaluation of the find by a qualified archaeologist. If the find is determined to be a unique archaeological resource, contingency funding and a time allotment sufficient to allow for implementation of avoidance measures or appropriate mitigation shall be available. Work may continue on other parts of the construction site while archaeological resource mitigation takes place. The City of Irvine has standard conditions applied prior to the issuance of grading permits when a project site includes potentially significant archaeological sites. These include retaining a qualified archaeologist, establishing procedures for cultural and scientific resource surveillance, and protection of any resources discovered during the grading process. Compliance with this measure shall be verified by the Community Development Department.	Requires the development and submission of an archaeological mitigation program by project applicant.	Prior to the issuance of grading permits and/or building permits in PAs 51 and 30.	Director of Community Development or designee.	
CULT4	<p>Prior to the issuance of any grading and/or building permits, a mitigation program shall be submitted by the developer to the City of Irvine to address the accidental discovery or recognition of any human remains. The program shall include the following:</p> <p>X There shall be no further excavation or disturbance of the site or any nearby area reasonably suspected to overlie adjacent human remains until:</p> <p>The county coroner must be contacted to determine that no investigation of the cause of death is required, and</p>	Requires the development and submission of an archaeological mitigation program by project applicant.	Prior to the issuance of grading permits and/or building permits.	Director of Community Development or designee.	

NO.	MITIGATION MEASURE	METHOD OF VERIFICATION	TIMING OF VERIFICATION	RESPONSIBLE PERSON	DATE OF COMPLETION/ INITIALS
	<p>If the coroner determines the remains to be Native American:</p> <p>X The coroner shall contact the Native American Heritage Commission within 24 hours.</p> <p>X The Native American Heritage Commission shall identify the person or persons it believes to be the most likely descended from the deceased Native American.</p> <p>X The most likely descendent may make recommendations to the landowner or the person responsible for the excavation work, for means of treating or disposing of, with appropriated dignity, the human remains and any associated grave goods as provided in Public Resources Code Section 5097.98, or</p> <p>X Where the following conditions occur, the landowner or his authorized representative shall rebury the Native American human remains and associated grave goods with appropriate dignity on the property in a location not subject to further subsurface disturbance.</p> <ul style="list-style-type: none"> • The Native American Heritage Commission is unable to identify a most likely descendent or the most likely descendent failed to make a recommendation within 24 hours after being notified by the commission. • The descendant identified fails to make a recommendation; or • The landowner or his authorized representative rejects the recommendation of the descendant, and the mediation by the Native American Heritage Commission fails to provide measures acceptable to the landowner. <p>Compliance with this measure shall be verified by the Community Development Department.</p>				

NO.	MITIGATION MEASURE	METHOD OF VERIFICATION	TIMING OF VERIFICATION	RESPONSIBLE PERSON	DATE OF COMPLETION/ INITIALS
5.12 AESTHETICS (Base Plan and Overlay Plan)					
A1	Prior to issuance of building permits, lighting plans and signage plans for new development shall be reviewed by the Community Development Department to ensure that minimal light intrusion and spillover into adjacent residential areas occurs.	Requires review of site specific plans for light intrusion and spillover by City of Irvine.	Prior to the issuance of building permits, lighting plans, and/or signing plans.	Director of Community Development or designee.	
A2	Prior to the issuance of building permits, and during the master plan review process for future development in the project area, the Director of Community Development shall ensure that mirrored and highly reflective surfaces are discouraged or, where proposed, shall be accompanied by a design-level glare impact analysis that demonstrates no adverse visual impairment to motorists or other visual nuisance occurs.	Discourages use of mirrored or reflective surfaces in proposed development; designs to be reviewed by the City of Irvine.	On-going (prior to the issuance of building permits; during master plan review).	Director of Community Development or designee.	
5.13 POPULATION AND HOUSING (Base Plan and Overlay Plan)					
	No mitigation measures are available.				
5.14 PUBLIC SERVICES AND FACILITIES (Base Plan and Overlay Plan)					
	Mitigation Measures identified in other sections of the OCGP FEIR (Section 5.1 – 5.13) address the impacts associated with the construction and operation of new public services and facilities (including law enforcement, fire and emergency medical services, parks and recreation, and school services). Refer to the individual sections mentioned above for a discussion on specific mitigation monitoring and reporting programs.				
5.15 UTILITIES (Base Plan and Overlay Plan)					
	Mitigation Measures identified in other sections of the OCGP FEIR (Section 5.1 – 5.13) address the impacts associated with the construction and operation of new utilities (including potable water, recycled water, and sewer). Refer to the individual sections mentioned above for a discussion on specific mitigation monitoring and reporting programs. Mitigation Measures pertaining to solid waste are described below.				
SW1	It is anticipated that much of the solid waste resulting from the demolition, dismantling, or other deconstruction of the aged structures and property, including but not limited to buildings and runways, at MCAS El Toro, is contaminated with lead based paints, asbestos, or other materials that may render it unsuitable for recycling or reuse. At the sole cost and expense	Requires the development and submission of a technical evaluation by the project applicant to	Prior to the issuance of grading permits.	Director of Community Development or designee.	

NO.	MITIGATION MEASURE	METHOD OF VERIFICATION	TIMING OF VERIFICATION	RESPONSIBLE PERSON	DATE OF COMPLETION/ INITIALS
	<p>of the project applicant, in order to evaluate this condition and determine the feasibility of recycling of solid waste material from the MCAS El Toro site by ordinary means, a technical evaluation by a qualified environmental consultant must be conducted. The technical evaluation shall include sufficient sample testing of all types of solid waste materials to be generated by the project to analyze its composition. A copy of the full technical evaluation and its findings must be submitted to the City of Irvine Community Development Department. The City of Irvine must confirm the adequacy of the technical evaluation prior to authorizing the demolition, dismantling, or deconstruction project to proceed.</p> <p>If it is determined by the technical evaluation that the material is contaminated and prohibited from being recycled by ordinary means, a further evaluation must be conducted to identify and evaluate other feasible methods approved by state law to divert the material from landfills. This may include the delivery of the waste material to other appropriate non-disposal or transformation facilities, such as "waste-to-energy" (WTE) plants.</p>	determine the composition of solid waste materials generated during the development of the project area.			
SW2	For that solid waste which is determined to be inappropriate for recycling (as that term is defined by California Public Resources Code Section 40180), the project applicant must submit a written plan to the City and implement such plan to ensure that 75 percent of the material, or the maximum amount feasible as determined by the technical evaluation, is diverted from the landfill through other methods that comply with state statutes and regulations.	Requires the project applicant to submit written plans to the City of Irvine to ensure recycling maximum feasible levels of solid waste material is recycled.	Prior to the issuance of grading permits.	Director of Community Development or designee.	
SW3	For that solid waste which the technical study deems to be suitable for recycling, the project applicant must submit a written plan to the City and implement such plan to ensure that solid waste material generated by the demolition, dismantling, or deconstruction project, land use operations and maintenance is collected by a City authorized solid waste hauler or recycling agent, and that a minimum of 75% of the	Requires the project applicant to submit written plans to the City of Irvine to ensure recycling maximum feasible levels of solid waste	Prior to the issuance of grading permits.	Director of Community Development or designee.	

NO.	MITIGATION MEASURE	METHOD OF VERIFICATION	TIMING OF VERIFICATION	RESPONSIBLE PERSON	DATE OF COMPLETION/ INITIALS
	solid waste from the project is diverted from landfills by recycling, as that term is defined by California Public Resources Code Section 40180. ("Recycling" does not include transformation, as defined in Public Resources Code Section 40201.)	material is recycled.			
SW4	<p>To ensure ongoing compliance with these mitigation measures, the project applicant will be required to submit solid waste tonnage reports to the City of Irvine on City approved forms, accompanied by "weight ticket" receipts from state-certified disposal, nondisposal, or transformation facilities, on a quarterly basis to demonstrate that solid waste diversion has occurred in accordance with these required mitigation measures and in a manner that is consistent with, and not detrimental to, the efforts of the City of Irvine to comply with AB939.</p> <p>To assure compliance with applicable statutes related to the disposal of solid waste, it is necessary for the City to require appropriate and effective mitigation measures to limit the disposal and ensure significant recycling of solid waste on-site.</p>	Requires the project applicant to submit quarterly solid waste tonnage reports to the City of Irvine in order to demonstrate solid waste diversion has occurred.	Prior to the issuance of grading permits.	Director of Community Development or designee.	
SW5	For green waste, the project applicant must submit a written plan to the City and implement such plan to ensure that the green waste material generated by landscape maintenance operations is collected by a City authorized waste hauler or recycling agent, that the maximum feasible amount of that collected green waste is recycled, and that a minimum of 50 percent of the green waste from the project is diverted from landfills by recycling, as that term is defined by California Public Resources Code Section 40180.	Requires the project applicant to submit a written plan to the City of Irvine to ensure recycling of the maximum feasible amount of green waste material (minimum of 50 percent) by qualified agent.	Prior to the issuance of grading permits.	Director of Community Development or designee.

1. EIR Addendum Summary

1.1 PURPOSE AND SCOPE

This Initial Study/Addendum provides the basis for an addendum to the previously certified Final Environmental Impact Report (State Clearinghouse Number 2002101020) for the Orange County Great Park (OCGP) and serves as the environmental review of:

- Amended Vesting Tentative Tract Map (VTTM) No. 17008 (00474083-PTT)
- Vesting Tentative Tract Map No. 17283 (00467853-PTT)
- Modification to OCGP Streetscape Design Guidelines (00475427-PMP)
- Master Landscape and Trails Plan (MLTP) (00467322-PMP)
- Master Plan for Non-Residential Development within the Lifelong Learning District (00470483-PMP)

The requested entitlements do not permit any new development or other changes to approved intensities. This Addendum has been prepared pursuant to the provisions of the California Environmental Quality Act (CEQA), Public Resources Code Sections 21000 et seq., the State CEQA Guidelines, and the City of Irvine Local Guidelines for Implementing CEQA (Local CEQA Guidelines).

1.2 ENVIRONMENTAL PROCEDURES

Pursuant to CEQA, the State CEQA Guidelines, and the Local CEQA Guidelines, the City's review of the proposed Initial Study/Addendum focuses on the proposed VTTMs and related applications to determine if the project would cause a change in the conclusions of the Orange County Great Park Final Environmental Impact Report (OCGP FEIR), and any change in circumstances or new information that would substantially change the conclusions of the OCGP FEIR.

Pursuant to Section 21166 of CEQA and Section 15162 of the State CEQA Guidelines, when an EIR has been certified or a negative declaration adopted for a project, no subsequent EIR shall be prepared for the project unless the lead agency determines, on the basis of substantial evidence, that one or more of the following conditions are met:

- (1) *Substantial changes are proposed in the project that will require major revisions of the previous EIR due to the involvement of new significant environmental effects or a substantial increase in the severity of previously identified significant effects;*
- (2) *Substantial changes occur with respect to the circumstances under which the project is undertaken that will require major revisions of the previous EIR due to the involvement of new significant environmental effects or a substantial increase in the severity of previously identified significant effects; or*

1. EIR Addendum Summary

- (3) *New information of substantial importance, which was not known and could not have been known with the exercise of reasonable diligence at the time the previous EIR was certified as complete, suggests any of the following:*
- a) *The project would have one or more significant effects not discussed in the previous EIR or negative declaration.*
 - b) *Significant effects previously examined would be substantially more severe than identified in the previous EIR.*
 - c) *Mitigation measures or alternatives previously found not to be feasible would in fact be feasible, and would substantially reduce one or more significant effects of the project, but the project proponent declines to adopt the mitigation measures or alternatives.*
 - d) *Mitigation measures or alternatives that are considerably different from those analyzed in the previous EIR would substantially reduce one or more significant effects on the environment, but the project proponent declines to adopt the mitigation measures or alternatives.*

Section 15164 of the State CEQA Guidelines states that an Addendum to an EIR shall be prepared “if some changes or additions are necessary, but none of the conditions described in Section 15162 calling for preparation of a subsequent EIR has occurred.” This Initial Study/Addendum reviews the changes proposed by the project and any changes to the existing conditions that have occurred since the OCGP FEIR was certified. It also reviews any new information of substantial importance that was not known and could not have been known with exercise of reasonable diligence at the time that the OCGP FEIR was certified. It further examines whether, as a result of any changes or any new information, a subsequent or supplemental EIR may be required. This examination includes an analysis of the provisions of Section 21166 of CEQA and Section 15162 of the State CEQA Guidelines and their applicability to the proposed project. This Initial Study/Addendum relies on the attached Environmental Analysis, which addresses environmental checklist issues on a section-by-section basis.

The City of Irvine Environmental Checklist Form has been completed by the City and included in Section 3, *Environmental Checklist*. The Environmental Checklist Form is marked with the findings of the Community Development Director as to the environmental effects of the proposed project in comparison with the findings of the OCGP FEIR. The checklist has been prepared pursuant to Section 15168(c)(4) of CEQA, which states that “where the subsequent activities involve site specific operations, the agency should use a written checklist or similar device to document the evaluation of the site and the activity to determine whether the environmental effects of the operation were covered in the program EIR.”

Using that approach, the City of Irvine, the Lead Agency, determined that an Addendum to the previously approved OCGP FEIR is the appropriate environmental clearance for the project application.

1.3 PREVIOUS ENVIRONMENTAL DOCUMENTATION

The OCGP FEIR was certified by the City of Irvine in May 2003. The project analyzed in the OCGP Program EIR consisted of the following actions: 1) Annexation, General Plan Amendment, Pre-Zoning (prior to annexation), and Zoning of the unincorporated portion of Planning Area 51; 2) Annexation of the unincorporated portion of Planning Area 35 (Irvine Ranch Water District Parcel); 3) General Plan Amendment and Zone Change for Planning Area 30; and 4) Approval of the form of a Development Agreement vesting approval of overlay uses and intensities in consideration for dedication of land for public purposes and for developing and funding certain infrastructure improvements and maintenance of the public uses by the

1. EIR Addendum Summary

purchaser/developer and subsequent landowners and funding for specific park, roadways, and other circulation facilities and infrastructure. Together, these actions establish the policy and legislative structure to guide the development of the former MCAS El Toro property.

The OCGP FEIR mitigation measures are provided in the adopted Mitigation Monitoring and Reporting Program included in Appendix A. The table includes:

- Mitigation number and a description of the action;
- Timing for implementation;
- Approving authority and reviewing agency(s), if any; and
- Method of compliance

Addendum No. 1, approved by the City on May 18, 2006, addressed the potential for environmental issues associated with the implementation of the OCGP Redevelopment Project Area Plan.

Addendum No. 2 was approved by the City Council on October 24, 2006. It analyzed the potential for environmental issues associated with minor adjustments to the boundary between the public and private areas of the OCGP; revisions to Zoning Code text and figures related to Planning Areas 30 and 51; the creation of a mixed-use zoning category called the Lifelong Learning District (LLD) within Planning Area 51; and minor technical changes to the General Plan, as described in Section 2.3 of the Addendum No. 2.

Addendum No. 3, approved by the City Planning Commission on May 17, 2007, addressed the potential for environmental issues associated with a proposal to approve the Master Subdivision Map (Vesting Tentative Tract Map No. 17008), submitted pursuant to Section 7.1 of the “Original Development Agreement”, to identify the backbone infrastructure in the Overlay Plan project area, to define the areas for potential future subdivision and development and to delineate the limits of rough grading for the development on approximately 2,157 acres (Heritage Fields development) of the approximately 3,705 acres that the predecessor to Heritage Fields El Toro, LLC (Heritage Fields) purchased from the United States Department of the Navy (DON).

Addendum No. 4 was approved by the City Planning Commission on August 2, 2007. It analyzed the Orange County Great Park Master Plan, which provides a conceptual design for the future buildout of the 1,145-acre park with passive and active features with key activity areas identified as Upper Canyon, Bowling Green, Great Lawn, Bosque, Trabuco Entry, Berm Garden, Memorial Site, Aircraft Museum, Timeline, Sports Park, Cultural Terrace, Lake, Botanical Garden, Promenade, Linear Ramble, Agua Chinon, Wildlife Corridor, Orchard Parking, and Maintenance Facility.

Addendum No. 5 was approved by City Council on July 22, 2008. It analyzed changes to appropriate figures in the General Plan to reflect the Bake Parkway/Marine Way intersection relocation and the Rockfield Boulevard reconfiguration in the southern portion of Planning Area 30; and amendments to the existing Development Agreement to clarify the backbone infrastructure components, phasing and fiscal responsibility; update the document to be consistent with current planning concepts for both the Great Park and Heritage Fields; and provide internal consistency between documents, policies, and ordinances.

The OCGP FEIR, as augmented by Addendum No. 1, Addendum No. 2, Addendum No. 3, Addendum No. 4, Addendum No. 5 (collectively, Addenda) and all of the associated technical documents, reports and analyses are on file and can be reviewed at the City of Irvine, Community Development Department, at 13825 “B”, Irvine, California 92618.

1. EIR Addendum Summary

1.4 ENVIRONMENTAL SETTING

The Orange County Great Park (which consists of City of Irvine Planning Areas 30 and 51) is located in the central portion of Orange County, approximately 45 miles southeast of Los Angeles. The project area is generally bounded by the Woodbury residential development to the west, future Portola Springs residential development to the north (under construction), Irvine Spectrum to the south, and the City of Lake Forest to the east. Other nearby local jurisdictions include the Cities of Laguna Hills, Laguna Niguel, Laguna Woods, Mission Viejo, Aliso Viejo, and Tustin.

The Irvine Station, a major multimodal transit center linking Orange County Transportation Authority (OCTA) bus, Metrolink commuter rail, and Amtrak rail services, is adjacent to the Southern California Regional Rail Authority (SCRRA) Metrolink tracks, which bisect the project area and separate Planning Areas 30 and 51. The existing facilities and uses within the project site include California State University, Fullerton; Marine Memorial Golf Course; equestrian facilities; recreational vehicle storage; and agricultural and nursery operations. The OCGP FEIR also describes interim activities that might occur on the site, including short-term use of the land or existing buildings on-site. Currently, there are offices occupied by the City of Irvine Community Development Department, Great Park Corporation (GPC), and Heritage Fields. Other tenants include Second Harvest Food Bank, Families Forward, Legacy, Orange County Great Park Balloon Preview Park, and Tierra Verde Industries. A day-care facility is immediately adjacent to these office uses. Finally, a small portion of the existing runway has been removed within the southern portion of PA 51.

Ownership of Planning Areas 30 and 51 has changed since certification of the OCGP FEIR, including certain parcels that have been transferred to the Federal Aviation Administration, City of Irvine, County of Orange, and Heritage Fields by the DON or leased in furtherance of conveyance.

2. Project Description

2.1 PROJECT LOCATION

The Orange County Great Park, encompassing Planning Areas 30 and 51, is northeast of the freeway junction at Interstate 5 (I-5) and Interstate 405 (I-405), within the City of Irvine. Figure 2-1 depicts the project location in a regional context and Figure 2-2 shows its local context.

Major roadways bordering the project are Sand Canyon Avenue to the northwest, Portola Parkway and Irvine Boulevard to the north, and Bake Parkway to the northeast. An aerial photograph of the project site and surrounding area is shown on Figure 2-3. The Irvine Station is adjacent to the SCRRA Metrolink tracks, which traverse the site and separate Planning Areas 30 and 51. Surrounding the site are residential and nonresidential uses under construction to the north and west, open space to the northeast, and nonresidential and mixed land uses to the east and southeast within the City of Lake Forest and City of Irvine.

2.2 PROJECT CHARACTERISTICS

2.2.1 Project Background

On May 27, 2003, the City Council certified a Final Environmental Impact Report and adopted a general plan amendment and zone change to implement the development of the Orange County Great Park. In order to develop at the maximum intensities allowed in the Overlay Plan shown in the General Plan and Zoning Code, the property owners entered into a development agreement, which required the dedication of land and the development or funding of infrastructure improvements in excess of the City's standard requirements, and the commitment to long-term maintenance of the public facilities.

In July 2005, Heritage Fields, LLC, the predecessor of Heritage Fields, purchased all four bid parcels through a US Department of Navy/General Services Agency online auction process. Subsequent to the land purchase, the Great Park Corporation and Heritage Fields initiated their respective master design and development processes for the OCGP. To facilitate additional design options, both the Great Park Corporation (GPC) and Heritage Fields requested and the City initiated an amendment to the General Plan and the Zoning Code to reconfigure the boundaries between the two properties. In addition, Heritage Fields requested the creation of a new mixed-use zoning district called the 8.1/8.1A Lifelong Learning District. They also proposed minor clarifications to the zoning text within Planning Areas 30 and 51. These revisions to the Overlay Plan were analyzed in Addendum No. 2 dated September 2006, and were approved as the Revised Overlay Plan (Overlay Plan) by the City Council on October 24, 2006. These changes did not increase the building intensity already approved for the Site, and did not increase any significant environmental impacts previously identified in the 2003 OCGP FEIR. Addendum No. 2 was also approved on October 24, 2006, and is on file with the City Community Development Department for review.

On June 28, 2006, and pursuant to Section 7.1 of the Development Agreement, Heritage Fields El Toro, LLC, (Heritage Fields) filed an application for the Master Subdivision Map (Vesting Tentative Tract Map No. 17008) for the Overlay Plan. The Master Subdivision Map was approved by the Planning Commission on May 17, 2007. The Master Subdivision Map subdivided approximately 3,585 gross acres of the Site into 44 numbered lots and 14 lettered lots, but did not authorize the construction of any trip-generating land uses or alter any land use or associated acreages to the approved Overlay Plan. As noted, CEQA compliance was accomplished via Addendum No. 3 approved on May 17, 2007. The City concluded that the Master

2. Project Description

Subdivision Map was consistent with the Overlay Plan land uses, as approved, and that no new areas were proposed for development. Addendum No. 3 is on file with the City Community Development Department for review.

In 2007, the GPC requested approval of a conceptual master plan for the Orange County Great Park Development (Great Park Master Plan). The Great Park Master Plan was approved by the Planning Commission on August 2, 2007. As noted, the CEQA compliance was established via Addendum No. 4 dated July 2007 and approved on August 2, 2007. Addendum No. 4 is on file with the City Community Development Department for review.

During preliminary consideration of the conceptual design of Marine Way, the California Department of Transportation (Caltrans) expressed concerns regarding the location of Marine Way and its relationship to the Bake Parkway freeway on-ramp. A revised alignment was first discussed in conjunction with the Master Subdivision Map for Heritage Fields and the Great Park. At that time, it was recognized that the revised alignment required an amendment to the General Plan and that further study of the alignment was warranted." Addendum No. 5 provided that additional analysis, based on which the City amended the City's General Plan, zoning code, and the Orange County Transportation Authority's Master Plan of Arterial Highways to effectuate that change. Addendum No. 5 also examined the amendments to the Development Agreement and related changes to the City's General Plan and Zoning Ordinance, the amendments clarified the backbone infrastructure components, phasing and fiscal responsibility; update the document to be consistent with current planning concepts for both the Great Park and Heritage Fields development; and provide internal consistency between documents, policies, and ordinances. This document was approved on July 22, 2008 by the City Council and is on file with the City Community Development Department for review.

The development analyzed in the OCGP FEIR and Addenda includes both Public Park (Great Park development) and private development components (Heritage Fields). The Great Park development, the public park component, is owned by the City and is being developed by the GPC. The Heritage Fields development, the private development component, is being developed by Heritage Fields.

2.2.2 Project Components

This Addendum addresses the potential for environmental issues associated with the requested entitlements. The Proposed Project includes the following requested actions:

Amended VTTM 17008

The City of Irvine Planning Commission approved the Master Subdivision Map (Vesting Tentative Tract Map No. 17008) on May 17, 2007. VTTM 17008 was submitted pursuant to Section 7.1 of the "Original Development Agreement", to identify the backbone infrastructure in the Overlay Plan project area, to define the areas for potential future subdivision and development and to delineate the limits of rough grading for the development on approximately 2,157 acres (Heritage Fields development) of the approximately 3,705 acres that the predecessor to Heritage Fields El Toro, LLC (Heritage Fields) purchased from the United States Department of the Navy (DON). Amended VTTM 17008 will revise the approved lot configuration and subdivide 3570.2 gross acres into 50 numbered lots and 12 lettered lots (00474083-PTT). The modification will change the street configuration to realign Marine Way between Alton Parkway and Bake Parkway and realign Rockfield Boulevard from the project perimeter to Marine Way consistent with General Plan Amendment (00468566-PGA) and Zone Change (00468567-PZC). In addition, slight modifications to the "O" Street alignment and "T" Street alignment are proposed within the Lifelong Learning District (see Figure 2-4). There are also changes to the lot configurations consistent with Amended Parcel Map 2006-271 (00467325-PTP) as approved by the Subdivision Committee on August 27, 2008.

2. Project Description

Proposed VTTM 17283

The proposed VTTM would subdivide the non-residential portions of the LLD to implement approved Overlay Plan densities and intensities in those portions of the LLD. The VTTM would subdivide approximately 525 gross acres within the LLD into 71 numbered lots and 3 lettered lots for future institutional (education-related) uses, mixed uses, commercial recreation, research and development/office, medical, and retail commercial (see Figure 2-5). The VTTM only authorizes the development of non-residential uses, and does not permit or provide for the development of any new residences or other changes to approved intensities; future residential projects will require the submittal of a master plan application and tentative tract map. The project has a zoning designation of 8.1 Lifelong Learning District.

The portion of the LLD included in the VTTM includes 1,452,600 square feet of industrial (educational) facility, 336,900 square feet of medical office, 638,400 square feet of research and development, and 150,000 square feet of commercial development. Table 2-1 summarizes the land uses assumed with the proposed development in the LLD.

Table 2-1		
VTTM 17283 Lifelong Learning District Land Use		
Land Use	Amount	Unit
Medical Office	336.9	TSF
R& D	638.4	TSF
Retail	150	TSF
Institutional (Education)	1,452.6	TSF

Project design features are associated with Proposed VTTM 17283. These project design features are as follows:

- Both the eastbound and westbound approaches of Burt Road at Sand Canyon Avenue will be restriped to one left turn lane and a shared through/de-facto right turn lane. Additionally, the traffic signal will be modified as needed to accommodate the operations with this movement. This Project Design Feature is not needed in the event that the proposed grade separated crossing of Sand Canyon and the railroad tracks is fully funded and scheduled for construction by 2012. In such an event, this Project Design feature is not needed and may be removed from the project at the discretion of the Director of Public Works.
- The westbound approach of Marine Way at Sand Canyon will be restriped to one left turn lane and one shared left/right turn lane. Additionally, the traffic signal will be modified as needed to accommodate the operations with this movement. This Project Design Feature is not needed in the event that the proposed grade separated crossing of Sand Canyon and the railroad tracks is fully funded and scheduled for construction by 2012. In such an event, this Project Design feature is not needed and may be removed from the project at the discretion of the Director of Public Works

Modification to OCGP Streetscape Design Guidelines (00475427-PMP)

The conceptual design of the Overlay Plan provided general land use patterns and types of development initially envisioned for the property. Based on the conceptual design of the Overlay Plan, the Planning

2. Project Description

Commission approved the OCGP Master Streetscape Design Guidelines on February 19, 2004. In conjunction with the Amended VTTM 17008, Heritage Fields submitted an application to modify the approved OCGP Master Streetscape Design Guidelines. These modifications will update the approved guidelines to provide consistency between documents.

Master Landscape and Trails Plan (MLTP) (00467322-PMP)

This master plan provides comprehensive information regarding trail connections (equestrian, pedestrian, and bicycle), walls and fences, and conceptual landscaping palette along primary streets within the project site such as Irvine Boulevard, Marine Way, “O” Street, and Trabuco Road. In addition, it ensures that a cohesive landscape and trails plan is provided throughout the entire site and the surrounding properties such as the Orange County Great Park.

Master Plan for the Lifelong Learning District Design Guidelines (00470483-PMP)

Master Plan 00470483-PMP provides a design program for the non-residential portions of Lifelong Learning District pursuant to Section 9-51-6 of the Zoning Code. This document is composed of three separate documents, namely, (1) master plan for non-residential development which has specific project details for VTTM 17283, (2) Lifelong Learning District Design Guidelines which identifies the design program for the entire Lifelong Learning District (i.e. architectural theme, landscape treatments, etc.), and (3) Green Book which is a visionary document that establishes the goals for creating an environmentally sustainable project and implementing the City’s Sustainable Travelway Guidelines. Together these documents specifically implement the design program for the non-residential portions of the Lifelong Learning District. Subsequent master plans and tentative tract maps are required for any future residential development within the Lifelong Learning District.

2.3 DISCRETIONARY APPROVALS

Implementation of the project includes the following discretionary action to be undertaken by the City:

- Adoption of this Addendum No. 6
- Approval of Amended Vesting Tentative Tract Map (VTTM) No. 17008 (00474083-PTT)
- Approval of Vesting Tentative Tract Map No. 17283 (00467853-PTT)
- Approval of Modification to OCGP Streetscape Design Guidelines (00475427-PMP)
- Approval of Master Landscape and Trails Plan (MLTP) (00467322-PMP)
- Approval of Master Plan for Lifelong Learning District Design Guidelines (00470483-PMP)

The OCGP FEIR lists additional discretionary actions to be taken by the City and other public agencies at or as part of the completion of the project—the adopted Overlay Plan (OCGP FEIR pages 3-29 and 3-30). The actions listed therein which have not yet been undertaken also are necessary for implementation of the project. The actions and responsible public agencies include, but are not necessarily limited to, these approvals:

- Master plans and subdivisions for development (City)
- Community facilities districts or other assessment districts (City)
- Actions to improve interim use activities (City and DON)
- Transfer of parcels within Planning Area 51 (DON)
- Clean Water Act section 404 permits (U.S. Army Corps of Engineers)
- Endangered Species Act compliance (U.S. Fish and Wildlife Service)
- Clean Water Act section 401 and National Pollutant Discharge Elimination System (NPDES) permits (Regional Water Quality Control Board)
- California Fish and Game Code 1602 permits (California Department of Fish and Game)
- Revisions to the Orange County Master Plan of Arterial Highways (Orange County Transportation Authority)

The City of Irvine Environmental Information Form and Environmental Checklist Form have been completed by the City and are included on the following pages. The Environmental Checklist Form is marked with the findings of the Community Development Department as to the environmental effects of the proposed changes to the project in comparison with the findings of the certified OCGP FEIR.

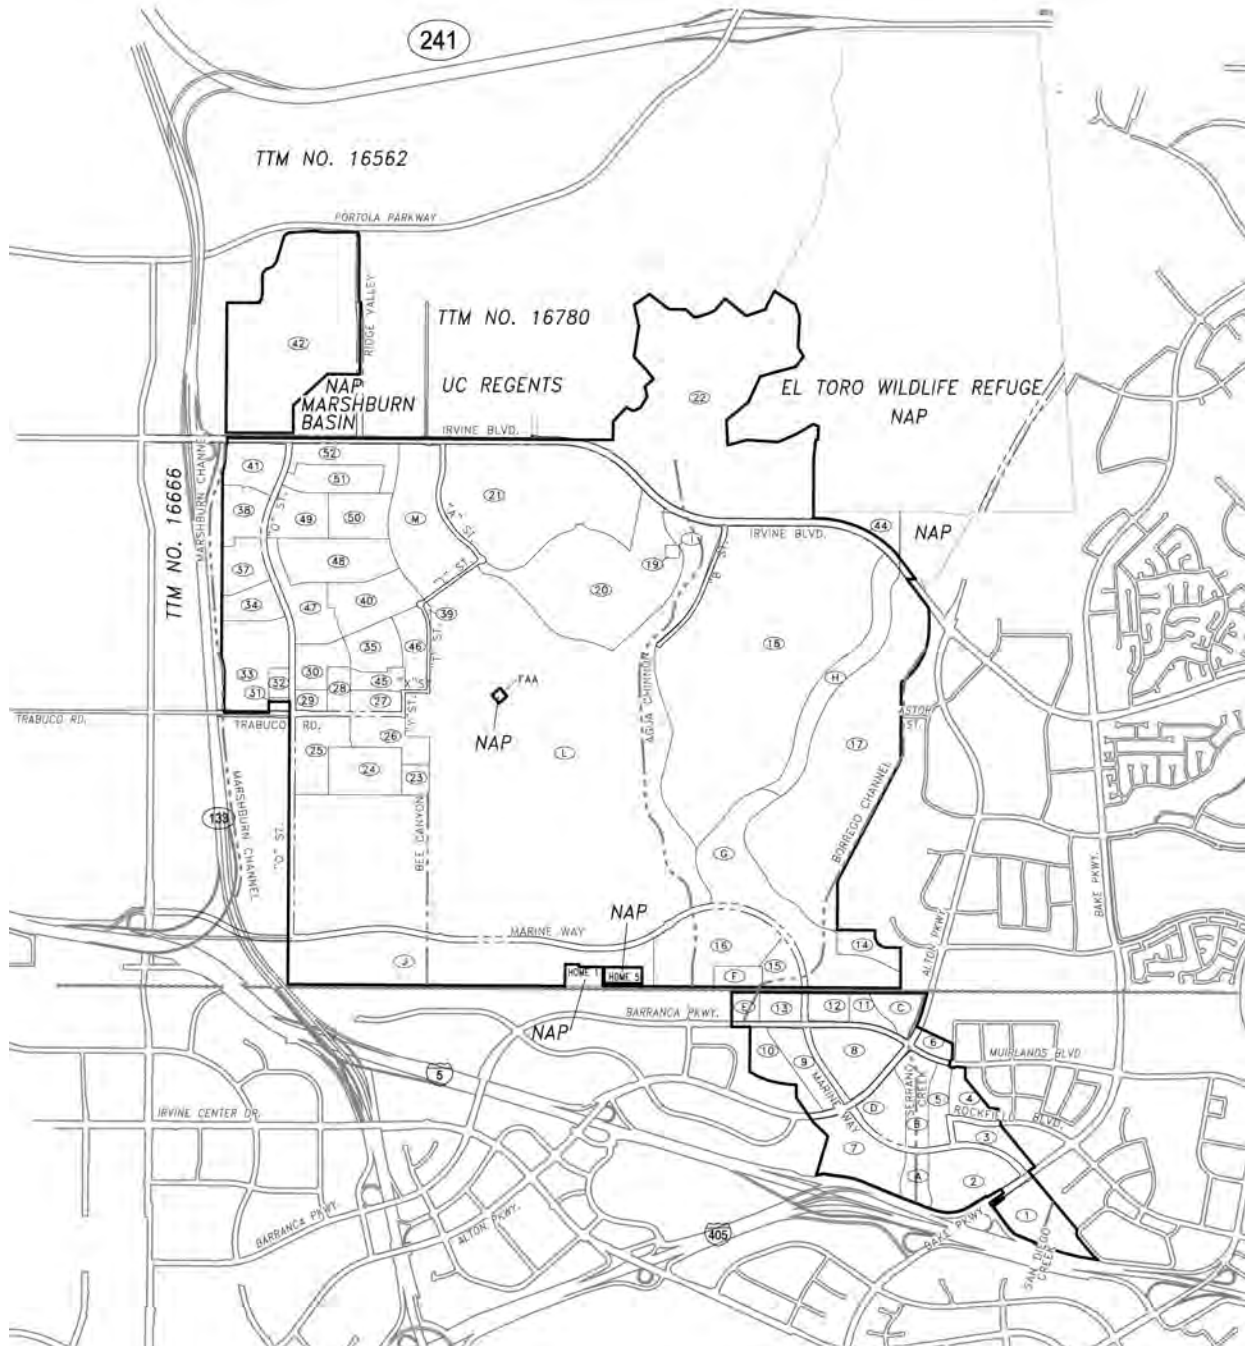

As explained above, this comparative analysis has been undertaken, pursuant to the provisions of the California Environmental Quality Act, to provide the City with the factual basis for determining whether any changes in the project, any changes in the circumstances, or any new information requires additional environmental review or preparation of a subsequent or supplemental EIR. The basis for each of the findings listed in the attached Environmental Checklist Form in Section 3 is explained in Section 4 of the Addendum.

3. Environmental Checklist

3.1 CITY OF IRVINE INITIAL STUDY AND ENVIRONMENTAL EVALUATION

The City of Irvine Environmental Information Form and Environmental Checklist Form have been completed by the City and are included on the following pages. The Environmental Checklist Form is marked with the findings of the Community Development Department as to the environmental effects of the proposed VTTMs and related applications in comparison with the findings of the certified OCGP FEIR and Addenda.

As explained above, this comparative analysis has been undertaken, pursuant to the provisions of CEQA, to provide the City with the factual basis for determining whether any changes in the project, any changes in the circumstances under which the project is undertaken, or any new information requires additional environmental review or preparation of a subsequent or supplemental EIR. The basis for each of the findings listed in the attached Environmental Checklist Form is explained in Section 4 of the Addendum.

1. Project Title:

Orange County Great Park And Heritage Fields Amended VTTM No. 17008, VTTM No. 17283, and Other Associated Actions.

2. Lead Agency Name and Address:

City of Irvine Community Development Department
13825 "B" Street
Irvine, California 92618

3. Contact Person and Phone Number:

David R. Law, Senior Planner (949) 724-7459 and Michelle Drou  , Associate Planner (949) 724-6314

4. Project Location:

The project area is north of Interstate 5 (Santa Ana Freeway), east of State Route 133 (Eastern Transportation Corridor), west of the City of Lake Forest, and south of State Route 241 (Foothill Transportation Corridor).

5. Project Sponsor's Name and Address:

City of Irvine Community Development
13825 "B" Street
Irvine, California 92618

6. General Plan Designation: Orange County Great Park (OCGP)

3. Environmental Checklist

7. Zoning:

1.1 Exclusive Agriculture, 1.4 Preservation, 1.5 Recreation, 1.8 Golf Course Overlay, 2.2 Low Density Residential, 2.3 Medium Density Residential, 3.2 Transit Oriented Development, 4.3 Vehicle-Related Commercial, 5.4B General Industrial, 6.1 Institutional, and 8.1/8.1A Lifelong Learning District

8. Description of Project

See Section 1.6.2, *Project Components*.

9. Surrounding Land Uses and Setting (Briefly describe the project's surroundings):

The proposed project area (which consists of City of Irvine Planning Areas 30 and 51) is located in the central portion of Orange County, approximately 45 miles southeast of Los Angeles. The project area is generally bounded by Irvine Spectrum to the south, the City of Lake Forest to the east, the Woodbury residential community to the west, and the future Portola Springs residential development to the north.

The project area is north of I-5, east of SR-133, and south of SR-241. Major roadways bordering the project area include Barranca Parkway to the south, Sand Canyon Avenue to the west, Portola Parkway and Irvine Boulevard to the north, and Alton Parkway to the east.

10. Other Public Agencies Whose Approval Is Required (e.g., permits, financing approval, or participation agreement):

County of Orange
Orange County Transportation Authority (Master Plan of Arterial Highways)
Cal Trans

3. Environmental Checklist

3.2 ENVIRONMENTAL FACTORS POTENTIALLY AFFECTED

The environmental factors checked below would be potentially affected by this project, involving at least one impact that is a "Potentially Significant Impact" as indicated by the checklist on the following pages.

- | | | |
|--|---|---|
| <input type="checkbox"/> Aesthetics | <input type="checkbox"/> Agricultural Resources | <input type="checkbox"/> Air Quality |

3.3 DETERMINATION

On the basis of this initial evaluation:

☐ I find that the proposed project COULD NOT have a significant effect on the environment, and a NEGATIVE DECLARATION will be prepared.

☐ I find that although the proposed project could have a significant effect on the environment, there will not be a significant effect in this case because revisions in the project have been made by or agreed to by the project proponent. A MITIGATED NEGATIVE DECLARATION will be prepared.

☐ I find that the proposed project MAY have a significant effect on the environment, and an ENVIRONMENTAL IMPACT REPORT is required.

☐ I find that the proposed project MAY have a "potentially significant impact" or "potentially significant unless mitigated" impact on the environment, but at least one effect (1) has been adequately analyzed in an earlier document pursuant to applicable legal standards, and (2) has been addressed by mitigation measures based on the earlier analysis as described on attached sheets. An ENVIRONMENTAL IMPACT REPORT is required, but it must analyze only the effects that remain to be addressed.

☒ I find that although the proposed project could have a significant effect on the environment, because all potentially significant effects (a) have been analyzed adequately in an earlier EIR or NEGATIVE DECLARATION pursuant to applicable standards, and (b) have been avoided or mitigated pursuant to that earlier EIR or NEGATIVE DECLARATION, including revisions or mitigation measures that are imposed upon the proposed project, nothing further is required.

David R. Law, Senior Planner

Date

3. Environmental Checklist

3.4 EVALUATION OF ENVIRONMENTAL IMPACTS

- 1) A brief explanation is required for all answers except “No Impact” answers that are adequately supported by the information sources a lead agency cites in the parentheses following each question. A “No Impact” answer is adequately supported if the referenced information sources show that the impact simply does not apply to projects like the one involved (e.g., the project falls outside a fault rupture zone). A “No Impact” answer should be explained where it is based on project-specific factors as well as general standards (e.g., the project will not expose sensitive receptors to pollutants, based on a project-specific screening analysis).
- 2) All answers must take account of the whole action involved, including off-site as well as on-site, cumulative as well as project-level, indirect as well as direct, and construction as well as operational impacts.
- 3) Once the lead agency has determined that a particular physical impact may occur, the checklist answers must indicate whether the impact is potentially significant, less than significant with mitigation, or less than significant. “Potentially Significant Impact” is appropriate if there is substantial evidence that an effect may be significant. If there are one or more “Potentially Significant Impact” entries when the determination is made, an EIR is required.
- 4) “Negative Declaration: Less Than Significant With Mitigation Incorporated” applies where the incorporation of mitigation measures has reduced an effect from “Potentially Significant Impact” to a “Less Than Significant Impact.” The lead agency must describe the mitigation measures, and briefly explain how they reduce the effect to a less than significant level.
- 5) Earlier analyses may be used where, pursuant to the tiering, program EIR, or other CEQA process, an effect has been adequately analyzed in an earlier EIR or negative declaration. Section 15063(c)(3)(D). In this case, a brief discussion should identify the following:
 - a) **Earlier Analysis Used.** Identify and state where they are available for review.
 - b) **Impacts Adequately Addressed.** Identify which effects from the above checklist were within the scope of and adequately analyzed in an earlier document pursuant to applicable legal standards, and state whether such effects were addressed by mitigation measures based on the earlier analysis.
 - c) **Mitigation Measures.** For effects that are “Less Than Significant With Mitigation Incorporated,” describe the mitigation measures that were incorporated or refined from the earlier document and the extent to which they address site-specific conditions for the project.
- 6) Lead agencies are encouraged to incorporate into the checklist references to information sources for potential impacts (e.g., general plans, zoning ordinances). Reference to a previously prepared or outside document should, where appropriate, include a reference to the page or pages where the statement is substantiated.
- 7) Supporting Information Sources: A source list should be attached, and other sources used or individuals contacted should be cited in the discussion.

3. Environmental Checklist

- 8) This is only a suggested form, and lead agencies are free to use different formats; however, lead agencies should normally address the questions from this checklist that are relevant to a project's environmental effects in whatever format is selected.
- 9) The explanation of each issue should identify:
- a) the significance criteria or threshold, if any, used to evaluate each question; and
 - b) the mitigation measure identified, if any, to reduce the impact to less than significant.

	<i>Subsequent or Supplemental EIR</i>				<i>Addendum to EIR</i>	
	Substantial Change in Project Requiring Major EIR Revisions	Substantial Change in Circumstances Requiring Major EIR Revisions	New Information Showing Greater Significant Effects than Previous EIR	New Information Showing Ability to Reduce Significant Effects in Previous EIR	Less Than Significant Impacts/No Changes or New Information Requiring Preparation of an EIR	No Impact
ENVIRONMENTAL ISSUES						
I. AESTHETICS: Would the project:						
a) Have a substantial adverse effect on a scenic vista?					X	
b) Substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a State scenic highway or local scenic expressway, scenic highway, or eligible scenic highway?					X	
c) Substantially degrade the existing visual character or quality of the site and its surroundings?					X	
d) Create a new source of substantial light or glare which would adversely affect day or nighttime views in the area?					X	
e) Result in the visible grading of over 5,000 cubic yards on any 20-acre portion of the project site; or visible cut and fill slope over 25 vertical feet?					X	
f) Result in the creation of light spillover and glare effects that present a nuisance to residential land uses?					X	
g) Result in the substantial alteration of the existing landform of the site or of a unique topographic feature on the site?					X	

3. Environmental Checklist

	Subsequent or Supplemental EIR				Addendum to EIR	
ENVIRONMENTAL ISSUES	Substantial Change in Project Requiring Major EIR Revisions	Substantial Change in Circumstances Requiring Major EIR Revisions	New Information Showing Greater Significant Effects than Previous EIR	New Information Showing Ability to Reduce Significant Effects in Previous EIR	Less Than Significant Impacts/No Changes or New Information Requiring Preparation of an EIR	No Impact
II. AGRICULTURAL RESOURCES: In determining whether impacts to agricultural resources are significant environmental effects, lead agencies may refer to the California Agricultural Land Evaluation and Site Assessment Mode (1997) prepared by the California Department of Conservation as an optional model to use in assessing impacts on agriculture and farmland. Would the project:						
a) Convert Prime Farmland, Unique Farmland, or Farmland of Statewide Importance (Farmland), as shown on the maps prepared pursuant to the Farmland Mapping and Monitoring Program of the California Resources Agency, to non-agricultural use?					X	
b) Conflict with existing zoning for agricultural use, or a Williamson Act contract?						X
c) Involve other changes in the existing environment which, due to their location or nature, could result in conversion of Farmland, to non-agricultural use?						X
III. AIR QUALITY: Where available, the significance criteria established by the applicable air quality management district or air pollution control district may be relied upon to make the following determinations. Would the project:						
a) Conflict with or obstruct implementation of the applicable air quality plan?						X
b) Violate any air quality standard or contribute substantially to an existing or projected air quality violation?					X	
c) Result in a cumulatively considerable net increase of any criteria pollutant for which the project region is in non-attainment under an applicable Federal or State ambient air quality standard (including releasing emissions which exceed quantitative thresholds for ozone precursors)?					X	
d) Expose sensitive receptors to substantial pollutant concentrations?					X	
e) Create objectionable odors affecting a substantial number of people?						X

3. Environmental Checklist

IV. BIOLOGICAL RESOURCES: Would the project:						
a) Have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Game or U.S. Fish and Wildlife Service?					X	
b) Have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations or by the California Department of Fish and Game or U.S. Fish and Wildlife Service?					X	
c) Have a substantial adverse effect on federally protected wetlands as defined by Section 404 of the Clean Water Act (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means?					X	
d) Interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites?					X	
e) Conflict with any local policies or ordinances protecting biological resources, such as tree preservation policy or ordinance?					X	
f) Conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or State habitat conservation plan?						X
V. CULTURAL RESOURCES: Would the project:						
a) Cause a substantial adverse change in the significance of a historical resource as defined in §15064.5 of the CEQA Guidelines?						X
b) Cause a substantial adverse change in the significance of an archaeological resource pursuant to §15064.5 of the CEQA					X	

3. Environmental Checklist

	Subsequent or Supplemental EIR				Addendum to EIR

Guidelines?						
c) Directly or indirectly destroy a unique paleontological resource or site or unique geological feature?					X	
d) Disturb any human remains, including those interred outside of formal cemeteries?					X	
VI. GEOLOGY AND SOILS: Would the project:						
a) Expose people or structures to potential substantial adverse effects, including the risk of loss, injury, or death involving:						
i) Rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known fault? Refer to Division of Mines and Geology Special Publication 42.						X
ii) Strong seismic ground shaking?					X	
iii) Seismic-related ground failure, including liquefaction?						X
iv) Landslides?					X	
b) Result in substantial soil erosion or the loss of topsoil?					X	
c) Be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on- or off-site landslide, lateral spreading, subsidence, liquefaction or collapse?						X
d) Be located on expansive soil, as defined by Table 18-1-B of the Uniform Building Code (1994), creating substantial risks to life or property?					X	
VII. HAZARDS AND HAZARDOUS MATERIALS: Would the project:						
a) Create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials?					X

ENVIRONMENTAL ISSUES						
b) Create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment?						X
c) Emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter-mile of an existing or proposed school?						X
d) Be located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, would it create a significant hazard to the public or the environment?					X	
e) For a project located within an airport land use plan, would the project result in a safety hazard for people residing or working in the project area?						X
f) For a project located within the vicinity of a private airstrip, would the project result in a safety hazard for people residing or working in the project area?						X
g) Impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan?						X
h) Expose people or structures to a significant risk of loss, injury or death involving wildland fires, including where wildlands are adjacent to urbanized areas or where residences are intermixed with wildlands?					X	
VIII. HYDROLOGY AND WATER QUALITY: Would the project:						
a) Violate any water quality standards or waste discharge requirements?					X	
b) Substantially deplete groundwater supplies or interfere substantially with groundwater recharge such that there would be a net deficit in aquifer volume or a lowering of the local groundwater table level (e.g., the production rate of pre-existing nearby wells						X

adopted for the purpose of avoiding or mitigating an environmental effect?						
c) Conflict with any applicable habitat conservation plan or natural community conservation plan?						X
X. MINERAL RESOURCES: Would the project:						
a) Result in the loss of availability of a known mineral resource that would be of value to the region and the residents of the State?						X
b) Result in the loss of availability of a locally-important mineral resource recovery site delineated on a local general plan, specific plan or other land use?						X
XI. NOISE: Would the project result in:						
a) Exposure of persons to or generation of noise levels in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?					X	
b) Exposure of persons to or generation of excessive groundborne vibration or groundborne noise levels?					X	
c) A substantial permanent increase in ambient noise levels in the project vicinity above levels existing without the project?					X	
d) A substantial temporary or periodic increase in ambient noise levels in the project vicinity above levels existing without the project?					X	
e) For a project located within an airport land use plan, would the project expose people residing or working in the project area to excessive noise levels?						X
f) For a project within the vicinity of a private airstrip, heliport or helistop, would the project expose people residing or working in the project area to excessive noise levels?						X
XII. POPULATION AND HOUSING: Would the project:						
a) Induce substantial population growth in an area, either directly (for example, by					X

ENVIRONMENTAL ISSUES	Substantial Change in Project Requiring Major EIR Revisions	Substantial Change in Circumstances Requiring Major EIR Revisions	New Information Showing Greater Significant Effects than Previous EIR	New Information Showing Ability to Reduce Significant Effects in Previous EIR	Less Than Significant Impacts/No Changes or New Information Requiring Preparation of an EIR	No Impact
proposing new homes and businesses) or indirectly (for example, through the extension of roads or other infrastructure)?						
b) Displace substantial numbers of existing housing, necessitating the construction of replacement housing elsewhere?						X
c) Displace substantial numbers of people, necessitating the construction of replacement housing elsewhere?						X
XIII. PUBLIC SERVICES: Would the project result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times or other performance objectives for any of the public services:						
a) Fire protection?					X	
b) Police protection?					X	
c) Schools?					X	
d) Parks?					X	
e) Other public facilities?					X	
XIV. RECREATION: Would the project:						
a) Increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated?					X	
b) Include recreational facilities or require the construction or expansion of recreational facilities which might have an adverse physical effect on the environment?					X	
XV. TRANSPORTATION/TRAFFIC: Would the project:						
a) Cause an increase in traffic, which is substantial in relation to the existing traffic load and capacity of the street system (i.e., result in a substantial increase in either the number of vehicle trips, the volume to capacity ratio on roads, or congestion at intersections)?					X	

3. Environmental Checklist

c. Does the project have environmental effects which will cause substantial adverse effects on human beings, either directly or indirectly?					X	

3. Environmental Checklist

This page intentionally left blank.

4. Discussion of Checklist and Mitigation Measures

This section is intended to provide evidence to substantiate the conclusions set forth in the Environmental Checklist. The section will briefly summarize the OCGP FEIR conclusions and then discuss whether or not the proposed project is consistent with the findings contained in the OCGP FEIR.

4.1 AESTHETICS

4.1.1 Environmental Setting

The OCGP FEIR addressed in detail the potential visual impacts associated with the development of the former MCAS El Toro. The OCGP FEIR discussed the project's visual setting associated with its location adjacent to various arterial highways and state and federal highways. None of these roadways are designated County or State scenic highways; although Sand Canyon Avenue is designated as a highway with rural/natural character. The City's General Plan also designates I-5 as an urban character Scenic Highway.

Generally, views of the former military base are from the surrounding highways. From these highways, a variety of land uses, structures, and facilities of differing ages, sizes, and architectural styles may be viewed. Though agricultural areas are adjacent to and within the base, the predominant features are associated with the military use of the base, including runways, aprons, hangars, warehouses, barracks housing, recreational facilities, golf course, single-family housing, offices, and commercial structures.

The City of Lake Forest and the James A. Musick Branch Jail are to the southeast; Irvine Spectrum abuts the former base along the eastern and southern boundaries; and existing and developing residential developments are to the north and west. Further to the south are the residential areas of the Cities of Laguna Woods and Laguna Hills. These communities are at higher elevations and therefore have panoramic views of the project. Residences with views of the facility are not impacted by existing light sources on the site since the residences are at least two miles from the property.

4.1.2 Impacts Identified in the OCGP FEIR and Addenda

The OCGP FEIR discussed the potential aesthetic effects of the development of the site, including Planning Areas 51 and 30, under the adopted Overlay Plan and found that future development of these two planning areas would introduce new sources of light within the project area. These sources include street lighting along planned roadways and various forms of exterior lighting, including security lighting, parking lots, educational facilities, institutional and commercial developments, and lighting associated with athletic fields. The OCGP FEIR concluded that significant light impacts could have occurred if proposed light sources were directed into or located near existing or planned residential uses, which are sensitive to light intrusion during nighttime hours, but that, with the mitigation ultimately adopted by the City, these potential impacts would be less than significant. The OCGP FEIR and Addenda further concluded that the proposed mitigation measures for the project would reduce potentially significant light impacts to less than significant levels.

With regard to other aesthetic-related impact significance threshold presented in the OCGP FEIR, no other significant or potentially significant aesthetic impacts were identified. These other thresholds primarily concern visual aesthetic impacts and include such evaluative factors as view-shed obstruction or impairment, landform alteration, and the degradation of valued or unique scenic resources or features.

4. Discussion of Checklist and Mitigation Measures

4.1.3 Impacts Associated with the Requested Entitlements

There are no scenic routes, scenic resources, or unique geologic or topographic features within the project site. Amended VTTM No. 17008 shifts the Bake Parkway/Marine Way intersection approximately 900 feet to the east of the I-5 NB exit ramp and reconfigures Rockfield Boulevard consistent with General Plan Amendment (00468566-PGA) and Zone Change (00468567-PZC) GPA. In addition, Amended VTTM 17008 also proposes slight modifications to the street alignment to “O” and “T” Street within the Lifelong Learning District. Proposed VTTM No. 17283 allows for development of the Lifelong Learning District (LLD) consistent with the type and intensity of development analyzed in the OCGP EIR and Addenda. The roadways remain in the same general vicinity as the original planned roadways previously examined in the OCGP FEIR.

The project would not introduce new light sources or highly reflective building materials that would result in new sources of potential glare beyond those already considered by the OCGP FEIR, because it includes the same land uses and intensity, and comparable physical area for future development as the adopted Overlay Plan.

Major EIR Revisions Not Required. Based on the foregoing analysis and information, there is no evidence that the changes to the project require a major revision to the certified OCGP FEIR due to any new significant environmental impact or a substantial increase in the severity of impacts.

No Substantial Change in Circumstances Requiring Major EIR Revisions. There is no information in the record or otherwise available indicating substantial changes in circumstances that would require major changes to certified OCGP FEIR.

No New Information of Substantial Importance Showing Greater Significant Effects Than Previous EIR. This Initial Study/Addendum has analyzed all available relevant information and has determined that there is no new information of substantial importance that was unknown and could not have been known with the exercise of reasonable diligence at the time the OCGP EIR was certified, indicating that the project would have one or more significant effects not discussed in the previous EIR or result in a substantial increase in the severity of previously identified effects.

No New Information of Substantial Importance Showing Ability to Reduce Significant Effects in Previous EIR. This Initial Study/Addendum has analyzed all available relevant information and has determined that there is no new information of substantial importance that was unknown and could not have been known with the exercise of reasonable diligence at the time the OCGP FEIR was certified, indicating that: 1) mitigation measures or alternatives previously found not to be feasible would in fact be feasible, and would substantially reduce one or more significant effects of the project, but the project proponent declines to adopt the mitigation measures or alternatives; or 2) mitigation measures or alternatives that are considerably different from those analyzed in the previous EIR would substantially reduce one or more significant effects on the environment, but the project proponent declines to adopt the mitigation measures or alternatives. There are no alternatives to the project or additional mitigation measures that would substantially reduce one or more of the significant aesthetics effects identified in and considered by the certified OCGP FEIR.

4.1.4 Mitigation from the OCGP FEIR and Applicability to the Requested Entitlements

The OCGP FEIR identified mitigation measures A1 and A2, which, if fulfilled, would reduce the effects of development under the adopted Overlay Plan to a less than significant level. Measures A1 and A2 are applicable to future development under the project.

4. Discussion of Checklist and Mitigation Measures

- A1 Prior to issuance of building permits, lighting plans and signage plans for new development shall be reviewed by the Community Development Department to ensure that minimal light intrusion and spillover into adjacent residential areas occurs.
- A2 Prior to the issuance of building permits, and during the master plan review process for future development in the project area, the Director of Community Development shall ensure that mirrored and highly reflective surfaces are discouraged or, where proposed, shall be accompanied by a design-level glare impact analysis that demonstrates no adverse visual impairment to motorists or other visual nuisance occurs.

4.2 AGRICULTURAL RESOURCES

4.2.1 Environmental Setting

The OCGP FEIR described the Farmland Mapping and Monitoring Program of the California Department of Conservation Division of Land Resources Protection classifications of agricultural lands present within the project area as follows:

- Prime Farmland: Land which has the best combination of physical and chemical features able to sustain long-term production of agricultural crops. This land has the soil quality, growing season, and moisture supply needed to produce sustained high yields. Land must have been used for production of irrigated supply needed to produce sustained high yields. Land must have been used for production of irrigated crops at some time during the previous two map updates.
- Farmland of Statewide Importance: Similar to Prime Farmland, except this land has minor shortcomings such as greater slopes or less ability to store soil moisture than Prime Farmland. This land has minor shortcomings, such as greater slopes or less ability to store soil moisture than Prime Farmland. Land must have been used for production of irrigated crops at some time during the previous two map updates.
- Unique Farmland: Lesser quality soils used for the production of the state's leading crops. This land is usually irrigated, but may include non-irrigated orchards or vineyards as found in some climate zones in California. This land is used for the production of specific high economic value crops such as oranges, olives, avocados, rice, grapes, or cut flowers. Land must have been cropped at some time during the two previous maps updates.
- Farmland of Local Importance: Land of importance to the local agricultural economy as determined by each county's board of supervisors and a local advisory committee.

The OCGP FEIR identified approximately 659 acres of designated Prime Farmland, 70 acres of designated Unique Farmland, and 99 acres of designated Farmland of Statewide Importance. The Orange County Board of Supervisors has not designated any farmland as being of Local Importance.

City of Irvine Policies and Programs

The City of Irvine General Plan Objective L-10, as amended in 2002 and presented in the OCGP FEIR, includes the following policies to “encourage the maintenance of agriculture in undeveloped areas of the City until the time of development, and in areas not available for development”:

4. Discussion of Checklist and Mitigation Measures

Policy (a): Provide for farming opportunities in the community, where feasible and appropriate, through an Agricultural Legacy Program facilitating limited-scale agricultural operations and program on public lands. The program may include components such as edible landscape, metro-farming, heritage farming, model farming, education and community service farming and other farm or farm market program. Location for implementation of the Agricultural Legacy Program to be considered should, at a minimum, include:

- Designated open space spine network,
- Designated open space areas not subject to the Natural Community Conservation Plan (NCCP), and
- Other appropriate publicly owned lands.

Policy (b): Consider creating a “working model” farm to act as a center for education and enjoyment of all age groups pursuant to the Agricultural Legacy Program in conjunction with the City’s planning efforts concerning the reuse of MCAS El Toro, or with the South Coast Research Extension owned by UC Regents.

Policy (c): Permit agricultural use of land which is unsuitable for building because it is within flood plains, or is subject to hazards to public health, safety, and welfare or similar constraints precluding development. Conversion from agricultural use may be allowed where the identified hazard conditions have been eliminated.

Policy (d): Permit agricultural uses, on an interim bases, on land designated for development, and consider agricultural uses as part of the City’s planning efforts for the re-use of MCAS El Toro.

Policy (e): Encourage and support federal and state legislation proposed for the purpose of preservation of agricultural lands which are compatible with the City’s goals and objectives.

Policy (f): Allow for conversion of interim and permanent agricultural uses to development to provide land for the construction of housing units consistent with the Land Use and Housing Elements, and the development of commercial and industrial buildings consistent with the provision of job opportunities as described in the Land Use Element, where such conversion does not conflict with other L-10 policies.

Policy (g): Pursue the open space policies contained in the Conservation and Open Space Element and address any open space or aesthetic impacts from the conversion of interim and permanent agricultural uses to development as part of the City’s existing policies for the preservation of open space and existing policies for mitigation of views and aesthetic impacts under the policies in the Conservation and Open Space Element.

4.2.2 Impacts Identified in the OCGP FEIR and Addenda

The OCGP FEIR and Addenda determined the Overlay Plan would preserve in perpetuity 303 acres¹ of land for agricultural use, of which 251 acres are classified as Prime Farmland, Unique Farmland, and Farmland of Statewide Importance. The locations of the 303 acres of permanent agricultural land are listed below, and the Farmlands Map can be found in the OCGP FEIR as Figure 5.8-1:

¹ Please note that there is a typographical error within the OCGP FEIR: Table 1-2 on page 1-8 and Table 3-4 on pages 3-12 and 3-13 identify the total agricultural land as 303 acres; however on page 5.8-10 the agricultural use acreage is noted as 307.

4. Discussion of Checklist and Mitigation Measures

- **PA 30:** 13 acres within Planning Area Zone (PAZ) 26; and
- **PA 51:** 90 acres within PAZ 4; 200 acres within PAZ 1.

The Overlay Plan also resulted in the permanent loss of 802 acres of designated farmland comprised of 651 acres of Prime Farmland, 63 acres of Unique Farmland, and 88 acres of Farmland of Statewide Importance. This impact was considered significant and unavoidable.

It was determined the Overlay Plan resulted in a significant impact associated with the conversion of agricultural land to nonagricultural use. The OCGP FEIR noted the context of agricultural production in Orange County—including development pressures that have contributed to the decrease in agricultural production in the County overtime—which suggested that conversion of agricultural land to urban uses would occur with or without the development of the project.

Addendum No. 5 determined that the removal of 173 acres in PAZ 1 would not result in new significant impacts to agricultural resources (refer to Section 4.2.3 of Addendum No. 5 for additional details). Despite the Prime Farmland designation, none of the soils in PAZ 1 are currently used for growing crops. As well, existing regulatory programs, namely, the City of Irvine General Plan Objective L-10 and establishment of the Irvine Agricultural Legacy Program address and mitigate this loss of agricultural land. As a result, this project is required to preserve 130 acres for permanent agricultural use.

4.2.3 Impacts Associated with the Requested Entitlements

Modifications to VTTM 17008 include changes to the street and lot configuration within the Lifelong Learning District and Transit Oriented Development District. VTTM 17283 defines the subdivision area for non-residential development within the Lifelong Learning District. Both the VTTMs and related applications are consistent with the various land uses, densities, development standards, and intensities allowed under the existing General Plan and Zoning Code. Amended VTTM No. 17008, Proposed VTTM No. 17283, or the associated actions would not increase allowable intensities or areas planned for development and would not create any new impacts to agricultural resources beyond those evaluated in the OCGP FEIR and Addenda.

Major EIR Revisions Not Required. Based on the foregoing analysis and information, there is no evidence that the changes to the project require a major change to the certified OCGP FEIR. The project would not result in any new significant environmental impact nor is there a substantial increase in the severity of impacts from that described in the certified OCGP FEIR.

No Substantial Change in Circumstances Requiring Major EIR Revisions. There is no information in the record or otherwise available indicating substantial changes in circumstances that would require major changes to certified OCGP FEIR.

No New Information of Substantial Importance Showing Greater Significant Effects Than Previous EIR. This Initial Study/Addendum has analyzed all available relevant information and has determined that there is no new information of substantial importance that was unknown and could not have been known with the exercise of reasonable diligence at the time the OCGP EIR was certified, indicating that the project will have one or more significant effects not discussed in the previous EIR or result in a substantial increase in the severity of previously identified effects.

No New Information of Substantial Importance Showing Ability to Reduce Significant Effects in Previous EIR. This Initial Study/Addendum has analyzed all available relevant information and has determined that there is no new information of substantial importance that was unknown and could not have been known with the exercise or reasonable diligence at the time the OCGP FEIR was certified, indicating

4. Discussion of Checklist and Mitigation Measures

that; 1) mitigation measures or alternatives previously found not to be feasible would in fact be feasible, and would substantially reduce one or more significant effects of the project, but the project proponent declines to adopt the mitigation measures or alternatives; or 2) mitigation measures or alternatives that are considerably different from those analyzed in the previous EIR would substantially reduce one or more significant effects on the environment, but the project proponent declines to adopt the mitigation measures or alternatives. There are no alternatives to the project or additional mitigation measures that would substantially reduce one or more of the significant agricultural effects identified in and considered by the certified OCGP FEIR.

4.2.4 Mitigation from the OCGP FEIR and Applicability to the Requested Entitlements

Mitigation measures AG1 through AG3 would be implemented in conjunction with master plan review and subsequent development permits. The project would neither change these mitigation measures nor their application to future development projects.

AG1 In order to encourage agriculture as an interim land use pending development on the project site by warning future residents that they are buying or renting a house adjacent to existing agricultural operators, City of Irvine Standard Discretionary Case Condition B.4 and City of Irvine Subdivision Condition 3.4 regarding disclosure statements shall be amended to include the following for subdivisions proposed adjacent to existing agricultural operations:

Prior to issuance of building permits, the applicant shall submit, and the Director of Community Development shall have approved, a completed occupancy disclosure form for the project. The approved disclosure form, along with its attachments, shall be included as part of the rental/lease agreement and as part of the sales literature for the project. The disclosure statement shall include the following information:

- Continuation of agricultural operations adjacent to the site and their potential effects (spraying of pesticides, noise, dust, odor, etc.) on future residents or tenants.

AG2 Heritage and community service/educational farming operations shall be encouraged within utility easements and other lands. Heritage farming is defined as small-scale specialty farming operations that can be accommodated in an urban environment. An example would be the Edible Landscape project located adjacent to Harvard Avenue within the Edison right-of-way.

AG3 Future landowners and the City shall work cooperatively with farmers to minimize conflicts between agricultural operation and adjacent urban uses.

4.3 AIR QUALITY

4.3.1 Environmental Setting

The OCGP FEIR described the existing air quality regarding the following regulated pollutants: ozone (O₃), carbon monoxide (CO), suspended particulate matter (PM₁₀), nitrogen oxides (NO_x), sulfur dioxide (SO₂), lead (Pb), volatile organic compounds (VOC), and reactive organic gases (ROG). The South Coast Air Basin (SCAB) is described as a non-attainment area for O₃, CO, and PM₁₀; annual maximum concentrations of O₃, CO, PM₁₀, and SO₂ exceeded both federal and state standards in some or all areas in the SCAB during the reporting period (2000). In contrast, standards for nitrogen dioxide (NO₂), SO₂, and Pb were not exceeded during the reporting period. The OCGP FEIR also noted the pending promulgation by the U.S. Environmental Protection Agency (EPA) and California Air Resources Board of standards for PM_{2.5}.

4. Discussion of Checklist and Mitigation Measures

(particulate matter less than 2.5 microns in diameter). The standards are provided in Table 4-1 (Federal and State Standards for PM_{2.5}) below.

Table 4-1 Federal and State Standards^a for PM_{2.5}		
Averaging Time	Federal Standards	California Standards^b
Annual Arithmetic Mean	15 µg/m ³	12 µg/m ³
24-Hour	65 µg/m ³	No Separate Standard

Sources:
a www.epa.gov/pmdesignations/state/California.htm [June 5, 2006].
b 17 CFR §70200, Table of Standards.

The California Air Resources Board adopted the annual standard identified above but has postponed establishing a 24-hour standard for PM_{2.5}. EPA has identified several counties, including Orange County, as PM_{2.5} non-attainment areas. EPA is in the process of responding to comments on related regulations. At the local level, the South Coast Air Quality Management District (SCAQMD) is in the process of developing a methodology for calculating PM_{2.5} and PM_{2.5} significance thresholds for the purpose of analyzing local and regional air quality impacts in CEQA documents. A draft communication issued in May 2006 by the SCAQMD to its working group indicated that the methodology for calculating PM₁₀ could also be used to calculate PM_{2.5}.

4.3.2 Impacts Identified in the OCGP FEIR and Addenda

The OCGP FEIR identified significant air quality impacts associated with construction and operation of the Overlay Plan. The construction impact analysis assumed that demolition, grading, and new construction would occur in two phases; the first phase would begin in 2007 and end in 2016 and the second phase would begin in 2017 and end in 2025. The emissions associated with demolition of existing structures, including 31.2 million cubic feet of concrete from removal of the runways, site grading and development would generate construction air emissions above the significance thresholds for ROG, NO_x and PM₁₀. The OCGP FEIR described the construction air impacts after mitigation as significant and unavoidable. (Refer to OCGP FEIR pp. 5.3-16 through 5.3.20.)

The operations-related air quality impacts associated with build-out under the Overlay Plan included emissions associated with energy consumption and vehicular trips. The Urban Emissions (URBEMIS) 2001 model and EMFAC7F (motor vehicle emission factor model) were used in the OCGP FEIR to estimate air emissions associated with operation of the project site through the “post 2025” analysis year (i.e., General Plan build-out). The operations air emissions for project area and vehicular mobile sources were estimated at above the significance thresholds for ROG, NO_x, CO, and PM₁₀, are described in the OCGP FEIR as significant after mitigation, and are an unavoidable consequence of the project’ (adopted Plan). No other construction- and operations-related significant air quality impacts were identified in the OCGP FEIR. (Refer to OCGP FEIR pp. 5.3-20 through 5.3-58, and 7-19.)

In addition, the OCGP FEIR disclosed the results of the CO “hotspots” analysis, in which levels of CO concentrations were predicted for intersections with a LOS of “D” or higher at AM and PM peak hours using the CALINE 4.0 model and EMFAC7F motor vehicle emissions factors. No intersections in the traffic study area were expected to result in one-hour or eight-hour CO concentrations above the state standard of 20

4. Discussion of Checklist and Mitigation Measures

parts per million (ppm) for one-hour concentrations and 9 ppm for eight-hour concentrations. (Refer to OCGP FEIR pp. 5.3-31 through 5.3-53.)

As part of the certification of the OCGP FEIR, Findings of Fact and a Statement of Overriding Considerations were adopted for unmitigatable environmental effects, including air quality.

Operations Phase

Among the various sources of a project's operations-phase emissions, those attributable to mobile sources (i.e. vehicular traffic) comprise the largest proportion by far. Mobile source emissions are a function of both the number and trip length characteristics of vehicle trips directly and indirectly associated with the project under consideration. The OCGP FEIR estimates of the daily mobile source emission volumes attributable to OCGP project implementation were based on traffic volumes and average trip lengths associated with build out of the overall OCGP project pursuant to adopted Overlay Plan development parameters. The development parameters for the OCGP project as a whole under the Overlay Plan were provided in OCGP FEIR Table 3-4 beginning at Page 3-12.

Since the Amended VTTM No. 17008, Proposed VTTM No. 17283, and the associated actions implements a portion of the development of the LLD in the approved Overlay Plan, it is consistent with the development parameters that served as the basis for determining the operations phase-related mobile source emissions provided in the OCGP FEIR and Addenda, the results of the operations phase-related emissions provided in the OCGP FEIR and Addenda adequately characterize the potential air quality effects of the project and further analysis is neither warranted nor required.

Construction Phase

With regard to the Overlay Plan construction, more precise and refined information regarding earth movement quantities, locations and anticipated demolition activities and timeframes than what was known and analyzed in the July 2003 OCGP FEIR has become available. PCR Services Corporation prepared reports for Addendum No. 3 and 4 in which they conducted an analysis to determine whether the projected emissions associated with more recent, precise and refined information regarding the Overlay Plan and OCGP Conceptual Master Plan (refer to Section 4.3.3 of Addendum No. 3 and Section 4.3.3 of Addendum No. 4 for additional details). Both Addenda determined that earthmoving activities would be consistent with the emissions inventory assumed in the certified OCGP FEIR and within the envelope of the original air quality analysis. The subject reports are available for review in Appendix B of Addendum No. 3 and Appendix C of Addendum No. 4, OCGP FEIR.

The analysis was conducted using SCAQMD's recommended CEQA emissions inventory model URBEMIS. A new version of URBEMIS (URBEMIS 2007 Version 9.2) was released in 2007 and was used in this analysis in accordance with SCAQMD's most recent recommendations for preparation of air quality analyses. The new version of URBEMIS is considered a major overhaul to URBEMIS 2002. It incorporates the current version of California Air Resources Board's OFFROAD model (OFFROAD 2007) construction equipment emission factors and reflects a better estimate of the population, activity, and emissions estimate of the varied types of off-road equipment. The emissions estimates from the proposed grading equipment mix are provided in Table 4-2 (*Comparison of Daily Construction Emissions for OCGP Construction Activities*).

4. Discussion of Checklist and Mitigation Measures

Table 4-2
Comparison of Daily Construction Emissions for OCGP Construction Activities

<i>Emissions Inventory</i>	<i>Emission Totals, lbs./day [tons per day]</i>				
	<i>CO</i>	<i>NO_x</i>	<i>PM₁₀</i>	<i>VOC</i>	<i>SO_x</i>
OCGP FEIR	280	840	1440	4660 ^c	40
OCGP Site Grading ^a	174	343	663	37	<1
SCAQMD Significance Threshold ^b	550	100	150	75	150
Over (Under)	(376)	243	513	(38)	(149)
Significant for OCGP FEIR?	No	Yes	Yes	Yes	No
Significant for OCGP Equipment Mix?	No	Yes	Yes	No	No

Source: PCR Services Corporation 2007.

a Compiled using the URBEMIS 2007 emissions inventory model and EPA AP-42 emission factors for PM₁₀

b The OCGP FEIR misstated the CEQA Significant Thresholds on Tables 5.3-12 and 5.3-13 for VOC and NO_x as 0.03 tpd, which are the correct thresholds for those pollutants during the operational phase of a project. The significance determinations in the OCGP FEIR were correctly assessed.

c VOC emissions presented in the OCGP FEIR are for application of architectural coatings. VOC emissions for site grading would result in a slight decrease based on the other pollutant trends.

As shown in Table 4-2 above, the OCGP equipment mix results in an overall decrease in daily emissions associated with equipment exhaust and fugitive dust PM₁₀, as compared to those levels estimated for the FEIR. The equipment mix identified above could complete the grading associated the assumptions contained in the OCGP FEIR. As Addendum No. 4 concluded, no new significant impacts and no substantial increase in the severity of previously identified impacts would occur as a result of implementation of the OCGP equipment mix. The addendum does not address other construction activities, such as painting and paving, which resulted in the VOC emissions reported previously in the OCGP FEIR.

Concurrent Grading and Demolition Activities

The site grading and demolition will most likely occur in a phased approach, over the course of numerous years. PCR also conducted an analysis to determine whether the construction emissions inventory for a maximum plausible worst case day (consisting of concurrent grading of the OCGP Master Plan along with site grading activities for Heritage Fields, the Agua Chionon, and the wildlife corridor and runway demolition activities) is consistent with the emissions inventory presented in the OCGP FEIR and is within the envelope of the original air quality impact assessment.

- Assumptions were developed and refined consistent with the requirements for the proposed demolition and grading activities. Details of the emissions and calculation from the concurrent construction activities are provided in Section 4.3.3 of Addendum No. 4.

The analysis was conducted using SCAQMD's recommended CEQA emissions inventory model URBEMIS 2007 Version 9.2. The emission inventory prepared for Addendum No. 3 used the previous version of URBEMIS (URBEMIS 2002) and was therefore updated using URBEMIS 2007. The new version of URBEMIS is considered a major overhaul to URBEMIS 2002. . The emissions from the concurrent construction activities are provided in Table 4-3 (*Comparison of Daily Construction Emissions for Concurrent OCGP Construction Activities*). Concurrent grading and demolition activities results in a slight decrease in equipment exhaust emissions and fugitive dust PM₁₀ emissions, as compared to those levels estimated for the OCGP FEIR. While CO emissions show an increase, that increase is a function of updated emission factors in the current version of URBEMIS2007 and not a substantial change in the construction intensity. Regardless, CO

4. Discussion of Checklist and Mitigation Measures

emissions are less than the SCAQMD significance threshold and no new significant impacts and no substantial increase in the severity of previously identified impacts would occur as a result of concurrent construction activities. It should be noted that these emission estimates do not address other construction activities, such as painting and paving, which resulted in the VOC emissions reported previously in the OCGP FEIR.

Table 4-3
Comparison of Daily Construction Emissions for Concurrent OCGP Construction Activities

<i>Emissions Inventory</i>	<i>Emission Totals, lbs./day [tons per day]</i>				
	<i>CO</i>	<i>NOx</i>	<i>PM10</i>	<i>VOC</i>	<i>SOx</i>

b The OCGP FEIR misstated the CEQA Significant Thresholds on Tables 5.3-12 and 5.3-13 for VOC and NOx as 0.03 tpd, which are the correct thresholds for those pollutants during the operational phase of a project. The significance determinations in the OCGP FEIR were correctly assessed.

c VOC emissions presented in the OCGP FEIR are for application of architectural coatings. VOC emissions for site grading would result in a slight decrease based on the other pollutant trends.

4.3.3 Impacts Associated with the Requested Entitlements

Regional Construction Impacts

Construction activities associated with the proposed project would have a short-term impact on air quality. Construction emissions associated with construction of the backbone infrastructure and development within the LLD portion of Planning Area 51 were included in the OCGP FEIR and Addenda, since Amended VTTM No. 17008, Proposed VTTM No. 17283, and the associated actions are consistent with the adopted Overlay Plan. Neither VTTM allows any additional development intensity beyond that allowed by the adopted Overlay Plan and no increase in construction emissions would occur. In addition, the analytical assumptions concerning construction, development phasing, and operations of the adopted Overlay Plan remain appropriate for the project (OCGP FEIR Table 5.3-14). Consequently, the project would not increase the maximum daily air pollutant emissions generated during construction and demolition activities. The OCGP FEIR concluded that air pollutant emissions associated with construction and demolition activities of the Overlay Plan were considered a Significant Unavoidable Adverse Impact. As part of the certification of the OCGP FEIR, Findings of Fact and a Statement of Overriding Considerations were adopted for unmitigatable environmental effects, including air quality. The construction air emissions associated with the project are anticipated to be less than those addressed in the OCGP FEIR, and therefore would not result in any new significant impacts that were not previously anticipated.

4. Discussion of Checklist and Mitigation Measures

Regional Operational Impacts

Amended VTTM No. 17008, Proposed VTTM No. 17283, and the associated actions would not result in land use changes that would increase project-related stationary or mobile sources of air pollution generated by the approved Overlay Plan. Neither VTTMs or associated actions allows any additional development intensity beyond that allowed by the adopted Overlay Plan or increases project-generated trips. Consequently, the project would not increase the maximum daily air pollutant emissions generated during operational activities. The OCGP FEIR concluded that air pollutant emissions associated with operational activities of the Overlay Plan were considered a Significant Unavoidable Adverse Impact. As part of the certification of the OCGP FEIR for OCGP, Findings of Fact and a Statement of Overriding Considerations were adopted for unmitigatable environmental effects, including air quality. Therefore, the operational air emissions associated with the project are anticipated to be less than those addressed in the OCGP FEIR, and therefore would not result in any new significant impacts that were not previously anticipated.

Consistency Determination with the Air Quality Management Plan

The OCGP FEIR included a consistency evaluation with the SCAQMD's Air Quality Management Plan (AQMP). The consistency evaluation concluded development of the adopted Overlay Plan would have a negligible impact on the overall air quality within the South Coast Air Basin. The project would not result in new activities or new land uses that would change the consistency evaluation in the OCGP FEIR.

Localized Construction Impacts

As stated previously, the project would not increase the maximum daily air pollutant emissions generated during construction activities. However, the OCGP FEIR identified significant localized air quality impacts associated with construction of the adopted Overlay Plan based on the extent and schedule of construction activities, primarily from particulate matter (PM₁₀ and PM_{2.5}) emissions associated with fugitive dust. The OCGP FEIR concluded that air pollutant emissions associated with construction activities of the Overlay Plan were considered a Significant Unavoidable Adverse Impact. As part of the certification of the OCGP FEIR for OCGP, Findings of Fact and a Statement of Overriding Considerations were adopted for unmitigatable environmental effects, including air quality. The construction air emissions associated with the project are anticipated to be less than those addressed in the OCGP FEIR, and therefore would not result in any new significant impacts which were not previously anticipated.

Localized Operational Impacts

The OCGP FEIR did not identify significant localized air quality impacts associated with operation of the adopted Overlay Plan for either mobile sources or stationary sources. Because the project would not result in an increase of the number of units or permitted square footage of buildings on-site, the project would not increase the concentrations of stationary-source air pollutant emissions generated during operational activities.

Odors

The OCGP FEIR identified that development of the adopted Overlay Plan would not handle large amounts of solid waste, chemicals associated with heavy industry, or other uses that would generate objectionable odors and that no significant odor impacts would occur. The project would not result in new activities or new land uses that would change the odor evaluation in the OCGP FEIR.

4. Discussion of Checklist and Mitigation Measures

Major EIR Revisions Not Required. Based on the foregoing analysis and information, there is no evidence that the changes to the project require a major change to the certified OCGP FEIR. The project would not result in any new significant environmental impact nor is there a substantial increase in the severity of impacts from that described in the certified OCGP FEIR.

No Substantial Change in Circumstances Requiring Major EIR Revisions. There is no information in the record or otherwise available indicating substantial changes in circumstances that would require major changes to certified OCGP FEIR.

No New Information of Substantial Importance Showing Greater Significant Effects Than Previous EIR. This Initial Study/Addendum has analyzed all available relevant information and has determined that there is no new information of substantial importance, that was unknown and could not have been known with the exercise of reasonable diligence at the time the OCGP EIR was certified, indicating that the project would have one or more significant effects not discussed in the previous EIR or result in a substantial increase in the severity of previously identified effects.

No New Information of Substantial Importance Showing Ability to Reduce Significant Effects in Previous EIR. This Initial Study/Addendum has analyzed all available relevant information and has determined that there is no new information of substantial importance, that was unknown and could not have been known with the exercise of reasonable diligence at the time the OCGP FEIR was certified, indicating that; 1) mitigation measures or alternatives previously found not to be feasible would in fact be feasible, and would substantially reduce one or more significant effects of the project, but the project proponent declines to adopt the mitigation measures or alternatives; or 2) mitigation measures or alternatives that are considerably different from those analyzed in the previous EIR would substantially reduce one or more significant effects on the environment, but the project proponent declines to adopt the mitigation measures or alternatives. There are no alternatives to the project or additional mitigation measures that would substantially reduce one or more of the significant air quality effects identified in and considered by the certified OCGP FEIR.

4.3.4 Mitigation from the OCGP FEIR and Applicability to the Requested Entitlements

The OCGP FEIR identified mitigation measures AQ1 through AQ5, which reduce the air quality effects of construction and operations of development under the adopted Plan. However, as noted above, the OCGP FEIR found that short-term and long-term air quality impacts would remain significant and unavoidable. The measures are applicable to future development under the project.

- AQ1 Prior to the start of demolition and construction within the project area, adjacent sensitive receptors shall be informed of the planned demolition and construction activities. Measures to avoid significantly impacting these receptors shall be developed and implemented by the project proponent in coordination with these uses. Other applicable mitigation measures such as erection of fences around construction areas; staggered use of equipment near sensitive receptors; diversion of truck trips away from receptors; etc.; shall be employed as necessary. Compliance with this measure shall be verified by the Director of Community Development.
- AQ2 Prior to the commencement of construction activities required to demolish and/or remove existing DON structures, including runways, the Director of Community Development shall receive and approve a construction emissions mitigation plan from the chosen demolition contractor. Prior to the issuance of grading permits, the applicant of any future development project shall submit, and the Director of Community Development shall approve a construction emissions mitigation plan. The plan shall identify implementation procedures for each of the

4. Discussion of Checklist and Mitigation Measures

following emissions reduction measures and all feasible mitigation measures shall be implemented. If certain measures are determined infeasible, an explanation thereof shall be provided.

- Evaluate the availability and use, if available, of low-emission (i.e., methanol- or natural gas-powered) construction equipment instead of diesel for each construction phase.
- Water exposed soils at least twice daily and maintain equipment and vehicle engines in good condition and in proper tune.
- Wash off trucks leaving the site.
- Replace ground cover on construction sites when it is determined that the site will be undisturbed for lengthy periods.
- Reduce speeds on unpaved roads to less than 15 miles per hour.
- Halt all grading and excavation operations when wind speeds exceed 25 miles per hour.
- Suspend all emission generating activities during smog alerts.
- Use propane- or butane-powered on-site mobile equipment instead of diesel/gasoline, whenever feasible.
- Properly maintain diesel-powered on-site mobile equipment.
- Sweep streets at the end of the day if substantial visible soil material is carried over to the adjacent streets.
- Use electricity from power poles rather than temporary on-site diesel- or gasoline-powered generators, whenever feasible.
- Use of low-VOC asphalt.
- Cover all trucks hauling dirt, sand, soil or other loose material to and from the site.
- Provide temporary traffic controls (e.g., flag persons) during all phases of construction to ensure minimum disruption of traffic.
- Schedule construction activities that affect traffic flow on adjoining streets to off-peak hours to the extent possible.
- Reroute construction trucks away from congested streets, whenever feasible.
- Provide dedicated turn lanes for movement of construction trucks and equipment on- and off-site, whenever feasible.

AQ3 Prior to the issuance of building permits for any future development, the applicant shall submit, and Director of Community Development shall have approved, an operation-emissions mitigation plan. The plan shall identify implementation procedures for each of the following

4. Discussion of Checklist and Mitigation Measures

emissions reduction measures and all feasible mitigation measures shall be implemented. If certain measures are determined infeasible, an explanation thereof shall be provided.

- Utilize built-in energy-efficient appliances to reduce energy consumption and emissions.
- Utilize energy-efficient and automated controls for air conditioners and lighting to reduce electricity consumption and associated emissions.
- Install special sunlight-filtering window coatings or double-paned windows to reduce thermal loss, whenever feasible.
- Utilize light-colored roofing materials as opposed to dark roofing materials to conserve electrical energy for air-conditioning.
- Provide shade trees in residential subdivisions as well as public areas, including parks, to reduce building heating and cooling needs, whenever feasible.
- Ensure that whenever feasible, commercial truck traffic is diverted from local roadways to off-peak periods.
- Centralize space heating and cooling for multiple-family dwelling units and commercial space.
- Orient buildings north/south for reducing energy-related combustion emissions.
- Use solar energy, when feasible.
- Use high rating insulation in walls and ceilings.

AQ4 At the time of residential and commercial lease and sales agreements, future sales information on available housing and employment opportunities within the project area shall be provided to employees and residents of the project area, so as to encourage employees to live within the residential developments planned on-site and future residents to find employment nearby.

AQ5 At the time of residential and commercial lease and sales agreements, the applicant shall demonstrate to the satisfaction of the Director of Community Development that future employment generating nonresidential development shall include measures to reduce vehicle trips including: the promotion of carpool incentives and alternative work schedules, easy access to public transit systems, trail linkages between uses, low emissions vehicles fleets, and the provision of on-site facilities such as banking and food courts, and bicycle parking facilities, and other transportation demand management measures, as deemed appropriate.

4.4 BIOLOGICAL RESOURCES

4.4.1 Environmental Setting

The OCGP FEIR described the biological resources within Planning Areas 30 and 51, including a 995-acre parcel of land in the easternmost portion of Planning Area 51 retained in federal ownership and designated as both “habitat reserve” and a part of the Orange County Central-Coastal Sub-region Natural Community Conservation Plan/Habitat Conservation Plan (NCCP/HCP). The areas outside the habitat reserve were

4. Discussion of Checklist and Mitigation Measures

described as: 1) providing minimal native or undisturbed habitat, and, 2) consisting of agricultural, ornamental, and domestic landscapes.

The OCGP FEIR identified nine vegetative communities within the project site, including Venturan-Diegan sage scrub, southern cactus scrub, chaparral, woodland, riparian scrub, grassland, open water, agriculture, and predominately disturbed or developed areas. Several sensitive plant species and a large number of mature trees also were identified as potentially occurring within the project site. The sensitive plant species potentially occurring in Planning Areas 30 and 51 include the southern tarplant, Palmer's grapplinghook, many-stemmed dudleya, Coulter's Matilija poppy, Catalina mariposa lily, and intermediate mariposa lily. The OCGP FEIR also noted the Coulter's saltbush, Laguna Beach dudleya, San Fernando Valley spineflower, and the Lewis's evening-primrose as having a moderate potential for occurrence. Species with a low potential for occurrence include the Los Angeles sunflower, south coast saltscale, Santa Monica Mountains dudleya, heart-leafed pitcher sage, coast wooly-heads, slender-horned spineflower, Santa Barbara morning glory, tecate cypress, and salt spring checkerbloom.

The OCGP FEIR documented an observation made of one sensitive wildlife species, a burrowing owl. This individual, observed during the conductance of protocol focus studies for a nearby development proposal, was outside the habitat reserve at the southwest end of Planning Areas 30 and 51 along Serrano Creek. Forty other sensitive wildlife species or species of local concern were identified as having a potential to occur on the site.

The OCGP FEIR also describes the Wildlife Corridor Concept Plan that would be incorporated into the eastern portion of the project site (Refer to pp. 5.9-9 through 5.9-14 of the OCGP FEIR) and explains the guidelines pursuant to which the ultimate corridor will be designed and constructed. The subject guidelines are primarily concerned with the creation and re-vegetation of wildlife habitats that would flourish in the proposed areas and serve as protective cover for target wildlife species that will presumably utilize the proposed corridor. A preliminary design concept for the creation and/or re-vegetation of the proposed route has also been prepared which is consistent with the guidelines described below (Draft Irvine Wildlife Corridor Master Plan, November 2002). The draft recommends a series of actions to improve the environmental quality for wildlife:

- Creation (establishes historical ecosystems on lands that did not previously support that ecosystem or on severely altered sites)
- Revegetation
- Reduce the amount of noise pollution and urban influence.
- Remove and restore the unnecessary developed (paved) areas within the corridor right-of-way.
- Create a protective habitat along the entire length of the corridor.
- Apply minimum height/width requirements based on the specific wildlife species.

OCGP FEIR Mitigation Measure BIO3, which continues to apply to this addendum, ensures that the City of Irvine will continue to work with State and federal agencies to implement the revegetation/restoration plan necessary to create a viable wildlife corridor within the project area. The City has already engaged in this process as is demonstrated through the preparation of the Draft Irvine Wildlife Corridor Master Plan, which is independent of this project.

4. Discussion of Checklist and Mitigation Measures

4.4.2 Impacts Identified in the OCGP FEIR and Addenda

The OCGP FEIR concluded that implementation of the overall project could result in the occurrence of the following potentially significant effects:

- The southern tarplant, a federal species of concern, might be adversely affected by project development.
- Although very limited in aerial extent and highly disturbed wetland, there exist isolated riparian habitat remnants that could be adversely impacted by project implementation.

The project site contains a large number of trees, many of which are mature, representing a wide range of species. Project implementation may result in damage and destruction of the trees. A significant impact related to conflicts with the City's Urban Forestry Ordinance could occur.

4.4.3 Impacts Associated with the Requested Entitlements

Amended VTTM No. 17008, Proposed VTTM No. 17283, and the associated actions are consistent with the adopted Overlay Plan, and the impacts of that development on Biological Resources were analyzed in the OCGP FEIR. Amended VTTM No. 17008, Proposed VTTM No. 17283, or the associated actions would not allow any additional development intensity beyond what is allowed by the adopted Overlay Plan, but merely implements the backbone infrastructure and allows development of the LLD consistent with that Plan. Therefore, the project would not result in any new or increased impacts to any biological resources beyond those evaluated in the OCGP FEIR.

Major EIR Revisions Not Required. Based on the foregoing analysis and information, there is no evidence that the changes to the project require a major change to the certified OCGP FEIR. The project would not result in any new significant environmental impact nor is there a substantial increase in the severity of impacts from that described in the certified OCGP FEIR.

No Substantial Change in Circumstances Requiring Major EIR Revisions. There is no information in the record or otherwise available indicating substantial changes in circumstances that would require major changes to certified OCGP FEIR.

No New Information of Substantial Importance Showing Greater Significant Effects Than Previous EIR. This Initial Study/Addendum has analyzed all available relevant information and has determined that there is no new information of substantial importance that was unknown and could not have been known with the exercise of reasonable diligence at the time the OCGP EIR was certified, indicating that the project would have one or more significant effects not discussed in the previous EIR or result in a substantial increase in the severity of previously identified effects.

No New Information of Substantial Importance Showing Ability to Reduce Significant Effects in Previous EIR. This Initial Study/Addendum has analyzed all available relevant information and has determined that there is no new information of substantial importance that was unknown and could not have been known with the exercise of reasonable diligence at the time the OCGP FEIR was certified, indicating that 1) mitigation measures or alternatives previously found not to be feasible would in fact be feasible, and would substantially reduce one or more significant effects of the project, but the project proponent declines to adopt the mitigation measures or alternatives; or 2) mitigation measures or alternatives that are considerably different from those analyzed in the previous EIR would substantially reduce one or more significant effects on the environment, but the project proponent declines to adopt the mitigation measures

4. Discussion of Checklist and Mitigation Measures

or alternatives. There are no alternatives to the project or additional mitigation measures that would substantially reduce one or more of the significant biological effects identified in and considered by the certified OCGP FEIR.

4.4.4 Mitigation from the OCGP FEIR and Applicability to the Requested Entitlements

Mitigation measures BIO1 through BIO4 would be implemented in conjunction with master plan review and subsequent development permits. The project would neither change these mitigation measures nor their application to future development projects.

- BIO1 Prior to approval of a subdivision map for each project area, a focused survey for the southern tarplant, mountain plover, and burrowing owl shall be conducted. Prior to approval of a subdivision map for development within or in proximity to Serrano Creek, a focused survey shall be conducted for the least Bell's vireo and southwestern willow flycatcher. Should the focused survey identify a significant population of southern tarplant or mountain plover, or the presence of burrowing owl, least Bell's vireo, or southwestern willow flycatcher in an area proposed for development, impacts shall be avoided through incorporation of the species into an open space easement, or if impacts cannot be avoided, then mitigation shall be negotiated through consultation with the United States Fish and Wildlife Service (USFWS) and the California Department of Fish and Game (CDFG).
- BIO2 Prior to approval of a subdivision map for each project area, a wetland delineation shall be performed for all areas within the master plan sub-area that contain the potential for wetland habitat and/or jurisdictional waters. The loss of impacted wetlands shall be mitigated through the implementation of a wetland mitigation plan prepared and accepted by the appropriate agency (i.e., U.S. Army Corps of Engineers, U.S. Fish and Wildlife Service, California Department of Fish and Game). Wetlands impacted on-site shall be mitigated through on-site or off-site replacement, recreation (i.e., within the proposed wildlife corridor), and/or re-vegetation as deemed acceptable by the appropriate jurisdictional agencies.
- BIO3 The City shall continue to work with State and federal agencies during the implementation of the proposed project to implement the revegetation/restoration plan for the wildlife corridor. Measures such as sight and sound barriers, including artificial sound walls and natural diversions (e.g., hedges and tree lines) shall be incorporated into corridor design to ensure the viability of the corridor. The City shall implement the corridor consistent with the design criteria and viability analysis established in the OCGP FEIR.
- BIO4 Prior to issuance of a grading permit for each project area, a complete inventory of all trees of trunk diameter at breast height (DBH) greater than six inches and any significant (as determined by a certified arborist selected by the City) plants on the project site, excluding those within the habitat preserve shall be prepared. This inventory shall be prepared by an arborist certified by the International Society of Arboriculture and shall include (but not be limited to) data for each tree such as species, variety, DBH, condition (excellent, good, fair, poor, dead), and any recommendations. All trees in this inventory shall be considered "Significant Trees" under the City of Irvine's Urban Forestry Ordinance (UFO) (Sections 5-7-401 et al.) and the UFO shall apply to all trees included in this inventory.

4. Discussion of Checklist and Mitigation Measures

4.5 CULTURAL RESOURCES

4.5.1 Environmental Setting

Cultural Resources

The discussion of cultural resources includes archaeological and historical resources. The OCGP FEIR presents information pertaining to the regional setting of former MCAS El Toro from both a prehistoric and historic perspective. The OCGP FEIR reported the presence of ten prehistoric archaeological sites and eight isolated prehistoric artifacts that have been recorded in the northeastern habitat preserve portions of PA 51. These sites are generally on the ridges between Borrego Canyon Wash and the Agua Chinon Wash.

The former MCAS El Toro was surveyed to determine whether any of the structures would be eligible for the National Register. Generally, a structure that has achieved significance in the past 50 years is not considered eligible for the National Register unless it is of exceptional importance. The evaluation was expanded to include eligibility under the Legacy Cold War Project (Public Law No. 101-511, Section 8120). Portions of PAs 30 and 51 (the former MCAS El Toro) were established during WWII, and no structure earlier than this period is at the former MCAS El Toro. Therefore, the historical significance of any structures at the former military base would be as part of the Cold War Legacy. Surveys conducted by the US Army Corps of Engineers and the Department of the Navy in conjunction with the base's closure concluded there were no structures eligible for designation as Cold War Legacy or for inclusion in the National Register of Historic Places.

Paleontological Resources

The OCGP FEIR reported that a majority of Planning Areas 30 and 51 is on the Tustin Plain, a coastal alluvial plain. Alluvium from the Late Pleistocene to Holocene Epochs (approximately 2 million to 11,000 years ago) immediately underlies the majority of the project area, including the part occupying the coastal plain and washes in the eastern portion of PA 51. The Pleistocene Alluvium formation is widespread and believed to extend to depths of 1,000 feet in PA 30. A significant deposit of Pleistocene terrestrial vertebrates was recovered during excavation of a flood control basin four miles from PA 30; thus, it is possible that similar beds underlie PA 30 (OCGP FEIR 5.10-2).

The eastern portion of PA 51 is in the western foothills of the northern Santa Ana Mountains. The hills and ridges in the eastern part of PA 51 are composed of older, underlying marine and nonmarine rock units of early Oligocene to late Pleistocene (23 million to 2 million years ago). In order of decreasing geologic age, these latter rock units include the undifferentiated Sespe and Vaqueros Formations, Topanga and Monterey Formations, Oso Member of the Capistrano Formation, Niguel Formation, and Nonmarine Terrace Deposits. Nonmarine Terrace Deposits also underlie the terraces at the south corner of PA 51. The northwestern corner of PA 51 contains a small portion of the Santa Ana Mountains foothills, which were separated from the main formation by erosion. This small portion is composed of undifferentiated late Cretaceous (135 million years ago) Marine Williams Formation. The rock units underlying portions of PA 51 have previously yielded important fossil remains at recorded fossil sites on and near the site. There are three recorded fossil sites in PA 51. These sites occur in undifferentiated Sespe and Vaqueros Formations and in the Topanga Formation. Fossil types include marine invertebrates and vertebrates, continental vertebrates, land plants, and land mammals. The three recorded fossil sites lie within the proposed habitat preserve portion of PA 51 (OCGP FEIR p. 5.10-1 and Table 5.10-1).

4. Discussion of Checklist and Mitigation Measures

4.5.2 Impacts Identified in the OCGP FEIR and Addenda

Cultural Resources

The OCGP FEIR determined that development according to the adopted Overlay Plan would not cause a substantial adverse change in the significance of any historical structure. The consequence of grading activities associated with future development, however, could potentially result in a substantial adverse change in the significance of an archaeological resource. The OCGP FEIR also stated that grading activities could uncover previously unknown human remains, including those interred outside formal cemeteries.

Although the entire project area was the subject of previous cultural resources investigations as part of the Base Realignment and Closure process, it was later determined that an updated survey and report was necessary to supplement the previous work. PCR Services performed an additional Phase I and II cultural resources investigation, the results of which can be found in the *Cultural Resources Update and Review, Heritage Fields/The Great Park, City of Irvine, Orange County, California* report² dated September 2006. This report can be reviewed by the public at the City of Irvine, Community Development Department, at 13825 “B”, Irvine, California 92618.

Paleontological Resources

The OCGP FEIR stated that earthmoving operations associated with grading and trenching have the greatest potential to impact buried paleontological resources in the moderately to highly sensitive areas in the coastal plain and washes, northeastern, northwestern, and southern portions of Planning Area 51. The OCGP FEIR considered the potential impact associated with earthmoving operations as a significant impact for which mitigation was necessary.

4.5.3 Impacts Associated with Requested Entitlements

Cultural Resources

Amended VTTM No. 17008, Proposed VTTM No. 17283, or the associated actions provides a development that is consistent with the General Plan Land Use and Zoning designations for Planning Areas 30 and 51. The project would not allow any additional development intensity beyond what is allowed by the adopted Overlay Plan and would not open new areas to disturbance nor cause greater disturbance than reported in the OCGP FEIR. Therefore, impacts to cultural resources remain the same. The mitigation measures related to cultural resources developed for the OCGP FEIR remain applicable to future development under the project.

Paleontological Resources

As described in the OCGP FEIR, earthmoving operations such as grading and trenching have the potential to significantly impact buried paleontological resources. Amended VTTM No. 17008, Proposed VTTM No. 17283, or the associated actions would not allow any additional development intensity beyond what is allowed by the adopted Overlay Plan. Therefore, the impacts to paleontological resources remain the same. The paleontological mitigation measure developed for the OCGP FEIR remains applicable to future development under the project.

² *Cultural Resources Update and Review, Heritage Fields/The Great Park, City of Irvine, Orange County, California*, report is available for review at the City of Irvine.

4. Discussion of Checklist and Mitigation Measures

Major EIR Revisions Not Required. Based on the foregoing analysis and information, there is no evidence that the changes to the project require a major change to the certified OCGP FEIR. The project would not result in any new significant environmental impact nor is there a substantial increase in the severity of impacts from that described in the certified OCGP FEIR.

No Substantial Change in Circumstances Requiring Major EIR Revisions. There is no information in the record or otherwise available indicating substantial changes in circumstances that would require major changes to certified OCGP FEIR.

No New Information of Substantial Importance Showing Greater Significant Effects Than Previous EIR. This Initial Study/Addendum has analyzed all available relevant information and has determined that there is no new information of substantial importance was unknown and could not have been known with the exercise of reasonable diligence at the time the OCGP EIR was certified, indicating that the project would have one or more significant effects not discussed in the previous EIR or result in a substantial increase in the severity of previously identified effects.

No New Information of Substantial Importance Showing Ability to Reduce Significant Effects in Previous EIR. This Initial Study/Addendum has analyzed all available relevant information and has determined that there is no new information of substantial importance was unknown and could not have been known with the exercise of reasonable diligence at the time the OCGP FEIR was certified, indicating that: 1) mitigation measures or alternatives previously found not to be feasible would in fact be feasible, and would substantially reduce one or more significant effects of the project, but the project proponent declines to adopt the mitigation measures or alternatives; or 2) mitigation measures or alternatives that are considerably different from those analyzed in the previous EIR would substantially reduce one or more significant effects on the environment, but the project proponent declines to adopt the mitigation measures or alternatives. There are no alternatives to the project or additional mitigation measures that would substantially reduce one or more of the significant cultural or paleontological effects identified in and considered by the certified OCGP FEIR.

4.5.4 Mitigation from the OCGP FEIR and Applicability to the Requested Entitlements

Cultural Resources

The OCGP FEIR identified mitigation measures CULT1 through CULT4 which, if fulfilled, would reduce the effects of development under the adopted Plan to a level less than significant. Measures CULT 1 through CULT 4 are applicable to future development under the project.

CULT1 Prior to subdivision for development, a detailed archaeological report(s) shall be prepared within PAs 51 and 30. This report(s) shall specifically address the potential for encountering archaeological resources at the time specific development is proposed. The report(s) shall provide recommendations to prevent degradation of archaeological resources such as site avoidance and data recovery. Recommendations contained in the report shall be implemented. Compliance with this measure shall be verified by the Community Development Department.

CULT2 Monitoring of excavation and grading activities associated with future development in PAs 51 and 30 shall be conducted by a certified archaeologist in accordance with the report required in Mitigation Measure CULT1. If resources are encountered in the course of ground disturbance, the archaeological monitor shall be empowered to halt grading and to initiate an archaeological testing program. The testing shall include recordation of artifacts, controlled removal of the materials, and an assessment of their importance under CEQA

4. Discussion of Checklist and Mitigation Measures

and the City's local guidelines. Compliance with this measure shall be verified by the Community Development Department.

CULT3 Prior to the issuance of grading permits and/or building permits for any future development in PAs 51 and 30, a detailed mitigation program shall be submitted by the applicant to the City of Irvine to address archaeological resources discovered during grading. Provisions of the program shall include an immediate evaluation of the find by a qualified archaeologist. If the find is determined to be a unique archaeological resource, contingency funding and a time allotment sufficient to allow for implementation of avoidance measures or appropriate mitigation shall be available. Work may continue on other parts of the construction site while archaeological resource mitigation takes place. The City of Irvine has standard conditions applied prior to the issuance of grading permits when a project includes potentially significant archaeological sites. These include retaining a qualified archaeologist, establishing procedures for cultural and scientific resource surveillance, and protection of any resources discovered during the grading process. Compliance with this measure shall be verified by the Community Development Department.

CULT4 Prior to the issuance of any grading and/or building permits, a mitigation program shall be submitted by the developer to the City of Irvine to address the accidental discovery of recognition of any human remains. The program shall include the following:

There shall be no further excavation or disturbance of the site or any nearby area reasonably suspected to overlie adjacent human remains until:

- The county coroner must be contacted to determine that no investigation of the cause of death is required, and

If the coroner determines the remains to be Native American:

- The coroner shall contact the Native American Heritage Commission within 24 hours.
- The Native American Heritage Commission shall identify the person or persons it believes to be the most likely descended from the deceased Native American.
- The most likely descendent may make recommendations to the landowner or the person responsible for the excavation work, for the means of treating or disposing of, with appropriated dignity, the human remains and any associated grave goods as provided in Public Resources Code Section 5097.98, or
- Where the following conditions occur, the landowner or his authorized representative shall rebury the Native American human remains and associated grave goods with appropriate dignity on the property in a location not subject to further subsurface disturbance.
 - The Native American heritage Commission is unable to identify a most likely descendent or the most likely descendent failed to make a recommendation within 24 hours after being notified by the commission.
 - The descendant identified fails to make a recommendation; or

4. Discussion of Checklist and Mitigation Measures

- The landowner or his authorized representative rejects the recommendation of the descendant, and the mediation by the Native American Heritage commission fails to provide measures acceptable to the landowner.

Compliance with this measure shall be verified by the Community Development Department.

Paleontological Resources

The OCGP FEIR identified mitigation measure P1, which, if fulfilled, would reduce the effects of development under the adopted Overlay Plan to a level less than significant. Measure P1 is applicable to future development under the project.

- P1 Prior to issuance of a grading permit for any portion of the project area, a qualified paleontologist shall be retained by the City or designee to carry out an appropriate paleontology investigation of the area proposed for grading. (A qualified paleontologist is defined as an individual with an M.S. or Ph.D. in paleontology or geology who is familiar with paleontological procedures and techniques.) The City of Irvine has standard conditions applied prior to the issuance of grading permits when a project site includes potentially significant paleontological sites, and paleontological monitoring conditions have not been attached to the previous map approval. These standard conditions include retaining a qualified paleontologist, establishing procedures for cultural and scientific resource surveillance, and protection of any resources discovered during the grading process.

When fossils are discovered, the paleontologist (or paleontological monitor) shall recover them. In most cases, this fossil salvage can be completed in a short period of time. However, some fossil specimens (such as a complete large mammal skeleton) may require an extended salvage period. In these instances the paleontologist (or paleontological monitor) shall be allowed to temporarily direct, divert or halt grading to allow recovery of fossil remains in a timely manner. Because of the potential for the recovery of small fossil remains, such as isolated mammal teeth, it may be necessary in certain instances to set up a screening-washing operation on-site.

Fossil remains collected during the monitoring and salvage portion of the mitigation program shall be cleaned, repaired, sorted, and cataloged. Compliance with this measure shall be verified by the Community Development Department.

4.6 GEOLOGY AND SOILS

4.6.1 Environmental Setting

The OCGP FEIR describes the topography of the project site as nearly flat and gently sloping down to the west to southwest with elevations ranging from 450 feet above mean sea level (msl) to 200 feet above msl. Planning Area 30 is at the southeast margin of the Tustin plain with elevations ranging from about 260 to 300 feet above msl. Planning Area 51 includes some slopes of the Santa Ana foothills which each elevations of about 750 feet above msl. Alluvial soils of six major soil associations consisting predominantly of varying sands, silts, and clayey silty sands are present within PA 51. Soils underlying PA 30 contain clayey loam alluvial material, terrace deposits, and old and unconsolidated recent alluvium of the Myford and Sorrento series.

The OCGP FEIR identified the primary potential seismic hazard in the area as ground motion. Seismic Response Areas (SRA) designations are used by the City to assess the geologic and seismic risk associated

4. Discussion of Checklist and Mitigation Measures

with potential development. All of PA 30 and a majority of PA 51 are within SRA-2 (denser soils/deeper groundwater) and are considered suitable for development. The planned development area of PA 51 situated north of Irvine Boulevard is designated SRA-3 (alluvium/shallow bedrock) and also susceptible to ground motion.

No known active faults crossing or projecting into the project area were identified; however, the project site is within the seismically active southern California region and there are two active faults—Whittier-Elsinore Fault and Newport-Inglewood Fault—within 14 miles of the site.

4.6.2 Impacts Identified in the OCGP FEIR and Addenda

The OCGP FEIR disclosed the potential for future development of the project area to result in the exposure of people or structures to strong ground shaking in the event of a major earthquake along any one of the active faults in the region. The OCGP FEIR noted that new construction would be required to adhere to current seismic safety building codes which address seismic concerns. Existing buildings within current Planning Area 51 do not meet current seismic codes; therefore, the temporary or permanent reuse of the existing buildings and the associated exposure of people or structures to potential substantial adverse effects due to strong seismic-related ground shaking were considered significant impacts.

Because of the documented landslides in the northeastern Santa Ana foothills area of the Site, the OCGP FEIR analysis concluded that the project would result in a significant impact associated with landslides in the affected area of Planning Area 51 east of Irvine Boulevard, where future development of habitable structures could occur under the adopted Overlay Plan. The OCGP FEIR also concluded future development has the potential to result in soil erosion or the loss of topsoils and risk to life and property with the presence of expansive soils, and that these impacts are considered significant.

4.6.3 Impacts Associated with Requested Entitlements

The project occurs within the same development envelope as the OCGP FEIR, includes the same land uses and development areas as the adopted Overlay Plan, and does not provide for additional development intensity. Impacts related to seismic hazards, landslides, expansive soils, and loss of topsoil or soil erosion are not intensified by the proposed project. As a result, the conclusions drawn in the OCGP FEIR adequately describe the environmental effects of the project relative to soils, geologic hazards, and seismic safety, as well as the severity of the impacts. Consistent with the Mitigation Measures included in the OCGP FEIR and included below, an updated preliminary geotechnical report for VTTM 17283 by Leighton & Associates dated April 2008 has been prepared. VTTM 17283 will be developed in accordance with the recommendations of the preliminary geotechnical report. This report is on file with the Community Development Department.

Major EIR Revisions Not Required. Based on the foregoing analysis and information, there is no evidence that the changes to the project require a major change to the certified OCGP FEIR. The project would not result in any new significant environmental impact nor is there a substantial increase in the severity of impacts from that described in the certified OCGP FEIR.

No Substantial Change in Circumstances Requiring Major EIR Revisions. There is no information in the record or otherwise available indicating substantial changes in circumstances that would require major changes to certified OCGP FEIR.

No New Information of Substantial Importance Showing Greater Significant Effects Than Previous EIR. This Initial Study/Addendum has analyzed all available relevant information and has determined that there is

4. Discussion of Checklist and Mitigation Measures

no new information of substantial importance, which was unknown and could not have been known with the exercise of reasonable diligence at the time the OCGP EIR was certified, indicating that the project will have one or more significant effects not discussed in the previous EIR or result in a substantial increase in the severity of previously identified effects.

No New Information of Substantial Importance Showing Ability to Reduce Significant Effects in Previous EIR. This Initial Study/Addendum has analyzed all available relevant information and has determined that there is no new information of substantial importance, which was unknown and could not have been known with the exercise of reasonable diligence at the time the OCGP FEIR was certified, indicating that; (1) mitigation measures or alternatives previously found not to be feasible would in fact be feasible, and would substantially reduce one or more significant effects of the project, but the project proponent declines to adopt the mitigation measures or alternatives; or (2) mitigation measures or alternatives that are considerably different from those analyzed in the previous EIR would substantially reduce one or more significant effects on the environment, but the project proponent declines to adopt the mitigation measures or alternatives. There are no alternatives to the project or additional mitigation measures that would substantially reduce one or more of the significant geological effects identified in and considered by the certified OCGP FEIR.

4.6.4 Mitigation from the OCGP FEIR and Applicability to the Requested Entitlements

The OCGP FEIR identified four mitigation measures to reduce the effects of the adopted Overlay Plan on soils, geologic hazards and seismic safety. All of the mitigation measures are applicable to implementation of the project and would be carried forward to future development of the project site. Implementation of measures GS1 through GS4 (listed below) would reduce Project impacts to a level less than significant.

- GS1 Prior to issuance of a building permit, the City of Irvine shall require that all development be designed in accordance with the seismic design provisions outlined in future proposed development geotechnical reports and specified in the latest Building Codes adopted by the City of Irvine. Compliance with this measure shall be verified by the Community Development Department.
- GS2 Prior to issuance of a building permit, as per existing City policies, geotechnical studies shall be prepared at the time specific development projects are proposed to address site specific geotechnical considerations. The scope of each geotechnical study is based on the underlying geotechnical conditions of the individual site. These reports will provide measures to prevent settlement.
1. Prior to design and construction of any future developments within the project area, a comprehensive geotechnical evaluation, including development-specific subsurface exploration and laboratory testing, shall be conducted. The purpose of the subsurface evaluation is to:
 - a. Further evaluate the subsurface conditions in the area of the proposed structures.
 - b. Provide specific data on potential geologic and geotechnical hazards.
 - c. Provide information pertaining to the engineering characteristics of earth materials in the project area.

4. Discussion of Checklist and Mitigation Measures

From this data, recommendations for grading/earthwork, surface, and subsurface drainage, temporary and/or subsurface drainage, temporary and/or permanent dewatering, foundations, pavement structural section, and other pertinent geotechnical design considerations may be formulated and shall be included in the grading and building plans for individual developments. General recommendations are as follows:

- Seismic Ground Shaking – Measures to prevent risk of loss, injury or death involving seismic ground shaking include constructing new development to the latest adopted building codes. In addition, new development should not be located near active earthquake faults.
- Erosion or Loss of Topsoil – Erosion and sediment control measures shall be implemented as required by the City's Grading and Water Quality ordinances.
- Where Expansive Soils Exist – Measures for the design of foundation, slabs, flatwork and other improvements subject to drainage from expansive soils.

Compliance with this measure shall be verified by the Community Development Department.

- GS3 Prior to issuance of building permits for the occupancy of any existing structure at the former MCAS El Toro, or occupancy of any existing structure if a building permit is not issued, a seismic evaluation of the structure including recommendations for seismic improvements required for compliance with current Building Codes for use of existing structures adopted by the City of Irvine and plans for any required seismic improvements shall be submitted to the Chief Building Official for review and approval.
- GS4 Prior to issuance of a grading permit, detailed geotechnical and hydrology reports shall be prepared prior to any development approval or grading activities. These reports shall specifically address erosion control and surface runoff for both construction and long-term operations on the site. Recommendations contained in these reports to prevent soil erosion, siltation, and debris influx into the drainage system shall be implemented. Compliance with this measure shall be verified by the Community Development Department.

4.7 HAZARDS AND HAZARDOUS MATERIALS

4.7.1 Environmental Setting

Hazardous Materials and Hazardous Wastes

The OCGP FEIR discussed an environmental baseline survey (EBS) that was conducted for the project area. Information was used from the Base Realignment and Closure Business Plan for Marine Corps Air Station (MCAS) El Toro dated May 2002; the EBS dated 1995; and an update to the EBS—April 2003 Draft Final EBS. The 2003 EBS identified “76 potential release locations, all of which require further evaluation for potential releases to the environment and subsequent remediation, if required” (Refer to OCGP FEIR p. 5.5-5).

Regarding the Installation Restoration Program (IRP), the OCGP FEIR summarizes the status of each IRP site based on the information available at the time the EIR was prepared. Ten (10) IRP sites were identified as requiring “No Further Action,” including sites 4, 6, 7, 9, 10, 13, 14, 15, 19, 20, 21, 22 and 25. The IRP sites identified as “Action Required” included sites 1, 2, 3, anomaly 3, 5, 8, 11, 12, 16, 17, 18 (plume), and 24 (Refer to OCGP FEIR pp. 5.5-6 through 5.5-9).

4. Discussion of Checklist and Mitigation Measures

Of the 404 underground storage tanks (USTs) identified, 357 had been remediated and received findings of “no further action” at the time the OCGP FEIR was prepared. Of the 39 aboveground storage tanks (ASTs) on the property, 36 had been remediated and received findings of “no further action” (Refer to OCGP FEIR p. 5.5-10).

Evaluation and remediation of previously identified IRP sites within the project site continues with the resulting changes in the condition of the property largely anticipated in the OCGP FEIR. Subsequent to certification of the OCGP FEIR, the DON completed environmental related findings that support the suitability to transfer (FOST) real property made available through the Base Realignment and Closure process and to support of the lease of areas not yet suitable for transfer.³ (Refer to *Installation Restoration Program (IRP) Locations*, OCGP FEIR Addendum No. 4, Figure 4-2).

The areas suitable for lease encompass locations of concern identified in the 1995 and 2003 EBS, and in the OCGP FEIR, where future evaluation and/or actions are ongoing or required. These areas were identified as “carve-outs” in the DON documentation.⁴

Progress relative to conveyance of the carve-outs includes DON transfer of approximately eight acres of the project site to Heritage Fields and the Great Park Corporation on March 22, 2006. At the time of the initial land sale, these properties (carve-outs) were retained by the DON in order to complete environmental cleanup, and have since been approved by the regulatory agencies for transfer (FOST #2). The following sites were included in this transfer:

- Carve-out parcel II-J consists of approximately 0.2 acre in the central portion of former MCAS El Toro. It contains one building—Building No. 860—and 1 location of concern.
- Carve-out parcel II-Q (portion) consists of approximately 5 acres in the eastern portion of the former MCAS El Toro. It is an abandoned jet fuel (JP-5) pipeline.
- Carve-out parcel II-S consists of approximately 1.3 acres in the southeastern portion of former MCAS El Toro. It contains 6 buildings (347, 377, 447, 448, 566, and 726) and 13 locations of concern.
- Carve-out parcel II-T consists of approximately 0.5 acre in the southeastern portion of former MCAS El Toro. It contains 1 building—Building No. 761—and 4 locations of concern. The facility was a former aircraft wash rack.
- Carve-out parcel III-C consists of approximately 1 acre in the western portion of the former MCAS El Toro. It contains 1 building—Building No. 240—and 7 locations of concern. This site was a former ordnance storage facility.

Emergency Plans

The OCGP FEIR described the former MCAS El Toro site (Planning Areas 30 and 51) as a potential emergency response staging area because of its capacity for processing and storing large quantities of

³ U.S. Department of the Navy, 2004. *Final Finding of Suitability to Transfer, Parcel IV and Portions of Parcels I, II, and III, Former Marine Corps Air Station, El Toro, California, July 2004; Final Finding of Suitability to Lease for Carve-outs Within Parcels I, II, and III, Former Marine Corps Air Station, El Toro, California, July 2004.*

⁴ U.S. Department of the Navy, 2004a. *Final Finding of Suitability to Lease for Carve-outs within Parcels I, II, and III, Former Marine Corps Air Station, El Toro, California, July 2004.*

4. Discussion of Checklist and Mitigation Measures

cargo. The Orange County Emergency Plan, which incorporates the statewide standardized emergency management system (SEMS), guides multijurisdictional response to emergency conditions. No substantial change to the description of the setting regarding emergency plans has occurred that would alter the analysis and conclusions of the OCGP FEIR on emergency plans and response.

Wildland Fires

The OCGP FEIR identified high fire hazard areas within open space, undeveloped land northeast of and adjacent to Planning Area 51. The City has no construction records of existing buildings and structures on the property. No substantial change to the description of the setting relative to wildland fires has occurred that would alter the analysis and conclusions of the OCGP FEIR regarding wildland fires.

4.7.2 Impacts Identified in the OCGP FEIR and Addenda

Hazardous Materials and Wastes

The OCGP FEIR identified no significant impacts associated with the No Further Action IRP sites, which are listed in Table 4-4. Table 4-5 identifies each Action Required IRP site and its location relative to the adopted Overlay Plan. The OCGP FEIR disclosed the following environmental consequences of the adopted Overlay Plan as significant impacts:

- Construction activities involving demolition and possible substantial remodeling of existing structures in the project area as the project area develops could result in the disturbance of structures and soils containing asbestos-containing building materials (ACM) and lead-based paint.
- IRP site 24 is located in the 6.1 Institutional and 1.5 Recreation zoning districts. The site may be conveyed with temporary restrictions on use that are not appropriate for transportation facility use. This is considered a significant impact.
- Future uses of IRP site 3 may be potentially constrained by the implementation of institutional controls.
- IRP site 16 (Crash Crew Pit No. 2) is located in the 1.5 Recreation zoning district. The site may be conveyed with temporary restrictions on use that are not appropriate for recreational land uses.

4. Discussion of Checklist and Mitigation Measures

Table 4-4
No Further Action IRP Sites and Zoning

IRP Site	IRP Designation	Adopted Overlay Plan Zoning District
4	Ferrocene Spill Area	8.1 Lifelong Learning District
6	Drop Tank Drainage Area No. 1	2.2 Low-Density Residential with 1.8 Golf Course Overlay
9	Crash Crew Pit No. 1	1.5 Recreation
10	Petroleum Disposal Area	1.5 Recreation
13	Oil Change Area	1.5 Recreation
15	Suspended Fuel Tanks	1.5 Recreation
19	Air Craft Expeditionary Refueling	2.2 Low-Density Residential with 1.8 Golf Course Overlay
20	Hobby Shop	8.1 LLD
21	Materials Management Group	6.1 Institutional
22	Tactical Air Fuel Dispensing System	1.5 Recreation

16	Crash Crew Pit No. 2	1.5 Recreation
17	Communications Station Landfill	1.4 Preservation
24	VOC Source Area	6.1 Institutional/ 1.5 Recreation/ 3.2 Transit Oriented Development

Source: OCGP FEIR, Table 5.5-4, p. 5.5-22; SEMA Associates (June 7, 2006) (rev June 2008).

Emergency Plans

The OCGP FEIR determined the Overlay Plan would not be expected to interfere with emergency response and evacuation plans on the basis that other sites within Orange County are already designated as emergency staging areas and portions of the OCGP would remain available to non-aviation emergency response equipment. Accordingly, the OCGP FEIR concluded that the adopted Overlay Plan would not result in a significant impact related to emergency response and evacuation plans.

4. Discussion of Checklist and Mitigation Measures

Wildland Fires

The OCGP FEIR concluded that the Habitat Reserve, Wildlife Corridor, and Recreational areas in the northeastern portion of Planning Area 51 would be exposed to the highest level of fire risk from wildland fires under the adopted Overlay Plan, and that reuse of existing buildings require inspection for conformance to fire life safety code requirements. The OCGP FEIR identified the wildland fire impacts as potentially significant.

4.7.3 Impacts Associated with the Requested Entitlements

Hazardous Materials and Wastes

Amended VTTM No. 17008, Proposed VTTM No. 17283, or the associated actions would not allow any additional development intensity beyond what is allowed by the adopted Overlay Plan. As a result, the proposed project would not alter the findings and conclusions previously certified and adopted in the OCGP FEIR and Addenda. Therefore, the OCGP FEIR adequately describes the environmental effects of the project relative to hazardous materials and wastes for the project site. No new or modified mitigation measures are required.

Emergency Plans

Amended VTTM No. 17008, Proposed VTTM No. 17283, or the associated actions would not allow any additional development intensity or new land uses beyond what is allowed by the adopted Overlay Plan, and would not be expected to interfere with emergency response and evacuation plans. Other sites within Orange County are already designated emergency staging areas and portions of the OCGP would remain available to non-aviation emergency response equipment. Accordingly, the proposed project would not change the OCGP FEIR conclusions; the project would not result in a significant impact related to emergency response and evacuation plans.

Wildland Fires

As previously stated in the OCGP FEIR, the Habitat Reserve, Wildlife Corridor, and recreational areas in the northeastern portion of current Planning Area 51 would be exposed to the highest level of fire risk from wildland fires, and reuse of existing buildings would require inspection for conformance to fire life safety code requirements. Amended VTTM No. 17008, Proposed VTTM No. 17283, or the associated actions would not allow any additional development intensity and would not alter the findings and conclusions of the OCGP FEIR and Addenda regarding wildland fires.

Major EIR Revisions Not Required. Based on the foregoing analysis and information, there is no evidence that the changes to the project require a major change to the certified OCGP FEIR. The project would not result in any new significant environmental impact nor is there a substantial increase in the severity of impacts from that described in the certified OCGP FEIR.

No Substantial Change in Circumstances Requiring Major EIR Revisions. There is no information in the record or otherwise available indicating substantial changes in circumstances that would require major changes to certified OCGP FEIR.

No New Information of Substantial Importance Showing Greater Significant Effects Than Previous EIR. This Initial Study/Addendum has analyzed all available relevant information and has determined that there is no new information of substantial importance, which was unknown and could not have been known with the

4. Discussion of Checklist and Mitigation Measures

exercise of reasonable diligence at the time the OCGP FEIR was certified, indicating that the project will have one or more significant effects not discussed in the previous EIR or result in a substantial increase in the severity of previously identified effects.

No New Information of Substantial Importance Showing Ability to Reduce Significant Effects in Previous EIR. This Initial Study/Addendum has analyzed all available relevant information and has determined that there is no new information of substantial importance, which was unknown and could not have been known with the exercise of reasonable diligence at the time the OCGP FEIR was certified, indicating that; (1) mitigation measures or alternatives previously found not to be feasible would in fact be feasible, and would substantially reduce one or more significant effects of the project, but the project proponent declines to adopt the mitigation measures or alternatives; or (2) mitigation measures or alternatives that are considerably different from those analyzed in the previous EIR would substantially reduce one or more significant effects on the environment, but the project proponent declines to adopt the mitigation measures or alternatives. There are no alternatives to the project or additional mitigation measures that would substantially reduce one or more of the significant hazardous effects identified in and considered by the certified OCGP FEIR.

4.7.4 Mitigation from the OCGP FEIR and Applicability to the Requested Entitlements

The OCGP FEIR identified six mitigation measures to reduce the effects of the adopted Overlay Plan on public health and safety—specifically, environmental effects associated with hazardous materials and waste, emergency response, and wildland fires—to a level less than significant. All of the mitigation measures are applicable to implementation of the proposed project and would be carried forward to future development of the project site. Measures HH1 through HH6 are listed below:

- HH1
- a. Prior to the conveyance of the property and issuance of subsequent grading permits, where the presence of ACMs is identified, the DON or its transference shall ensure that all available information concerning ACMs has been provided to the City of Irvine, and the purchasers of the property, including:
 - The type, location and condition of ACMs
 - The results of any asbestos testing
 - Description of asbestos control measures taken, if any
 - The costs or time necessary to remove existing ACMs
 - The results of any site-specific asbestos inventory updates
 - b. For any structures known to contain ACMs that will be renovated and/or demolished prior to transfer, the DON shall ensure that all asbestos is removed and disposed of in accordance with applicable federal, state and local regulatory requirements.
 - c. Prior to transfer of any structure constructed before October 1988, scheduled for renovation and/or demolition, and in which the presence of ACMs is unknown, an asbestos survey shall be conducted by the DON. This requirement can be waived if an architect or project engineer responsible for the construction of the structure or an accredited asbestos inspector signs a statement that no ACM was specified as a building material, and to the best of their knowledge, no ACMs were used as a building material.

4. Discussion of Checklist and Mitigation Measures

- d. Any existing structures in which ACMs have been identified and which will remain in use shall be addressed in an Operation and Maintenance Plan and must be managed in accordance with applicable laws.
 - e. Any renovation and/or LBP abatement activities on residential units at former MCAS El Toro, shall be conducted in accordance with all applicable federal, state and local regulatory requirements.
- HH2
- a. Prior to transfer, the City shall receive from the DON, with the concurrence of the appropriate regulatory agencies, a statement that the “Action Required” IRP Site 3 is to be conveyed for restricted use and that all institutional controls have been identified and implemented. The City Irvine will adopt appropriate rules, policies, and regulations necessary to avoid actions that compromise the integrity of the remediated sites and that uphold the institutional controls. The actions of the City of Irvine shall be in accordance with the General Development Standards for the zone, which requires the Planning Commission to approve a master plan for the entire Planning Area indicating location, acreage, and types of land use within the Planning Area. As stated under Sec. 9-51-5 General Development Standards, boundaries and acreages are approximate and shall be established by master plan approval.
 - b. Prior to transfer, if the DON chooses to impose temporary restrictions on the use of Sites 16 and 24 pending adequate remediation of groundwater, the City of Irvine shall receive from the DON a statement of temporary restrictions on the use of the sites and the release of the sites for restricted use following implementation of adequate remediation of groundwater. The City of Irvine shall adopt appropriate rules, policies, and regulations necessary to avoid actions that compromise the integrity of the remediated sites and that uphold the institutional controls. The actions of the City of Irvine shall be in accordance with the General Development Standards for the zone, which requires the Planning Commission to approve a master plan for the entire Planning Area indicating location, acreage, and types of land use within the Planning Area. As stated under Sec. 9-51-5 General Development Standards, boundaries and acreages are appropriate and shall be established by master plan approval.
- HH3
- The Community Development Department, in coordination with the Orange County Fire Authority (OCFA), will be responsible for review of all development plans, which would include evaluation of very high fire severity zones, special fire protection plans, and any requirements for fuel modification zones. Projects potentially impacted by wildland fire hazards will be subject to OCFA Guidelines for “Development Within and Exclusion from Very High Fire Severity Zones” and “Fuel Modification Plans and Maintenance.” Additionally, all demolition, renovation, and construction activities in the project area will be subject to review by OCFA to ensure adequate fire protection, water flow, emergency access, design features, etc., according to the standards of the Uniform Fire Code and the California Fire Code. Due to the implementation of these standard fire protection procedures, the proposed project is not anticipated to result in significant short- or long-term adverse impacts related to fire hazards.
- HH4
- Prior to issuance of occupancy permits of any existing structure at the former MCAS El Toro, a fire life-safety evaluation of the structure including recommendations for improvements required for compliance with current Building Codes for use of existing structures adopted by the City of Irvine and plans for any required improvements shall be submitted to the Chief Building Official for review and approval.

4. Discussion of Checklist and Mitigation Measures

- HH5 Prior to the issuance of a grading permit, the applicant shall prepare and the Director of Community Development shall approve a protocol plan (including but not limited to worker training, health and safety precautions, additional testing requirements, and emergency notification procedures) in the event that unknown hazardous materials are discovered during grading, construction, and/or related development activities. Additionally, said protocol plan will be revised should the discovery of previously unknown hazardous materials be made during any of the above mentioned development activities. The applicant and/or property owner that discovers contamination due to past military operations not previously identified by the DON shall be responsible for notifying the DON, appropriate regulatory agencies, and the Director of Community Development of the City of Irvine in a timely manner. Additionally, said Protocol Plan shall be revised should the discovery of previously unknown hazardous materials be made during any of the above mentioned development activities.
- HH6 The City of Irvine shall develop and maintain the location and status, as well as other pertinent information, of all monitoring wells on the former MCAS El Toro in a geographic information systems database (GIS). The City will review all permit applications on the former air station for monitoring well locations that may be affected by a permit, and require applicants to maintain appropriate access. Access to monitoring wells will be limited to authorized personnel.

4.8 HYDROLOGY AND WATER QUALITY

4.8.1 Environmental Setting

The OCGP FEIR describes the project site as within the San Diego Creek watershed, which includes the San Diego Creek, Peters Canyon Channel, and the tributaries to these water courses. The major drainage channels that traverse the site (PA 51) are the Marshburn Channel, Bee Canyon Channel, Agua Chinon Channel, and Borrego Canyon Channel. Serrano Creek and Upper San Diego Creek Channel traverse PA 30 in the southern tip of the project site, south of the existing SCRRA Metrolink railroad tracks.

San Diego Creek and Upper Newport Bay are listed as impaired water bodies under Section 303(d) of the Clean Water Act. Accordingly, Total Maximum Daily Load (TMDL) for pollutants that have impaired these water bodies has been established and was included in the OCGP FEIR (Refer to OCGP FEIR Table 5.7-2).

The OCGP FEIR also notes the County of Orange and the City of Irvine hold a Nationwide Pollution Discharge Elimination System (NPDES) permit for the storm drain systems, and that the State has issued a NPDES general permit relating to construction activities on sites over five acres in the area. Lastly, the flood control improvements associated with the SR-133 toll road were noted in the OCGP FEIR as having reduced the 100-year flood zone north and west of the property.

4.8.2 Impacts Identified in the OCGP FEIR and Addenda

The OCGP FEIR identified several significant impacts on hydrology and water quality associated with future development under the adopted Overlay Plan before mitigation. First, grading and excavation activities required for future development could result in the exposure of bare soils to both wind- and water-related erosion and associated significant water quality impacts (specifically, a violation of water quality standards or waste discharge requirements). Compliance with City grading and water quality regulations—including the NPDES discharge permitting requirements and preparation of a Storm Water Pollution Prevention Plan (SWPPP) and a Water Quality Management Plan (WQMP)—are the primary means of controlling the potential impacts of grading and excavation activities. These City requirements, which are described in mitigation measures H/WQ1 and H/WQ2, will reduce the impact to a less-than-significant level.

4. Discussion of Checklist and Mitigation Measures

According to the OCGP FEIR, the existing drainage patterns and stream courses will not be substantially altered by future development under the adopted Overlay Plan. In addition, the potential for inundation is reduced by improvements to upstream flood-control facilities. Without project-related flood-control facilities, the rate or amount of surface runoff due to new development would result in flooding on- and off-site, depending on the nature of the specific development. Although this impact was identified as significant, the effect of increased runoff will be reduced to a less-than-significant level through preparation and implementation of hydraulic studies and recommendations for the specific development and the construction of flood-control improvements commensurate with the specific development (Mitigation Measure H/WQ3).

The impact analysis for the Overlay Plan assumed development of the land use patterns created by the zoning designations for the Overlay Plan area and a backbone storm drain system. The storm drain system took into consideration and included improvements identified in the San Diego Creek Flood Control Master Plan (Refer to OCGP FEIR p. 5.7-16 and Figure 5.7-2). The drainage plan for the Overlay Plan area included improvements to the major drainages, including Marshburn Channel, Bee Canyon Channel, Agua Chinon Channel, and the Borrego Channel, Wildlife Corridor and Serrano Creek, and San Diego Creek, as described in the OCGP FEIR and Addenda.

While relatively conceptually defined in the OCGP FEIR, the foregoing area-wide drainage and flood control facility system has since been undergoing increasingly more definitive design engineering refinement. The latest formal expression of these system enhancements is memorialized in the following documents: Master Plan of Drainage, Fuscoe Engineering February 23, 2007,⁵ Orange County Great Park – Hydrology/Hydraulic Report, Fuscoe Engineering June 12, 2007 (collectively, Fuscoe Reports); Planning Area 51 and Planning Area 30 Bee Canyon, Agua Chinon, Borrego, Serrano and Upper San Diego Creek Update, RBF Consulting July 14, 2008, and Planning Area 51 Marshburn Watershed Update, RBF Consulting July 15, 2008 (collectively, RBF Reports). These reports merely refine the drainage control system components described above, and are on file with the City, and available for inspection at the Irvine Community Development Department during normal business hours. The on-site channels will continue to drain the project site as under existing conditions. Additional backbone storm drain facilities will be designed to accommodate the changes in the land use surface runoff within the Heritage Fields development. The post-development hydrology was analyzed per the Orange County Hydrology Manual for a 100-year peak storm design event.

OCGP FEIR Mitigation Measure H/WQ3 states that prior to approval of the first tentative tract or parcel map in the project area, detailed hydrologic and hydraulic analysis shall be conducted. Studies and analyses shall be prepared in accordance with Orange County Flood Control District (OCFCD) methodologies and standards and the Flood Control Master Plan for San Diego Creek, as well as any additional guidelines in effect at the time of project design. Recommendations contained in the hydrology studies and/or hydraulic analysis to address drainage/flooding issues related to proposed development shall be implemented. In compliance with the mitigation measure, the Fuscoe Reports, and RBF Reports were prepared. The primary focus of these reports was to evaluate the proposed drainage concept for the Heritage Fields development with respect to surface water hydrology. The studies identified surface water runoff as well as drainage and flood-control improvements for the proposed project. The reports also provide a brief discussion of the local hydrologic regime; an overview which ranges from the watershed delineation of the San Diego Creek Watershed to the physical drainage characteristics of Heritage Fields in Orange County.

4.8.3 Impacts Associated with the Requested Entitlements

According to the Project Engineer, the watersheds and land uses proposed for Amended VTTM No. 17008 are consistent with the approved VTTM No. 17008. (See letter from Hunsaker & Associates to City of Irvine

⁵ This report was submitted to the City of Irvine as a part of the Master Subdivision Map application.

4. Discussion of Checklist and Mitigation Measures

dated September 8, 2008.) As a result, the changes made to Amended VTTM No. 17008 have no significant changes to drainage patterns and no impacts downstream. In addition, the downstream points of connection are the same, and the resulting flowrates calculated at the downstream points of connection do not result in a significant impact to existing regional flood control facilities.

Amended VTTM No. 17008, Proposed VTTM No. 17283, or the associated actions would not allow any additional development intensity or permit additional residences. Development of the proposed project will not expand the development boundary and will implement all mitigation measures identified in the OCGP FEIR and Addenda. The Fuscoe Reports and RBF Reports, described above, evaluate the proposed drainage concept for the Heritage Fields development, including the proposed project, with respect to surface water hydrology. The studies identified surface water runoff as well as drainage and flood-control improvements for the proposed project. The OCGP FEIR mitigation measures will be implemented in accordance with local and State regulatory requirements. As future projects are planned and development occurs in the project area, specific BMPs and other water quality control methods will be utilized to reduce water quality degradation of the Newport Bay watershed. As a result, the requested entitlements will have no additional impact to the hydrology and water quality. Accordingly, the impact analysis presented in OCGP FEIR Section 5.7 adequately describes the project effects on hydrology and water quality.

Major EIR Revisions Not Required. Based on the foregoing analysis and information, there is no evidence that the changes to the project require a major change to the certified OCGP FEIR. The project would not result in any new significant environmental impact nor is there a substantial increase in the severity of impacts from that described in the certified OCGP FEIR.

No Substantial Change in Circumstances Requiring Major EIR Revisions. There is no information in the record or otherwise available indicating substantial changes in circumstances that would require major changes to certified OCGP FEIR.

No New Information of Substantial Importance Showing Greater Significant Effects Than Previous EIR. This Initial Study/Addendum has analyzed all available relevant information and has determined that there is no new information of substantial importance, which was unknown and could not have been known with the exercise of reasonable diligence at the time the OCGP EIR was certified, indicating that the project will have one or more significant effects not discussed in the previous EIR or result in a substantial increase in the severity of previously identified effects.

No New Information of Substantial Importance Showing Ability to Reduce Significant Effects in Previous EIR. This Initial Study/Addendum has analyzed all available relevant information and has determined that there is no new information of substantial importance, which was unknown and could not have been known with the exercise of reasonable diligence at the time the OCGP FEIR was certified, indicating that; (1) mitigation measures or alternatives previously found not to be feasible would in fact be feasible, and would substantially reduce one or more significant effects of the project, but the project proponent declines to adopt the mitigation measures or alternatives; or (2) mitigation measures or alternatives that are considerably different from those analyzed in the previous EIR would substantially reduce one or more significant effects on the environment, but the project proponent declines to adopt the mitigation measures or alternatives. There are no alternatives to the project or additional mitigation measures that would substantially reduce one or more of the significant hydrology effects identified in and considered by the certified OCGP FEIR.

4. Discussion of Checklist and Mitigation Measures

4.8.4 Mitigation from the OCGP FEIR and Applicability to the Requested Entitlements

The OCGP FEIR identified four mitigation measures to reduce the effects of the project on hydrology and water quality. All of the mitigation measures are applicable to implementation of the project and would be carried forward to future development of the project site. Implementation of measures H/WQ 1 through H/WQ 4 (listed below) would reduce project impacts to a less than significant level.

H/WQ1 Prior to issuance of a grading permit, the applicant shall provide evidence that the development of the project area shall comply with City of Irvine adopted Grading and Water Quality Ordinances to ensure that the potential for soil erosion is minimized on a project-by-project basis. Specifically, the NPDES discharge permitting requirements to which the City is obligated will ensure that construction activities reduce, to the maximum extent feasible, the water quality impacts of construction activities. The NPDES permit guidance states that “industrial/commercial construction operations that result in a disturbance of one acre or more of total land area...and residential construction sites that result in the disturbance of five acres or more...shall be required to develop and implement BMPs...to control erosion and siltation and contaminated runoff from the construction sites.” Note: In March 2003 this provision will apply to residential construction sites that result in the disturbance of one acre or more.

The City’s standard conditions of approval indicate that a Storm Water Pollution Prevention Plan (SWPPP) shall be prepared prior to the approval of grading permits for any project site in order to reduce sedimentation and erosion. The SWPPP shall include the adoption of erosion and sediment control practices such as desilting basins and construction site chemical control management measures.

Additionally, prior to the issuance of a grading permit, project applicants must submit, and the Director of Community Development or designee must have approved, a Water Quality Management Plan (WQMP). The WQMP must identify the Best Management Practices (BMPs) that will be used on the site to control predictable pollutant runoff after the site is occupied. Ongoing operations after construction would be subject to the Countywide Municipal NPDES Stormwater Permit, for which the City is a Co-Permittee. This WQMP shall identify, at a minimum, the routine, structural, and non-structural measures specified in the Countywide NPDES DAMP Appendix which they are applicable to a project, the assignment of long-term maintenance responsibilities (specifying the developer, parcel owner, maintenance association, lessee, etc.), and shall reference the location(s) of structural BMPs.

Also in accordance with standard City project permitting and approval procedures, Notices of Intent (NOI) for coverage of projects under the General Construction Activity Storm Water Runoff Permit will be submitted to the State Water Resources Control Board prior to issuance of grading permits in the project area. This requirement will be met to the satisfaction of the Director of Community Development of any disturbance of one acre or more of soil in the project area. Also in force during the period of construction would be the General Dewatering NPDES permit of the Santa Ana RWQCB, as well as the provisions of the Countywide Permit.

The Mitigation Measures will be implemented in accordance with local and State regulatory requirements. As future projects are planned and designed in the project area, specific BMPs and other water quality control methods will be utilized to reduce water quality degradation in the Newport Bay watershed. Future projects in the proposed project area will acknowledge and implement those additional requirements that may be imposed by RWQCB in the future. Compliance with these measures shall be verified by the Community Development Department.

4. Discussion of Checklist and Mitigation Measures

- H/WQ2 Prior to issuance of a grading permit, evidence (e.g., in the form of a construction management plan) shall be provided that demonstrates that all stormwater runoff and dewatering discharges from the project area shall be managed to the maximum extent practicable or treated as appropriate to comply with water quality requirements identified in the Santa Ana Regional Water quality Control Board Basin Plan, including Total Maximum Daily Load (TMDL) Implementation Plan adopted for this watershed.
- H/WQ3 Prior to approval of the first tentative tract or parcel map in the project area, detailed hydrologic and hydraulic analysis shall be conducted. Studies and analysis shall be prepared in accordance with OCFCD methodologies and standards and the Flood Control Master Plan for San Diego Creek, as well as any additional guidelines in effect at the time of project design. Recommendations contained in the hydrology studies and/or hydraulic analysis to address drainage/flooding issues related to proposed development shall be implemented. Compliance with this measure shall be verified by the Community Development Department.
- H/WQ4 Prior to issuance of a building permit, developers with property located in the newly delineated 100-year floodplain shall be required to construct such improvements as necessary to remove the property from the 100-year floodplain. Additionally, the developer shall prepare a Letter of Map Revision (LOMR) request to have the FIRMs revised to remove the development areas from the 100-year floodplain upon completion of the approved flood control facilities. The LOMR request shall be filed upon completion of design of the flood control improvements to contain or redirect the 100-year flood flows away from the property.

After the improvements are constructed, Record Drawings and a maintenance agreement with, or letter from, a public agency shall be submitted to FEMA to complete the LOMR process.

4.9 LAND USE

4.9.1 Environmental Setting

The OCGP FEIR described the existing and former land uses on Planning Areas 30 and 51, and other areas adjoining and surrounding these planning areas. Subsequent to the City's approval of the General Plan Amendment and Zone Change for the Overlay Plan, the DON initiated an auction process for the sale of the former MCAS El Toro property. To facilitate the transfer, the property was divided into and presented to prospective buyers as four distinct parcels. Interested parties were invited to bid on one or more of the parcels. In 2005, Heritage Fields successfully purchased all four parcels from the DON (3,671 acres), and entered into a Development Agreement with the City of Irvine on July 12, 2005. The Development Agreement sets forth the terms and conditions of subsequent development and implementation of the Great Park Plan, including dedication in fee of 1,096 acres of the property for development of the Great Park Plan.

The condition of Planning Area 30—generally, the cultivation of agricultural lands—is substantially the same as the OCGP FEIR baseline year. Consistent with a provision in the zoning code, there are interim uses that reuse existing buildings on-site. These uses include offices occupied by the City of Irvine Community Development Department, Great Park Corporation (GPC), and Heritage Fields. Other tenants include Second Harvest Food Bank, Families Forward, Orange County Great Park Balloon Preview Park, California State University, Fullerton. A day-care facility is immediately adjacent to these office uses. A few parcels such as Tierra Verde Industries have been leased and are operating on an interim basis.

4. Discussion of Checklist and Mitigation Measures

4.9.2 Impacts Identified in the OCGP FEIR and Addenda

The OCGP FEIR identified no significant impact to established communities. There were no residents living within the Planning Areas 30 and 51 at the time the OCGP FEIR was prepared and there has been no change in this regard; there are no residents living within the project site. The OCGP FEIR analyzed certain amendments to the City's General Plan that were adopted on May 27, 2003, as part of the City's adoption of the Overlay Plan. Further revisions were analyzed in the Addenda and found to be consistent. The adopted Overlay Plan was determined to be consistent with each element of the General Plan, as summarized below.

Land Use Element: The goal of the Land Use Element is to “promote land use patterns that maintain safe residential neighborhoods, bolster economic prosperity, preserve open space, and enhance the overall quality of life in Irvine.” The “OCGP, Orange County Great Park” land use category was created to reflect the types, intensity, and density of uses and activities contemplated in the OCGP and was determined to be consistent with the goal of the Land Use Element.

Circulation Element: The Circulation Element's goal is to “provide a balanced transportation system.” Adoption of the Overlay Plan included the following modifications to the General Plan Circulation Element:

- Policy B-1(c) was changed to include the following provision:

“In conjunction with individual subdivision map level traffic studies for development proposed in the Overlay Plan area, a LOS [level of service] ‘E’ would be considered acceptable for application to intersections impacted in Planning Areas 13, 30, 31, 32, 34, 35, and 39.”
- Figure B-1 (Master Plan of Arterial Highways) and Figure B-2 (Operational Characteristics) were amended to reflect the alignment of roadways within the OCGP, including:
 - Marine Way is aligned to terminate at Bake Parkway approximately 900 feet east of the northbound exit ramp from Interstate 5.
 - Trabuco Road terminates at the Orange County Great Park Trabuco Entry.
 - Rockfield Boulevard is realigned to terminate at Marine Way.
 - On-site circulation includes a new commuter highway/collector (Y Street [Ridge Valley]).
 - Research Parkway is renamed College Road and modified to extend from Irvine Boulevard to Marine Way.
- Figure B-3 (Public Transit) was amended to reflect the alignment of roadways within the OCGP.
- Figure B-4 (Trails Network) was amended to reflect the alignment of roadways within the OCGP.

Housing Element: The goal of the Housing Element is to “provide for safe and decent housing for all economic segments of the community.” The adopted Overlay Plan would add up to 3,625 new dwelling units and carry forward all adopted policies and objectives of the Housing Element; specifically, the residential development component would explore opportunities for maintenance of the housing stock and help the City meet its Regional Housing Needs Assessment through year 2025.

4. Discussion of Checklist and Mitigation Measures

Conservation and Open Space Element: The goal of this element is to “maintain and preserve the environmental systems as a major feature in the City.” This goal would be achieved through the implementation of Objectives L-1 through L-12 and corresponding policies. Objective L-10 encourages “the maintenance of agriculture in undeveloped areas of the City until the time of development, and in areas not available for development.” The adopted Overlay Plan includes 1,096 acres of Great Park recreational land, 130 acres of permanent agricultural land, and 974 acres of Habitat Preserve.

Cultural Resources: The goal of the Cultural Resources Element is to “ensure the proper disposition of historical, archaeological, and paleontological resources to minimize adverse impacts, and to develop an increased understanding and appreciation for the community’s historic and prehistoric heritage, and that of the region.” The OCGP FEIR identified the flatland area of the property as a low paleontological sensitivity zone and the hillside areas north of Irvine Boulevard as a high paleontological sensitivity zone. No objective of this element was amended by the adopted Overlay Plan and all of the objectives and implementing policies were to be implemented as part of the adopted Overlay Plan.

Noise Element: The Noise Element’s goal is to “contribute to a healthy and safe environment by minimizing noise impacts.” The adopted Overlay Plan would not affect the mobile noise, stationary noise, and noise abatement objectives and implementing policies of the Noise Element.

Public Facilities and Services Element: The goal of this element is to “provide a full range of necessary public facilities and services that are convenient to users, economical, reinforce City and community identity, and reflect the participation of citizens.” The facilities and services described in the Urban Service Plan for the adopted Overlay Plan were formulated through a public participatory process and found to implement the goal and adopted objectives and related policies of this element.

Integrated Waste Management Element: This element seeks to “encourage solid waste reduction and provide for the efficient recycling and disposal of refuse and solid waste material without deteriorating the environment.” The OCGP FEIR disclosed that the Overlay Plan would not affect the adopted objectives and implementing policies regarding solid waste, waste, wastewater, and solid waste facility siting requirements; rather, it would provide the opportunity to better respond to the City’s solid waste reduction requirements and other provisions of the element by broadening the range of design options.

Growth Management Element: The goal of the Growth Management Element is to “ensure that growth and development are integrally planned with, and phased concurrently with, the City of Irvine’s ability to provide an adequate circulation system and public facilities.” When the OCGP FEIR was certified, it was disclosed that though the project made changes to the *Master Plan of Arterial Highways*, the project would not change any of the objectives or implementing policies of the Growth Management Element.

Parks and Recreation Element: The goal of the Parks and Recreation Element is to “provide park and recreation opportunities at a level that maximizes available funds and enables residents of all ages to utilize their leisure time in a rewarding, relaxing, and creative manner.” The OCGP FEIR reported that there would be no change to the objectives or implementing policies of this element.

Seismic Element: The goal of the Seismic Element is to “minimize the loss of life, disruption of goods and services, and the destruction of property associated with an earthquake.” Five Seismic Response Area (SRA) designations are used to describe the magnitude and types of potential seismic hazards present within the City, and to provide policy guidance. The OCGP FEIR reported that the majority of the El Toro property was in category SRA-2 and that no objectives or implementing policies would be changed as a result of the project.

4. Discussion of Checklist and Mitigation Measures

Safety Element: The goal of the Safety Element is to “minimize the danger to life and property from man-made and natural hazards, including fire hazards, flood hazards, non-seismic geologic hazards and air hazards.” The OCGP FEIR disclosed the need for fuel modification to mitigate potential wildland fire hazards and drainage improvements to lessen flood hazards associated with implementation of the adopted Overlay Plan, and concluded no objectives or implementing policies would be changed as a result of the adopted Overlay Plan.

4.9.3 Impacts Associated with the Requested Entitlements

The project is consistent with the land uses approved in the OCGP FEIR and Addenda. Amended VTTM No. 17008, Proposed VTTM No. 17283, and the associated actions would implement approved development, and therefore would not affect the goals, objectives, or policies, or the facilities and services described in any of the General Plan Elements. No changes or new impacts would occur. The following analysis discusses the proposed project in consideration of each General Plan element.

Land Use Element: The Land Use Element designates Planning Areas 30 and 51 as “Orange County Great Park.” The proposed project is consistent with the General Plan designation, and would not interfere with the City’s or Heritage Fields’ opportunity to develop regionally significant conservation and open space, parks and recreation, educational facilities, and other public-oriented land uses, integrated with privately developed multi-use, residential, commercial, and industrial properties. Amended VTTM No. 17008, Proposed VTTM No. 17283, or the associated actions does not allow any additional development intensity and would not change the previously approved acreages for the project area.

Circulation Element: The goal of the Circulation Element is “to provide a balanced transportation system.” The project would not alter the planned network of arterials and connections to roadways in the surrounding area; nor would they materially change the riding and hiking trails and trail linkages; pedestrian and bicycle circulation; and transit, air transportation, and telecommunication opportunities.

Housing Element: The goal of the Housing Element is to “provide for safe and decent housing for all economic segments of the community.” The project would not permit new residential units or increase allowable development intensity. However, the project implements a portion of the adopted Overlay Plan, which, overall, distribute 3,625 residential dwelling units throughout Planning Areas 51 and 30, and would carry forward the adopted policies and objectives of the Housing Element, specifically by helping the City meet its Regional Housing Needs Assessment through 2025 and implement the provisions of the Development Agreement regarding the residential component of the adopted Overlay Plan.

Cultural Resources: The project would not affect the adopted goals, objectives, and policies of this element. Development would be required to comply with this element’s requirements and to implement mitigation measures found in the OCGP FEIR. With implementation of OCGP FEIR measures P1 and CULT1 through CULT4, the impacts of new development on paleontological and cultural resources would be less than significant. Furthermore, the proper disposition of such resources, if any are encountered prior to or during construction would be ensured; and through the information recovered, the community’s understanding and appreciation for its historic and prehistoric heritage will have been enhanced.

Noise Element: The project would not affect the goal of this element – “to contribute to a healthy and safe environment by minimizing noise impacts” – or the mobile noise, stationary noise, and noise abatement objectives and implementing policies of the element.

Public Facilities and Services Element: The project would not affect facilities or services described in the Urban Service Plan for the adopted Overlay Plan. As no substantive change in the Urban Service Plan is

4. Discussion of Checklist and Mitigation Measures

necessary, and that plan was a principle means of demonstrating consistency with the Public Facilities and Services Element, the project also is consistent with this element of the General Plan. Additionally, development would be required to implement the element's objectives and policies to ensure that a full range of necessary public facilities and services that are convenient to users are provided.

Integrated Waste Management Element: The project would not affect the adopted objectives and implementing policies regarding solid waste, waste, wastewater, and solid waste facility siting requirements. This element seeks to “encourage solid waste reduction and provide for the efficient recycling and disposal of refuse and solid waste material without deteriorating the environment.”

Growth Management Element: The goal of the Growth Management Element is to “ensure that growth and development are integrally planned with, and phased concurrently with, the City of Irvine’s ability to provide an adequate circulation system and public facilities.” When the OCGP FEIR was certified it disclosed that though the project made changes to the Master Plan of Arterial Highways, the project would not change any of the objectives or implementing policies of the Growth Management Element. The project likewise would not alter any of the objectives or implementing policies because it would remain consistent with the development phasing already a part of the overall development plan.

Parks and Recreation Element: The goal of the Parks and Recreation Element is to “provide park and recreation opportunities at a level that maximizes available funds and enables residents of all ages to utilize their leisure time in a rewarding, relaxing, and creative manner.” The OCGP FEIR reported there would be no changes to the objectives or implementing policies of the Element. Amended VTTM No. 17008, Proposed VTTM No. 17283, or the associated actions will not result in any losses of park land or increases in development intensity for the project. Furthermore, through the Great Park Development Agreement, Heritage Fields has dedicated 1,096 acres: 367 acres for the park, 165 acres for the sports park, 229 acres for the drainage corridor, 179 acres for the wildlife corridor, and 156 acres for the exposition center south.

Conservation and Open Space Element: The goal of this element is to “maintain and preserve the environmental systems as a major feature in the City.” This goal would continue to be achieved through the implementation of objectives L-1 through L-12 and corresponding policies. Objective L-10 encourages “the maintenance of agriculture in undeveloped areas of the City until the time of development, and in areas not available for development.” The project would not alter any of the objectives or implementing policies.

Seismic Element: The goal of the Seismic Element is to “minimize the loss of life, disruption of goods and services, and the destruction of property associated with an earthquake.” Five Seismic Response Area (SRA) designations are used to describe the magnitude and types of potential seismic hazards present within the City, and provide policy guidance. The OCGP FEIR reported that the majority of the El Toro property was in category SRA-2. All of Planning Area 30 and the portions of the Lifelong Learning District (LLD) and the Park District southwest of Irvine Boulevard are identified as SRA-2. The areas of the LLD and the Park District situated northeast of Irvine Boulevard are designated SRA-3; the SRA-4 classification has been applied to small areas along the northern edge of the LLD, and the Park District’s boundary within the Habitat Preserve area. The OCGP FEIR reported that no objectives or implementing policies would be changed as a result of the project. Likewise, the project would not alter that finding/conclusion because all project development remains within the previously established boundaries.

Safety Element: The goal of the Safety Element is to “minimize the danger to life and property from man made and natural hazards, including fire hazards, flood hazards, non-seismic geologic hazards, and air hazards.” The OCGP FEIR disclosed the need for fuel modification to mitigate potential wildland fire hazards and drainage improvements to lessen flood hazards associated with implementation of the project, and concluded no objectives or implementing policies would be changed as a result of the adopted Overlay Plan.

4. Discussion of Checklist and Mitigation Measures

The project does not contain elements that would alter the findings, conclusions and mitigation measures because all project development remains within the previously established project boundaries.

Major EIR Revisions Not Required. Based on the foregoing analysis and information, there is no evidence that the changes to the project require a major change to the certified OCGP FEIR. The proposed projects would not result in any new significant environmental impact nor is there a substantial increase in the severity of impacts from that described in the certified OCGP FEIR.

No Substantial Change in Circumstances Requiring Major EIR Revisions. There is no information in the record or otherwise available indicating substantial changes in circumstances that would require major changes to certified OCGP FEIR.

No New Information of Substantial Importance Showing Greater Significant Effects Than Previous EIR. This Initial Study/Addendum has analyzed all available relevant information and has determined that there is no new information of substantial importance, which was unknown and could not have been known with the exercise of reasonable diligence at the time the OCGP EIR was certified, indicating that the project will have one or more significant effects not discussed in the previous EIR or result in a substantial increase in the severity of previously identified effects.

No New Information of Substantial Importance Showing Ability to Reduce Significant Effects in Previous EIR. This Initial Study/Addendum has analyzed all available relevant information and has determined that there is no new information of substantial importance, which was unknown and could not have been known with the exercise of reasonable diligence at the time the OCGP FEIR was certified, indicating that; (1) mitigation measures or alternatives previously found not to be feasible would in fact be feasible, and would substantially reduce one or more significant effects of the project, but the project proponent declines to adopt the mitigation measures or alternatives; or (2) mitigation measures or alternatives that are considerably different from those analyzed in the previous EIR would substantially reduce one or more significant effects on the environment, but the project proponent declines to adopt the mitigation measures or alternatives. In that the OCGP FEIR did not identify any significant land use impacts there is no need for further alternatives to the project or the imposition of mitigation measure requirements.

4.9.4 Mitigation from the OCGP FEIR and Applicability to the Requested Entitlements

The OCGP FEIR identified no significant land use impact; therefore no mitigation measures were proposed.

4.10 NOISE

4.10.1 Environmental Setting

The OCGP FEIR described mobile noise sources from nearby freeways, roadways, rail facilities, and vehicle use at adjacent commercial businesses, light industrial facilities, and agricultural lands as the dominate noise source in the project area. Stationary sources of noise included temporary and intermittent noise from construction activities and agricultural operations, noise associated with the industrial/business parks to the east and the business park and entertainment uses to the south.

The OCGP FEIR presents the results of a noise survey conducted on December 10–12, 2002, in which noise measurements were conducted at nine locations. Ambient noise levels at the four surveyed representative residential locations ranged from 58 dBA to 65 dBA CNEL (Refer to OCGP FEIR p. 5.4-18, Figure 5.4-6, and Table 5.4-7). The audible noise sources included local traffic, distant traffic, birds, aircraft, and human voices, all of which were characterized as typical of suburban areas.

4. Discussion of Checklist and Mitigation Measures

4.10.2 Impacts Identified in the OCGP FEIR and Addenda

The OCGP FEIR concluded that development of the Overlay Plan would not result in any significant noise effects. The noise assessment considered a worst-case condition of simultaneous demolition and construction activities with the combined sound level of 20 pieces of large mobile equipment operating at a distance of 5,000 feet; 5 concrete breakers operating at a distance of 6,000 feet; and 2 crusher plants operating at a distance of 10,000 feet from the nearest off-project area residential location. The distances represented the closest possible location of the construction equipment to the nearest off-project area residences during a heavy construction period. The nearest off-site residential uses (sensitive noise source) were located approximately 4,000 feet from the property boundary. Under this scenario, the analysis estimated sound levels of approximately 56 dBA at the nearest off-site residential location. (Refer to OCGP FEIR, p. 5.4-24 and Table 5.4-8.)

As buildout of the project site was assumed to occur over time (years 2007–2025), construction-related noise impacts on residential areas within the project site were also estimated. Using the same construction equipment assumptions and a distance of 600 feet from the nearest residential area, the combined effect of the equipment was estimated at a sound level of 70 dBA at the nearest on-site residential locations during a heavy construction period. While the City of Irvine Noise Ordinance does not specify a limit on construction noise levels, it stipulates the days and hours during which construction activities may occur and when construction would not be allowed unless a temporary waiver is requested and granted; specifically, construction is allowed Monday through Friday between 7:00 a.m. and 7:00 p.m., and on Saturdays between 9:00 a.m. and 6:00 p.m.; no construction is allowed outside those hours, on Sundays, or on federal holidays. (Refer to OCGP FEIR, p. 5.4-31.)

4.10.3 Impacts Associated with the Requested Entitlements

The OCGP FEIR noise assessment considered a worst-case condition of simultaneous demolition and construction activities. The worst-case assumptions described for the adopted Overlay Plan remain reasonable assumptions for the project; no new information about future demolition and construction has become available that would increase the number of pieces of equipment to be operated simultaneously.

Construction Noise

Construction activities associated with the proposed project would have a short-term impact on ambient noise levels in the project vicinity. Amended VTTM No. 17008, Proposed VTTM No. 17283, or the associated actions does not allow any additional development intensity beyond what is allowed by the adopted Overlay Plan, and therefore would not result in an increase in construction noise levels. In addition, the analytical assumptions concerning construction, development phasing, and operations of the adopted Overlay Plan remain appropriate for the project. Consequently, the project would not increase the noise levels generated during construction activities. Therefore, the construction noise levels associated with this component of the project are anticipated to be similar to those addressed in the OCGP FEIR and Addenda and would not result in any new significant impacts which were not previously anticipated.

Construction Vibration

The OCGP FEIR identified that nuisance vibration from construction activities associated with the adopted Overlay Plan would result in noticeable vibration levels. However, because vibration from construction activities would be temporary, nuisance vibration would be less than significant. The project would not generate significantly higher levels of vibration. Therefore, the construction vibration levels associated with

4. Discussion of Checklist and Mitigation Measures

the project are anticipated to be similar to those addressed in the OCGP FEIR and Addenda and would not result in any new significant impacts which were not previously anticipated.

Operation

Current information regarding the noise impacts within the non-residential portions of the LLD (VTTM 17283) have been evaluated in a preliminary acoustical report by Wieland Acoustics dated October 2008 (see Appendix B). The proposed project includes Project Design Features that will attenuate for both present and future noise levels to meet City standards, which will not result in any new significant impacts. Project Design Features include standard wall construction, sound rated windows and doors, and mechanical ventilation for five general areas, which is discussed in detail and shown in Figure 1-2 of the report. Amended VTTM No. 17008, Proposed VTTM No. 17283, or the associated actions would not result in land use changes that would increase project-related stationary or mobile source noise generated by the project. Therefore, the noise levels associated with the project are anticipated to be similar to those addressed in the OCGP FEIR and would not result in any new significant impacts which were not previously anticipated.

Airport Noise

The former MCAS El Toro operations have ceased and no public airport, public use airport, or airport land use plan exists in the project vicinity.

Land Use Compatibility

The project includes land use types and intensity identical to the adopted Overlay Plan. Because the OCGP FEIR and Addenda did not identify any significant impacts related to land use compatibility, the proposed project is also compatible with the Irvine General Plan and zoning code for noise and vibration compatibility.

Major EIR Revisions Not Required. Based on the foregoing analysis and information, there is no evidence that the changes to the project require a major change to the certified OCGP FEIR. The project will not result in any new significant environmental impact nor is there a substantial increase in the severity of impacts from that described in the certified OCGP FEIR.

No Substantial Change in Circumstances Requiring Major EIR Revisions. There is no information in the record or otherwise available indicating substantial changes in circumstances that would require major changes to certified OCGP FEIR.

No New Information of Substantial Importance Showing Greater Significant Effects Than Previous EIR. This Initial Study/Addendum has analyzed all available relevant information and has determined that there is no new information of substantial importance, which was unknown and could not have been known with the exercise of reasonable diligence at the time the OCGP EIR was certified, indicating that the project will have one or more significant effects not discussed in the previous EIR or result in a substantial increase in the severity of previously identified effects.

No New Information of Substantial Importance Showing Ability to Reduce Significant Effects in Previous EIR. This Initial Study/Addendum has analyzed all available relevant information and has determined that there is no new information of substantial importance, which was unknown and could not have been known with the exercise of reasonable diligence at the time the OCGP FEIR was certified, indicating that; (1) mitigation measures or alternatives previously found not to be feasible would in fact be feasible, and would substantially reduce one or more significant effects of the project, but the project proponent declines to adopt the mitigation measures or alternatives; or (2) mitigation measures or

4. Discussion of Checklist and Mitigation Measures

alternatives that are considerably different from those analyzed in the previous EIR would substantially reduce one or more significant effects on the environment, but the project proponent declines to adopt the mitigation measures or alternatives. There are no alternatives to the project or additional mitigation measures that would substantially reduce one or more of the significant noise effects identified in and considered by the certified OCGP FEIR.

4.10.4 Mitigation from the OCGP FEIR and Applicability to the Requested Entitlements

The OCGP FEIR identified no significant noise impacts; therefore no mitigation measures were proposed.

4.11 POPULATION AND HOUSING

4.11.1 Environmental Setting

The OCGP FEIR discussed the caretaker status of the base following its closure. At the time the OCGP FEIR was prepared there was a limited number of military and civilian staff working on the base. There are no residents living on the base. Consequently, there are 4,380 vacant group quarters units and 1,209 residential dwelling units. The OCGP FEIR examined demographics in the context of the existing and projected population of the Orange County region and the City of Irvine. Population and housing information was developed based on the 2000 United States Bureau of Census population, household, and employment census information. The areas surrounding the former base and the Orange County subregion are considered jobs-rich and housing-poor. The Southern California Association of Governments (SCAG) seeks to encourage housing growth over job growth in the Orange County subregion. The OCGP FEIR reported that the ratio of jobs to housing in the area has environmental implications related to transportation and air quality. Thus, a major focus of the regional planning efforts has been to improve the ratio of jobs to housing in all affected subregions in order to reduce vehicular trips, costly infrastructure improvements, and resultant air emissions. Despite attempts, according to SCAG projections, the Orange County subregion's jobs/housing balance will worsen through the year 2025 as the number of jobs surpasses housing gains.

4.11.2 Impacts Identified in the OCGP FEIR and Addenda

As noted above, the area surrounding the former MCAS El Toro and the Orange County subregion are considered jobs-rich and housing-poor. SCAG seeks to discourage job growth over housing growth in the Orange County subregion. The OCGP FEIR reported that regional projections are dynamic and, as a compilation of local land use projections, reflect changing community views on the location and the types of growth desired. Although implementation of the adopted Overlay Plan would not have exceeded the Orange County Preferred-2000 employment projections, its impact on employment was considered significant because the Orange County subregion is anticipated to become increasingly jobs-rich over the next 20 years and the Overlay Plan-related employment would exacerbate the subregional jobs/housing imbalance. The Overlay Plan is expected to result in the provision of 3,625 dwelling units. Based on the city's zoning categories planned for this site, the dwelling units could accommodate up to 9,000 people. This increase in population will not substantially exceed projections contained for the site in OCP-2000. No significant impacts to population and housing were identified (www.scag.ca.gov).

4.11.3 Impacts Associated with the Requested Entitlements

The project would not alter the population, housing, and employment information contained in the OCGP FEIR. The project would not introduce new levels of development that would improve the ratio of jobs to housing beyond that already considered by the OCGP FEIR. The adopted Overlay Plan, including the proposed project, would result in:

4. Discussion of Checklist and Mitigation Measures

- an increase of up to 9,000 people (resident population);
- development of 3,625 residential dwelling units—1,100 low density, 860 medium density, 1,500 medium-high density, and 165 dwelling units allocated to homeless providers; and
- an approximate increase of 16,510 jobs.

The project's impacts would be the same as those identified in the OCGP FEIR, that is, less than significant for population and housing, and significant and unavoidable for employment.

Major EIR Revisions Not Required. Based on the foregoing analysis and information, there is no evidence that the changes to the project require a major change to the certified OCGP FEIR. The project would not result in any new significant environmental impact nor is there a substantial increase in the severity of impacts from that described in the certified OCGP FEIR.

No Substantial Change in Circumstances Requiring Major EIR Revisions. There is no information in the record or otherwise available indicating substantial changes in circumstances that would require major changes to certified OCGP FEIR.

No New Information of Substantial Importance Showing Greater Significant Effects than Previous EIR. This Initial Study/Addendum has analyzed all available relevant information and has determined that there is no new information of substantial importance, which was unknown and could not have been known with the exercise of reasonable diligence at the time the OCGP EIR was certified, indicating that the project will have one or more significant effects not discussed in the previous EIR or result in a substantial increase in the severity of previously identified effects.

No New Information of Substantial Importance Showing Ability to Reduce Significant Effects in Previous EIR. This Initial Study/Addendum has analyzed all available relevant information and has determined that there is no new information of substantial importance, which was unknown and could not have been known with the exercise of reasonable diligence at the time the OCGP FEIR was certified, indicating that; (1) mitigation measures or alternatives previously found not to be feasible would in fact be feasible, and would substantially reduce one or more significant effects of the project, but the project proponent declines to adopt the mitigation measures or alternatives; or (2) mitigation measures or alternatives that are considerably different from those analyzed in the previous EIR would substantially reduce one or more significant effects on the environment, but the project proponent declines to adopt the mitigation measures or alternatives. There are no alternatives to the project or additional mitigation measures that would substantially reduce one or more of the significant effects identified in and considered by the certified OCGP FEIR.

4.11.4 Mitigation from the OCGP FEIR and Applicability to the Requested Entitlements

The OCGP FEIR identified a significant impact associated with the jobs/housing ratio. The OCGP FEIR also stated that no mitigation is available to rectify conflicts between the numerical objectives of regional planning documents including the jobs/housing ratio. This finding remains applicable to the Amended VTTM 17008, VTTM 17283, and related applications.

4. Discussion of Checklist and Mitigation Measures

4.12 PUBLIC SERVICES

4.12.1 Environmental Setting

Law Enforcement

At the time of the certification of the OCGP FEIR, law enforcement was provided by the Orange County Sheriff through a contract with the Department of the Navy (DON) in PA 51 and the Irvine Police Department provided law enforcement within PA 30. Subsequent to the annexation of the property, the City of Irvine Police Department has assumed law enforcement responsibility within both planning areas. The Irvine Police Department is headquartered at the Irvine Civic Center Complex and also has a satellite facility in the Irvine Spectrum Entertainment Complex. The OCGP FEIR stated that the current police facilities are adequate to handle the personnel and equipment that are employed and utilized by the department for PA 30. The OCGP FEIR also stated that the Irvine Police Department is researching the expansion of their facilities, although the specific details of constructing a substation were not known.

Fire and Emergency Medical Services

At the time of the certification of the OCGP FEIR, primary fire protection to PAs 30 and 51 was provided by Orange County Fire Authority (OCFA) under contract to the County of Orange on an interim basis. Subsequent to the annexation of the property, OCFA has continued to provide fire protection service to the project area. The OCGP FEIR stated that OCFA is planning two additional fire stations in the general vicinity. OCFA also has in place an agreement with the Irvine Company as part of the Northern Sphere Area that should provide adequate service to all areas surrounding the project.

Parks and Recreation

The site presently contains no parks, trails, bike lanes or other recreation facilities that are open to the public. However, many public facilities are located within five miles of the OCGP including neighborhood and community parks, recreational trails, and open space.

There are approximately 506 acres of neighborhood and community parks and recreational trails in the City of Irvine's public park system, including one aquatic complex containing three competition size pools. William R. Mason Regional Park, a County of Orange facility, and numerous private parks and recreation facilities are also available throughout Irvine that provide additional recreational opportunities for the City's residents.

The City of Irvine, through its Conservation and Open Space Element has established an open space program comprehensively aggregating open space, adjoining other regional open space, promoting conservation and passive recreational opportunities (e.g. Bommer Canyon, Shady Canyon and Limestone Canyon).

At the time of the certification of the OCGP FEIR, the DON, acting in a caretaker's role, offered public access to a variety of existing recreational facilities including the existing Marine Memorial Golf Course and equestrian stables. Currently, these facilities remain closed and are under demolition and preparation for future development.

4. Discussion of Checklist and Mitigation Measures

School Services

Planning Areas 30 and 51 are within the school service boundaries of the Irvine Unified School District (IUSD) and the Saddleback Valley Unified School District (SVUSD). Prior to the closure of the base, an IUSD elementary school with a 600-student capacity was operated on the former base property.

4.12.2 Impacts Identified in the OCGP FEIR

Law Enforcement

The OCGP FEIR discussed the law enforcement needs of both Planning Areas 30 and 51, and stated that following annexation, the Irvine Police Department would provide law enforcement for the entire project area. The OCGP FEIR also analyzed the number of police officers, police supervisors and support staff, as well as the number of vehicles, equipment, and services. The OCGP FEIR stated that police protection for the park area would be funded through the use of a special park assessment. As stated in the OCGP FEIR, the general impacts associated with construction and operation of public facilities were analyzed in the OCGP FEIR as part of the planned land uses which also included the construction of a new Police substation.

Fire and Emergency Medical Services

Subsequent to annexation of the property, Planning Areas 30 and 51 continue to be served by OCFA. The OCGP FEIR stated that there was the likelihood that additional fire services infrastructure would be required to support the proposed project. To date, a temporary fire station (Station No. 20) located southeast of Trabuco Road and Sand Canyon is under construction and will be used to serve the OCGP. Specific details of the permanent facility and specific environmental impact of constructing the new fire facilities to serve the project could not be determined as specific site plans and locations has not been prepared.

Parks and Recreation

As discussed in detail in OCGP FEIR, the parkland acreage under the project will greatly exceed the existing City of Irvine's standards, and will provide a regional open space amenity for the benefit of Orange County. The OCGP FEIR calculated a total of 45.1 acres of parkland required for the proposed development. A portion of that acreage will be in neighborhood parks, primarily for pools and tot lots within close proximity of homes.

The community park requirement for the future Heritage Fields development has been addressed through the Development Agreement between the City and Heritage Fields (Recorded on July 12, 2005). Conveyance of the OCGP to the City satisfied any requirement imposed on the developer for the dedication or development of community parks as required by the City's General Plan and Municipal Ordinance. The neighborhood park requirements for the future Heritage Fields development will be met within the Heritage Fields development, outside the OCGP. Details of specific park locations, ownership, sizes, and improvements will be presented to the Community Services Commission as a part of the Park Plan for the new residential developments. This is consistent with the findings of the OCGP FEIR.

The OCGP FEIR also discussed the Implementation Agreement regarding the Natural Community Conservation Plan (NCCP) for the Central/Coastal Orange County Sub-region of the Coastal Sage Scrub NCCP (July 1996), and that the Habitat Reserve will be established on approximately 974 acres in the northeastern portion of current Planning Area 51. It is noted that that acreage was not sold by the Navy, but rather transferred to the Federal Aviation Administration (FAA). The FAA has an agreement with the Department of the Interior (DOI) for the maintenance of extant gnatcatcher habitat. There are two designated

4. Discussion of Checklist and Mitigation Measures

drainage corridors and one wildlife corridor on the Site. The wildlife corridor is located on the southern portion of the project area. The adopted Overlay Plan also includes opportunities for museums, theaters, gardens and other cultural facilities, as well as a sports park, a golf course, and network of recreational riding and hiking trails throughout the project site.

School Services

The OCGP FEIR discussed in detail the proposed project, the related student generation, and the required school facilities. Based on an initial analysis, the IUSD estimated the need for one 13-acre K–8 site as well as funding for expansion and modernization of existing middle and high school facilities by project buildout.

4.12.3 Impacts Associated with the Requested Entitlements

Law Enforcement

The project does not change the intensity or type of land uses in the approved Overlay Plan, and, therefore, the demand on law enforcement is within the envelope of analysis presented in the OCGP FEIR.

Fire and Emergency Medical Services

Since the project does not change the intensity or type of land uses in the approved Overlay Plan, the demand on fire protection is within the envelope of analysis presented in the previously certified OCGP FEIR.

Parks and Recreation

The project does not propose changes to the land use intensities and types in the approved Overlay Plan, and maintains all of these facilities and amenities as project features. Therefore, the project remains within the envelope analyzed in the previously certified OCGP FEIR.

School Services

Since the project does not propose changes to the number and type of residential units, or to any of the other land uses in the approved Overlay Plan, the proposed project remains within the envelope analyzed in the previously certified OCGP FEIR.

Major EIR Revisions Not Required. Based on the foregoing analysis and information, there is no evidence that the changes to the project require a major change to the certified OCGP FEIR. The project would not result in any new significant environmental impact nor is there a substantial increase in the severity of impacts from that described in the certified OCGP FEIR.

No Substantial Change in Circumstances Requiring Major EIR Revisions. There is no information in the record or otherwise available indicating substantial changes in circumstances that would require major changes to certified OCGP FEIR.

No New Information of Substantial Importance Showing Greater Significant Effects Than Previous EIR. This Initial Study/Addendum has analyzed all available relevant information and has determined that there is no new information of substantial importance, which was unknown and could not have been known with the exercise of reasonable diligence at the time the OCGP EIR was certified, indicating that the project will have one or more significant effects not discussed in the previous EIR or result in a substantial increase in the severity of previously identified effects.

4. Discussion of Checklist and Mitigation Measures

No New Information of Substantial Importance Showing Ability to Reduce Significant Effects in Previous EIR. This Initial Study/Addendum has analyzed all available relevant information and has determined that there is no new information of substantial importance, which was unknown and could not have been known with the exercise or reasonable diligence at the time the OCGP FEIR was certified, indicating that; (1) mitigation measures or alternatives previously found not to be feasible would in fact be feasible, and would substantially reduce one or more significant effects of the project, but the project proponent declines to adopt the mitigation measures or alternatives; or (2) mitigation measures or alternatives that are considerably different from those analyzed in the previous EIR would substantially reduce one or more significant effects on the environment, but the project proponent declines to adopt the mitigation measures or alternatives. There are no alternatives to the project or additional mitigation measures that would substantially reduce one or more of the significant effects identified in and considered by the certified OCGP FEIR.

4.12.4 Mitigation from the OCGP FEIR and Applicability to the Requested Entitlements

The OCGP FEIR determined the mitigation measures identified in other sections of the OCGP FEIR (Sections 5.1–5.13) address the impacts associated with the construction and operation of public facilities. These measures would be applicable to any new construction and operation of facilities for police, fire protection, park and recreation, and education to serve new growth expected in the northern portion of the City.

4.13 RECREATION

Issues related to Recreation are discussed above under Section 4.11, *Public Services*.

4.14 TRANSPORTATION/TRAFFIC

4.14.1 Environmental Setting

The OCGP FEIR describes the traffic and circulation conditions of a study area that encompassed 145 existing intersection analysis sites (2007) and an additional 11 future sites (Post 2025) in the City of Irvine, and portions of 7 adjacent jurisdictions including the Cities of Lake Forest, Mission Viejo, Laguna Hills, Laguna Woods, Aliso Viejo, Laguna Beach, and unincorporated areas of Orange County.

The OCGP FEIR used the City of Irvine Traffic Performance Criteria, which establishes level of service (LOS) “A” to “D” as the peak-hour minimum acceptable service level. In its adoption of the Overlay Plan, the City General Plan Policy B-1 (C), which identified LOS E as acceptable for application to intersections in Planning Areas 13, 31, 32, 34, 35 and 39, was changed to include the effects of future development in Planning Areas 30 and 51 on the intersections in those Planning Areas. The City’s performance criteria also includes a standard of 0.02—roadway volume to capacity (V/C) ratio or the intersection capacity utilization (ICU)—to identify significant project impacts and associated need for improvements at both roadways and intersections.

At the time the OCGP FEIR was prepared the following 10 study area intersections experienced deficient peak hour traffic operations:

- Culver Drive and Walnut Avenue
- Culver Drive and University Drive
- Jeffrey Road and Alton Parkway
- Jeffrey Road and I-405 Northbound Ramps
- Bake Parkway and Irvine Boulevard

4. Discussion of Checklist and Mitigation Measures

- Bake Parkway and Jeronimo Road
- El Toro Road and Aliso Creek Road
- Los Alisos Boulevard and Los Alisos Boulevard
- Muirlands Boulevard and Los Alisos Boulevard
- Trabuco Road and Alicia Parkway

4.14.2 Impacts Identified in the OCGP FEIR

The OCGP FEIR concluded that the adopted Overlay Plan would cause an increase in traffic which would be substantial in relation to the existing traffic load and capacity of the street system—that is, a substantial increase in either the number of vehicle trips, the V/C on roadways, or congestion at intersections—in the year 2007, year 2025, and post-2025 scenarios (OCGP FEIR page 5.2-66):

Year 2007

- I-5 Freeway at Alton Parkway—southbound off-ramp (A.M.)
- I-405 Freeway at Irvine Center Drive—southbound off-ramp (A.M.)

Year 2025

- University Drive from the I-405 Freeway to Michelson Drive (A.M.)
- I-5 Freeway from Sand Canyon Avenue to Jeffrey Road—northbound (P.M.)
- I-5 Freeway from Jeffrey Road to Sand Canyon Avenue—southbound (A.M.)
- I-405 Freeway from Jeffrey Road to Sand Canyon Avenue—southbound (A.M.)
- I-5 Freeway at Jeffrey Road—southbound on-ramp (A.M.)
- I-5 Freeway at Sand Canyon Avenue—northbound on-ramp (P.M.)
- I-5 Freeway at Sand Canyon Avenue—southbound off-ramp (A.M.)
- I-5 Freeway at Alton Parkway—southbound off-ramp (A.M.)
- I-5 Freeway at Bake Parkway—southbound off-ramp (A.M.)
- I-405 Freeway at Sand Canyon Avenue—northbound direct on-ramp (P.M.)
- I-405 Freeway at Sand Canyon Avenue—southbound off-ramp (A.M.)
- I-405 Freeway at Irvine Center Drive—southbound off-ramp (A.M.)
- SR-241 Tollway at Lake Forest Drive—southbound off-ramp (A.M.)
- SR-133 Freeway at Barranca Parkway—northbound direct on-ramp (P.M.)

Post-2025

- I-5 Freeway from Sand Canyon Avenue to Jeffrey Road—northbound (P.M.)
- I-5 Freeway from Jeffrey Road to Sand Canyon Avenue—southbound (A.M.)
- I-405 Freeway from Jeffrey Road to Sand Canyon Avenue—southbound (A.M.)
- I-5 Freeway at Jeffrey Road—southbound on-ramp (A.M.)
- I-5 Freeway at Jeffrey Road—northbound off-ramp (P.M.)
- I-5 Freeway at Sand Canyon Avenue—northbound on-ramp (P.M.)
- I-5 Freeway at Sand Canyon Avenue—southbound off-ramp (A.M.)
- I-5 Freeway at Alton Parkway—southbound off-ramp (A.M.)
- I-5 Freeway at Bake Parkway—southbound off-ramp (A.M.)
- I-5 Freeway at El Toro Road—southbound off-ramp (P.M.)
- I-405 Freeway at Sand Canyon Avenue—northbound direct on-ramp (A.M./P.M.)
- I-405 Freeway at Sand Canyon Avenue—southbound off-ramp (A.M.)

4. Discussion of Checklist and Mitigation Measures

- I-405 Freeway at Irvine Center Drive—southbound off-ramp (A.M.)

Intersections

For the list of impacted intersections by analysis year, please refer to the following OCGP FEIR tables:

- Table 5.2-12 for year 2007
- Table 5.2-13 for year 2025
- Table 5.2-15 for post 2025

4.14.3 Impacts Analyzed in the OCGP FEIR and Addenda

The OCGP FEIR established trip thresholds (also known as “trip caps”) for each of the planning areas within the Great Park area. The trip cap is based on socioeconomic data average daily trip generation for the approved Orange County Great Park plan (the Overlay Plan area), which the Heritage Fields development is a part. The traffic impacts of the 2006 GPA/ZC project were analyzed in Addendum No. 2 by distributing project-related traffic over existing and future traffic conditions. The three future conditions (year 2010, year 2025 and post-2025) are based on the existing circulation system plus fully funded intersection improvements that were planned to be in place in each future time frame and the land use and development growth that is projected in each future time frame. In each case, project impacts were identified by comparing traffic conditions with and without the 2006 GPA/ZC project.

The circulation system performance criteria applied in the analysis were the criteria approved in the 2003 North Irvine Transportation Model (NITM) Program Nexus Study. The performance criteria were also consistent with the criteria adopted by the jurisdictions that are within the project study area. The criteria include components for arterial roadways, intersections, freeway/tollway ramps, and freeway/tollway mainline segments.

The results of the year 2010, year 2025 and post-2025 analysis indicated that the proposed 2006 GPA/ZC project was not forecast to significantly impact any roadway segment based on the second level of analysis (the City’s peak hour link capacity analysis methodology), intersection, freeway/tollway ramp, or any freeway/tollway mainline segment.

Subsequently, as addressed in Addendum No. 3, a Traffic Study (refer to Appendix C of Addendum No. 3) for the Master Subdivision Map was prepared by Austin-Foust Associates, Inc. (dated April 11, 2007) to address the transportation impacts for the “project,” i.e. backbone infrastructure with no new land use development in an interim year timeframe consistent with the TTM scope of work of the North Irvine Transportation Mitigation (NITM) Program Ordinance.

The Traffic Study analyzed the impacts of the Master Subdivision Map (MSM) application based on Year 2010 traffic conditions in the traffic analysis study area.

That proposed project was presented in Figure 4-2 to Addendum No. 3, and included Marine Way from Sand Canyon Avenue to Bake Parkway, Trabuco Road from the SR-133 to “O” Street, and the extension of Rockfield Boulevard to Marine Way as four-lane primary arterials, Ridge Valley (formerly “Y” Street) from Portola Parkway to Irvine Boulevard and “O” Street (formerly College Road) as four-lane secondary arterials, Trabuco Road east of “O” Street, “A” Street, “B” Street, “C” Street and “D” Street as two-lane local road ways. The mid-block lanes were shown in Figure 4-3 to Addendum No. 3. It should be noted that the proposed project included the construction of two lanes on “O” Street between Trabuco Road and Marine

4. Discussion of Checklist and Mitigation Measures

Way. The remaining two lanes will be built by the owner of the adjacent property (west side of “O” Street) when that property is developed.

An Internal Circulation Analysis (refer to Appendix D to Addendum No. 3) for the Master Subdivision Map in the Overlay Plan area was prepared by Austin-Foust Associates, Inc. to analyze the access and internal circulation for the Heritage Fields project. Project access was illustrated in Figure 4-4 in Addendum No. 3, which showed the proposed access locations for the Lifelong Learning District, the Park District, and the Transit Oriented Development (TOD) District. The project traffic loaded directly onto the surrounding arterial system at several locations. These include access to Irvine Boulevard via Ridge Valley; “O” Street (formerly College Road), “A” Street and “B” Street to Sand Canyon Avenue via Trabuco Road and Marine Way (and indirectly via Irvine Boulevard); and to Alton Parkway, Barranca Parkway, and Bake Parkway via Marine Way. Project access to the SR-133 is provided directly via a planned interchange at Trabuco Road and indirectly via “O” Street to the Irvine Boulevard interchange.

The intersections shown in Figure 4-5 in Addendum No. 3 were analyzed using intersection capacity utilization (ICU) values to determine level of service (LOS). The results of this analysis showed that all intersections operate at an acceptable level of service under Post-2025 buildout conditions. The intersections were then analyzed for signalization needs. Traffic signal warrants based on peak hour volumes (as adopted by the Federal Highway Administration and Caltrans) were used to determine the need for signalization. The results of this analysis were illustrated in the Figure 4-4 in Addendum No. 3. Based on the application of the warrants, it was determined that traffic signals should be installed at all of the analyzed intersections except for the intersections of “C” Street and “D” Street at Marine Way.

Recommended on-site traffic-control measures included one-way stop signs, signals, and roundabouts. Left-turn pocket lengths for project access intersections with exclusive left-turn lanes were estimated using the County of Orange Environmental Management Agency (EMA) Highway Design Manual. The estimated left-turn storage length requirements for the analyzed intersections were based on peak hour volumes.

Right-turn lanes will be provided for select project access locations on site where additional intersection capacity is needed. The length of the right-turn lane is a function of the adjacent through-traffic queue and LOS at the intersection. A minimum length of 250 feet plus a 120-foot transition will be provided at these locations. Right-turn deceleration lanes are provided along the periphery of the project site and along major roadways within the project site where higher speeds prevail (i.e., Irvine Boulevard, Trabuco Road, and on Marine Way with the exception of locations within the TOD District). The right-turn deceleration lane will be a minimum of 150 feet with a 120-foot transition, in order to provide a safe transition from the through lane to the right-turn lane.

Addendum No. 5 analyzed the impacts associated with realignment of the Marine Way/Bake Parkway intersection and concluded that the project would not produce or substantially worsen significant impacts identified in the OCGP FEIR. Consistent with the conclusions in the OCGP FEIR, traffic and circulation impacts associated with the project would be less than significant, as the future development would implement all applicable laws and regulations to reduce impacts on traffic and circulation. However, the following project design features would need to be implemented as part of the project:

Bake Parkway/I-5 Northbound Ramp

The General Plan approved Bake Parkway at Marine Way intersection provides direct access from the Bake Parkway at the I-5 northbound ramps intersection onto Marine Way. The proposed Bake Parkway at Marine Way intersection is relocated north (east) of the General Plan approved Bake Parkway at Marine Way intersection on Bake Parkway. The relocation of the Bake Parkway at Marine Way intersection includes

4. Discussion of Checklist and Mitigation Measures

project design features along Bake Parkway. Specifically, Bake Parkway is proposed to be widened north (east) of the existing I-5 bridge to provide four through lanes to Rockfield Boulevard while southbound (westbound) Bake Parkway from Rockfield Boulevard will be widened to provide four through lanes which reduces to three through lanes at the I-5 NB on-ramp. In addition, the proposed Bake Parkway at Marine Way relocation is also accompanied by improvements at the I-5 northbound off-ramp. The I-5 northbound off-ramp at Bake Parkway will be widened to provide one left-turn lane and three right-turn lanes. The project design features at this location needed for Year 2030 and Post-2030 operations, tied to the construction of the Bake Parkway and Marine Way intersection will provide acceptable levels of service at this intersection.

Sand Canyon/I-5 Northbound Ramp

The proposed relocation of the Bake Parkway/Marine Way intersection resulted in the need for restriping at the eastbound approach or the southbound approach of the Sand Canyon/I-5 Northbound Ramp intersection. As part of the project design features, the southbound approach at this intersection will be restriped to provide two left-turn lanes, four through lanes, and one right-turn lane. The restriping improvement provides ICU values lower than the Without Project condition.

4.14.4 Impacts Associated with the Requested Entitlements

A traffic study analyzing the potential impacts of the Proposed VTTM No. 17283 was prepared by the City of Irvine and Iteris, Inc. in October 2008 and is included in its entirety as Appendix C. The following summarizes the analysis and conclusions contained in the traffic study.

A traffic study was carried out to determine the potential impacts of Vesting Tentative Tract Map 17283 (VTTM 17283) for a portion of the Lifelong Learning District (LLD) of the Heritage Fields site located in Planning Area (PA) 51 in the City of Irvine. The purpose of the study is to provide traffic analysis data for the VTTM 17283 application for this development for the year 2012 horizon. The study presents data that will be the basis of design for key on-site project roadways in support of the VTTM 17283 application. The study also identifies the location, timing and prioritization of NITM improvements related to potential impacts caused by traffic from the proposed project. The traffic study was conducted in accordance with the requirements of an approved Scope of Work (see Appendix D of Traffic Study).

The results of the year 2012 analysis indicate that the proposed project is forecast to result in the need for improvements at two freeway ramps within the NITM study area based on peak hour intersection and ramp performance criteria. The ramp locations requiring improvements are:

- I-405 at Sand Canyon - NB Direct On Ramp (Convert the HOV lane to a second metered mixed flow lane)
- I-405 at Sand Canyon - SB Off Ramp (Add a second drop lane from I-405 to the off ramp)

The proposed improvements will bring the ramp locations to an acceptable level of service. These improvements have been previously identified as mitigation requirements in the underlying EIR and are included in the NITM Program. The development of VTTM 17283 requires the advancement of these NITM improvements from 2025 to 2012 in the NITM Program. The NITM Program allocates a fair share portion of the improvement costs at these freeway ramp locations to this development. Therefore the projects participation in the NITM Program fulfills the project's mitigation requirement at these ramp locations. For internal intersections and roadway segments, the report presents the proposed lane configurations, traffic control and turn lane pocket lengths per the City of Irvine Transportation Design Procedures.

4. Discussion of Checklist and Mitigation Measures

Project Design Features

- Included as a Project Design Feature, both the eastbound and westbound approaches of Burt Road at Sand Canyon Avenue will be restriped to one left turn lane and a shared through/de-facto right turn lane. Additionally, the traffic signal will be modified as needed to accommodate the operations with this movement. This Project Design Feature is not needed in the event that the proposed grade separated crossing of Sand Canyon and the railroad tracks is fully funded and scheduled for construction by 2012. In such an event, this Project Design feature is not needed and may be removed from the project at the discretion of the Director of Public Works.
- Included as a Project Design Feature the westbound approach of Marine Way at Sand Canyon will be restriped to one left turn lane and one shared left/right turn lane. Additionally, the traffic signal will be modified as needed to accommodate the operations with this movement. This Project Design Feature is not needed in the event that the proposed grade separated crossing of Sand Canyon and the railroad tracks is fully funded and scheduled for construction by 2012. In such an event, this Project Design feature is not needed and may be removed from the project at the discretion of the Director of Public Works.

Conclusion

The proposed project will not produce new or substantially worsen significant impacts identified in the OCGP FEIR or addenda. Consistent with the conclusions in the OCGP FEIR, traffic and circulation impacts associated with the project would be considered less than significant as the future development would implement all applicable laws and regulations to reduce impacts on traffic and circulation.

The OCGP FEIR disclosed the traffic analysis assumptions that the cumulative impact of the Revised Overlay Plan traffic along with other regional growth at the identified ramp and freeway locations would be mitigated through a combination of regional programs that area the responsibility of other agencies and, if said programs are implemented for the cumulative freeway/tollway ramp, impacts would remain significant and unavoidable (OCGP FEIR page 7-19). The project will not alter this conclusion. Mitigation measures have been developed for the intersection locations identified as being impacted by the OCGP development. This mitigation measure are not considered new; rather, they are funded NITM Improvements identified in previous traffic studies and related CEQA document.

Major EIR Revisions Not Required. Based on the foregoing analysis and information, there is no evidence that the changes to the project require a major change to the certified OCGP FEIR. The project will not result in any new significant environmental impact nor is there a substantial increase in the severity of impacts from that described in the certified OCGP FEIR.

No Substantial Change in Circumstances Requiring Major EIR Revisions. There is no information in the record or otherwise available indicating substantial changes in circumstances that would require major changes to certified OCGP FEIR.

No New Information of Substantial Importance Showing Greater Significant Effects Than Previous EIR. This Initial Study/Addendum has analyzed all available relevant information and has determined that there is no new information of substantial importance, which was unknown and could not have been known with the exercise of reasonable diligence at the time the OCGP FEIR was certified, indicating that the project will have one or more significant effects not discussed in the previous EIR or result in a substantial increase in the severity of previously identified effects.

4. Discussion of Checklist and Mitigation Measures

No New Information of Substantial Importance Showing Ability to Reduce Significant Effects in Previous EIR. This Initial Study/Addendum has analyzed all available relevant information and has determined that there is no new information of substantial importance, which was unknown and could not have been known with the exercise or reasonable diligence at the time the OCGP FEIR was certified, indicating that; (1) mitigation measures or alternatives previously found not to be feasible would in fact be feasible, and would substantially reduce one or more significant effects of the project, but the project proponent declines to adopt the mitigation measures or alternatives; or (2) mitigation measures or alternatives that are considerably different from those analyzed in the previous EIR would substantially reduce one or more significant effects on the environment, but the project proponent declines to adopt the mitigation measures or alternatives. There are no alternatives to the project or additional mitigation measures that would substantially reduce one or more of the significant effects identified in and considered by the certified OCGP FEIR.

4.14.5 Mitigation from the OCGP FEIR and Applicability to the Requested Entitlements

The OCGP FEIR identified mitigation measures TRAN1 through TRAN8 which, if fulfilled prior to specified development approvals, would eliminate or substantially reduce the traffic and circulation effects of development under the adopted Plan. The measures are applicable to future development under the project.

TRAN 1 Prior to the approval of any final map (other than a financing and conveyance map) allocating building intensity within Planning Areas 30 and 51, and prior to issuances of any building permits for permanent improvements within Planning Areas 30 and 51, the landowner or subsequent project applicant shall either (i) apply for annexation of any areas within the final map to the Irvine Spectrum Transportation Management Association (TMA) ("Spectrumotion") in accordance with Article X of the recorded Declaration of Covenants, Conditions and Restrictions (CC&Rs) for the Irvine Spectrum TMA, including any supplementary or amended CC&Rs, to reduce traffic, air quality and noise impacts or (ii) develop and implement a similar transportation management plan containing the elements and meeting the criteria described below as approved by the Director of Public Works:

Transportation Management Plan (TMP)

The development and implementation of a Transportation Management Plan is an identified mitigation measure to manage transportation access for Planning Areas 30 and 51. This document summarizes the key elements of the TMP.

A. Introduction

The purpose of this document is to provide an outline for a comprehensive TMP for the Planning Areas 30 and 51 ("Great Park TMP"). This report is not intended to provide the specific details of the plan, but rather to highlight the key components and provide direction for subsequent detailed planning and implementation activities. When preparation of the TMP is undertaken, all of the agency and stakeholders will be invited to provide input.

The applicant may elect to annex Planning Area 51 and a portion of Planning Area 30 into the Irvine Spectrum Transportation Management Association (Spectrumotion). Spectrumotion is a private, non-profit Transportation Management Association (TMA) formed to reduce traffic congestion in Irvine Spectrum. Spectrumotion promotes, markets, and subsidizes alternatives to solo-commuting and assists the business community in complying with trip reduction related requirements. Membership is mandatory to property owners with deed restrictions requiring

4. Discussion of Checklist and Mitigation Measures

participation in the TMA. Membership dues provide the funding for the Association and its programs, which offer a variety of employer and commuter services focused on reducing vehicular trip generation.

In the event that the applicant elects not to annex into Spectrumotion, a TMP similar to that provided by Spectrumotion will be developed and implemented. This document sets forth the components of the TMP should it be necessary.

B. Transportation Management Plan Framework

The key elements of the Great Park TMP are set forth below:

New Hire Orientation: Inform newly hired employees of commuting services available to them.

Public Transportation Pass Sales: Provide a central location for purchase of passes to available transit services ((i.e., OCTA buses, Metrolink, Amtrak, etc.).

Vanpool and Carpool Formation Assistance: Perform all of the administrative work necessary to establish van pools and car pools.

On-site Promotions: Hold rideshare promotions at work sites and assist in employer assistance promotions.

Telecommuting/Alternative Work Schedule Consulting: Assist employers in developing and implementing a telecommuting or alternative work schedule program.

Personalized Commute Consulting: Provide a personalized commute profile to any commuter, which includes carpool match list containing the names of other commuters in the North Irvine Sphere that live and work near each other.

Website: Maintain a website with all of their program information available.

Rideshare Promotions: Conduct high visibility rideshare promotions as a means to advertise its services.

Subsidies: To the extent financially feasible, offer subsidies to assist in the formation of vanpools, the formation of carpools, and to encourage the trying of transit services.

Public Agency Coordination: Work closely with various public and quasi-public agencies to improve bus and commuter rail service to the Spectrum and North Irvine Sphere areas.

C. Transportation Management Plan Implementation

As part of the TMP, a process will be established to monitor its effectiveness in reducing peak hour trip generation in the Planning Areas 30 and 51. Provision shall be made for the Plan to be modified as appropriate to enhance its effectiveness.

TRAN2 Prior to the issuance of the first building permit, City shall establish, and the landowner or subsequent project applicant shall commit to participate in, a transportation system/infrastructure

4. Discussion of Checklist and Mitigation Measures

fee program to fund improvements identified as mitigation measures listed in Tables 5.2-16 and 5.2-17 of the OCGP FEIR.

- TRAN3 Prior to issuance of any building permits for permanent improvements within Planning Areas 30 and 51, the landowner or subsequent project applicant shall implement or contribute its percentage funding responsibility for traffic improvements as identified in the NITM Ordinance.
- TRAN4 Prior to approval of each Tentative Map or Master Plan that allocates intensity for numbered lots, the landowner or subsequent project applicant shall prepare, subject to City review and approval, an updated traffic study consistent with the City of Irvine Traffic Study Guidelines inclusive of a phasing plan for traffic improvements associated with the subject Tentative Map or Master Plan that allocates intensity for numbered lots. The traffic study area shall be the same as the study area utilized in the NITM Nexus Study. The phasing plan will specify the timing, funding, construction, and responsibilities for all traffic improvements identified in the updated traffic study. The updated traffic study will determine whether any additional or alternative traffic improvements are necessary based on updated traffic forecasts. The updated traffic study will evaluate at a minimum the cumulative impact of the subject map and/or Master Plans that allocates intensity and all previously approved or concurrently submitted maps and/or Master Plans. The methodology for the study area, applicable land use and circulation modifications, and standards for assessing and mitigating impacts employed in the updated traffic study shall be consistent with a City approved traffic study scope of work. The landowner or subsequent project applicant shall construct or bond for and enter into a funding agreement for necessary improvements identified in the updated traffic study and/or participate in the City fee program (OCGP FEIR Mitigation Measure TRAN2) to the extent that the improvements identified in the updated traffic study are listed in Tables 5.2-16 and 5.2-17 of the OCGP FEIR.

Traffic signals that are on-site or directly related to the development in Planning Areas 30 and 51 will be installed as warranted through the mitigation implementation plan process.

- TRAN5 In conjunction with the preparation of any updated traffic study as required in Mitigation Measure Tran 4 for each master tentative map or equivalent, and assuming that a regional transportation agency has not already programmed and funded the warranted improvements to the impacted freeway mainline or freeway/toll way ramp locations in conjunctions with fulfilling its regional role, that landowner or subsequent project applicant and the City will take the following actions:
1. The City shall ensure that the updated traffic study identifies the project's proportionate impact on the specific freeway mainline and/or freeway-toll way ramp locations and its percentage responsibility for mitigating these impacts (assuming tolled conditions on the Transportation Corridors) based on thresholds of significance, performance standards and methodologies used in the OCGP FEIR and established in the Orange County Congestion Management Program and City of Irvine Traffic Study Guidelines.
 2. The City shall estimate the cost of the project's percentage responsibility in cooperation with Caltrans and the Transportation Corridor Agency.
 3. The landowner or subsequent project applicant shall enter into an agreement with the City prior to recordation of the first final map for each Master Tentative map or equivalent to establish the method and timing of payment of the identified percentage responsibility.

4. Discussion of Checklist and Mitigation Measures

4. The City shall allocate landowner or subsequent project applicant's percentage contribution to traffic improvements that result in improved traffic flow on the impacted mainline and ramp locations, including but not limited to construction of physical or operational improvements, contributions to mandated trip reduction or transit programs, or funding participation in a regional transportation improvement fee program, if adopted.

TRAN6 The project shall mitigate to insignificant levels all project impacts at significantly impacted study area intersections. Tables 5.2-16 and 5.2-17 in the OCGP FEIR show the mitigation program for each phase. With regard to impacts that require improvements in other jurisdictions, the City of Irvine shall cooperate with the affected jurisdiction to ensure that the improvements are constructed in a timely manner.

TRAN7 Assuming that a regional transportation agency has not already programmed and funded the improvements, the City of Irvine shall coordinate with Caltrans and the Transportation Corridor Agencies, and submit for their approval proposed plans for modifications to the state highway system and the transportation corridors, as required to provide ramp connections to Trabuco Road. If needed, the City shall prepare a Project Study Report, a new Connection Request, and a Detailed Traffic Revenue Study for review by Caltrans and the Transportation Corridor Agency for the proposed connection of Trabuco Road to the Eastern Transportation Corridor. The City shall perform toll and revenue impact studies for any mitigation measure (improvement) that may be impacted by the non-complete clause or any similar agreement restricting a public agency's authority to construct improvement.

TRAN8 Following adoption of a land use plan and circulation plan for the Great Park property and before the issuance of any building permits within the base property, the City of Irvine shall enter into a cooperative study with OCTA and other affected jurisdictions to amend the Orange County Master Plan of Arterial Highways (MPAH). Marine Way, Trabuco Road from the SR-133 toll way to College Road, and Y Street should be included on the MPAH.

The timing of mitigation measure TRAN 1 and TRAN 4 has been changed above to be able to effectively implement these measures.

4.15 UTILITIES AND SERVICE SYSTEMS

4.15.1 Environmental Setting

Potable Water

The OCGP FEIR described the potable water system for the project. The IRWD is the jurisdictional agency responsible for plan approval and water service to the project area. Planning Areas 30 and 51 are within Zone 3 North and Zone 4 of the IRWD water system. The existing on-site distribution system includes a network of distribution system pipelines, six reservoirs, and two pump stations.

Recycled Water

As stated in the OCGP FEIR, IRWD is the jurisdictional agency responsible for plan approval and water service for the project area. Recycled water is currently supplied to Planning Areas 30 and 51 via a 12-inch IRWD Zone B pipeline and connecting to an 8-inch former military base pipeline in the southwest corner of the property.

4. Discussion of Checklist and Mitigation Measures

Sewer

As stated in the OCGP FEIR, IRWD is the jurisdictional agency responsible for plan approval and sewer service for the project area. Planning Areas 30 and 51 are served by a two-branched system with flow, mainly by gravity, from the northeast to the southwest. The system includes a series of pipes ranging from 6 to 15 inches in diameter.

Solid Waste

The OCGP FEIR discussed in detail the environmental setting for solid waste for the project. Solid waste at the project site is collected by Waste Management, Inc., and is disposed of at the Frank R. Bowerman Landfill owned by the County of Orange Integrated Waste Management Department (IWMD).

The IWMD's Countywide Integrated Waste Management Plan (CIWMP) was approved in 1996 pursuant to California Integrated Waste Management Board requirement. The CIWMP shows that there is sufficient solid waste disposal capacity in the County for the next 30 years.

Energy and Communications

Southern California Edison (SCE) serves the project via two primary substations. The Southern California Gas Company serves Planning Areas 30 and 51. AT&T is the communications provider for these Planning Areas. Detailed information regarding the environmental setting of dry utilities was included in the OCGP FEIR.

4.15.2 Impacts Identified in the OCGP FEIR and Addenda

Potable Water

The OCGP FEIR projected the potable water demand to be less than 1.75 million gallons per day (MGD) calculated for the land uses proposed within the project. Since the Proposed Entitlements do not include any additional intensity or change in the mix of land uses, the demand projection is consistent with the OCGP FEIR and Addenda. As stated in the OCGP FEIR, selected portions of the existing potable water facilities are assumed to remain in place and operational through project buildout. The OCGP FEIR stated that the existing system will be expanded and integrated into the IRWD system and thus provide a backbone service to all users on the project site. The OCGP FEIR assumed a potable water system that would follow the routing of existing and proposed roadways. The approved Master Subdivision Map includes the alignment for water lines throughout Heritage Fields, which was an additional project design detail and is not a change in the project.

Recycled Water

The OCGP FEIR stated that on January 27, 2003, the IRWD Board of Directors approved the assessment of water supply for the project. According to the findings of the assessment, the IRWD has determined that a sufficient non-potable water supply is available to serve the project. Since the proposed entitlements do not increase the intensity or change the mix of land uses, the total non-potable water supplies will meet the project demand.

The OCGP FEIR stated that the implementation of the project would require the expansion of the recycled water transmission lines to serve the project. It was assumed that selected on-site facilities would remain in place and operational through buildout. The OCGP FEIR stated that the existing system will be expanded

4. Discussion of Checklist and Mitigation Measures

and integrated into the IRWD system and provide a backbone service to all users in the project site. The OCGP FEIR assumed a non-potable system that would follow the routing of existing and proposed roadways within the project. The approved Master Subdivision Map included the alignment for the recycled water lines throughout Heritage Fields, which was an additional project design detail and is not a change in the project.

Sewer

The OCGP FEIR stated that the IRWD will continue to provide sewer service to the project. The IRWD has indicated that it would have sufficient capacity to meet the future demand; however, additional wastewater treatment capacity may need to be purchased by project proponents as specific development projects come forward. The OCGP FEIR stated that projected buildout demand for sewer services based on the land uses in the project were 0.89 MGD and that the project would require an increase of sewer transmission capacity to serve the project. The proposed sewer system would preserve selected, existing on-site facilities in place and operational through buildout and would expand the system through extension of existing sewer lines. The OCGP FEIR stated that additional IRWD maintenance and equipment could be required to operate and maintain the proposed system.

The adopted Master Subdivision Map ensured that any projected use of the existing sewer system would be in conformance with all applicable regional and state requirements and the mitigation requirements of the OCGP FEIR and Addenda. It included the alignment for the sewer lines throughout the project, which was an additional project design detail and did not change the project description.

Solid Waste

As stated in OCGP FEIR, demolition of existing runways, buildings, and structures within PA 51 will generate debris materials that will have to be disposed of at local landfills. Green waste will be also generated as a result of ongoing park and landscaping maintenance. In addition to the City requirement for recycling of construction and demolition material to reduce waste, solid waste reduction will also be achieved through compliance with AB 939, which requires that a minimum of 50 percent of the solid waste generated in cities in California be diverted from landfills. Further, SB 1374 requires that all cities implement measures that require diversion of 75 percent of all construction and demolition waste from landfills. While the OCGP FEIR identified a potential impact related to solid waste, it concluded that, with the recommended, City-adopted mitigation measures, the impact would be less than significant.

Energy and Communications

The Overlay Plan has proposed to install the new systems generally along a routing that coincides with the existing and proposed roadway within the project. A portion of the routing, (specifically the portion along the “loop road”) is not included in the project and will require an adjustment to the routing system for the expansion of the dry utilities system. However, the expansion of the system will generally coincide with the existing and proposed roadways consistent with the OCGP FEIR. The OCGP FEIR further stated that the specific impacts of constructing new energy and communication transmission facilities could not be determined at the program level analysis, as site-specific plans for the installation of the energy and communication transmission backbone system have not been prepared. The general significant impacts associated with the construction and operation of public facilities, including the project’s construction and operation of the transmission system, were addressed in the OCGP FEIR.

4. Discussion of Checklist and Mitigation Measures

4.15.3 Impacts Associated with the Requested Entitlements

Potable Water

Amended VTTM No. 17008, Proposed VTTM No. 17283, or the associated actions does not allow any additional development intensity. Therefore, the demand projection for potable water is consistent with the OCGP FEIR and Addenda. No additional mitigation measures or change in any mitigation measure is required.

Recycled Water

The OCGP FEIR stated that on January 27, 2003, the IRWD Board of Directors approved the assessment of water supply for the project. Amended VTTM No. 17008, Proposed VTTM No. 17283, or the associated actions does not allow any additional development intensity, and the total nonpotable water supplies would meet the project demand, as analyzed in the OCGP FEIR and Addenda.

Sewer

Amended VTTM No. 17008, Proposed VTTM No. 17283, or the associated actions does not allow any additional development intensity. Therefore, demand projections and proposed system expansion would remain the same. The OCGP FEIR further stated that the specific environmental impact of constructing new sewer facilities to serve the project cannot be determined at the program level analysis, as site-specific plans for the installation of the sewer backbone system had not been prepared. However, the general significant impacts associated with the construction and operation of public facilities, including the project's construction and operation of the sewer system, has been addressed in the OCGP FEIR.

Solid Waste

As stated in OCGP FEIR, demolition of existing runways, buildings, and structures within Planning Area 51 would generate debris materials that would have to be disposed of at local landfills. Green waste would also be generated as a result of ongoing park and landscaping maintenance. The project would not change the land uses or intensity in the approved Overlay Plan; therefore, no change in impact to solid waste is anticipated. No additional mitigation measures or changes in any mitigation measure are required.

Energy and Communications

Amended VTTM No. 17008, Proposed VTTM No. 17283, or the associated actions does not allow any additional development intensity and would have no impact on the fuel and energy consumption projected for the project, which the OCGP FEIR previously analyzed in detail. The analysis and conclusions in the OCGP FEIR do not change since the intensity and types of land uses in the revised plan have not changed from those previously analyzed in the OCGP FEIR.

Major EIR Revisions Not Required. Based on the foregoing analysis and information, there is no evidence that the changes to the project require a major change to the certified OCGP FEIR. The project would not result in any new significant environmental impact nor is there a substantial increase in the severity of impacts from that described in the certified OCGP FEIR.

No Substantial Change in Circumstances Requiring Major EIR Revisions. There is no information in the record or otherwise available indicating substantial changes in circumstances that would require major changes to certified OCGP FEIR.

4. Discussion of Checklist and Mitigation Measures

No New Information of Substantial Importance Showing Greater Significant Effects Than Previous EIR.

This Initial Study/Addendum has analyzed all available relevant information and has determined that there is no new information of substantial importance, which was unknown and could not have been known with the exercise of reasonable diligence at the time the OCGP EIR was certified, indicating that the project will have one or more significant effects not discussed in the previous EIR or result in a substantial increase in the severity of previously identified effects.

No New Information of Substantial Importance Showing Ability to Reduce Significant Effects in Previous EIR. This Initial Study/Addendum has analyzed all available relevant information and has determined that there is no new information of substantial importance, which was unknown and could not have been known with the exercise of reasonable diligence at the time the OCGP FEIR was certified, indicating that; (1) mitigation measures or alternatives previously found not to be feasible would in fact be feasible, and would substantially reduce one or more significant effects of the project, but the project proponent declines to adopt the mitigation measures or alternatives; or (2) mitigation measures or alternatives that are considerably different from those analyzed in the previous EIR would substantially reduce one or more significant effects on the environment, but the project proponent declines to adopt the mitigation measures or alternatives. There are no alternatives to the project or additional mitigation measures that would substantially reduce one or more of the significant effects identified in and considered by the certified OCGP FEIR.

4.15.4 Mitigation from the OCGP FEIR and Applicability to the Requested Entitlements

The OCGP FEIR determined the mitigation measures identified in other sections of the OCGP FEIR (5.1-5.13) address the impacts associated with the construction and operation of public facilities. These measures would be applicable to any new construction and operation of facilities for the following types of utilities to serve new growth expected in the project area:

- potable water
- recycled water
- wastewater
- energy and communication transmission facilities

Mitigation Measures SW1 through SW5 apply to future demolition and new construction, and would be carried forward through permit approvals for subsequent development projects. The proposed project would neither change these mitigation measures nor their application to future development projects.

SW1 It is anticipated that much of the solid waste resulting from the demolition, dismantling, or other deconstruction of the aged structures and property, including but not limited to buildings and runways, at MCAS El Toro is contaminated with lead-based paints, asbestos, or other materials that may render it unsuitable for recycling or reuse. At the sole cost and expense of the project applicant, in order to evaluate this condition and determine the feasibility of recycling of solid waste material from the MCAS El Toro site by ordinary means, a technical evaluation by a qualified environmental consultant must be conducted. The technical evaluation shall include sufficient sample testing of all types of solid waste materials to be generated by the project to analyze its composition. A copy of the full technical evaluation and its findings must be submitted to the City of Irvine Community Development Department. The City of Irvine must confirm the adequacy of the technical evaluation prior to authorizing the demolition, dismantling, or deconstruction project to proceed.

4. Discussion of Checklist and Mitigation Measures

If it is determined by the technical evaluation that material is contaminated and prohibited from being recycled by ordinary means, a further evaluation must be conducted to identify and evaluate other feasible methods approved by state law to divert the material from landfills. This may include the delivery of the waste material to other appropriate non-disposal or transformation facilities, such as “waste-to-energy” (WTE) plants.

SW2 For that solid waste which is determined to be inappropriate for recycling (as that term is defined by California Public Resources Code Section 40180), the project applicant must submit a written plan to the City and implement such plan to ensure that 75% of the material, or the maximum amount feasible as determined by the technical evaluation, is diverted from the landfill through other methods that comply with state statutes and regulations.

SW3 For that solid waste which the technical study deems to be suitable for recycling, the project applicant must submit a written plan to the City and implement such plan to ensure that solid waste material generated by the demolition, dismantling, or deconstruction project, land use operations and maintenance is collected by a City authorized solid waste hauler or recycling agent, and that a minimum of 75% of the solid waste from the project is diverted from landfills by recycling, as that term is defined by California Public Resources Code Section 40180 (“Recycling” does not include transformation, as defined in Public Resources Code Section 40201).

SW4 To ensure ongoing compliance with these mitigation measures, the project applicant will be required to submit solid waste tonnage reports to the City of Irvine on City approved forms, accompanied by “weight ticket” receipts from state-certified disposal, nondisposal, or transformation facilities, on a quarterly basis to demonstrate that solid waste diversion has occurred in accordance with these required mitigation measures and in a manner that is consistent with, and not detrimental to, the efforts of the City of Irvine to comply with AB939.

To assure compliance with applicable statutes related to the disposal of solid waste, it is necessary for the City to require appropriate and effective mitigation measures to limit the disposal and ensure significant recycling of solid waste on-site.

SW 5 For green waste, the project applicant must submit a written plan to the City and implement such plan to ensure that the green waste material generated by landscape maintenance operations is collected by a City authorized waste hauler or recycling agent, that the maximum feasible amount of that collected green waste is recycled, and that a minimum of 50% of the green waste from the project is diverted from landfills by recycling, as that term is defined by California Public Resources Code Section 40180.

4.16 DETERMINATION

Based on the information and analysis in this Initial Study/Addendum, and pursuant to Section 15162 of the State CEQA Guidelines, the City has determined that:

1. There are no substantial changes to the project that will require major revisions to the OCGP FEIR due to new, significant environmental effects or a substantial increase in the severity of impacts identified in the OCGP FEIR;
2. Substantial changes have not occurred in the circumstances under which the project is being undertaken that will require major revisions of the OCGP FEIR to disclose new, significant environmental effects or a substantial increase in the severity of the impacts identified in the OCGP FEIR; and

4. Discussion of Checklist and Mitigation Measures

3. There is no new information of substantial importance not known at the time the OCGP FEIR was certified that shows any of the following:
 - a) The project will have any new significant effects not discussed in the OCGP FEIR;
 - b) There are impacts that were determined to be significant in the OCGP FEIR that will be substantially increased;
 - c) There are additional mitigation measures or alternatives to the project that would substantially reduce one or more of the significant effects identified in the OCGP FEIR; or
 - d) There are additional mitigation measures or alternatives that were rejected by the project proponent that are considerably different from those analyzed in the OCGP FEIR that would substantially reduce any significant impact identified in that EIR.

OCGP FEIR Mitigation Monitoring and Reporting Program

**ORANGE COUNTY GREAT PARK
FINAL EIR (FEIR)
CITY OF IRVINE
MITIGATION MONITORING AND REPORTING PROGRAM CHECKLIST**

1.0 INTRODUCTION

Section 21081.6 to the State of California Public Resources Code requires a lead or responsible agency that approves or carries out a project where an environmental impact report (EIR) has identified significant environmental effects to adopt a “reporting or monitoring program for adopted or required changes to mitigate or avoid significant environmental effects.” The City of Irvine is the lead agency for the Great Park Plan EIR, and therefore is responsible for implementation of the mitigation monitoring program. An EIR has been prepared for this project which addresses potential environmental impacts and, where appropriate, recommends measures to mitigate these impacts. As such, a mitigation reporting or monitoring program is required to ensure that adopted mitigation measures are implemented.

The project is located in the center of Orange County and includes land within the City or Irvine as well as unincorporated area. The project area encompasses approximately 4,701 acres, or 7.5 square miles. The total area proposed for annexation is 4,287 acres.

The project area is bounded by the City of Lake Forest to the south and southeast, the City of Irvine to the west and southwest, and the County of Orange to the north. The former MCAS El Toro is generally located north of the Santa Ana (I-5) Freeway, east of the Eastern Transportation Corridor (SR-133), and south of the Foothill Transportation Corridor (SR-241). Major roadways bordering the project area include Barranca Parkway to the south, Sand Canyon Avenue to the west, Portola Parkway and Irvine Boulevard to the north, and Alton Parkway to the east. The James A. Musick Jail Facility is located on a 105-acre site northwest of existing Bake Parkway and east of the future extension of Alton Parkway. The northern boundary of the Musick Jail abuts the former MCAS El Toro. Existing buildings of the Irvine Spectrum abut the Musick Jail site to the west/southwest. An eight-acre parcel west of the Musick Jail contains the IRWD East Irvine Pumping Station, Zone III 5-million gallon potable water reservoir, and a 7-million gallon potable water reservoir.

The project consists of the following actions: 1) Annexation, General Plan Amendment, Pre-Zoning (prior to annexation), and Zoning of the unincorporated portion of Planning Area 51; 2) Annexation of the unincorporated portion of Planning Area 35 (the Irvine Ranch Water District Parcel); 3) General Plan Amendment and Zone Change for Planning Area 30 with is presently in the City of Irvine; and, 4) Approval in the form of a Development Agreement vesting approval of higher intensity overlay uses in consideration of dedication of land for public purposes and for funding certain infrastructure improvements and maintenance of the public uses by the

purchaser/developer and subsequent landowners and funds for specified park, roadways, and other circulation facilities and infrastructure. The proposed project also includes the dedication of approximately 21 acres to be used for the Jeffrey Pine Open Space Spine (JOSS). The JOSS acreage will serve as a connector to the regional open space system and will provide recreational opportunities in the Northern Sphere.

2.0 PROGRAM MANAGEMENT

The mitigation monitoring and reporting program (MMRP) for the Great Park Plan will be in place through all phases of project approval. Enforcement of the MMRP will be the responsibility of a Project Manager (PM) at the City of Irvine.

2.1 Roles and Responsibilities: Project Manager

The role is assigned by the Community Development Director. The PM assigned to the proposed project will supervise the MMRP during design, construction, and operation of the project and is responsible for the overall management of the MMRP. The PM is thoroughly familiar with the project and qualified to determine if an adopted measure is being properly implemented. The PM oversees the MMRP and reviews the Reporting and Implementation (R&I) Forms to ensure they are filled out correctly and proper action is being taken on each measure. The PM and/or an assignee will also be responsible for the filling and updating of the R&I Forms during all phases of the project. The PM will determine the need for a measure to be modified and ensure the use of a mitigation specialist if technical expertise beyond the PM's is required. If it is found that an adopted mitigation measure is not being properly implemented, the PM will require corrective actions to ensure adequate implementation. The responsibilities of the PM include the following:

1. An MMRP Reporting Form will be prepared for each potential significant impact and its corresponding mitigation, as identified in the list of significant impacts and mitigation measures attached hereto.
2. Appropriate specialists will be retained, as needed, to monitor specific mitigation activities and provide appropriate written approvals to the PM.
3. The PM and/or an assignee will approve, by signature and date, the completion of each action item that was identified on the MMRP Reporting Form.
4. All MMRP Reporting Forms for an impact issue requiring no further monitoring will be signed off as completed by the PM and/or an assignee at the bottom of the MMRP Reporting Form.

5. Unanticipated circumstances may arise requiring the refinement or addition of mitigation measures. The PM is responsible for approving any such refinements or additions. An MMRP Reporting Form will be completed by the PM and/or an assignee. The completed form will be provided to the appropriate design, construction, or operational personnel.
6. The PM has the authority to stop the work of construction contractors if compliance with any aspects of the MMRP is not occurring after written notification has been issued. The PM also has authority to hold certificates of occupancies if compliance with a mitigation measure attached herein is not occurring. The PM also has authority to hold the issuance of a building permit until all mitigation measures are implemented. Should the applicant/contractor disagree with the findings and actions of the PM, an appeal to the Community Development Director can be submitted.

2.2 General Procedures

MMRP Program Definitions

The MMRP consists of key program elements. The elements are summarized below.

MMRP Files

Files are established to document and retain records of the MMO. The file organization is established by the PM according to mitigation measures and project phases.

R&I Forms

R&I Forms are designed to record the monitoring activity in a consistent manner with appropriate approvals. The R&I Forms are placed in the MMRP files.

Environmental Compliance Verification

At the completion of construction contracts that are part of the overall development of the project, a verification of environmental compliance is executed by the PM. The verification concludes the construction monitoring process for the contract.

Mitigation Monitoring and Reporting Program Procedures

The policies and procedures for the MMRP described herein are intended to provide focused, yet flexible guidelines for monitoring the implementation of the mitigation measures discussed in the final EIR. The Mitigation Monitoring and Reporting Checklist lists each mitigation measure, the method of verification for each mitigation measure, and the party responsible for monitoring efforts. The Mitigation Monitoring and Reporting Checklist also provides the PM a verification of compliance for each mitigation measure during each applicable phase of the project. An R&I form is prepared for each potential significant impact and its corresponding mitigation measure. After each measure is

verified for compliance, no further action is required for the specific phase. The PM shall initial and date the measure on Mitigation Monitoring and Reporting Checklist.

Disposition of Monitoring Forms

All actions and completed R&I Forms are kept in the MMRP file with the City of Irvine during the pre-design, design, construction, and operational phases of the project. Reports will be available from the city upon request at the following address:

City of Irvine (Lead Agency)
Community Development Department
One Civic Center Plaza
Irvine, California 92623-9575

MITIGATION MONITORING AND REPORTING PROGRAM

ORANGE COUNTY GREAT PARK

NO.	MITIGATION MEASURE	METHOD OF VERIFICATION	TIMING OF VERIFICATION	RESPONSIBLE PERSON	DATE OF COMPLETION/ INITIALS
5.1 LAND USE (Base Plan and Overlay Plan)					
	No mitigation measures are required.				
5.2 TRAFFIC/CIRCULATION (Base Plan and Overlay Plan)					
TRAN1	<p>Prior to the approval of any final map (other than a financing and conveyance map) allocating building intensity within Planning Areas 30 and 51, and prior to issuances of any building permits for permanent improvements within Planning Areas 30 and 51, the landowner or subsequent project applicant shall either (i) apply for annexation of any areas within the final map to the Irvine Spectrum Transportation Management Association (TMA) ("Spectrumotion") in accordance with Article X of the recorded Declaration of Covenants, Conditions and Restrictions (CC&Rs) for the Irvine Spectrum TMA, including any supplementary or amended CC&Rs, to reduce traffic, air quality and noise impacts or (ii) develop and implement a similar transportation management plan containing the elements and meeting the criteria described below as approved by the Director of Public Works:</p> <p><i>Transportation Management Plan (TMP)</i></p> <p>The development and implementation of a Transportation Management Plan is an identified mitigation measure to manage transportation access for Planning Areas 30 and 51. This document summarizes the key elements of the TMP.</p> <p><i>A. Introduction</i></p> <p>The purpose of this document is to provide an outline for a</p>	<p>Requires submittal of annexation plans by project applicant in accordance with the Irvine Spectrum TMA. Failure to obtain approval of such plans requires project applicant to develop and implement a TMP as described in TRAN1.</p>	<p>Prior to the approval of any final map (other than a financing and conveyance map) allocating building intensity within Planning Areas 30 and 51, and prior to issuances of any building permits for permanent improvements within Planning Areas 30 and 51.</p>	<p>Director of Community Development or designee.</p>	

NO.	MITIGATION MEASURE	METHOD OF VERIFICATION	TIMING OF VERIFICATION	RESPONSIBLE PERSON	DATE OF COMPLETION/ INITIALS
	<p>comprehensive TMP for the Planning Areas 30 and 51 ("Great Park TMP"). This report is not intended to provide the specific details of the plan, but rather to highlight the key components and provide direction for subsequent detailed planning and implementation activities. When preparation of the TMP is undertaken, all of the agency and stakeholders will be invited to provide input.</p> <p>The applicant may elect to annex Planning Area 51 and a portion of Planning Area 30 into the Irvine Spectrum Transportation Management Association (Spectrumotion). Spectrumotion is a private, non-profit Transportation Management Association (TMA) formed to reduce traffic congestion in Irvine Spectrum. Spectrumotion promotes, markets, and subsidizes alternatives to solo-commuting and assists the business community in complying with trip reduction related requirements. Membership is mandatory to property owners with deed restrictions requiring participation in the TMA. Membership dues provide the funding for the Association and its programs, which offer a variety of employer and commuter services focused on reducing vehicular trip generation.</p> <p>In the event that the applicant elects not to annex into Spectrumotion, a TMP similar to that provided by Spectrumotion will be developed and implemented. This document sets forth the components of the TMP should it be necessary.</p> <p><i>B. Transportation Management Plan Framework</i></p> <p>The key elements of the Great Park TMP are set forth below:</p> <p><i>New Hire Orientation:</i> Inform newly hired employees of commuting services available to them.</p> <p><i>Public Transportation Pass Sales:</i> Provide a central location</p>				

NO.	MITIGATION MEASURE	METHOD OF VERIFICATION	TIMING OF VERIFICATION	RESPONSIBLE PERSON	DATE OF COMPLETION/ INITIALS
	<p>for purchase of passes to available transit services ((i.e., OCTA buses, Metrolink, Amtrak, etc.).</p> <p><i>Vanpool and Carpool Formation Assistance:</i> Perform all of the administrative work necessary to establish van pools and car pools.</p> <p><i>On-site Promotions:</i> Hold rideshare promotions at work sites and assist in employer assistance promotions.</p> <p><i>Telecommuting/Alternative Work Schedule Consulting:</i> Assist employers in developing and implementing a telecommuting or alternative work schedule program.</p> <p><i>Personalized Commute Consulting:</i> Provide a personalized commute profile to any commuter, which includes carpool match list containing the names of other commuters in the North Irvine Sphere that live and work near each other.</p> <p><i>Website:</i> Maintain a website with all of their program information available.</p> <p><i>Rideshare Promotions:</i> Conduct high visibility rideshare promotions as a means to advertise its services.</p> <p><i>Subsidies:</i> To the extent financially feasible, offer subsidies to assist in the formation of vanpools, the formation of carpools, and to encourage the trying of transit services.</p> <p><i>Public Agency Coordination:</i> Work closely with various public and quasi-public agencies to improve bus and commuter rail service to the Spectrum and North Irvine Sphere areas.</p> <p><i>Transportation Management Plan Implementation</i></p> <p>As part of the TMP, a process will be established to monitor its effectiveness in reducing peak hour trip generation in the</p>				

NO.	MITIGATION MEASURE	METHOD OF VERIFICATION	TIMING OF VERIFICATION	RESPONSIBLE PERSON	DATE OF COMPLETION/ INITIALS
	Planning Areas 30 and 51. Provision shall be made for the Plan to be modified as appropriate to enhance its effectiveness.				
TRAN2	Prior to the issuance of the first building permit, City shall establish, and the landowner or subsequent project applicant shall commit to participate in, a transportation system/infrastructure fee program to fund improvements identified as mitigation measures listed in Tables 5.2-16 and 5.2-17 of the OCGP FEIR.	Requires contractual agreement between the City of Irvine and project applicant to fund improvement listed in the EIR.	Prior to the issuance of the first building permit.	Director of Community Development or designee.	
TRAN3	Prior to issuance of any building permits for permanent improvements within Planning Areas 30 and 51, the landowner or subsequent project applicant shall implement or contribute its percentage funding responsibility for traffic improvements as identified in the NITM Ordinance.	Requires contractual agreement between the City of Irvine and project applicant to fund improvement listed in the EIR.	Prior to issuance of any building permits for permanent improvements in the project area.	Director of Community Development or designee.	
TRAN4	Prior to approval of each Tentative Map or Master Plan that allocates intensity for numbered lots, the landowner or subsequent project applicant shall prepare, subject to City review and approval, an updated traffic study consistent with the City of Irvine Traffic Study Guidelines inclusive of a phasing plan for traffic improvements associated with the subject Tentative Map or Master Plan that allocates intensity for numbered lots. The traffic study area shall be the same as the study area utilized in the NITM Nexus Study. The phasing plan will specify the timing, funding, construction, and responsibilities for all traffic improvements identified in the updated traffic study. The updated traffic study will determine whether any additional or alternative traffic improvements are necessary based on updated traffic forecasts. The updated traffic study will evaluate at a minimum the cumulative impact of the subject map and/or Master Plans that allocates intensity and all previously approved or concurrently submitted maps and/or Master Plans. The methodology for the study area, applicable land use and circulation modifications, and standards for assessing and mitigating impacts employed in the updated traffic study shall be consistent with a City	Requires the separate submission of updated traffic study developed in accordance with City of Irvine Traffic Study Guidelines.	Prior to the approval of each Tentative Map or Master Plan that allocates intensity for numbered lots	Director of Community Development or designee.	

NO.	MITIGATION MEASURE	METHOD OF VERIFICATION	TIMING OF VERIFICATION	RESPONSIBLE PERSON	DATE OF COMPLETION/ INITIALS
	<p>approved traffic study scope of work. The landowner or subsequent project applicant shall construct or bond for and enter into a funding agreement for necessary improvements identified in the updated traffic study and/or participate in the City fee program (OCGP FEIR Mitigation Measure TRAN2) to the extent that the improvements identified in the updated traffic study are listed in Tables 5.2-16 and 5.2-17 of the OCGP FEIR.</p> <p>Traffic signals that are on-site or directly related to the development in Planning Areas 30 and 51 will be installed as warranted through the mitigation implementation plan process.</p>				
TRAN5	<p>In conjunction with the preparation of any updated traffic study as required in Mitigation Measure Tran 4 for each master tentative map or equivalent, and assuming that a regional transportation agency has not already programmed and funded the warranted improvements to the impacted freeway mainline or freeway/tollway ramp locations in conjunctions with fulfilling its regional role, the landowner or subsequent project applicant and the City will take the following actions:</p> <ol style="list-style-type: none"> 1. The City shall ensure that the updated traffic study identifies the project's proportionate impact on the specific freeway mainline and/or freeway-tollway ramp locations and its percentage responsibility for mitigating these impacts (assuming tolled conditions on the Transportation Corridors) based on thresholds of significance, performance standards and methodologies used in the OCGP FEIR and established in the Orange County Congestion Management Program and City of Irvine Traffic Study Guidelines. 2. The City shall estimate the cost of the project's percentage responsibility in cooperation with Caltrans and the Transportation Corridor Agency. 3. The landowner or subsequent project applicant shall enter 	Requires the separate submission of updated traffic study developed in accordance with City of Irvine Traffic Study Guidelines.	Prior to the approval of each Master Tentative Map or equivalent document.	Director of Community Development or designee.	

NO.	MITIGATION MEASURE	METHOD OF VERIFICATION	TIMING OF VERIFICATION	RESPONSIBLE PERSON	DATE OF COMPLETION/ INITIALS
	<p>into an agreement with the City prior to recordation of the first final map for each Master Tentative Map or equivalent to establish the method and timing of payment of the identified percentage responsibility.</p> <p>4. The City shall allocate landowner or subsequent project applicant's percentage contribution to traffic improvements that result in improved traffic flow on the impacted mainline and ramp locations, including but not limited to construction of physical or operational improvements, contributions to mandated trip reduction or transit programs, or funding participation in a regional transportation improvement fee program, if adopted.</p>				
TRAN6	The project shall mitigate to insignificant levels all project impacts at significantly impacted study area intersections. Tables 5.2-16 and 5.2-17 in the OCGP FEIR show the mitigation program for each phase. With regard to impacts that require improvements in other jurisdictions, the City of Irvine shall cooperate with the affected jurisdiction to ensure that the improvements are constructed in a timely manner.	Requires the separate submission of updated traffic study developed in accordance with City of Irvine Traffic Study Guidelines. May require additional documentation and/or submission to other jurisdictions, depending on location of proposed improvement.	Prior to the approval of each Master Tentative Map or equivalent document.	Director of Community Development or designee.	
TRAN7	Assuming that a regional transportation agency has not already programmed and funded the improvements, the City of Irvine shall coordinate with Caltrans and the Transportation Corridor Agencies, and submit for their approval, proposed plans for modifications to the state highway system and the transportation corridors, as required to provide ramp connections to Trabuco Road. If needed, the City shall prepare a Project Study Report, a New Connection Request, and a Detailed Traffic Revenue Study for review by Caltrans	Requires the development and submission of a Project Study Report, a New Connection Request, and a Detailed Traffic Revenue Study by	Prior to the approval of each Master Tentative Map or equivalent document.	Director of Community Development for submission to Caltrans and potentially effected TCA's.	

NO.	MITIGATION MEASURE	METHOD OF VERIFICATION	TIMING OF VERIFICATION	RESPONSIBLE PERSON	DATE OF COMPLETION/ INITIALS
	and the Transportation Corridor Agency for the proposed connection of Trabuco Road to the Eastern Transportation Corridor. The City shall perform toll and revenue impact studies for any mitigation measure (improvement) that may be impacted by the non-compete clause or any similar agreement restricting a public agency's authority to construct improvement.	the City of Irvine.			
TRAN8	Following adoption of a land use plan and circulation plan for the Great Park property and before the issuance of any building permits within the base property, the City of Irvine shall enter into a cooperative study with OCTA and other affected jurisdictions to amend the Orange County Master Plan of Arterial Highways (MPAH). Marine Way, Trabuco Road from the SR-133 tollway to College Road, and Y Street should be included on the MPAH.	Requires cooperate study and subsequent amendment to Orange County Master Plan of Arterial Highways.	Following adoption of a land use plan and circulation plan for the project site and before the issuance of any building permits.	Director of Community Development, OCTA, and other affected jurisdictions.	
5.3 AIR QUALITY (Base Plan and Overlay Plan)					
AQ1	Prior to the start of demolition and construction within the project area, adjacent sensitive receptors shall be informed of the planned demolition and construction activities. Measures to avoid significantly impacting these receptors shall be developed and implemented by the project proponent in coordination with these uses. Other applicable mitigation measures such as erection of fences around construction areas; staggered use of equipment near sensitive receptors; diversion of truck trips away from receptors; etc.; shall be employed as necessary. Compliance with this measure shall be verified by the Director of Community Development.	Requires written notification to potentially affected sensitive receptors (residents and landowners).	Prior to the start of demolition and construction within the project area.	Director of Community Development or designee.	
AQ2	Prior to the commencement of construction activities required to demolish and/or remove existing DON structures, including runways, the Director of Community Development shall receive and approve a construction emissions mitigation plan from the chosen demolition contractor. Prior to the issuance of grading permits, the applicant of any future development project shall submit, and the Director of Community Development shall approve a construction emissions mitigation plan. The plan	Requires the development, submission, and approval of a construction emissions mitigation plan by project applicant.	Prior to the start of demolition and construction within the project area.	Director of Community Development or designee.	

NO.	MITIGATION MEASURE	METHOD OF VERIFICATION	TIMING OF VERIFICATION	RESPONSIBLE PERSON	DATE OF COMPLETION/ INITIALS
	<p>shall identify implementation procedures for each of the following emissions reduction measures and all feasible mitigation measures shall be implemented. If certain measures are determined infeasible, an explanation thereof shall be provided.</p> <ul style="list-style-type: none"> X Evaluate the availability and use, if available, of low-emission (i.e., methanol- or natural gas-powered) construction equipment instead of diesel for each construction phase. X Water exposed soils at least twice daily and maintain equipment and vehicle engines in good condition and in proper tune. X Wash off trucks leaving the site. X Replace ground cover on construction sites when it is determined that the site will be undisturbed for lengthy periods. X Reduce speeds on unpaved roads to less than 15 miles per hour. X Halt all grading and excavation operations when wind speeds exceed 25 miles per hour. X Suspend all emission generating activities during smog alerts. X Use propane- or butane-powered on-site mobile equipment instead of diesel/gasoline, whenever feasible. X Properly maintain diesel-powered on-site mobile equipment. X Sweep streets at the end of the day if substantial visible soil material is carried over to the adjacent streets. X Use electricity from power poles rather than temporary on-site diesel- or gasoline-powered generators, whenever feasible. X Use of low-VOC asphalt. X Cover all trucks hauling dirt, sand, soil or other loose material to and from the site. X Provide temporary traffic controls (e.g., flag persons) 				

NO.	MITIGATION MEASURE	METHOD OF VERIFICATION	TIMING OF VERIFICATION	RESPONSIBLE PERSON	DATE OF COMPLETION/ INITIALS
	<p>during all phases of construction to ensure minimum disruption of traffic.</p> <p>X Schedule construction activities that affect traffic flow on adjoining streets to off-peak hours to the extent possible.</p> <p>X Reroute construction trucks away from congested streets, whenever feasible.</p> <p>X Provide dedicated turn lanes for movement of construction trucks and equipment on- and off-site, whenever feasible.</p>				
AQ3	<p>Prior to the issuance of building permits for any future development, the applicant shall submit, and the Director of Community Development shall have approved, an operation-emissions mitigation plan. The plan shall identify implementation procedures for each of the following emissions reduction measures and all feasible mitigation measures shall be implemented. If certain measures are determined infeasible, an explanation thereof shall be provided.</p> <p>X Utilize built-in energy-efficient appliances to reduce energy consumption and emissions.</p> <p>X Utilize energy-efficient and automated controls for air conditioners and lighting to reduce electricity consumption and associated emissions.</p> <p>X Install special sunlight-filtering window coatings or double-paned windows to reduce thermal loss, whenever feasible.</p> <p>X Utilize light-colored roofing materials as opposed to dark roofing materials to conserve electrical energy for air-conditioning.</p> <p>X Provide shade trees in residential subdivisions as well as public areas, including parks, to reduce building heating and cooling needs, whenever feasible.</p> <p>X Ensure that whenever feasible, commercial truck traffic is diverted from local roadways to off-peak periods.</p> <p>X Centralize space heating and cooling for multiple-family dwelling units and commercial space.</p> <p>X Orient buildings north/south for reducing energy-related combustion emissions.</p>	Requires the development, submission, and approval of an operation-emissions mitigation plan by project applicant.	Prior to the issuance of building permits within the project area.	Director of Community Development or designee.	

NO.	MITIGATION MEASURE	METHOD OF VERIFICATION	TIMING OF VERIFICATION	RESPONSIBLE PERSON	DATE OF COMPLETION/ INITIALS
	X Use solar energy, when feasible. X Use high rating insulation in walls and ceilings.				
AQ4	At the time of residential and commercial lease and sales agreements, future sales information on available housing and employment opportunities within the project area shall be provided to employees and residents of the project area, so as to encourage employees to live within the residential developments planned on-site and future residents to find employment nearby.	Requires written notification to employees and residents within the project area.	On-going (at the time of residential and commercial lease and sales agreements).	Director of Community Development or designee.	
AQ5	At the time of residential and commercial lease and sales agreements, the applicant shall demonstrate to the satisfaction of the Director of Community Development that future employment generating non-residential development shall include measures to reduce vehicle trips including carpool incentives, easy access to public transit systems, trail linkages between uses, low-emissions vehicle fleets, and the provision of on-site facilities such as banking and food courts, and bicycle parking facilities, and other transportation demand management measures, as deemed appropriate.	Requires submission of potential measures to reduce vehicle trips, as identified in AQ5.	On-going (prior, during and upon completion of development of the project area).	Director of Community Development or designee.	
5.4 NOISE (Base Plan and Overlay Plan)					
	No mitigation measures are required.				
5.5 PUBLIC HEALTH AND SAFETY (Base Plan and Overlay Plan)					
HH1	a. Prior to the conveyance of the property and issuance of subsequent grading permits, where the presence of ACMs is identified, the DON or its transference shall ensure that all available information concerning ACMs has been provided to the City of Irvine, and the purchasers of the property, including: X The type, location and condition of ACMs X The results of any asbestos testing X Description of asbestos control measures taken, if any X The costs or time necessary to remove	Requires submission of Record of Decision (ROD) or similar applicable federal/state documentation to verify information provided to the City of Irvine by the DON.	Prior to the conveyance of the former MCAS EI Toro property; prior to the occupation of existing structures on the former MCAS EI Toro property.	Manager of Building and Safety; Director of Community Development.

	for review of all development plans, which would include evaluation of very high fire severity zones, special fire protection plans, and any requirements for fuel modification zones. Projects potentially impacted by wildland fire hazards will be subject to OCFA Guidelines for "Development Within and Exclusion from Very High Fire Severity Zones" and "Fuel Modification Plans and Maintenance." Additionally, all demolition, renovation, and construction activities in the project area will be subject to review by OCFA to ensure adequate fire protection, water flow, emergency access, design features, etc., according to the standards of the Uniform Fire Code and the California Fire Code. Due to the implementation of these standard fire protection procedures, the proposed project is not anticipated to result in significant short- or long-term adverse impacts related to fire hazards.	development plans by potential project applicants for review and approval.	development plans.	Safety ; Orange County Fire Authority.	
HH4	Prior to issuance of occupancy permits of any existing structure at the former MCAS El Toro, a fire life-safety evaluation of the structure including recommendations for improvements required for compliance with current Building Codes for use of existing structures adopted by the City of Irvine and plans for any required improvements shall be submitted to the Chief Building Official for review and approval.	Requires submission of development plans for existing structures for review and approval of required improvements.	Prior to the occupation of existing structures located on the former MCAS El Toro property.	Manager of Building and Safety; Orange County Fire Authority.	
HH5	Prior to the issuance of a grading permit, the applicant shall prepare and the Director of Community Development shall approve a protocol plan (including but not limited to worker training, health and safety precautions, additional testing requirements, and emergency notification procedures) in the event of unknown hazardous materials are discovered during grading, construction, and/or related development activities. Additionally, said protocol plan will be revised should the discovery of previously unknown hazardous materials be made during any of the above mentioned development activities. The applicant and/or property owner that discovers contamination due to past military operations not previously identified by the DON shall be responsible for notifying the DON, appropriate regulatory agencies, and the Director of	Requires the development, submission, and approval of a protocol plan by the potential project applicant.	On-going (prior to the issuance of a grading permit within the project area; in the event of the discovery of unknown hazardous materials).	Director of Community Development or designee; the DON.	

NO.	MITIGATION MEASURE	METHOD OF VERIFICATION	TIMING OF VERIFICATION	RESPONSIBLE PERSON	DATE OF COMPLETION/ INITIALS
	Community Development of the City of Irvine in a timely manner. Additionally, said protocol plan shall be revised should the discovery of previously unknown hazardous materials be made during any of the above mentioned development activities.				
HH6	The City of Irvine shall develop and maintain the location and status, as well as other pertinent information, of all monitoring wells located on the former MCAS El Toro in a geographic information systems database (GIS). The City will review all permit applications on the former air station for monitoring well locations that may be affected by a permit, and require applicants to maintain appropriate access. Access to monitoring wells will be limited to authorized personnel.	Requires the development and maintenance of a GIS database by the City of Irvine.	On-going (prior to the issuance of grading permits; during construction activities).	Department of Public Works.	
4.6 GEOLOGY AND SEISMICITY (Base Plan and Overlay Plan)					
GS1	Prior to issuance of a building permit, the City of Irvine shall require that all development be designed in accordance with the seismic design provisions outlined in future proposed development geotechnical reports and specified in the latest Building Codes adopted by the City of Irvine. Compliance with this measure shall be verified by the Community Development Department.	Requires potential project applicant to address seismic design provisions in geotechnical reports per adopted Building Codes.	Prior to the issuance of a building permit.	Director of Community Development.	
GS2	<p>Prior to issuance of a building permit, as per existing City policies, geotechnical studies shall be prepared at the time specific development projects are proposed to address site specific geotechnical considerations. The scope of each geotechnical study is based on the underlying geotechnical conditions of the individual site. These reports will provide measures to prevent settlement.</p> <p>1. Prior to design and construction of any future developments within the project area, a comprehensive geotechnical evaluation, including development-specific subsurface exploration and laboratory testing, shall be</p>	Requires potential project applicant to prepare geotechnical studies in support of specific development plans.	Prior to the issuance of a building permit.	Director of Community Development.	

NO.	MITIGATION MEASURE	METHOD OF VERIFICATION	TIMING OF VERIFICATION	RESPONSIBLE PERSON	DATE OF COMPLETION/ INITIALS
	<p>conducted. The purpose of the subsurface evaluation is to:</p> <ul style="list-style-type: none"> a. Further evaluate the subsurface conditions in the area of the proposed structures. b. Provide specific data on potential geologic and geotechnical hazards. c. Provide information pertaining to the engineering characteristics of earth materials in the project area. <p>From this data, recommendations for grading/earthwork, surface, and subsurface drainage, temporary and/or permanent dewatering, foundations, pavement structural sections, and other pertinent geotechnical design considerations may be formulated and shall be included in the grading and building plans for individual developments. General recommendations are as follows:</p> <ul style="list-style-type: none"> X Seismic Ground Shaking - Measures to prevent risk of loss, injury or death involving seismic ground shaking include constructing new development to the latest adopted building codes. In addition, new development should not be located near active earthquake faults. X Erosion or Loss of Topsoil – Erosion and sediment control measures shall be implemented as required by the City's Grading and Water Quality ordinances. X Where Expansive Soils Exist – Measures for the design of foundations, slabs, flatwork and other improvements subject to drainage from expansive soils. 				

NO.	MITIGATION MEASURE	METHOD OF VERIFICATION	TIMING OF VERIFICATION	RESPONSIBLE PERSON	DATE OF COMPLETION/ INITIALS
	Compliance with this measure shall be verified by the Community Development Department.				
GS3	Prior to issuance of building permits for the occupancy of any existing structure at the former MCAS El Toro, or occupancy of any existing structure if a building permit is not issued, a seismic evaluation of the structure including recommendations for seismic improvements required for compliance with current Building Codes for use of existing structures adopted by the City of Irvine and plans for any required seismic improvements shall be submitted to the Chief Building Official for review and approval.	Requires potential project applicant to develop and submit a seismic evaluation in accordance with adopted Building Codes.	Prior to the issuance of a building permit for the occupation of any existing structure at the former MCAS El Toro.	Manager of Building and Safety.	
GS4	Prior to issuance of a grading permit, detailed geotechnical and hydrology reports shall be prepared prior to any development approval or grading activities. These reports shall specifically address erosion control and surface runoff for both construction and long-term operations on the site. Recommendations contained in these reports to prevent soil erosion, siltation, and debris influx into the drainage system shall be implemented. Compliance with this measure shall be verified by the Community Development Department.	Requires potential project applicant to develop and submit geotechnical and hydrology reports in accordance with adopted local/state/federal regulations.	Prior to the issuance of a grading permit.	Director of Community Development.	
5.7 Hydrology/Water Quality (Base Plan and Overlay Plan)					
H/WQ1	Prior to issuance of a grading permit, the applicant shall provide evidence that the development of the project area shall comply with City of Irvine adopted Grading and Water Quality Ordinances to ensure that the potential for soil erosion is minimized on a project-by-project basis. Specifically, the NPDES discharge permitting requirements to which the City is obligated will ensure that construction activities reduce, to the maximum extent feasible, the water quality impacts of construction activities. The NPDES permit guidance states that "industrial/commercial construction operations that result in a disturbance of one acre or more of total land area . . . and residential construction sites that result in the disturbance of five acres or more . . . shall be required to develop and	Potential project applicant must show compliance with City of Irvine Grading and Water Quality Ordinances via approval of a NPDES permit, SWPPP, and WQMP. Notices of Intent (NOIs) for coverage	Prior to the issuance of a grading permit.	Director of Community Development; Manager of Building and Safety; City Engineer; State/Regional Water Quality Control Boards.	

NO.	MITIGATION MEASURE	METHOD OF VERIFICATION	TIMING OF VERIFICATION	RESPONSIBLE PERSON	DATE OF COMPLETION/ INITIALS
	<p>implement BMPs . . . to control erosion and siltation and contaminated runoff from the construction sites." Note: In March 2003 this provision will apply to residential construction sites that result in the disturbance of one acre or more.</p> <p>The City's standard conditions of approval indicate that a Storm Water Pollution Prevention Plan (SWPPP) shall be prepared prior to the approval of grading permits for any project site in order to reduce sedimentation and erosion. The SWPPP shall include the adoption of erosion and sediment control practices such as desilting basins and construction site chemical control management measures.</p> <p>Additionally, prior to the issuance of a grading permit, project applicants must submit, and the Director of Community Development or designee must have approved, a Water Quality Management Plan (WQMP). The WQMP must identify the Best Management Practices (BMPs) that will be used on the site to control predictable pollutant runoff after the site is occupied. Ongoing operations after construction would be subject to the Countywide Municipal NPDES Stormwater Permit, for which the City is a Co-Permittee. This WQMP shall identify, at a minimum, the routine, structural, and non-structural measures specified in the Countywide NPDES DAMP Appendix which details implementation of BMPs whenever they are applicable to a project, the assignment of long-term maintenance responsibilities (specifying the developer, parcel owner, maintenance association, leasee, etc.), and shall reference the location(s) of structural BMPs. (Completed with the WQMP (Fusco, June 28, 2006, Revised September 15, 2006).</p> <p>Also in accordance with standard City project permitting and approval procedures, Notices of Intent (NOIs) for coverage of projects under the General Construction Activity Storm Water Runoff Permit will be submitted to the State Water Resources Control Board prior to issuance of grading permits in the</p>	<p>of potential projects under the General Construction Activity Storm Water Runoff Permit must be submitted to the State Water Resources Control Board.</p>			

NO.	MITIGATION MEASURE	METHOD OF VERIFICATION	TIMING OF VERIFICATION	RESPONSIBLE PERSON	DATE OF COMPLETION/ INITIALS
	<p>project area. This requirement will be met to the satisfaction of the Director of Community Development for any disturbance of one acre or more of soil in the project area. Also in force during the period of construction would be the General Dewatering NPDES Permit of the Santa Ana RWQCB, as well as the provisions of the Countywide Permit.</p> <p>The Mitigation Measures will be implemented in accordance with local and State regulatory requirements. As future projects are planned and designed in the project area, specific BMPs and other water quality control methods will be utilized to reduce water quality degradation in the Newport Bay watershed. Future projects in the proposed project area will acknowledge and implement those additional requirements that may be imposed by RWQCB in the future. Compliance with these measures shall be verified by the Community Development Department.</p>				
H/WQ2	Prior to issuance of a grading permit, evidence (e.g., in the form of a construction management plan) shall be provided that demonstrates that all stormwater runoff and dewatering discharges from the project area shall be managed to the maximum extent practicable or treated as appropriate to comply with water quality requirements identified in the Santa Ana Regional Water Quality Control Board Basin Plan, including Total Maximum Daily Load (TDML) Implementation Plan adopted for this watershed.	Submission of a construction management plan required by the potential project applicant.	Prior to the issuance of a grading permit.	Director of Community Development; City Engineer; State/Regional Water Quality Control Boards.	
H/WQ3	Prior to approval of the first tentative tract or parcel map in the project area, detailed hydrology studies and hydraulic analysis shall be conducted. Studies and analysis shall be prepared in accordance with OCFCD methodologies and standards and the Flood Control Master Plan for San Diego Creek, as well as any additional guidelines in effect at the time of project design. Recommendations contained in the hydrology studies and/or hydraulic analysis to address drainage/flooding issues related to proposed development shall be implemented. Compliance	Requires the submission of a hydrology study and hydraulic analysis by the potential project applicant.	Prior to the approval of the first tentative tract or parcel map in the project area.	Director of Community Development; City Engineer.	

NO.	MITIGATION MEASURE	METHOD OF VERIFICATION	TIMING OF VERIFICATION	RESPONSIBLE PERSON	DATE OF COMPLETION/ INITIALS
	with this measure shall be verified by the Community Development Department.				
H/WQ4	<p>Prior to issuance of a building permit, developers with property located in the newly delineated 100-year floodplain shall be required to construct such improvements as necessary to remove the property from the 100-year floodplain. Additionally, the developer shall prepare a Letter of Map Revision (LOMR) request to have the FIRMs revised to remove the development areas from the 100-year floodplain upon completion of the approved flood control facilities. The LOMR request shall be filed upon completion of design of the flood control improvements to contain or redirect the 100-year flood flows away from the property.</p> <p>After the improvements are constructed, Record Drawings and a maintenance agreement with, or letter from, a public agency shall be submitted to FEMA to complete the LOMR process.</p>	Requires the development, review, and approval of a Letter of Map Revision; physical improvement of property located in 100-year floodplain by project applicant.	Prior to the issuance of a building permit.	Director of Community Development; City Engineer.	
5.8 AGRICULTURAL RESOURCES (Base Plan and Overlay Plan)					
AG1	<p>In order to encourage agriculture as an interim land use pending development on the project site by warning future residents that they are buying or renting a house adjacent to existing agricultural operations, City Of Irvine Standard Discretionary Case Condition B.4 and City Of Irvine Standard Subdivision Condition 3.4 regarding disclosure statements shall be amended to include the following for subdivisions proposed adjacent to existing agricultural operations:</p> <p>Prior to issuance of building permits, the applicant shall submit, and the Director of Community Development shall have approved, a completed occupancy disclosure form for the project. The approved disclosure form, along with its attachments, shall be included as part of the rental/lease agreement and as part of the sales literature for the project. The disclosure statement shall include the following</p>	Project applicant shall complete and receive approval for an occupancy disclosure form per the standards stated in Mitigation Measure AG1.	Prior to the issuance of a building permit.	Director of Community Development.	

NO.	MITIGATION MEASURE	METHOD OF VERIFICATION	TIMING OF VERIFICATION	RESPONSIBLE PERSON	DATE OF COMPLETION/ INITIALS
	information: X Continuation of agricultural operations adjacent to the site and their potential effects (spraying of pesticides, noise, dust, odor, etc.) on future residents or tenants.				
AG2	Heritage and community service/educational farming operations shall be encouraged within utility easements and other lands. Heritage farming is defined as small-scale specialty farming operations that can be accommodated in an urban environment. An example would be the Edible Landscape project located adjacent to Harvard Avenue within the Edison right-of-way.	May require development of a cooperative agreement.	On-going (prior to and during development of the project area).	Director of Community Development.	
AG3	Future landowners and the City shall work cooperatively with farmers to minimize conflicts between agricultural operations and adjacent urban uses.	May require development of a cooperative agreement.	On-going (prior to and during development of the project area).	Director of Community Development.	
5.9 BIOLOGICAL RESOURCES (Base Plan and Overlay Plan)					
BIO1	Prior to approval of a subdivision map for each project area, a focused survey for the southern tarplant, mountain plover, and burrowing owl shall be conducted. Prior to approval of a subdivision map for development within, or in proximity to Serrano Creek, a focused survey shall be conducted for the least Bell's vireo and southwestern willow flycatcher. Should the focused survey identify a significant population of southern tarplant or mountain plover, or the presence of burrowing owls, least Bell's vireo, or southwestern willow flycatcher in an area proposed for development, impacts shall be avoided through incorporation of the species into an open space easement or if impacts cannot be avoided, then mitigation shall be negotiated through consultation with the United States Fish and Wildlife Service (USFWS) and the California Department of Fish and Game (CDFG).	Requires the development and submission of focused biological surveys for resources indicated in BIO1.	Prior to the approval of a subdivision map.	Director of Community Development; US Fish and Wildlife Service; California Department of Fish and Game.	

NO.	MITIGATION MEASURE	METHOD OF VERIFICATION	TIMING OF VERIFICATION	RESPONSIBLE PERSON	DATE OF COMPLETION/ INITIALS
BIO2	Prior to approval of a subdivision map for each project area, a wetland delineation shall be performed for all areas within the master plan sub-area that contain the potential for wetland habitat and/or jurisdictional waters. The loss of impacted wetlands shall be mitigated through the implementation of a wetland mitigation plan prepared and accepted by the appropriate agency (i.e., U.S. Army Corps of Engineers, U.S. Fish and Wildlife Service, California Department of Fish and Game). Wetlands impacted on-site shall be mitigated through on-site or off-site replacement, re-creation (i.e. within the proposed wildlife corridor), and/or revegetation as deemed acceptable by the appropriate jurisdictional agencies.	Requires the development and submission of wetland survey for potential wetland resources.	Prior to the approval of a subdivision map.	Director of Community Development; US Army Corps of Engineers; US Fish and Wildlife Service; California Department of Fish and Game.	
BIO3	The City shall continue to work with State and federal agencies during the implementation of the proposed project to implement the revegetation/restoration plan for the wildlife corridor. Measures such as sight and sound barriers, including artificial sound walls and natural diversions (e.g. hedges and tree lines) shall be incorporated into corridor design to ensure the viability of the corridor. The City shall implement the corridor consistent with the design criteria and viability analysis established in the OCGP FEIR.	May require development of a revegetation and/or restoration plan for the identified wildlife corridor.	On-going (prior to and during development of the project area).	Director of Community Development; US Fish and Wildlife Service; California Department of Fish and Game.	
BIO4	Prior to issuance of a grading permit for each project area, a complete inventory of all trees of trunk diameter at breast height (DBH) greater than six inches and any significant (as determined by a certified arborist selected by the City) plants on the project site, excluding those within the habitat preserve shall be prepared. This inventory shall be prepared by an arborist certified by the International Society of Arboriculture and shall include (but not be limited to) data for each tree such as species, variety, DBH, condition (excellent, good, fair, poor, dead), and any recommendations. All trees in this inventory shall be considered "Significant Trees" under the City of Irvine's Urban Forestry Ordinance (UFO) (Section 5-7-401 et al) and the UFO shall apply to all trees included in this inventory.	Requires the development and submission of a tree inventory per the regulations outlined in the City of Irvine Urban Forestry Ordinance.	Prior to the issuance of a grading permit.	Director of Community Development; International Society of Arboriculture.	

NO.	MITIGATION MEASURE	METHOD OF VERIFICATION	TIMING OF VERIFICATION	RESPONSIBLE PERSON	DATE OF COMPLETION/ INITIALS
5.10 PALEONTOLOGICAL RESOURCES (Base Plan and Overlay Plan)					
P1	<p>Prior to issuance of a grading permit for any portion of the project area, a qualified paleontologist shall be retained by the City or designee to carry out an appropriate paleontology investigation of the area proposed for grading. (A qualified paleontologist is defined as an individual with an M.S. or Ph.D. in paleontology or geology who is familiar with paleontological procedures and techniques.) The City of Irvine has standard conditions applied prior to the issuance of grading permits when a project site includes potentially significant paleontological sites, and paleontological monitoring conditions have not been attached to the previous map approval. These standard conditions include retaining a qualified paleontologist, establishing procedures for cultural and scientific resource surveillance, and protection of any resources discovered during the grading process.</p> <p>When fossils are discovered, the paleontologist (or paleontological monitor) shall recover them. In most cases, this fossil salvage can be completed in a short period of time. However, some fossils specimens (such as a complete large mammal skeleton) may require an extended salvage period. In these instances the paleontologist (or paleontological monitor) shall be allowed to temporarily direct, divert or halt grading to allow recovery of fossil remains in a timely manner. Because of the potential for the recovery of small fossil remains, such as isolated mammal teeth, it may be necessary in certain instances to set up a screen-washing operation on-site.</p> <p>Fossil remains collected during the monitoring and salvage portion of the mitigation program shall be cleaned, repaired, sorted, and cataloged. Compliance with this measure shall be verified by the Community Development Department.</p>	Submittal of resource recovery and disposition plans to the Community Development Department; qualified paleontologists' attendance at pre-grading conference(s) and field observation.	Prior to issuance of a grading permit and during site grading.	Director of Community Development or designee.	

NO.	MITIGATION MEASURE	METHOD OF VERIFICATION	TIMING OF VERIFICATION	RESPONSIBLE PERSON	DATE OF COMPLETION/ INITIALS
5.11 CULTURAL RESOURCES (Base Plan and Overlay Plan)					
CULT1	Prior to subdivision for development, a detailed archaeological report(s) shall be prepared within PAs 51 and 30. This report(s) shall specifically address the potential for encountering archaeological resources at the time specific development is proposed. The report(s) shall provide recommendations to prevent degradation of archaeological resources such as site avoidance and data recovery. Recommendations contained in the report shall be implemented. Compliance with this measure shall be verified by the Community Development Department.	Requires development and submission of an archaeological resources report for PAs 51 and 30 by project applicant.	Prior to the issuance of subdivision maps.	Director of Community Development or designee.	September 2006 DL
CULT2	Monitoring of excavation and grading activities associated with future development in PAs 51 and 30 shall be conducted by a certified archaeologist in accordance with the report required in Mitigation Measure Cult1. If resources are encountered in the course of ground disturbance, the archaeological monitor shall be empowered to halt grading and to initiate an archaeological testing program. The testing shall include recordation of artifacts, controlled removal of the materials, and an assessment of their importance under CEQA and the City's local guidelines. Compliance with this measure shall be verified by the Community Development Department.	Requires field inspection and monitoring by qualified archaeologist implementing recommendations outlined in the report noted above.	Field inspection and monitoring required during grading activities.	Director of Community Development or designee.	
CULT3	Prior to the issuance of grading permits and/or building permits for any future development in PAs 51 and 30, a detailed mitigation program shall be submitted by the applicant to the City of Irvine to address archaeological resources discovered during grading. Provisions of the program shall include an immediate evaluation of the find by a qualified archaeologist. If the find is determined to be a unique archaeological resource, contingency funding and a time allotment sufficient to allow for implementation of avoidance measures or appropriate mitigation shall be available. Work may continue on other parts of the construction site while archaeological resource mitigation takes place. The City of Irvine has standard conditions applied prior to the issuance of grading permits when a project site includes potentially significant archaeological sites. These include retaining a qualified	Requires the development and submission of an archaeological mitigation program by project applicant.	Prior to the issuance of grading permits and/or building permits in PAs 51 and 30.	Director of Community Development or designee.	

NO.	MITIGATION MEASURE	METHOD OF VERIFICATION	TIMING OF VERIFICATION	RESPONSIBLE PERSON	DATE OF COMPLETION/ INITIALS
	archaeologist, establishing procedures for cultural and scientific resource surveillance, and protection of any resources discovered during the grading process. Compliance with this measure shall be verified by the Community Development Department.				
CULT4	<p>Prior to the issuance of any grading and/or building permits, a mitigation program shall be submitted by the developer to the City of Irvine to address the accidental discovery or recognition of any human remains. The program shall include the following:</p> <p>X There shall be no further excavation or disturbance of the site or any nearby area reasonably suspected to overlie adjacent human remains until:</p> <p>The county coroner must be contacted to determine that no investigation of the cause of death is required, and</p> <p>If the coroner determines the remains to be Native American:</p> <p>X The coroner shall contact the Native American Heritage Commission within 24 hours.</p> <p>X The Native American Heritage Commission shall identify the person or persons it believes to be the most likely descended from the deceased Native American.</p> <p>X The most likely descendent may make recommendations to the landowner or the person responsible for the excavation work, for means of treating or disposing of, with appropriated dignity, the human remains and any associated grave goods as provided in Public Resources Code Section 5097.98, or</p> <p>X Where the following conditions occur, the landowner or his</p>	Requires the development and submission of an archaeological mitigation program by project applicant.	Prior to the issuance of grading permits and/or building permits.	Director of Community Development or designee.	

NO.	MITIGATION MEASURE	METHOD OF VERIFICATION	TIMING OF VERIFICATION	RESPONSIBLE PERSON	DATE OF COMPLETION/ INITIALS
	<p>authorized representative shall rebury the Native American human remains and associated grave goods with appropriate dignity on the property in a location not subject to further subsurface disturbance.</p> <ul style="list-style-type: none"> • The Native American Heritage Commission is unable to identify a most likely descendent or the most likely descendent failed to make a recommendation within 24 hours after being notified by the commission. • The descendant identified fails to make a recommendation; or • The landowner or his authorized representative rejects the recommendation of the descendant, and the mediation by the Native American Heritage Commission fails to provide measures acceptable to the landowner. <p>Compliance with this measure shall be verified by the Community Development Department.</p>				
5.12 AESTHETICS (Base Plan and Overlay Plan)					
A1	Prior to issuance of building permits, lighting plans and signage plans for new development shall be reviewed by the Community Development Department to ensure that minimal light intrusion and spillover into adjacent residential areas occurs.	Requires review of site specific plans for light intrusion and spillover by City of Irvine.	Prior to the issuance of building permits, lighting plans, and/or signing plans.	Director of Community Development or designee.	
A2	Prior to the issuance of building permits, and during the master plan review process for future development in the project area, the Director of Community Development shall ensure that mirrored and highly reflective surfaces are discouraged or, where proposed, shall be accompanied by a design-level glare impact analysis that demonstrates no adverse visual impairment to motorists or other visual nuisance occurs.	Discourages use of mirrored or reflective surfaces in proposed development; designs to be reviewed by the City of Irvine.	On-going (prior to the issuance of building permits; during master plan review).	Director of Community Development or designee.	

NO.	MITIGATION MEASURE	METHOD OF VERIFICATION	TIMING OF VERIFICATION	RESPONSIBLE PERSON	DATE OF COMPLETION/ INITIALS
5.13 POPULATION AND HOUSING (Base Plan and Overlay Plan)					
	No mitigation measures are available.				
5.14 PUBLIC SERVICES AND FACILITIES (Base Plan and Overlay Plan)					
	Mitigation Measures identified in other sections of the OCGP FEIR (Section 5.1 – 5.13) address the impacts associated with the construction and operation of new public services and facilities (including law enforcement, fire and emergency medical services, parks and recreation, and school services). Refer to the individual sections mentioned above for a discussion on specific mitigation monitoring and reporting programs.				
5.15 UTILITIES (Base Plan and Overlay Plan)					
	Mitigation Measures identified in other sections of the OCGP FEIR (Section 5.1 – 5.13) address the impacts associated with the construction and operation of new utilities (including potable water, recycled water, and sewer). Refer to the individual sections mentioned above for a discussion on specific mitigation monitoring and reporting programs. Mitigation Measures pertaining to solid waste are described below.				
SW1	<p>It is anticipated that much of the solid waste resulting from the demolition, dismantling, or other deconstruction of the aged structures and property, including but not limited to buildings and runways, at MCAS El Toro, is contaminated with lead based paints, asbestos, or other materials that may render it unsuitable for recycling or reuse. At the sole cost and expense of the project applicant, in order to evaluate this condition and determine the feasibility of recycling of solid waste material from the MCAS El Toro site by ordinary means, a technical evaluation by a qualified environmental consultant must be conducted. The technical evaluation shall include sufficient sample testing of all types of solid waste materials to be generated by the project to analyze its composition. A copy of the full technical evaluation and its findings must be submitted to the City of Irvine Community Development Department. The City of Irvine must confirm the adequacy of the technical evaluation prior to authorizing the demolition, dismantling, or deconstruction project to proceed.</p> <p>If it is determined by the technical evaluation that the material is contaminated and prohibited from being recycled by ordinary means, a further evaluation must be conducted to identify and</p>	Requires the development and submission of a technical evaluation by the project applicant to determine the composition of solid waste materials generated during the development of the project area.	Prior to the issuance of grading permits.	Director of Community Development or designee.	

NO.	MITIGATION MEASURE	METHOD OF VERIFICATION	TIMING OF VERIFICATION	RESPONSIBLE PERSON	DATE OF COMPLETION/ INITIALS
	evaluate other feasible methods approved by state law to divert the material from landfills. This may include the delivery of the waste material to other appropriate non-disposal or transformation facilities, such as "waste-to-energy" (WTE) plants.				
SW2	For that solid waste which is determined to be inappropriate for recycling (as that term is defined by California Public Resources Code Section 40180), the project applicant must submit a written plan to the City and implement such plan to ensure that 75 percent of the material, or the maximum amount feasible as determined by the technical evaluation, is diverted from the landfill through other methods that comply with state statutes and regulations.	Requires the project applicant to submit written plans to the City of Irvine to ensure recycling maximum feasible levels of solid waste material is recycled.	Prior to the issuance of grading permits.	Director of Community Development or designee.	
SW3	For that solid waste which the technical study deems to be suitable for recycling, the project applicant must submit a written plan to the City and implement such plan to ensure that solid waste material generated by the demolition, dismantling, or deconstruction project, land use operations and maintenance is collected by a City authorized solid waste hauler or recycling agent, and that a minimum of 75% of the solid waste from the project is diverted from landfills by recycling, as that term is defined by California Public Resources Code Section 40180. ("Recycling" does not include transformation, as defined in Public Resources Code Section 40201.)	Requires the project applicant to submit written plans to the City of Irvine to ensure recycling maximum feasible levels of solid waste material is recycled.	Prior to the issuance of grading permits.	Director of Community Development or designee.	
SW4	To ensure ongoing compliance with these mitigation measures, the project applicant will be required to submit solid waste tonnage reports to the City of Irvine on City approved forms, accompanied by "weight ticket" receipts from state-certified disposal, nondisposal, or transformation facilities, on a quarterly basis to demonstrate that solid waste diversion has occurred in accordance with these required mitigation measures and in a manner that is consistent with, and not detrimental to, the efforts of the City of Irvine to comply with	Requires the project applicant to submit quarterly solid waste tonnage reports to the City of Irvine in order to demonstrate solid waste diversion has occurred.	Prior to the issuance of grading permits.	Director of Community Development or designee.	

NO.	MITIGATION MEASURE	METHOD OF VERIFICATION	TIMING OF VERIFICATION	RESPONSIBLE PERSON	DATE OF COMPLETION/ INITIALS
	<p>AB939.</p> <p>To assure compliance with applicable statutes related to the disposal of solid waste, it is necessary for the City to require appropriate and effective mitigation measures to limit the disposal and ensure significant recycling of solid waste on-site.</p>				
SW5	<p>For green waste, the project applicant must submit a written plan to the City and implement such plan to ensure that the green waste material generated by landscape maintenance operations is collected by a City authorized waste hauler or recycling agent, that the maximum feasible amount of that collected green waste is recycled, and that a minimum of 50 percent of the green waste from the project is diverted from landfills by recycling, as that term is defined by California Public Resources Code Section 40180.</p>	<p>Requires the project applicant to submit a written plan to the City of Irvine to ensure recycling of the maximum feasible amount of green waste material (minimum of 50 percent) by qualified agent.</p>	<p>Prior to the issuance of grading permits.</p>	<p>Director of Community Development or designee.</p>

LIST OF APPENDICES

APPENDIX A	LAND USE BY ITAM 8.4-10 TAZ
APPENDIX B	INTERSECTION ICU WORKSHEETS
APPENDIX C	INTERSECTION ICU WORKSHEETS WITH GREAT PARK EIR MITIGATION

1.0 PURPOSE AND BACKGROUND

1.1 PURPOSE

According to Section 15164(a) of the California Environmental Quality Act (CEQA) Guidelines, the lead agency or responsible agency shall prepare an addendum to an approved environmental impact report (EIR) if only minor technical changes or additions are necessary or none of the conditions described in Section 15162, which call for preparation of a subsequent or supplemental EIR, have occurred. The City of Irvine (City), as the lead agency under CEQA, has determined that an addendum to the Orange County Great Park Final EIR (State Clearinghouse Number 2002101020) would be required. The purpose of this Addendum is to discuss the changes to the Final EIR (namely the removal of mitigation measures at seven intersections and one ramp), evaluate the impacts of the changes, and document the findings of the evaluation.

1.2 BACKGROUND

1.2.1 The Great Park

As part of the July 1993 Base Realignment and Closure Act, the Department of the Navy made the decision to close the Marine Corps Air Station (MCAS) El Toro. Following that decision, the County of Orange, the El Toro Reuse Planning Authority and the City of Irvine, as well as other entities, developed plans for the properties reuse. A portion of the former MCAS El Toro was within the City of Irvine (414 acres) and a portion was within an unincorporated area of Orange County (4,392 acres). In March 2002 the Orange County voters passed the Measure W Initiative. Measure W amended the Orange County General Plan to change the designation of the unincorporated land from commercial airport to park, open space and other uses. After Measure W passed, the City of Irvine revised their plans for the properties reuse to be more consistent with the goals of the Measure W Initiative. In April 2002 the County of Orange voted against continuing plans for the former MCAS El Toro reuse, discontinued pursuit of purchasing the property, moved to support the annexation by the City of Irvine, and negotiated with the Department of the Navy for termination of the El Toro Master Lease. The lease was terminated in July 2002. The Orange County Great Park Plan was developed by the City of Irvine to be consistent with the concept for the MCAS El Toro reuse, while allowing for a reasonable economic return to private sector buyers.

The reuse plan analyzed in the Orange County Great Park Final EIR is consistent with the reuse concept adopted by the voters in 2002. In 2003 the City approved the Orange County Great Park Final EIR. The Project included a General Plan Amendment, Zone Change, and annexation of unincorporated portions of the site. The Project is centrally located within Orange County just northeast of Interstate 5 and the Eastern Transportation Corridor Toll Road (Figure 1-1). The cities of Irvine and Lake Forest border the site on the south and east, and an unincorporated area in the County of Orange borders the site's northern limit. The actions included in the Orange County Great Park Final EIR are as follows:

- Annexation, General Plan Amendment, Pre-Zoning (prior to annexation) and Zoning of the unincorporated portion of Planning Area 51
- Annexation of the unincorporated portion of Planning Area 35 (James A. Musick Branch Jail and the Irvine Ranch Water District Parcel)
- General Plan Amendment and Zone Change for Planning Area 30 which is presently in the City of Irvine
- Approval of the form of a Development Agreement vesting approval of higher intensity overlay uses in consideration for dedication of land for public purposes and for developing and funding certain infrastructure improvements and maintenance of the public uses by the purchaser/developer and

subsequent landowners and funding of specific park, roadway, and other circulation facilities and infrastructure

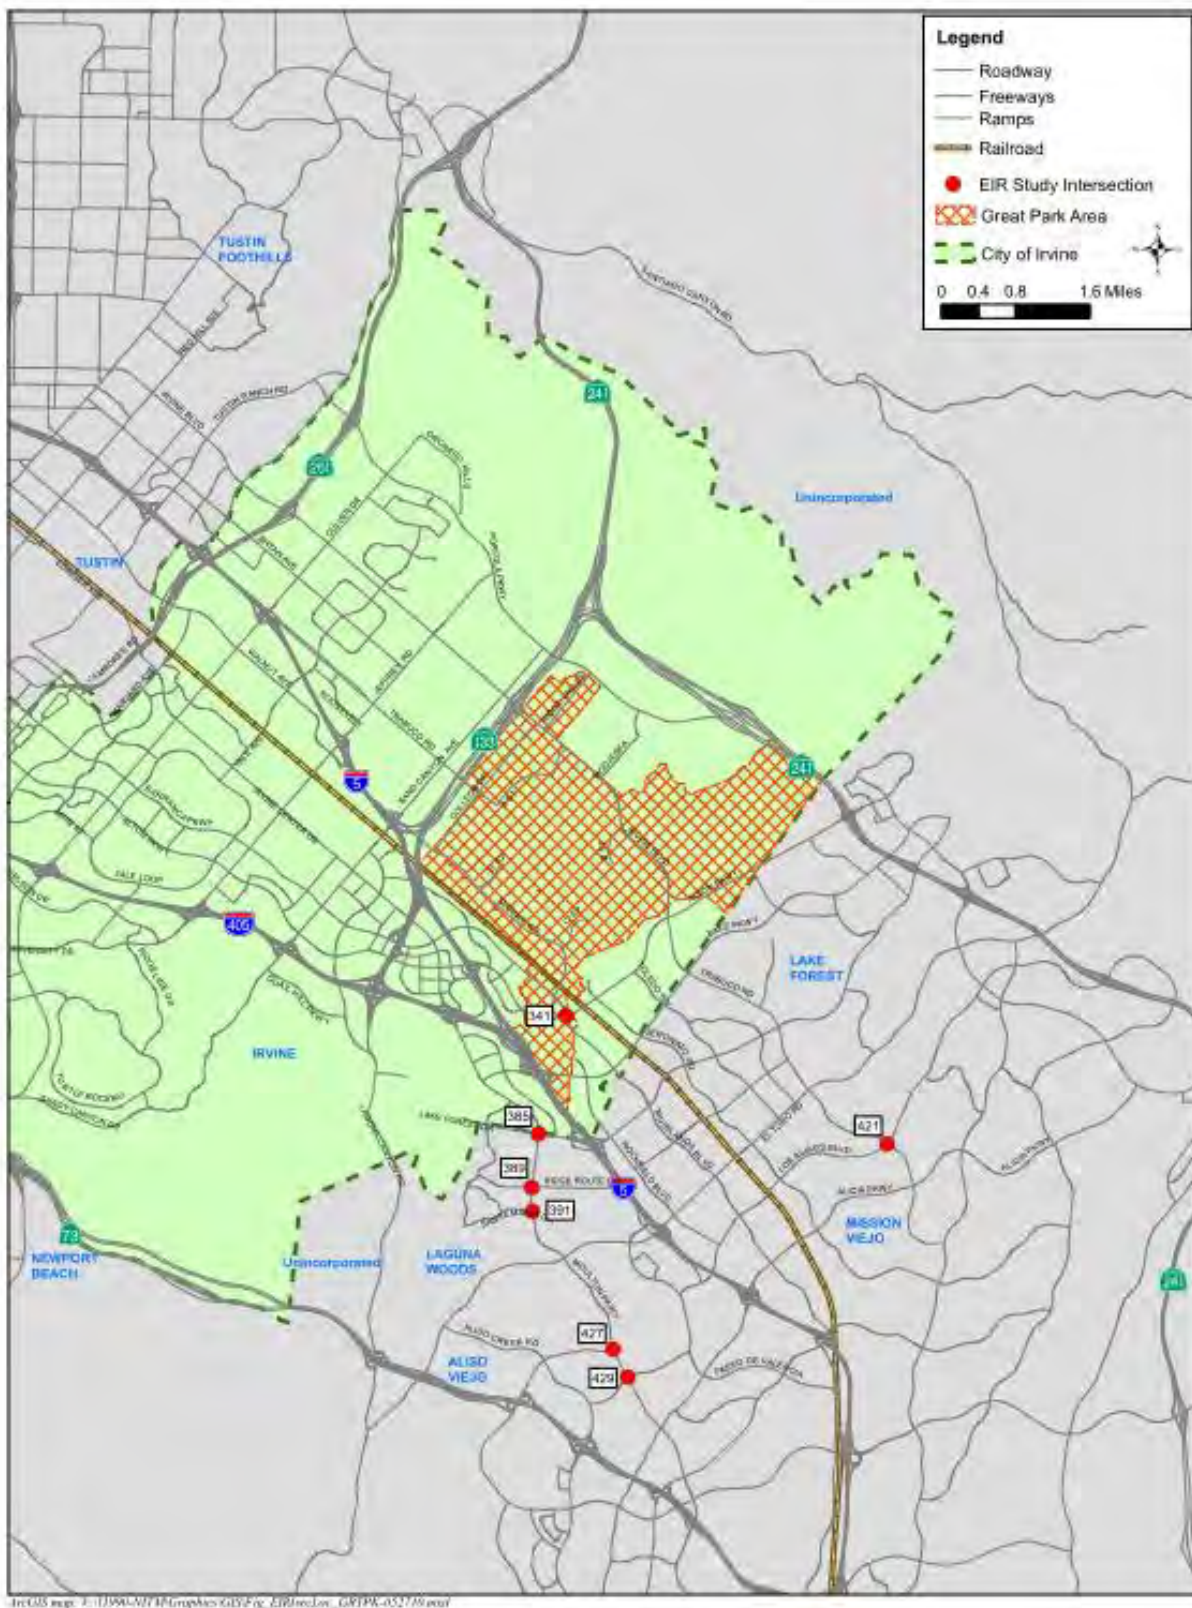

The Orange County Great Park Final EIR was processed as a program-level document so it could be used to address subsequent discretionary approvals as the area prepared for development. The Final EIR identified measures to reduce the anticipated impacts to traffic. The measures included various geometric and design improvements to satisfy level of service (LOS) requirements as development occurred.

1.2.2 North Irvine Transportation Mitigation (NITM) Program

In April 2003, the City developed the North Irvine Transportation Mitigation (NITM) program to implement and expedite circulation mitigation measures in previously certified CEQA documents by providing a mechanism for funding for the coordinated and phased installation of required traffic and transportation improvements in connection with land use entitlements for City Planning Areas 1, 2, 5, 6, 8, 9, 30, 40 and 51. The list of improvements in the NITM program included both fully funded and fair share improvements.

In 2007, the NITM Five Year Review was initiated for the purpose of updating cost allocations, proposing alternative mitigation measures, or eliminating specific traffic and/or transportation improvements that are no longer necessary. The NITM Five-Year Review Traffic Study determined that traffic mitigation measures were no longer needed for seven intersections (Alton Parkway/Barranca Parkway, Lake Forest Drive/Irvine Center Drive, Ridge Route Drive/Moulton Parkway, Santa Maria Drive/Moulton Parkway, Los Alisos Boulevard/Trabuco Road, Moulton Parkway/Glenwood Drive-Indian Creek Lane, and Moulton Parkway/Laguna Hills Drive) and one ramp (SR-241 at Lake Forest Drive) (Figure 1-1). These intersections were found to operate within an acceptable level of service (LOS) under baseline interim and long-term conditions. The improvements were therefore deleted from the List of NITM Improvements. Since improvements at these locations were incorporated in the Final Orange County Great Park EIR as mitigation, an addendum to the Final EIR was required to evaluate the removal of the improvements from the list of mitigation measures.

Figure 1-1 Project Area

2.0 CALIFORNIA ENVIRONMENTAL QUALITY ACT PROCESS

2.1 CEQA COMPLIANCE

The City of Irvine has the approval authority for the Orange County Great Park Project. This Addendum has been prepared in accordance with Section 15164 and Section 15162 of CEQA guidelines. This document discusses the revisions to the Orange County Great Park Project and whether those changes would result in substantial changes as defined by Section 15162.

Section 15164 of the CEQA guidelines states:

- (a) The lead agency or a responsible agency shall prepare an addendum to a previously certified EIR (Environmental Impact Report) if some changes or additions are necessary but none of the conditions described in Section 15162 calling for preparation of a subsequent EIR have occurred.
- (b) An addendum may be prepared if only minor technical changes or additions are necessary or none of the conditions described in Section 15162 calling for the preparation of a subsequent EIR or negative declaration have occurred.
- (c) An addendum need not be circulated for public review but can be included in or attached to the final EIR or adopted negative declaration.
- (d) The decision-making body shall consider the addendum with the final EIR or adopted negative declaration prior to making a decision on the project.
- (e) A brief explanation of the decision not to prepare a subsequent EIR pursuant to Section 15162 should be included in an addendum to an EIR, the lead agency's required findings on the project, or elsewhere in the record. The explanation must be supported by substantial evidence.

Section 15162 of the CEQA guidelines states:

- (a) When an EIR has been certified or negative declaration adopted for a project, no subsequent EIR shall be prepared for that project unless the lead agency determines, on the basis of substantial evidence in the light of the whole record, one or more of the following:
 - (1) Substantial changes are proposed in the project which will require major revisions of the previous EIR or negative declaration due to the involvement of new significant environmental effects or a substantial increase in the severity of previously identified significant effects;
 - (2) Substantial changes occur with respect to the circumstances under which the project is undertaken which will require major revisions of the previous EIR or negative declaration due to the involvement of new significant environmental effects or a substantial increase in the severity of previously identified significant effects; or
 - (3) New information of substantial importance, which was not known and could not have been known with the exercise of reasonable diligence at the time the previous EIR, was certified as complete or the negative declaration was adopted, shows any of the following:
 - (A) The project will have one or more significant effects not discussed in the previous EIR or negative declaration;
 - (B) Significant effects previously examined will be substantially more severe than shown in the previous EIR.

3.0 DESCRIPTION OF CHANGES

3.1 PROJECT CHANGES

The Orange County Great Park Final EIR identified traffic improvements at intersections as mitigation measures for the development and annexation of the Great Park. Based on the findings of the NITM Five-Year Review Traffic Study and subsequent analysis utilizing ITAM 8.4-10, it was determined that previously proposed traffic mitigation strategies were not required for those intersections since they operate at an acceptable LOS under all interim year and build-out conditions. In addition, improvements above and beyond the baseline conditions for these locations are not warranted based on forecast future traffic activity.

The seven intersections and one ramp were found to operate within an acceptable LOS under baseline interim and long-term conditions. Therefore, the associated traffic improvements proposed as mitigation measures in the Orange County Great Park Final EIR are no longer required. The following specific improvements are to be deleted from the List of NITM Improvements:

- Intersection #341: Alton Parkway and Barranca Parkway (Irvine) — Restripe eastbound approach to provide 2.5 left-turn lanes, 1.5 through lanes and no right-turn lane and modify signal to provide east/west split phasing
- Intersection #385: Lake Forest Drive and Irvine Center Drive (Irvine/Laguna Hills) — Designate LOS "E" as acceptable and make a contribution to the City of Irvine Traffic Management Systems Operation Study (TMSOS) in an amount equal to the construction cost of the following improvement that would be needed to achieve LOS D: convert eastbound de-facto right-turn lane to fourth through lane
- Intersection #389: Ridge Route Drive and Moulton Parkway (Laguna Hills/Laguna Woods) — Restripe northbound approach to provide 1 left-turn lane, 1.5 through lanes and 1.5 right-turn lanes
- Intersection #391: Santa Maria Drive and Moulton Parkway (Laguna Hills/Laguna Woods) — Convert eastbound right-turn lane to fourth through lane and add fourth westbound through lane
- Intersection #421: Los Alisos Boulevard and Trabuco Road (Mission Viejo) — Add second northbound left-turn lane and delete northbound de-facto right-turn lane
- Intersection #427: Moulton Parkway and Glenwood Drive/Indian Creek Lane (Aliso Viejo/Laguna Hills) — Add fourth northbound through lane
- Intersection #429: Moulton Parkway and Laguna Hills Drive (Aliso Viejo/Laguna Hills) — Restripe eastbound approach to provide 3 left-turn lanes, 2 through lanes and 1 right-turn lane
- Ramp #18: SR-241 at Lake Forest Drive, Southbound Off-ramp (Caltrans) — Add second drop lane from SR-241 to the off-ramp

For the locations that will be deleted from the List of NITM Improvements, one intersection, Alton Parkway at Barranca Parkway (#341) in the City of Irvine, was expected to be fully funded by the NITM program. The remaining locations that will be deleted from the improvement list were to be funded on a fair share basis.

3.2 CHANGES TO FINAL EIR

Sections in the Orange County Great Park Final EIR that will be removed as a result of subsequent analysis through application of ITAM 8.4-10 are as follows:

- Alton Parkway & Muirlands Boulevard (Barranca Parkway) – Construct westbound right turn lane (2025 Overlay Plan, FEIR page 5.2-72)
- Lake Forest Drive & Irvine Center Drive

- Restripe eastbound de-facto right turn lane into shared right through lane (2025 Base Plan, FEIR page 5.2-39)
 - Construct second westbound left turn lane (2025 Overlay Plan, FEIR page 5.2-57). This improvement is already constructed.
- Ridge Route Drive & Moulton Parkway – Convert one northbound through lane into a northbound right turn lane (Post-2025 Overlay, FEIR page 5.2-61)
- Santa Maria Drive & Moulton Parkway
 - Construct eastbound right turn lane (2025 Base Plan, FEIR page 5.2-39 & 2025 Overlay Plan, FEIR page 5.2-57) Construct second northbound left turn lane (Post-2025 Base Plan, FEIR, page 5.2-40)
 - Construct second northbound left turn lane and fourth eastbound through lane (Post-2025 Overlay, FEIR page 5.2-61)
- Los Alisos Boulevard & Trabuco Road – Construct second northbound left turn lane (2025 Base Plan, FEIR page 5.2-39)
- Moulton Parkway & Glenwood Drive/Indian Creek Lane – Add fourth northbound through lane (Post-2025 Overlay Plan, FEIR page 5.2-60)
- Moulton Parkway & Laguna Hills Drive
 - Construct third westbound through lane and provide westbound right turn overlap phase (Post 2025 Base Plan, FEIR page 5.2-40)
 - Construct third eastbound left turn lane (Post-2025 Overlay Plan, FEIR page 5.2-60, page 5.2-73) or alternate mitigation to convert southbound de-facto right turn lane into southbound through lane (Buildout, FEIR page 5.2-73)
- SR-241 at Lake Forest Drive – southbound off-ramp (2025 Overlay Plan, FEIR significant impact - page 5.2-66, potential impact - Table 2-1, page 2-14)

Furthermore, the Final EIR does not contain an analysis of Greenhouse Gas (GHG) Emissions as this was not a required analysis under State CEQA Guidelines prior to March 2010. The analysis of GHG as it relates to the proposed changes in this Addendum has been added to respond to recent California legislation.

4.0 ENVIRONMENTAL CHECKLIST

In preparing this Addendum, the potential impacts identified on the CEQA “Environmental Checklist Form” were considered. Table 4-1 shows the environmental topic areas that are addressed in the CEQA Checklist and which of those topic areas would be affected by the proposed changes to the EIR. If the analysis conducted for this Addendum determined there was a change from the previous analysis, the change was evaluated to determine if it was substantially different from previously identified effects and whether it would have a new significant impact. For those topic areas where no change would occur, the box indicating ‘no substantial change’ is marked.

Table 4-1: Environmental Checklist

Environmental Issues	New Significant Impact	Substantial Change from Previous Analysis	No Substantial Change from Previous Analysis
1. Aesthetics	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
2. Agriculture and Forest Resources	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
3. Air Quality	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
4. Biological Resources	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
5. Cultural Resources	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
6. Geology and Soils	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
7. Greenhouse Gas Emissions	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>
8. Hazards and Hazardous Materials	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
9. Hydrology and Water Quality	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
10. Land Use and Planning	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
11. Mineral Resources	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
12. Noise	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
13. Population and Housing	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
14. Public Services	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
15. Recreation	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
16. Transportation/Traffic	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>
17. Utilities and Service Systems	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>
18. Mandatory Findings of Significance	<input type="checkbox"/>	<input type="checkbox"/>	<input checked="" type="checkbox"/>

The Final EIR did not contain an analysis of GHG emissions as this was not a required analysis under State CEQA Guidelines prior to March 2010. The analysis of GHG as it relates to the proposed changes in this

Addendum has been added to respond to recent California legislation, namely Senate Bill 97 and Assembly Bill 32.

In addition, the traffic analysis was conducted for the removal of traffic mitigation measures. This analysis was a change from the previous analysis in the Final EIR. However, the analysis indicated that the removal of the traffic mitigation measures would not result in a new significant impact. Therefore, the removal of the traffic mitigation is considered a minor technical change consistent with CEQA Guidelines Section 15062 and 15064.

5.0 ANALYSIS OF POTENTIAL EFFECTS

As indicated in the CEQA Checklist Form in Section 4.0, impacts to all environmental issue areas would not be affected by the changes in the Final EIR or by removal of the traffic mitigation measures at the seven intersections and one ramp as identified in the NITM Five-Year Review.

1. Aesthetics

Would the project:

- a) Have a substantial adverse effect on a scenic vista?
- b) Substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic building within a state scenic highway?
- c) Substantially degrade the existing visual character or quality of the site and its surroundings?
- d) Create a new source of substantial light or glare which would adversely affect day or nighttime views in the area?

No Substantial Change from Previous Analysis. Impacts of the project on aesthetic resources are related to the potential effects of urban light and glare. The removal of street improvements at seven street intersections and one ramp would not introduce additional adverse impacts on scenic resources, aesthetic character and quality or light conditions. Therefore, there would be no substantial changes to the findings in the Final EIR for aesthetic resources.

2. Agriculture and Forest Resources

Would the project:

- a) Convert Prime Farmland, Unique Farmland, or Farmland of Statewide Importance (Farmland), as shown on the maps prepared pursuant to the Farmland Mapping and Monitoring Program of the California Resources Agency, to non-agricultural use?
- b) Conflict with existing zoning for agricultural use, or a Williamson Act contract?
- c) Conflict with existing zoning for, or cause rezoning of, forest land (as defined in Public Resources Code section 12220(g)), timberland (as defined by Public Resources Code section 4526), or timberland zoned Timberland Production (as defined by Government Code section 51104(g))?
- d) Result in the loss of forest land or conversion of forest land to non-forest use?
- e) Involve other changes in the existing environment which, due to their location or nature, could result in conversion of Farmland, to non-agricultural use or conversion of forest land to non-forest use?

No Substantial Change from Previous Analysis.

In the Final EIR the conversion of Prime and Unique Farmland and Farmland of Statewide Importance to non-agricultural uses was determined to be a significant impact. Removal of the traffic mitigation measures at seven intersections and one ramp would not result in any construction. It would not result in conflicts with agricultural zoning, convert farmland to non-farmland uses or result in a loss of forest land. There would be no substantial changes to the findings in the Final EIR for agricultural and forest resources.

3. Air Quality

Would the project:

- a) Conflict with or obstruct implementation of the applicable air quality plan?
- b) Violate any air quality standard or contribute substantially to an existing or projected air quality violation?
- c) Result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard (including releasing emissions which exceed quantitative thresholds for ozone precursors)?
- d) Expose sensitive receptors to substantial pollutant concentrations?
- e) Create objectionable odors affecting a substantial number of people?

No Substantial Change from Previous Analysis. According to the NITM Five-Year Review Traffic Study and subsequent traffic analysis utilizing ITAM 8.4-10, the proposed elimination of traffic mitigation measures would not impact traffic operations or traffic volumes. Since there is no change in traffic volumes, no change in operations emissions are anticipated. It would not result in any additional construction or construction-related emissions. Therefore, the removal of the traffic mitigation measures at the seven intersections and one ramp would not result in substantial changes to air quality or change the required mitigation measures for reducing impacts on air quality in the Final EIR. There would be no substantial changes to the findings in the Final EIR in regards to air quality.

4. Biological Resources

Would the project:

- a) Have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Game or U.S. Fish and Wildlife Service?
- b) Have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations or by the California Department of Fish and Game or US Fish and Wildlife Service?
- c) Have a substantial adverse effect on federally protected wetlands as defined by Section 404 of the Clean Water Act (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means?
- d) Interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites?
- e) Conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance?
- f) Conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan?

No Substantial Change from Previous Analysis. In the Final EIR, the Project was found to have impacts on a federal species of concern, highly disturbed wetland habitat, and a large number of mature trees. Mitigation measures identified to reduce impacts to less than significant included:

- focused surveys for southern tarplant, mountain plover, burrowing owl, least Bell's vireo and southwestern willow flycatcher;
- wetlands delineation;
- implementation of the revegetation and restoration plan for the wildlife corridor;
- an inventory of trees with trunk diameter at breast height greater than six inches and any significant plants.

The removal of the traffic mitigation measures would not affect biological resources or result in additional impacts on biological resources. There would be no construction associated with the removal of mitigation measures; therefore, there would be no impacts to species or habitat. In addition, none of the mitigation measures proposed to reduce impacts to biological resources would be affected by the removal of intersection mitigation. There would be no substantial changes to the findings in the Final EIR for biological resources.

5. Cultural Resources

Would the project:

- a) Cause a substantial adverse change in the significance of a historical resource as defined in §15064.5?
- b) Cause a substantial adverse change in the significance of an archaeological resource pursuant to §15064.5?
- c) Directly or indirectly destroy a unique paleontological resource or site or unique geologic feature?
- d) Disturb any human remains, including those interred outside of formal cemeteries?

No Substantial Change from Previous Analysis. In the Final EIR Project activities were identified to have the potential to affect as yet unidentified paleontological and archeological resources and unknown human remains. In addition, pleistocene terrestrial vertebrates were discovered near one of the planning areas and therefore, may be located within that planning area. These impacts were reduced to less than significant through mitigation measures aimed at preconstruction surveying, resource recovery, additional analyses, construction monitoring, and mitigation plans for discovered resources.

These mitigation measures would not be affected by changes in the traffic and transportation mitigation nor would there be additional impacts to these resources as a result of the change in traffic mitigation. In general, the mitigation measures for cultural resources would not be affected by changes in the traffic measures nor would additional adverse impacts to cultural resources occur. Since traffic improvements are removed, no construction at the seven intersections would commence. This eliminates the potential to affect yet unidentified prehistoric, historic and archeological sites and the potential to impact any paleontological resources at the seven locations. The changes in the traffic measures would not substantially change the findings in the Final EIR for cultural resources.

6. Geology and Soils

Would the project:

- a) Expose people or structures to potential substantial adverse effects, including the risk of loss, injury, or death involving:
 - i. Rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known fault? Refer to Division of Mines and Geology Special Publication 42?
 - ii. Strong seismic ground shaking?
 - iii. Seismic-related ground failure, including liquefaction?
 - iv. Landslides?
- b) Result in substantial soil erosion or the loss of topsoil?

- c) Be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on- or off-site landslide, lateral spreading, subsidence, liquefaction or collapse?
- d) Be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial risks to life or property?
- e) Have soils incapable of adequately supporting the use of septic tanks or alternative waste water disposal systems where sewers are not available for the disposal of waste water?

No Substantial Change from Previous Analysis. The proposed elimination of traffic improvements at seven intersections and one ramp would not affect the mitigation measures discussed above or have any additional adverse impact on geology or soils. By removing traffic mitigation measures, no grading or structures would be required at the eight locations. This would slightly reduce impacts regarding geology and soils. Therefore, there would be no substantial changes to the findings in the Final EIR for geology and soils.

7. Greenhouse Gas Emissions

Would the project:

- a) Generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment?
- b) Conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases?

Atmospheric gases that trap heat are called greenhouse gases (GHG). The accumulation of GHG in the atmosphere heats the earth's surface. GHGs are emitted through natural processes as well as by human activity. It is believed that human activities have elevated these gas concentrations beyond naturally occurring levels resulting in global warming. Global warming has been attributed to significant changes in climate patterns. GHG include carbon dioxide (CO₂), methane (CH₄), and nitrous oxide (N₂O) as well as other gases. Carbon dioxide, methane, and nitrous oxide are generated by human activity. GHG are primarily considered to be associated with energy consumption resulting from heating and air conditioning and lighting and fuel consumption from new residential and non-residential development, construction equipment, and motor vehicle travel.

The Final EIR did not contain an analysis of GHG Emissions as this was not a required analysis under State CEQA Guidelines prior to March 2010. The analysis of GHG as it relates to the proposed changes in this Addendum has been added to respond to recent California legislation, namely Senate Bill 97 and Assembly Bill 32.

Senate Bill 97 (Chapter 185, 2007) directed the Governor's Office of Planning and Research to develop CEQA guidelines that would address how state and local agencies should analyze and mitigate greenhouse gas emissions. On April 13, 2009 the Governor's Office submitted recommendations for amending the State Guidelines to the Secretary for Natural Resources. On March 18, 2010 the amendments became effective.

Presently, there are no CEQA thresholds of significance established for GHG. However, California Assembly Bill (AB) 32 passed in September 2006, called for the California Air Resources Board (CARB) to adopt regulations requiring statewide greenhouse gas emissions reporting, and set a year 2020 statewide greenhouse gas emissions limit equivalent to 1990 levels. Ultimately, it can be assumed that local air districts and agencies will be responsible for enacting regulations, in response to CARB mandates.

According to Recommendations by the Association of Environmental Professionals on *How to Analyze GHG Emissions and Global Climate change in CEQA Documents* (March 5, 2007), an individual project does not generate enough GHG emissions to significantly influence global climate change. Rather, global climate change is a cumulative impact. This means that a project may participate in a potential impact through its incremental contribution combined with the contributions of all other sources of GHG. In assessing cumulative impacts, it must be determined if a project's incremental effect is "cumulatively considerable."

The changes in traffic mitigations would not include additional construction or development that could add to additional human uses or affect the overall operations, traffic volume or level of service for the proposed transportation systems. The proposed changes in the traffic mitigation measures would not conflict with applicable plans, policies or adopted regulations aimed at reducing emissions of GHGs. The changes proposed by this Addendum would not result in GHG emissions and would not alter the incremental contribution of the project to GHG emissions. Mitigation measures promoting the use of alternative methods of transportation in the Final EIR would also not be affected or hindered by the proposed changes. The removal of the traffic improvements at the seven intersections and one ramp would not affect any significance conclusions in the Final EIR.

8. Hazards and Hazardous Materials

Would the project:

- a) Create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials?
- b) Create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment?
- c) Emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school?
- d) Be located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, would it create a significant hazard to the public or the environment?
- e) For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project result in a safety hazard for people residing or working in the project area?
- f) For a project within the vicinity of a private airstrip, would the project result in a safety hazard for people residing or working in the project area?
- g) Impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan?
- h) Expose people or structures to a significant risk of loss, injury or death involving wildland fires, including where wildlands are adjacent to urbanized areas or where residences are intermixed with wildlands?

No Substantial Change from Previous Analysis. The changes in traffic mitigations would not include additional construction or development. The proposed project changes would not affect existing hazards, introduce new hazards, or modify proposed hazards and hazardous waste mitigation. It would not generate solid waste, particularly waste containing hazardous materials. There would be no substantial change to the findings in the Final EIR in regards to hazards and hazardous waste.

9. Hydrology and Water Quality

Would the project:

- a) Violate any water quality standards or waste discharge requirements?
- b) Substantially deplete groundwater supplies or interfere substantially with groundwater recharge such that there would be a net deficit in aquifer volume or a lowering of the local groundwater table level (e.g., the production rate of pre-existing nearby wells would drop to a level which would not support existing land uses or planned uses for which permits have been granted)?

- c) Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, in a manner which would result in substantial erosion or siltation on- or off-site?
- d) Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, or substantially increase the rate or amount of surface runoff in a manner which would result in flooding on- or off-site?
- e) Create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff?
- f) Otherwise substantially degrade water quality?
- g) Place housing within a 100-year flood hazard area as mapped on a federal Flood Hazard Boundary or Flood Insurance Rate Map or other flood hazard delineation map?
- h) Place within a 100-year flood hazard area structures which would impede or redirect flood flows?
- i) Expose people or structures to a significant risk of loss, injury or death involving flooding, including flooding as a result of the failure of a levee or dam?
- j) Inundation by seiche, tsunami, or mudflow

No Substantial Change from Previous Analysis. The removal of the traffic mitigation measures eliminates the associated construction at the seven intersections and one ramp. The proposed changes would not increase impervious surfaces, generate additional runoff, or affect existing or proposed stormwater systems. There would be no substantial change to the findings in the Final EIR.

10. Land Use and Planning

Would the project:

- a) Physically divide an established community?
- b) Conflict with any applicable land use plan, policy, or regulation of an agency with jurisdiction over the project (including, but not limited to the general plan, specific plan, local coastal program, or zoning ordinance) adopted for the purpose of avoiding or mitigating an environmental effect?
- c) Conflict with any applicable habitat conservation plan or natural community conservation plan?

No Substantial Change from Previous Analysis. No land use impacts were identified during the Final EIR evaluation. The changes in traffic mitigations would not include additional construction or development. The removal of the traffic measures would not affect existing land use or land use plans. The proposed project changes would not result in any additional significant impacts to land use and planning; thus, they would not require mitigation measures. There would be no substantial change to the findings in the Final EIR.

11. Mineral Resources

Would the project:

- a) Result in the loss of availability of a known mineral resource that would be of value to the region and the residents of the state?
- b) Result in the loss of availability of a locally-important mineral resource recovery site delineated on a local general plan, specific plan or other land use plan?

No Substantial Change from Previous Analysis. The findings of the Final EIR determined that the Project would not have the potential for impacting mineral resources. The proposed elimination of traffic mitigation measures in eight locations also would not affect mineral resources. There would be no substantial change to the findings in the Final EIR.

12. Noise

Would the project:

- a) Exposure of persons to or generation of noise levels in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?
- b) Exposure of persons to or generation of excessive groundborne vibration or groundborne noise levels?
- c) A substantial permanent increase in ambient noise levels in the project vicinity above levels existing without the project?
- d) A substantial temporary or periodic increase in ambient noise levels in the project vicinity above levels existing without the project?
- e) For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project expose people residing or working in the project area to excessive noise levels?
- f) For a project within the vicinity of a private airstrip, would the project expose people residing or working in the project area to excessive noise levels?

No Substantial Change from Previous Analysis. No noise impacts were identified during the Final EIR evaluation. The changes in traffic mitigations would not include additional construction or development. Construction related noise would be eliminated at these locations. The removal of traffic mitigation would not generate additional long-term noise. There would be no substantial change to the findings in the EIR.

13. Population and Housing

Would the project:

- a) Induce substantial population growth in an area, either directly (for example, by proposing new homes and businesses) or indirectly (for example, through extension of roads or other infrastructure)?
- b) Displace substantial numbers of existing housing, necessitating the construction of replacement housing elsewhere?
- c) Displace substantial numbers of people, necessitating the construction of replacement housing elsewhere?

No Substantial Change from Previous Analysis. The changes in traffic mitigations would not include additional construction or development. It would not result in the inducement of substantial unplanned growth or displacement of housing or people. Hence, there would be no additional impacts to population and housing and no substantial change to the findings in the Final EIR.

14. Public Services

Would the project:

- a) Would the project result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times or other performance objectives for any of the public services:
 - i. Fire protection?
 - ii. Police protection?
 - iii. Schools?
 - iv. Parks?
 - v. Other public facilities?

No Substantial Change from Previous Analysis. The proposed project changes would not result in any additional adverse impacts to public services. The removal of the traffic mitigation measures would not increase demand for public services, would not require expansion or other alteration of existing public facilities. There would be no substantial change to the findings in the Final EIR.

15. Recreation

Would the project:

- a) Would the project increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated?
- b) Does the project include recreational facilities or require the construction or expansion of recreational facilities which might have an adverse physical effect on the environment?

No Substantial Change from Previous Analysis. The removal of the traffic mitigation measures would not increase demand for recreational facilities and would not require expansion or other alteration of existing facilities. The proposed project changes would not result in any additional adverse impacts to recreational resources. There would be no substantial change to the findings in the Final EIR.

16. Transportation and Traffic

Would the project:

- a) Conflict with an applicable plan, ordinance or policy establishing measures of effectiveness for the performance of the circulation system, taking into account all modes of transportation including mass transit and non-motorized travel and relevant components of the circulation system, including but not limited to intersections, streets, highways and freeways, pedestrian and bicycle paths, and mass transit?
- b) Conflict with an applicable congestion management program, including, but not limited to level of service standards and travel demand measures, or other standards established by the county congestion management agency for designated roads or highways?
- c) Result in a change in air traffic patterns, including either an increase in traffic levels or a change in location that results in substantial safety risks?
- d) Substantially increase hazards due to a design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment)?
- e) Result in inadequate emergency access?
- f) Conflict with adopted policies, plans or programs regarding public transit, bicycle, or pedestrian facilities, or otherwise decrease the performance or safety of such facilities?

Substantial Change from Previous Analysis.

The following traffic analysis was prepared to validate the removal of the seven intersection improvements and one ramp identified as mitigations in the Orange County Great Park Final EIR.

16.1 Introduction

The Orange County Great Park Environmental Impact Report (EIR) certified on May 27, 2003 identified a list of traffic mitigations to address the traffic and transportation impacts resulting from the proposed reuse of the Marine Corps Air Station (MCAS) El Toro.

On June 10, 2003, the City Council adopted the North Irvine Transportation Mitigation (NITM) Program to establish a funding program to implement the traffic and transportation improvements in connections with land use entitlements for the following future development areas: PA 1 and 2, Northern Sphere, Spectrum 8/PA 40 and the Great Park properties.

In 2007, the NITM Five Year Review was initiated for the purpose of updating cost allocations, proposing alternative mitigation measures, or eliminating specific traffic and/or transportation improvements that are no longer necessary. The recommendations from the NITM Five Year Review include deletion of seven intersection improvements and one ramp improvement, locations for which mitigation measures were previously identified in the Orange County Great Park EIR, from the NITM program.

This traffic and transportation analysis has been conducted to verify that the deletion of the NITM improvements at the following locations does not create an adverse impact on the circulation system and that improvements at these locations can be deleted from the list of mitigation identified in the Orange County Great Park EIR:

- #341 Alton Parkway/Barranca Parkway
- #385 Lake Forest Drive/Irvine Center Drive
- #389 Ridge Route Drive/Moulton Parkway
- #391 Santa Maria Drive/Moulton Parkway
- #421 Los Alisos Boulevard/Trabuco Road
- #427 Moulton Parkway/Glenwood Drive/Indian Creek Lane
- #429 Moulton Parkway/Laguna Hills Drive
- #18 SR-241 at Lake Forest Drive (southbound off-ramp)

16.2 Analysis Methodology

The NITM Five Year Review was conducted utilizing Irvine Transportation Analysis Model (ITAM) Version 7.3 and did not include projects under review at that time such as the Planning Area 40 General Plan Amendment/Zone Change and the Lake Forest Vacant Land Opportunities Studies. This traffic study was conducted through the application of the Irvine Transportation Analysis Model (ITAM) Version 8.4-10 released on April 13, 2010. The study analyzed three horizon years: 2015, 2030 and Post-2030. The land uses include projects approved through February 4, 2010.

16.2.1 Performance Criteria

Intersection capacity utilization (ICU) analyses were prepared to evaluate the need for improvements at the seven intersections identified. Volume to capacity (V/C) ratio analysis was prepared to evaluate the operations of the ramp location. The level of service is based on peak hour intersection capacity utilization (ICU) and V/C values. The following criteria were applied to determine the need for these improvements:

- Level of Service C or better at fully funded NITM locations;
- Level of Service C or better for NITM locations within the City of Irvine; and
- Level of Service D or better for fair share funded NITM improvements.

- Traffic Analysis Summary

16.3 Year 2015 Analysis

16.3.1 Year 2015 Land Use

Year 2015 land use assumptions are presented in Table 5-1. Detailed land use assumptions are included in Appendix A.

Table 5-1: Project Area Year 2015 Land Use

ITAM Land Use Description	Unit	Land Use Quantity
		2015

16.3.2 Year 2015 Analysis

Table 5-2 presents the peak hour intersection performance of the seven intersections under Year 2015 conditions. The intersection assumptions at these intersections do not include NITM improvements. As no Great Park Final EIR mitigation is required under 2015 conditions, Table 5-2 presents the operations without

assuming any Great Park mitigation at these locations and reveals that the intersections operate at an acceptable level of service. The Year 2015 ICU worksheets are included in Appendix B. Table 5-3 presents the 2015 peak hour ramp performance and indicates that the ramp operates at acceptable conditions. As no mitigation was specified for this ramp in the EIR, no analysis that incorporates EIR mitigation is warranted.

16.4.2 Year 2030 Intersection Analysis

Table 5-5 presents the peak hour intersection performance of the seven intersections under Year 2030 conditions. The intersection assumptions at these intersections do not include NITM improvements. Operating conditions with and without the Great Park mitigation measures are presented, where mitigation was identified in the EIR as required in the Year 2025. All locations are shown to operate at an acceptable level of service. The Year 2030 ICU worksheets are included in Appendix B. Table 5-6 presents the 2030 peak hour ramp performance and indicates that the ramp operates at acceptable conditions. As no mitigation was specified for this ramp in the EIR, no analysis that incorporates EIR mitigation is warranted.

16.5.2 Post-2030 Intersection Analysis

Table 5-8 presents the peak hour intersection performance of the seven intersections under Post-2030 conditions. The intersection assumptions at these intersections do not include NITM improvements. Operating conditions with and without the Great Park mitigation measures are presented and both conditions are shown to operate at acceptable levels of service for each intersection. The Post-2030 ICU worksheets are included in Appendix B. Table 5-9 presents the Post-2030 peak hour ramp performance and indicates that the ramp operates at acceptable conditions. As no mitigation was specified for this ramp in the EIR, no analysis with incorporates EIR mitigation is warranted.

16.6 Traffic Analysis Summary

Based on the results presented in Table 5-8, the traffic analyses conducted for three horizon years reveal mitigation previously identified in the Orange County Great Park EIR for these seven intersections is no longer required. Since the Great Park intersection mitigation measures are no longer required to satisfy future level of service thresholds, no improvements above and beyond baseline conditions are warranted. Based on the results presented in Table 5-9, the SR-241 at Lake Forest Drive southbound off-ramp is forecast to operate at acceptable levels of service, therefore it should not be classified as a significant impact and future fair share contributions as a result of this prior impact are no longer required.

The removal of the improvements described in this Addendum at the specified locations would not result in any adverse impacts to Traffic and Transportation within the Great Park study area.

17. Utilities and Service Systems

Would the project:

- a) Exceed wastewater treatment requirements of the applicable Regional Water Quality Control Board?
- b) Require or result in the construction of new water or wastewater treatment facilities or expansion of existing facilities, the construction of which could cause significant environmental effects?
- c) Require or result in the construction of new storm water drainage facilities or expansion of existing facilities, the construction of which could cause significant environmental effects?
- d) Have sufficient water supplies available to serve the project from existing entitlements and resources, or are new or expanded entitlements needed?
- e) Result in a determination by the wastewater treatment provider which serves or may serve the project that it has adequate capacity to serve the project's projected demand in addition to the provider's existing commitments?
- f) Be served by a landfill with sufficient permitted capacity to accommodate the project's solid waste disposal needs?
- g) Comply with federal, state, and local statutes and regulations related to solid waste?

No Substantial Change from Previous Analysis. The removal of the traffic mitigation measures would not increase demand for utility services and would not require expansion or other alteration of existing utilities and service systems. There would be no substantial change to the findings in the Final EIR.

18. Mandatory Findings of Significance

- a) Does the project have the potential to degrade the quality of the environment, substantially reduce the habitat of a fish or wildlife species, cause a fish or wildlife population to drop below self-sustaining levels, threaten to eliminate a plant or animal community, substantially reduce the number or restrict the range of a rare or endangered plant or animal or eliminate important examples of the major periods of California history or prehistory?
- b) Does the project have impacts that are individually limited, but cumulatively considerable? ("Cumulatively considerable" means that the incremental effects of a project are considerable when viewed in connection with the effects of past projects, the effects of other current projects, and the effects of probable future projects)?
- c) Does the project have environmental effects which will cause substantial adverse effects on human beings, either directly or indirectly?

No Substantial Change from Previous Analysis. Removal of the traffic mitigation measures at the seven intersections would not degrade the quality of the environment or affect fish, wildlife, or plant species. The proposed changes to the Final EIR would not cause cumulatively considerable impacts or environmental effects that would cause substantial adverse effects on human beings. Therefore, there would be no substantial change to the findings in the Final EIR.

6.0 CONCLUSION

This Addendum has been prepared to remove traffic improvements at seven intersections (Alton Parkway/Barranca Parkway, Lake Forest Drive/Irvine Center Drive, Ridge Route Drive/Moulton Parkway, Santa Maria Drive/Moulton Parkway, Los Alisos Boulevard/Trabuco Road, Moulton Parkway/Glenwood Drive-Indian Creek Lane, and Moulton Parkway/Laguna Hills Drive) from the list of traffic mitigation measures in the Orange County Great Park Final EIR. In addition, the notation of a significant impact for one ramp (SR-241 at Lake Forest Drive) will be removed and therefore there will be no responsibility to participate in fair share contributions towards study area circulation improvements for this prior ramp impact. In determining that an addendum to the Orange County Great Park Final EIR is required, the City has concluded that none of the conditions described in Section 15162 calling for preparation of a subsequent environmental document have occurred. No new significant environmental effects would occur, nor would the severity of impacts previously identified in the Orange County Great Park Final EIR substantially increase. Further, no new information of substantial importance, which was not known at the time the Final EIR was certified, has been noted. This does not represent a substantive change to the Orange County Great Park Final EIR. Therefore, this Addendum to the Final EIR is consistent with Sections 15162 and 15164 of the CEQA Guidelines. Per Section 15164(c) of CEQA Guidelines, this Addendum will not be circulated for public review, but will be attached to the Final EIR.

1. EIR Addendum Summary

1.1 PURPOSE AND SCOPE

This Initial Study/Addendum provides the basis for augmenting the previously certified Final Environmental Impact Report (State Clearinghouse Number 2002101020) for the Orange County Great Park (OCGP) and serves as the California Environmental Quality Act (CEQA) documentation for the:

- Park Design Review and Approval of the “Western Sector Park Development Plan” (00522145-PPD)
- Minor Modification to OCGP Master Plan (00524784-PMP)
- Adoption of this Addendum No. 8

The requested modification and park design review does not propose any changes to approved and environmentally-reviewed development intensities within the OCGP Master Plan area. This Addendum has been prepared pursuant to the provisions of CEQA (Public Resources Code Sections 21000 et seq.), the State CEQA Guidelines, and the City of Irvine Local Guidelines for Implementing CEQA (Local CEQA Guidelines).

1.2 ENVIRONMENTAL PROCEDURES

Pursuant to CEQA, the State CEQA Guidelines, and the Local CEQA Guidelines, this Initial Study/Addendum focuses on the proposed minor modification to the OCGP Master Plan, and on the Park Design Review for the “Western Sector Park Development Plan” (Project) to determine if the Project would cause a change in the environmental impact conclusions of the Orange County Great Park Final Environmental Impact Report (OCGP FEIR), and if any change in circumstances or new information that would substantially change the conclusions of the OCGP FEIR.

Pursuant to Section 21166 of CEQA and Section 15162 of the State CEQA Guidelines, when an EIR has been certified or a negative declaration adopted for a project, no subsequent EIR shall be prepared for the project unless the lead agency determines, on the basis of substantial evidence, that one or more of the following conditions are met:

- (1) Substantial changes are proposed in the project that will require major revisions of the previous EIR due to the involvement of new significant environmental effects or a substantial increase in the severity of previously identified significant effects;*
- (2) Substantial changes occur with respect to the circumstances under which the project is undertaken that will require major revisions of the previous EIR due to the involvement of new significant environmental effects or a substantial increase in the severity of previously identified significant effects; or*

1. EIR Addendum Summary

- (3) *New information of substantial importance, which was not known and could not have been known with the exercise of reasonable diligence at the time the previous EIR was certified as complete, suggests any of the following:*
- a) *The project would have one or more significant effects not discussed in the previous EIR or negative declaration.*
 - b) *Significant effects previously examined would be substantially more severe than identified in the previous EIR.*
 - c) *Mitigation measures or alternatives previously found not to be feasible would in fact be feasible, and would substantially reduce one or more significant effects of the project, but the project proponent declines to adopt the mitigation measures or alternatives.*
 - d) *Mitigation measures or alternatives that are considerably different from those analyzed in the previous EIR would substantially reduce one or more significant effects on the environment, but the project proponent declines to adopt the mitigation measures or alternatives.*

Section 15164 of the State CEQA Guidelines states that an Addendum to an EIR shall be prepared “if some changes or additions are necessary, but none of the conditions described in Section 15162 calling for preparation of a subsequent EIR has occurred.” This Initial Study/Addendum reviews the changes proposed by the Project and any changes to the existing conditions that have occurred since the OCGP FEIR was last augmented by the Heritage Fields SEIR. It also reviews any new information of substantial importance that was not known and could not have been known with exercise of reasonable diligence at the time that the OCGP FEIR was certified. It further examines whether, as a result of any changes or any new information, a subsequent or supplemental EIR may be required. This examination includes an analysis of the provisions of Section 21166 of CEQA and Section 15162 of the State CEQA Guidelines and their applicability to the proposed Project. This Initial Study/Addendum relies on the attached Environmental Analysis, which addresses environmental checklist issues on a section-by-section basis.

The City of Irvine Environmental Checklist Form has been completed by the City and included in Section 3, *Environmental Checklist*. The Environmental Checklist Form is marked with the findings of the Community Development Director as to the environmental effects of the proposed Project in comparison with the findings of the OCGP FEIR. The checklist has been prepared pursuant to Section 15168(c)(4) of CEQA, which states that “where the subsequent activities involve site specific operations, the agency should use a written checklist or similar device to document the evaluation of the site and the activity to determine whether the environmental effects of the operation were covered in the program EIR.”

Using that approach, the City of Irvine, the Lead Agency, determined that an Addendum to the previously approved OCGP FEIR is the appropriate environmental clearance for the Project.

1.3 PREVIOUS ENVIRONMENTAL DOCUMENTATION

The OCGP FEIR was certified by the City of Irvine in May 2003. The project analyzed in the OCGP Program EIR consisted of the following actions: 1) Annexation, General Plan Amendment, Pre-Zoning

1. EIR Addendum Summary

(prior to annexation), and Zoning of the unincorporated portion of Planning Area 51; 2) Annexation of the unincorporated portion of Planning Area 35 (Irvine Ranch Water District Parcel); 3) General Plan Amendment and Zone Change for Planning Area 30; and 4) Approval of the form of a Development Agreement vesting approval of overlay uses and intensities in consideration for dedication of land for public purposes and for developing and funding certain infrastructure improvements and maintenance of the public uses by the purchaser/developer and subsequent landowners and funding for specific park, roadways, and other circulation facilities and infrastructure. Together, these actions establish the policy and legislative structure to guide the development of the former MCAS El Toro property.

The OCGP FEIR mitigation measures are provided in the adopted Mitigation Monitoring and Reporting Program included in Appendix A. The table includes:

- Mitigation Measure number and a description of the action;
- Timing for implementation;
- Approving authority and reviewing agency(s), if any; and
- Method of compliance

Addendum No. 1, approved by the City on May 18, 2006, augmented the OCGP FEIR to address the potential for environmental issues associated with the implementation of the OCGP Redevelopment Project Area Plan.

Addendum No. 2 was approved by the City Council on October 24, 2006. It analyzed the potential for environmental issues associated with adjustments to the boundary between the public and private areas of the OCGP; revisions to Zoning Code text and figures related to Planning Areas 30 and 51; the creation of a mixed-use zoning category called the Lifelong Learning District (LLD) within Planning Area 51; and technical changes to the General Plan, as described in Section 2.3 of the Addendum No. 2.

Addendum No. 3, approved by the City Planning Commission on May 17, 2007, addressed the potential for environmental issues associated with a proposal for approval of Vesting Tentative Tract Map No. 17008 (Master Subdivision Map).

Addendum No. 4 was approved by the City Planning Commission on August 2, 2007. It analyzed the development of the Orange County Great Park (Great Park Master Plan), which provides a conceptual design for the future buildout of the 1,145-acre park with passive and active features.

Addendum No. 5, approved by City Council on July 22, 2008, analyzed changes to figures in the General Plan to reflect the Bake Parkway/Marine Way intersection relocation and the Rockfield Boulevard reconfiguration in the southern portion of Planning Area 30; and amendments to the Orange County Transportation Authority's Master Plan of Arterial Highways; the City-Heritage Fields Development Agreement; and related changes to the City's General Plan and Zoning Ordinance.

Addendum No. 6 was approved by the Planning Commission on October 16, 2008 and analyzed the potential for environmental issues associated with requested entitlements: amended Vesting Tentative Tract Map No. 17008, Vesting Tentative Tract Map No. 17283, Modification to OCGP Streetscape Design

1. EIR Addendum Summary

Guidelines, Master Landscape and Trails Plan, and Master Plan for Non-Residential Development within the Lifelong Learning District.

Addendum No. 7 to the 2003 OCGP EIR, approved by the City of Irvine on June 29, 2010, was prepared in connection with revisions to the North Irvine Transportation Mitigation (“NITM”) Program. The update removed planned traffic improvements at seven intersections from the list of traffic mitigation measures in the OCGP FEIR.

The OCGP FEIR, as augmented by Addenda 1 through 7 (collectively, Addenda) and all of the associated technical documents, reports and analyses are on file and can be reviewed at the City of Irvine, Community Development Department, at One Civic Center Plaza, Irvine, California 92623.

1.4 ENVIRONMENTAL SETTING

The Orange County Great Park (which is found within City of Irvine Planning Areas 30 and 51) is located in the central portion of Orange County, approximately 45 miles southeast of Los Angeles. The project area is generally bounded by the Woodbury residential development to the west, future Portola Springs residential development to the north (under construction), Irvine Spectrum to the south, and the City of Lake Forest to the east. Other nearby local jurisdictions include the Cities of Laguna Hills, Laguna Niguel, Laguna Woods, Mission Viejo, Aliso Viejo, and Tustin.

The Irvine Station, a major multimodal transit center linking Orange County Transportation Authority (OCTA) bus, Metrolink commuter rail, and Amtrak rail services, is adjacent to the Southern California Regional Rail Authority (SCRRA) Metrolink tracks, which bisect the project area and separate Planning Areas 30 and 51. The existing facilities and uses within the project site include recreational vehicle storage and agricultural and nursery operations. The OCGP FEIR also describes interim activities that might occur on the site, including short-term use of the land or existing buildings on-site. Currently, there are offices on site occupied by the Great Park Corporation (GPC). Other tenants include Second Harvest Food Bank, Families Forward, Legacy, Orange County Great Park Balloon Preview Park, and Tierra Verde Industries.

2. Project Description

2.1 PROJECT LOCATION

The Orange County Great Park (OCGP), located within City of Irvine Planning Areas 30 and 51, is northeast of the freeway junction at Interstate 5 (I-5) and Interstate 405 (I-405), within the City of Irvine. The proposed minor modification to the OCGP Master Plan and Park Design Review actions (Project) are focused on the Western Sector Park Development Plan area, which is located at the southwestern corner of the OCGP, bordered on the north by the property owned by Heritage Fields El Toro, LLC; on the south by Marine Way; and to the west by “O” Street. Figure 2-1 depicts the Project location in a regional context and Figure 2-2 shows its local context.

Major roadways bordering the Project are Sand Canyon Avenue to the northwest, Portola Parkway and Irvine Boulevard to the north, and Bake Parkway to the southeast. An aerial photograph of the Project site and surrounding area is shown on Figure 2-3. The Irvine Station is adjacent to the SCRRRA Metrolink tracks, which traverse the site and separate Planning Areas 30 and 51. Surrounding the site are residential and nonresidential uses under construction to the north and west, open space to the northeast, and nonresidential and mixed land uses to the east and southeast within the City of Lake Forest and City of Irvine.

2.2 PROJECT CHARACTERISTICS

2.2.1 Project Background

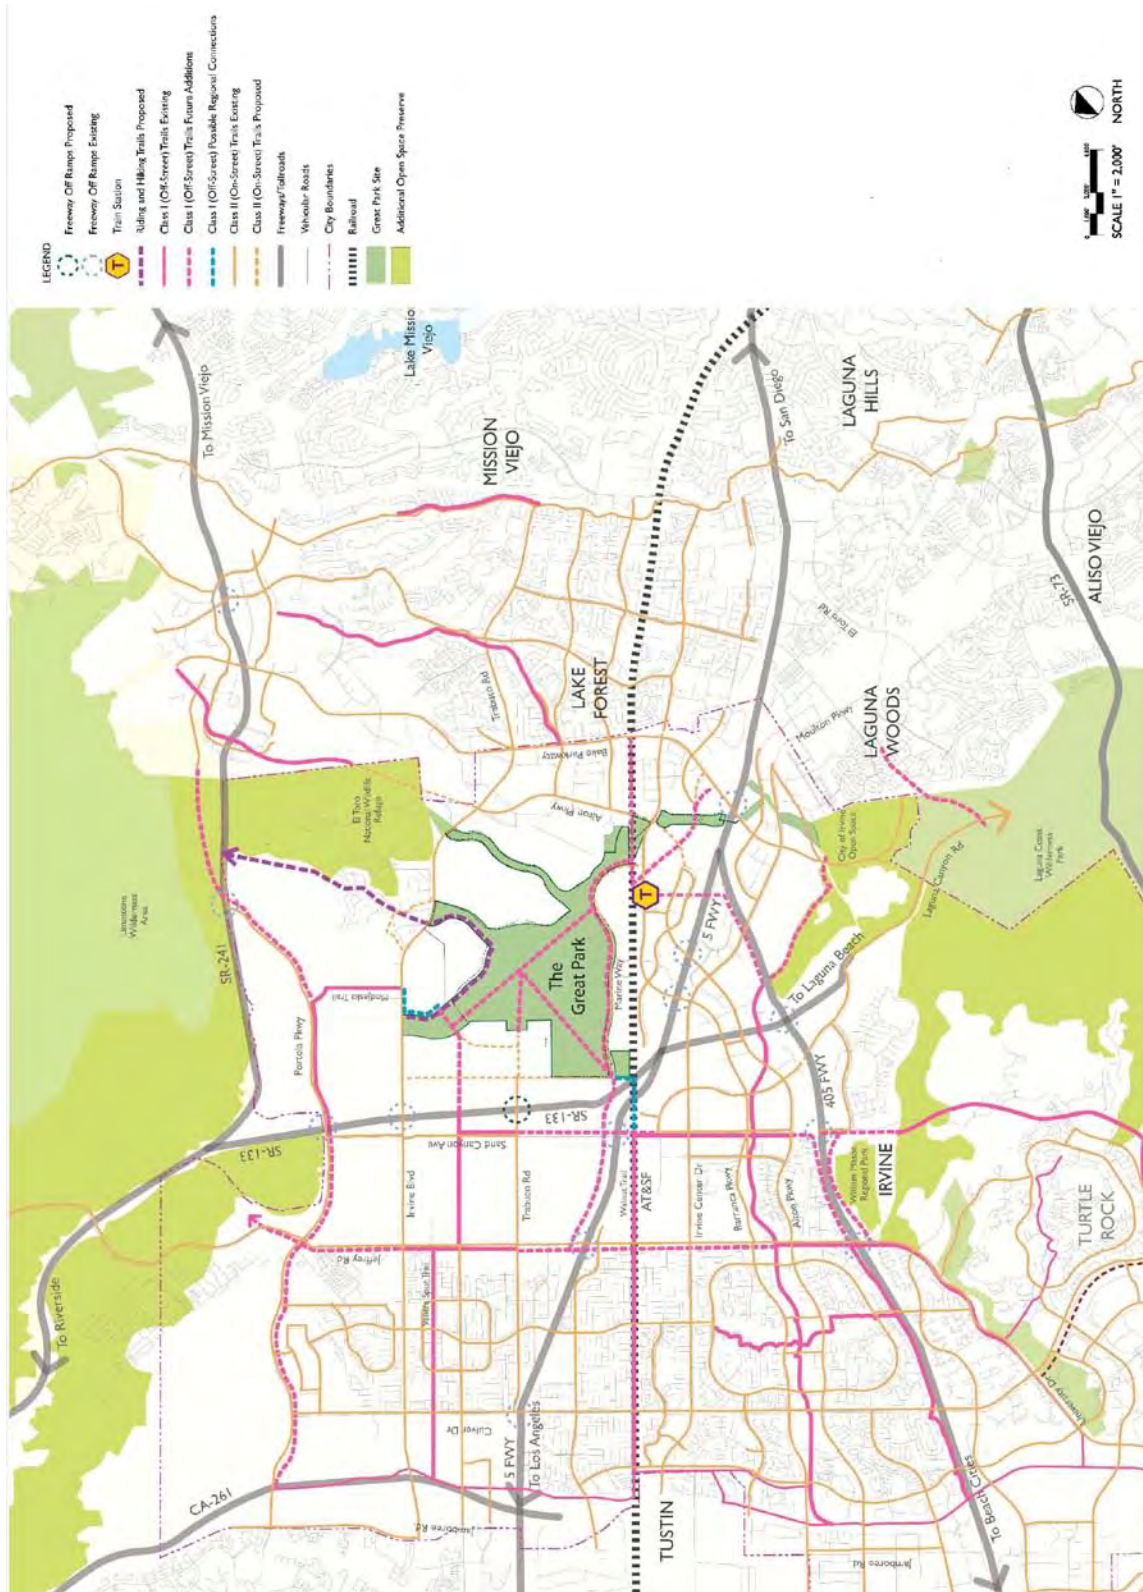

On May 27, 2003, the City Council certified a Final Environmental Impact Report (OCGP FEIR) and adopted a general plan amendment (GPA) and zone change (ZC) to implement the development of the OCGP. To develop at the maximum intensities allowed in the Overlay Plan shown in the General Plan and Zoning Code, the land use entitlements required that the property owner enter into a development agreement with the City, which required, among other things, the dedication of land and the development or funding of certain infrastructure improvements.

In July 2005, Heritage Fields LLC, the predecessor of Heritage Fields, purchased all four bid parcels through a US Department of Navy/General Services Agency online auction process. Subsequent to the land purchase, the Orange County Great Park Corporation (GPC) and Heritage Fields initiated their respective master design and development processes. To facilitate additional design options, both the GPC and Heritage Fields requested and the City initiated an amendment to the General Plan and the Zoning Code to reconfigure the property boundaries between the two entities. Heritage Fields requested the creation of a new mixed-use zoning district called the 8.1/8.1A Lifelong Learning District. Heritage Fields also proposed clarifications to the zoning text within Planning Areas 30 and 51. These revisions were analyzed in Addendum No. 2 dated September 2006, and were approved as the “Revised Overlay Plan” (Overlay Plan) by the City Council on October 24, 2006.

2. Project Description

Figure 2-1
Regional Location

Figure 2-2
Local Vicinity Map

2. Project Description

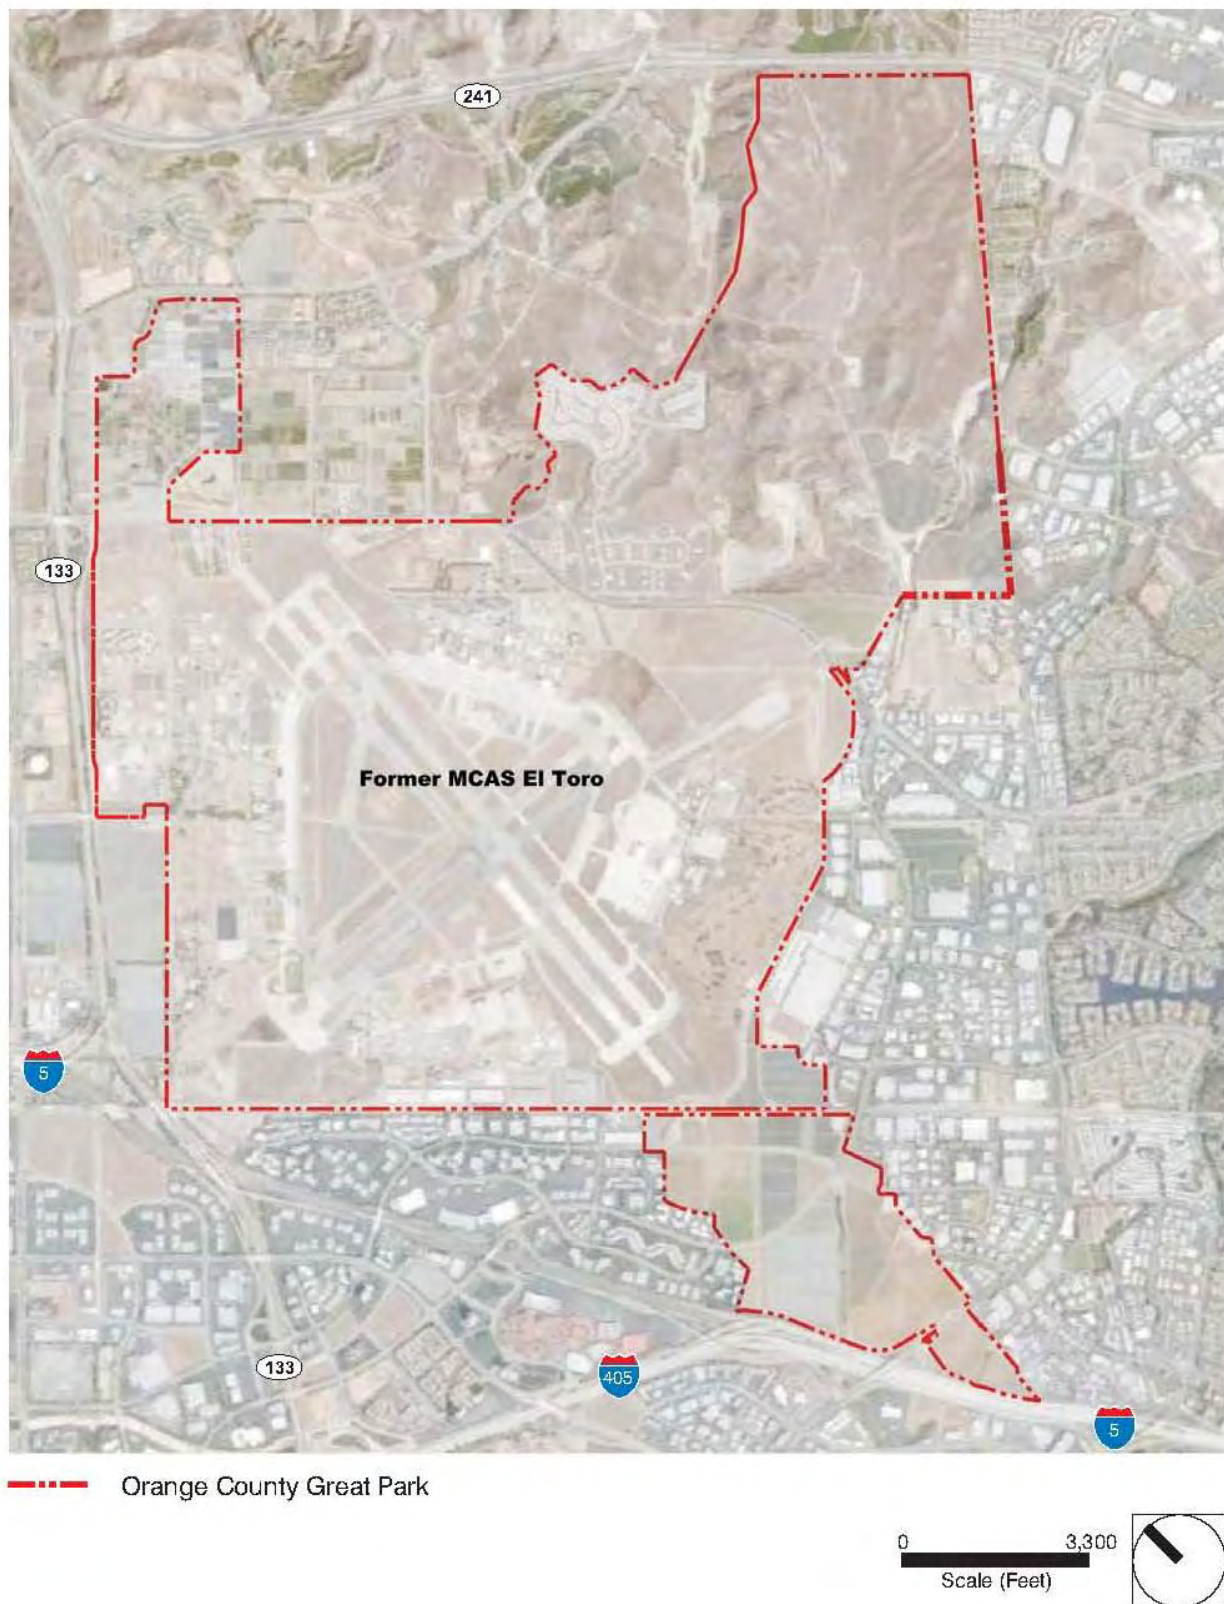

Figure 2-3
Aerial Photograph

On June 28, 2006 Heritage Fields filed an application for approval of Vesting Tentative Tract Map No. 17008 (Master Subdivision Map). The Master Subdivision Map was approved by the Planning Commission on May 17, 2007. CEQA compliance for the Master Subdivision Map was accomplished via Addendum No. 3 approved on May 17, 2007.

In 2007, the GPC sought approval of a conceptual master plan for the development of the Orange County Great Park (Great Park Master Plan). The Great Park Master Plan was approved by the Planning Commission on August 2, 2007. The CEQA compliance for the Great Park Master Plan was established via Addendum No. 4 dated July 2007 and approved on August 2, 2007.

During preliminary consideration of the conceptual design of Marine Way, the California Department of Transportation (Caltrans) expressed concerns regarding the location of Marine Way and its relationship to the Bake Parkway freeway on-ramp. It was recognized that the revised alignment required an amendment to the General Plan, the zoning code, and the Orange County Transportation Authority's Master Plan of Arterial Highways. Addendum No. 5 provided that CEQA review and compliance for those entitlement actions. Addendum No. 5 also examined the amendments to the City-Heritage Fields Development Agreement and related changes to the City's General Plan and Zoning Ordinance. Addendum No. 5 was approved on July 22, 2008.

In 2008, Addendum No. 6 was prepared analyzing the potential environmental issues associated with the following requested entitlements: amended Vesting Tentative Tract Map (VTTM) No. 17008; VTTM No. 17283; Modification to OCGP Streetscape Design Guidelines; Master Landscape and Trails Plan (MLTP); and Master Plan for Non-Residential Development within the Lifelong Learning District. Addendum No. 6 was approved on October 16, 2008 by the Planning Commission.

In 2010, Addendum No. 7 was prepared in connection with revisions to the North Irvine Transportation Mitigation (NITM) Program, which removed planned traffic improvements at seven intersections from the list of traffic mitigation measures in the OCGP FEIR. Addendum No. 7 also removed the finding of a significant impact (and associated mitigation obligations) at one ramp (SR-241 at Lake Forest Drive). Addendum No. 7 was approved on June 29, 2010.

In 2011, Heritage Fields sought from the City a series of general plan amendments, zone changes, subdivision map approvals, and other entitlements associated with the private development of a portion of the Heritage Fields-owned property within Planning Areas 30 and 51 ("Modified Project"). A Supplement to the OCGP FEIR (SEIR) was prepared in connection with those entitlement applications. The SEIR was approved and certified by the Irvine City Council on August 30, 2011. The cumulative development assumptions utilized in the SEIR include the Project under analysis in this Addendum.

2.2.2 Project Components

This Addendum (Addendum No. 8) addresses the potential for environmental impacts associated with the requested Orange County Great Park Master Plan Minor Modification and the Park Design Review associated with the implementation of the "Western Sector Park Development Plan". The project components include the following requested actions:

2. Project Description

Minor Modification to OCGP Master Plan

The OCGP Master Plan covers approximately 1,145.3 acres at the former El Toro Marine Corps Air Station. The minor modification portion of the Project consists mainly of changes to the proposed buildings within the Western Sector Park Development Plan site. Buildings that are no longer part of the OCGP Master Plan include the previously proposed Air Museum and the Concessions / Retail at the Sports Park. Those buildings have been replaced by the proposed Artist in Residency Facility, the proposed Community Ice Facility, and the proposed Nature Education Garden. In addition, Hangar 244 replaces the existing Air Museum Hangar. The overall square footage of the buildings within the OCGP Master Plan remains the same since the size of the three Civic / Museums within the OCGP Master Plan have been reduced to accommodate the additional square footages of the new buildings within the Western Sector Park Development Plan (see Table 2-1 and Figure 2-4).

Table 2-1. Proposed Building Area Modifications

Buildings	Approved Master Plan – 2007 (SF)	Master Plan MINOR Modification – 2011 (SF)
Field House	26,000	26,000
Main Maintenance	37,500	37,500
Botanic Garden Maintenance	7,200	7,200
Upper Canyon Maintenance	7,200	7,200
Pump House	4,400	4,400
Library	39,000	39,000
Botanic Garden Building	13,900	13,900
Tea House	800	800
Air Museum (Proposed)	60,000	0
Concessions / Retail at Sports Park (Existing)	13,060	0
Civic / Museum 1	81,000	60,000
Civic / Museum 2	108,400	82,000
Civic / Museum 3	85,000	52,695
Artist in Residence Facility*	0	12,800
Hangar 244 (Replaces Existing Air Museum Hangar)*	10,540	10,370
Community Ice Facility*	0	117,635
Nature Education Center (Existing)*	0	22,500
TOTAL	494,000	494,000
* Occurs within the Western Sector Park Development Plan Area		

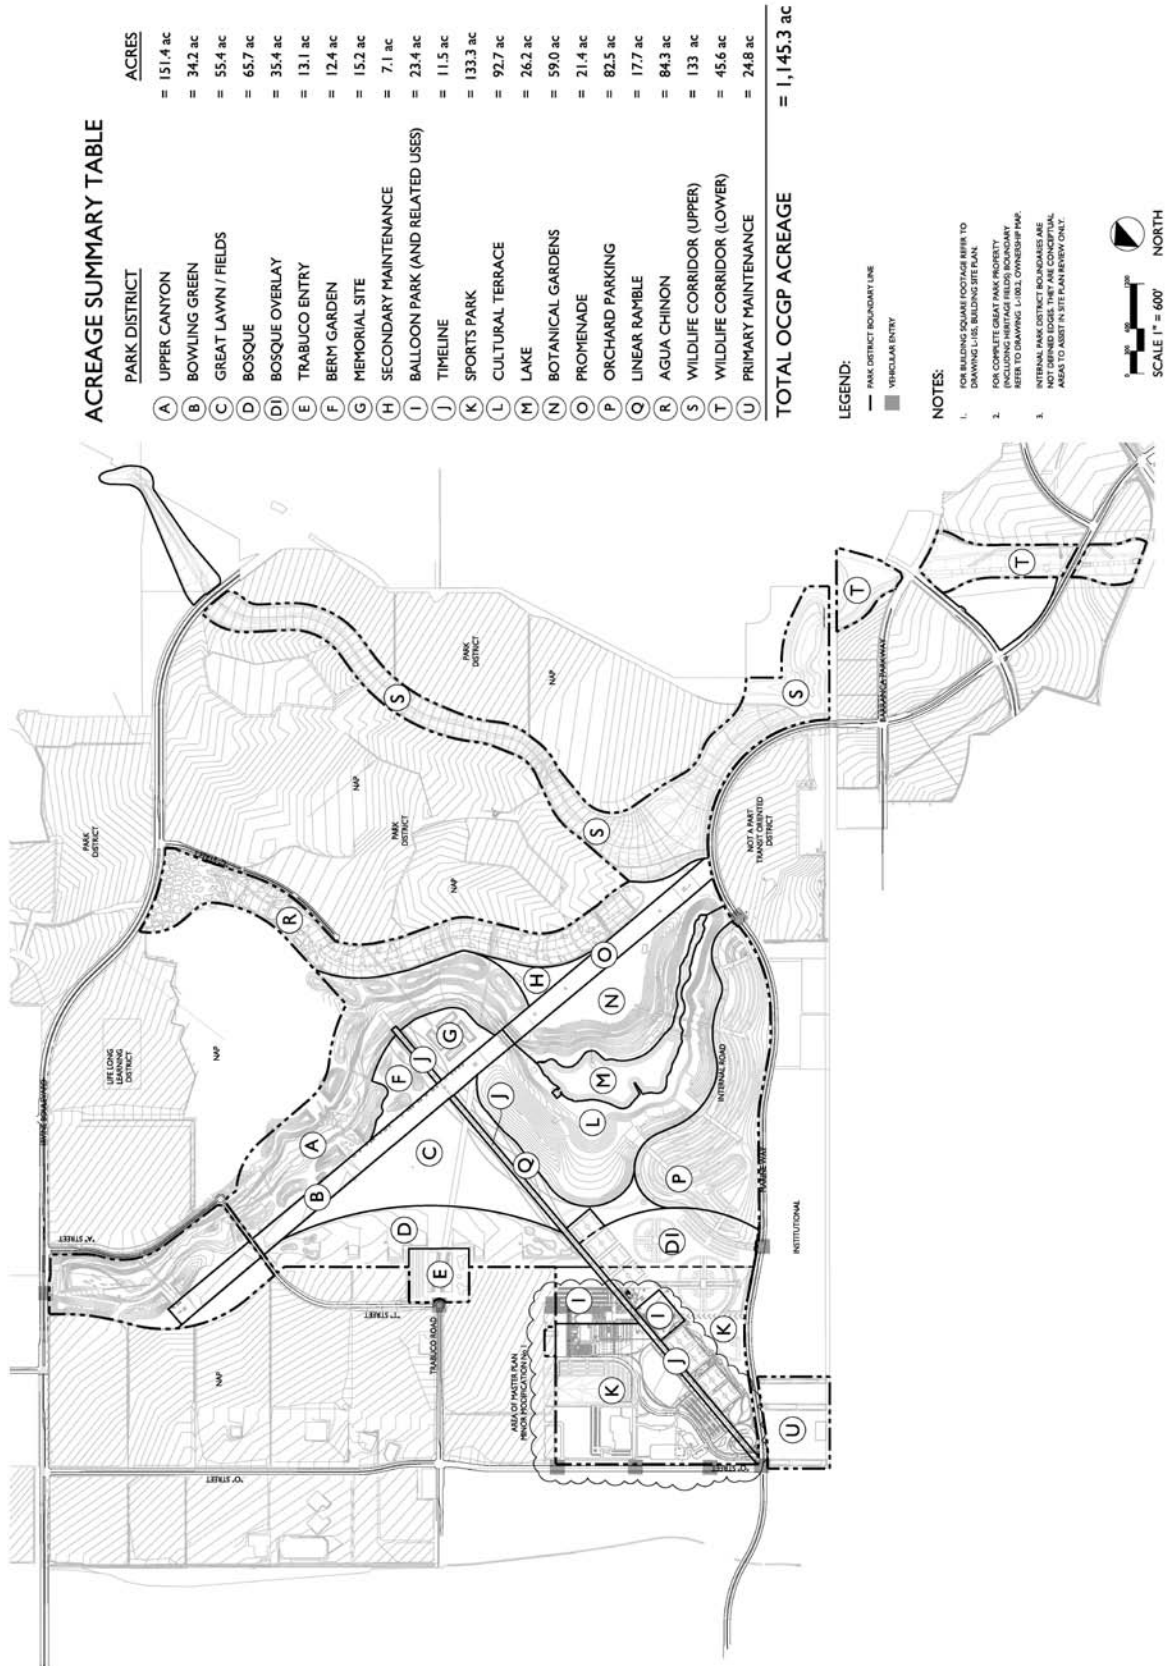

Figure 2-4
Great Park Master Plan Minor Modification

2. Project Description

Park Design Review for the “Western Sector Park Development Plan”

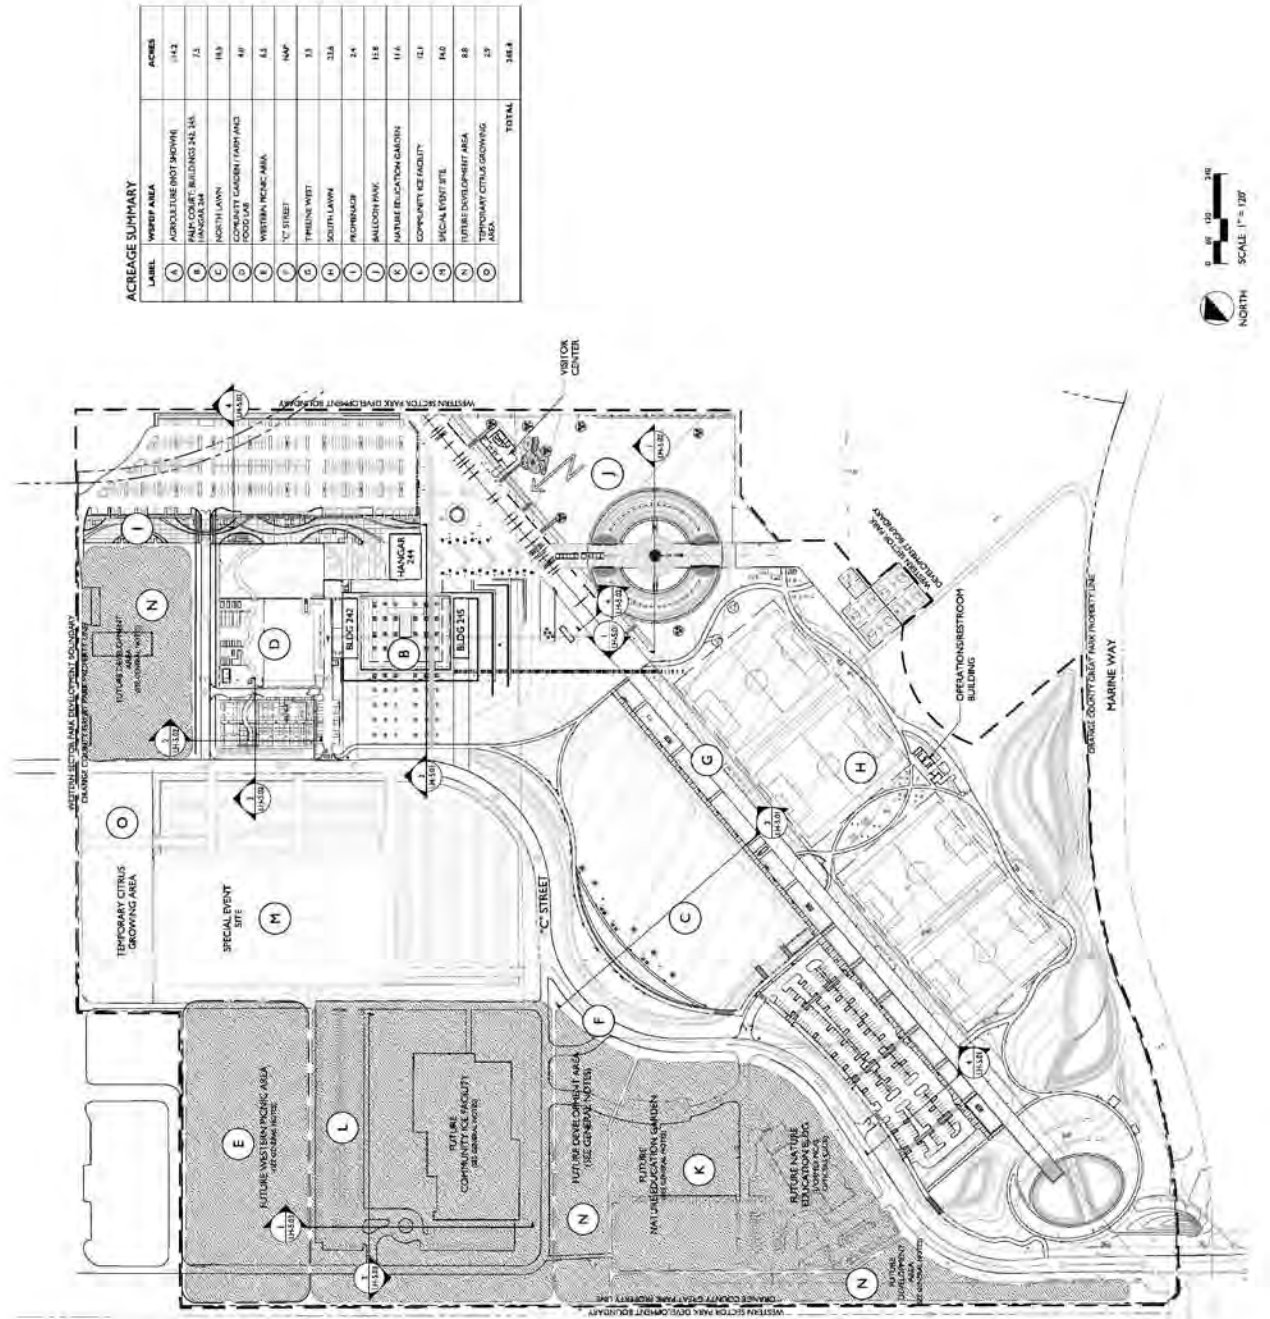

The Park Design for the Western Sector Park Development Plan area consists of approximately 245 acres and is located in the southwestern portion of the OCGP Master Plan. The Western Sector Park Development Plan site is bordered on the north by property owned by Heritage Fields El Toro, LLC; on the south by Marine Way; and to the west by future “O” Street. Similar to the approved OCGP Master Plan from 2007, the Park Design for the Western Sector Park Development Plan contains a Sports Park, a Balloon Park (and related uses) and a portion of the Timeline circulation corridor. These uses, in addition to others, are depicted on Figure 2-5.

The majority of the Western Sector Park Development Plan site is devoted to the Sports Park, which will also include the North and South Lawns. The program of the Sports Park consists of 12 soccer fields with an outdoor stadium; 4 little league baseball fields; 5 softball fields; 4 acres of multi-use fields; 12 tennis courts; 2 handball courts; 15 basketball courts; a public skate park; outdoor eating area; palm parade outdoor area; passive recreational area; picnic groves with tables; youth and children's play areas; outdoor chess; rock climbing; and a community garden. Buildings within the Sports Park include a 26,000 square foot Field House that may include a gymnasium, sports park office, equipment storage, and similar recreation-related uses; an “Artist in Residence” facility; a Community Ice facility with ice rinks; and an existing Nature Education Center. Restrooms, parking, and bicycle/pedestrian trails would also be provided for community use.

A Balloon Park, which features a tethered helium balloon which ascends passengers up to a height of 500 feet, a carousel, a visitor center, shade structures, display space, and other landscape terraforms is located southeast of the timeline. In addition, the existing Hangar 244 will continue to function as a multi-purpose space.

The Timeline Central and Timeline West is a circulation corridor that traverses the site in a southwest-northeast direction. It connects the Balloon Park to the rest of the improved areas and includes bicycle and pedestrian trails.

Other Project components include a special event site that can host festivals as well as corporate events; a community garden / farm and food lab for gardeners to grow produce as well as educate people on food and health; and a promenade for park visitors.

2. Project Description

2.3 DISCRETIONARY APPROVALS

Implementation of the Project includes the following discretionary actions to be undertaken by the City:

- Park Design Review and Approval of the “Western Sector Park Development Plan” (00522145-PPD)
- Approval of Minor Modification to OCGP Master Plan (00524784-PMP)
- Adoption of this Addendum No. 8

The OCGP FEIR lists additional discretionary actions to be taken by the City and other public agencies at or as part of the completion of the project (OCGP FEIR pages 3-29 and 3-30). The actions and responsible public agencies include, but are not necessarily limited to, these approvals:

- Master plans and subdivisions for development (City)
- Community facilities districts or other assessment districts (City)
- Actions to improve interim use activities (City and DoN)
- Transfer of parcels within Planning Area 51 (DoN)
- Clean Water Act section 404 permits (U.S. Army Corps of Engineers)
- Endangered Species Act compliance (U.S. Fish and Wildlife Service)
- Clean Water Act section 401 and National Pollutant Discharge Elimination System (NPDES) permits (Regional Water Quality Control Board)
- California Fish and Game Code 1602 permits (California Department of Fish and Game)
- Revisions to the Orange County Master Plan of Arterial Highways (Orange County Transportation Authority)

The City of Irvine Environmental Information Form and Environmental Checklist Form have been completed by the City and are included on the following pages. The Environmental Checklist Form is marked with the findings of the Community Development Department as to the environmental effects of the proposed changes to the project in comparison with the findings of the certified OCGP FEIR.

As explained above, this comparative analysis has been undertaken, pursuant to the provisions of the California Environmental Quality Act (CEQA), to provide the City with the factual basis for determining whether any changes in the project, any changes in the circumstances, or any new information requires additional environmental review or preparation of a subsequent or supplemental EIR. The basis for each of the findings listed in the attached Environmental Checklist Form in Section 3 is explained in Section 4 of the Addendum.

3. Environmental Checklist

3.1 CITY OF IRVINE INITIAL STUDY AND ENVIRONMENTAL EVALUATION

The City of Irvine Environmental Information Form and Environmental Checklist Form have been completed by the City and are included on the following pages. The Environmental Checklist Form is marked with the findings of the Community Development Department as to the environmental effects of the proposed OCGP Master Plan Minor Modification in comparison with the findings of the certified OCGP FEIR and Addenda.

As explained above, this comparative analysis has been undertaken, pursuant to the provisions of CEQA, to provide the City with the factual basis for determining whether any changes in the project, any changes in the circumstances under which the project is undertaken, or any new information requires additional environmental review or preparation of a subsequent or supplemental EIR. The basis for each of the findings listed in the attached Environmental Checklist Form is explained in Section 4 of the Addendum.

1. Project Title:

Orange County Great Park Master Plan Minor Modification

2. Lead Agency Name and Address:

City of Irvine Community Development Department One Civic Center Plaza Irvine,
California 92623

3. Contact Person and Phone Number:

David R. Law, Senior Planner (949) 724-6314

4. Project Location:

The project area is bordered on the north by the Heritage Fields, LLC property; on the south by Marine Way and to the west by future "O" Street.

5. Project Sponsor's Name and Address:

City of Irvine Community Development One Civic Center Plaza Irvine, California 92623

6. General Plan Designation:

Orange County Great Park (OCGP)

7. Zoning:

1.9 Orange County Great Park

8. Description of Project

See Section 1.6.2, *Project Components*

3. Environmental Checklist

9. Surrounding Land Uses and Setting (Briefly describe the project's surroundings):

The proposed Project area (which consists of City of Irvine Planning Area 51) is located in the central portion of Orange County, approximately 45 miles southeast of Los Angeles. The project area is generally bounded by Irvine Spectrum to the south, the City of Lake Forest to the east, the Woodbury residential community to the west, and the future Portola Springs residential development to the north.

The Project area is bordered on the north by the Heritage Fields, LLC property; on the south by Marine Way and to the west by future "O" Street.

10. Other Public Agencies Whose Approval Is Required (e.g., permits, financing approval, or participation agreement):

N/A

3. *Environmental Checklist*

3.2 ENVIRONMENTAL FACTORS POTENTIALLY AFFECTED

The environmental factors checked below would be potentially affected by this project, involving at least one impact that is a "Potentially Significant Impact" as indicated by the checklist on the following pages.

- | | | |
|---|--|---|
| <input type="checkbox"/> Aesthetics | <input type="checkbox"/> Agricultural Resources | <input type="checkbox"/> Air Quality |
| <input type="checkbox"/> Biological Resources | <input type="checkbox"/> Cultural Resources | <input type="checkbox"/> Geology/Soils |
| <input type="checkbox"/> Greenhouse Gas Emissions | <input type="checkbox"/> Hazards and Hazardous Materials | <input type="checkbox"/> Hydrology/Water Quality |
| <input type="checkbox"/> Land Use/Planning | <input type="checkbox"/> Mineral Resources | <input type="checkbox"/> Noise |
| <input type="checkbox"/> Population/Housing | <input type="checkbox"/> Public Services | <input type="checkbox"/> Recreation |
| <input type="checkbox"/> Transportation/Traffic | <input type="checkbox"/> Utilities/Service Systems | <input type="checkbox"/> Mandatory Findings of Significance |

3.3 DETERMINATION

On the basis of this initial evaluation:

- ☐ I find that the proposed project COULD NOT have a significant effect on the environment, and a NEGATIVE DECLARATION will be prepared.
- ☐ I find that although the proposed project could have a significant effect on the environment, there will not be a significant effect in this case because revisions in the project have been made by or agreed to by the project proponent. A MITIGATED NEGATIVE DECLARATION will be prepared.
- ☐ I find that the proposed project MAY have a significant effect on the environment, and an ENVIRONMENTAL IMPACT REPORT is required.
- ☐ I find that the proposed project MAY have a "potentially significant impact" or "potentially significant unless mitigated" impact on the environment, but at least one effect (1) has been adequately analyzed in an earlier document pursuant to applicable legal standards, and (2) has been addressed by mitigation measures based on the earlier analysis as described on attached sheets. An ENVIRONMENTAL IMPACT REPORT is required, but it must analyze only the effects that remain to be addressed.
- ☒ I find that although the proposed project could have a significant effect on the environment, because all potentially significant effects (a) have been analyzed adequately in an earlier EIR or NEGATIVE DECLARATION pursuant to applicable standards, and (b) have been avoided or mitigated pursuant to that earlier EIR or NEGATIVE DECLARATION, including revisions or mitigation measures that are imposed upon the proposed project, nothing further beyond an Addendum to the earlier EIR is required.

David R. Law, Senior Planner

10/11/11
Date

3. Environmental Checklist

3.4 EVALUATION OF ENVIRONMENTAL IMPACTS

- 1) A brief explanation is required for all answers except “No Impact” answers that are adequately supported by the information sources a lead agency cites in the parentheses following each question. A “No Impact” answer is adequately supported if the referenced information sources show that the impact simply does not apply to projects like the one involved (e.g., the project falls outside a fault rupture zone). A “No Impact” answer should be explained where it is based on project-specific factors as well as general standards (e.g., the project will not expose sensitive receptors to pollutants, based on a project-specific screening analysis).
- 2) All answers must take account of the whole action involved, including off-site as well as on-site, cumulative as well as project-level, indirect as well as direct, and construction as well as operational impacts.
- 3) Once the lead agency has determined that a particular physical impact may occur, the checklist answers must indicate whether the impact is potentially significant, less than significant with mitigation, or less than significant. “Potentially Significant Impact” is appropriate if there is substantial evidence that an effect may be significant. If there are one or more “Potentially Significant Impact” entries when the determination is made, an EIR is required.
- 4) “Negative Declaration: Less Than Significant With Mitigation Incorporated” applies where the incorporation of mitigation measures has reduced an effect from “Potentially Significant Impact” to a “Less Than Significant Impact.” The lead agency must describe the mitigation measures, and briefly explain how they reduce the effect to a less than significant level.
- 5) Earlier analyses may be used where, pursuant to the tiering, program EIR, or other CEQA process, an effect has been adequately analyzed in an earlier EIR or negative declaration. Section 1 5063(c) (3) (D). In this case, a brief discussion should identify the following:
 - a) **Earlier Analysis Used.** Identify and state where they are available for review.
 - b) **Impacts Adequately Addressed.** Identify which effects from the above checklist were within the scope of and adequately analyzed in an earlier document pursuant to applicable legal standards, and state whether such effects were addressed by mitigation measures based on the earlier analysis.
 - c) **Mitigation Measures.** For effects that are “Less Than Significant With Mitigation Incorporated,” describe the mitigation measures that were incorporated or refined from the earlier document and the extent to which they address site-specific conditions for the project.
- 6) Lead agencies are encouraged to incorporate into the checklist references to information sources for potential impacts (e.g., general plans, zoning ordinances). Reference to a previously prepared or outside document should, where appropriate, include a reference to the page or pages where the statement is substantiated.

3. Environmental Checklist

- 7) Supporting Information Sources: A source list should be attached, and other sources used or individuals contacted should be cited in the discussion.
- 8) This is only a suggested form, and lead agencies are free to use different formats; however, lead agencies should normally address the questions from this checklist that are relevant to a project's environmental effects in whatever format is selected.
- 9) The explanation of each issue should identify:
 - a) the significance criteria or threshold, if any, used to evaluate each question; and
 - b) the mitigation measure identified, if any, to reduce the impact to less than significant.

ENVIRONMENTAL ISSUES	Subsequent or Supplemental EIR				Addendum to EIR	
	Substantial Change in Project Requiring Major EIR Revisions	Substantial Change in Circumstances Requiring Major EIR Revisions	New Information Showing Greater Significant Effects than Previous EIR	New Information Showing Ability to Reduce Significant Effects in Previous EIR	Less Than Significant Impacts/No Changes or New Information Requiring Preparation of an EIR	No Impact
I. AESTHETICS: Would the project:						
a) Have a substantial adverse effect on a scenic vista?					X	
b) Substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a State scenic highway or local scenic expressway, scenic highway, or eligible scenic highway?					X	
c) Substantially degrade the existing visual character or quality of the site and its surroundings?					X	
d) Create a new source of substantial light or glare which would adversely affect day or nighttime views in the area?					X	
II. AGRICULTURE AND FORESTRY RESOURCES: In determining whether impacts to agricultural resources are significant environmental effects, lead agencies may refer to the California Agricultural Land Evaluation and Site Assessment Mode (1997) prepared by the California Department of Conservation as an optional model to use in assessing impacts on agriculture and farmland. Would the project:						
a) Convert Prime Farmland, Unique Farmland, or Farmland of Statewide Importance (Farmland), as shown on the maps prepared pursuant to the					X	

3. *Environmental Checklist*

	Subsequent or Supplemental EIR				Addendum to EIR	
	Substantial Change in Project Requiring Major EIR Revisions	Substantial Change in Circumstances Requiring Major EIR Revisions	New Information Showing Greater Significant Effects than Previous EIR	New Information Showing Ability to Reduce Significant Effects in Previous EIR	Less Than Significant Impacts/No Changes or New Information Requiring Preparation of an EIR	No Impact
ENVIRONMENTAL ISSUES						
Farmland Mapping and Monitoring Program of the California Resources Agency, to non-agricultural use?						
b) Conflict with existing zoning for agricultural use, or a Williamson Act contract?						X
c) Conflict with existing zoning for, or cause rezoning of, forest land (as defined in Public Resources Code section 12220(g)), timberland (as defined by Public Resources Code section 4526), or timberland zoned Timberland Production (as defined by Government Code section 51104(g))?						X
d) Result in the loss of forest land or conversion of forest land to non-forest use?						X
e) Involve other changes in the existing environment which, due to their location or nature, could result in conversion of Farmland, to non-agricultural use or conversion of forest land to non-forest use?					X	
III. AIR QUALITY: Where available, the significance criteria established by the applicable air quality management district or air pollution control district may be relied upon to make the following determinations. Would the project:						
a) Conflict with or obstruct implementation of the applicable air quality plan?						X
b) Violate any air quality standard or contribute substantially to an existing or projected air quality violation?					X	
c) Result in a cumulatively considerable net increase of any criteria pollutant for which the project region is in non-attainment under an applicable Federal or State ambient air quality standard (including releasing emissions which exceed quantitative thresholds for ozone precursors)?					X	

3. Environmental Checklist

	Subsequent or Supplemental EIR				Addendum to EIR

ENVIRONMENTAL ISSUES						
Natural Community Conservation Plan, or other approved local, regional, or State habitat conservation plan?						
V. CULTURAL RESOURCES: Would the project:						
a) Cause a substantial adverse change in the significance of a historical resource as defined in §15064.5 of the CEQA Guidelines?						X
b) Cause a substantial adverse change in the significance of an archaeological resource pursuant to §15064.5 of the CEQA Guidelines?					X	
c) Directly or indirectly destroy a unique paleontological resource or site or unique geological feature?					X	
d) Disturb any human remains, including those interred outside of formal cemeteries?					X	
VI. GEOLOGY AND SOILS: Would the project:						
a) Expose people or structures to potential substantial adverse effects, including the risk of loss, injury, or death involving:						
i) Rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known fault? Refer to Division of Mines and Geology Special Publication 42.						X
ii) Strong seismic ground shaking?					X	
iii) Seismic-related ground failure, including liquefaction?						X
iv) Landslides?					X	
b) Result in substantial soil erosion or the loss of topsoil?					X	
c) Be located on a geologic unit or soil that is unstable, or that would become						X

3. Environmental Checklist

ENVIRONMENTAL ISSUES	Subsequent or Supplemental EIR				Addendum to EIR

ENVIRONMENTAL ISSUES						
Government Code Section 65962.5 and, as a result, would it create a significant hazard to the public or the environment?						
e) For a project located within an airport land use plan, would the project result in a safety hazard for people residing or working in the project area?						X
f) For a project located within the vicinity of a private airstrip, would the project result in a safety hazard for people residing or working in the project area?						X
g) Impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan?						X
h) Expose people or structures to a significant risk of loss, injury or death involving wildland fires, including where wildlands are adjacent to urbanized areas or where residences are intermixed with wildlands?					X	
IX. HYDROLOGY AND WATER QUALITY: Would the project:						
a) Violate any water quality standards or waste discharge requirements?					X	
b) Substantially deplete groundwater supplies or interfere substantially with groundwater recharge such that there would be a net deficit in aquifer volume or a lowering of the local groundwater table level (e.g., the production rate of pre-existing nearby wells would drop to a level which would not support existing land uses or planned uses for which permits have been granted)?						X
c) Substantially alter the existing drainage pattern of the site or area, including through alteration of the course of a stream or river, in a manner which would result in					X	

3. Environmental Checklist

ENVIRONMENTAL ISSUES						
or mitigating an environmental effect?						
c) Conflict with any applicable habitat conservation plan or natural community conservation plan?						X
XI. MINERAL RESOURCES: Would the project:						
a) Result in the loss of availability of a known mineral resource that would be of value to the region and the residents of the State?						X
b) Result in the loss of availability of a locally-important mineral resource recovery site delineated on a local general plan, specific plan or other land use?						X
XII. NOISE: Would the project result in:						
a) Exposure of persons to or generation of noise levels in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?					X	
b) Exposure of persons to or generation of excessive groundborne vibration or groundborne noise levels?					X	
c) A substantial permanent increase in ambient noise levels in the project vicinity above levels existing without the project?					X	
d) A substantial temporary or periodic increase in ambient noise levels in the project vicinity above levels existing without the project?					X	
e) For a project located within an airport land use plan, would the project expose people residing or working in the project area to excessive noise levels?						X
f) For a project within the vicinity of a private airstrip, heliport or helistop, would the project expose people residing or working in the project area						X

3. Environmental Checklist

to excessive noise levels?						
XIII. POPULATION AND HOUSING: Would the project:						
a) Induce substantial population growth in an area, either directly (for example, by proposing new homes and businesses) or indirectly (for example, through the extension of roads or other infrastructure)?					X	
b) Displace substantial numbers of existing housing, necessitating the construction of replacement housing elsewhere?						X
c) Displace substantial numbers of people, necessitating the construction of replacement housing elsewhere?						X
XIV. PUBLIC SERVICES: Would the project result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times or other performance objectives for any of the public services:						
a) Fire protection?					X	
b) Police protection?					X	
c) Schools?					X	
d) Parks?					X	
e) Other public facilities?					X	
XV. RECREATION: Would the project:						
a) Increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated?					X	
b) Include recreational facilities or require the construction or expansion of recreational facilities which might have an adverse physical effect on the environment?					X	
XVI. TRANSPORTATION/TRAFFIC: Would the project:						
a) Conflict with an applicable plan,					X	

3. *Environmental Checklist*

	Subsequent or Supplemental EIR				Addendum to EIR	
	Substantial Change in Project Requiring Major EIR Revisions	Substantial Change in Circumstances Requiring Major EIR Revisions	New Information Showing Greater Significant Effects than Previous EIR	New Information Showing Ability to Reduce Significant Effects in Previous EIR	Less Than Significant Impacts/No Changes or New Information Requiring Preparation of an EIR	No Impact
ENVIRONMENTAL ISSUES						
ordinance or policy establishing measures of effectiveness for the performance of the circulation system, taking into account all modes of transportation including mass transit and non-motorized travel and relevant components of the circulation system, including but not limited to intersections, streets, highways and freeways, pedestrian and bicycle paths, and mass transit?						
b) Conflict with an applicable congestion management program, including, but not limited to level of service standards and travel demand measures, or other standards established by the county congestion management agency for designated roads or highways?					X	
c) Result in a change in air traffic patterns, including either an increase in traffic levels or change in location that results in substantial safety risks?						X
d) Substantially increase hazards due to a design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment)?						X
e) Result in inadequate emergency access?					X	
f) Conflict with adopted policies, plans, or programs supporting alternative transportation (e.g., bus stops/routes, bicycle lanes, sidewalks, etc.)?						X
XVII. UTILITIES AND SERVICE SYSTEMS: Would the project:						
a) Exceed wastewater treatment requirements of the applicable Regional Water Quality Control Board?					X	
b) Require or result in the construction of new water or					X	

3. Environmental Checklist

ENVIRONMENTAL ISSUES	Subsequent or Supplemental EIR				Addendum to EIR	
	Substantial Change in Project Requiring Major EIR Revisions	Substantial Change in Circumstances Requiring Major EIR Revisions	New Information Showing Greater Significant Effects than Previous EIR	New Information Showing Ability to Reduce Significant Effects in Previous EIR	Less Than Significant Impacts/No Changes or New Information Requiring Preparation of an EIR	No Impact
wastewater treatment facilities or expansion of existing facilities, the construction of which could cause significant environmental effects?						
c) Require or result in the construction of new storm water drainage facilities or expansion of existing facilities, the construction of which could cause significant environmental effects?					X	
d) Have sufficient water supplies available to serve the project (including large scale developments as defined by Public Resources Code Section 21151.9 and described in Question No. 20 of the Environmental Checklist) from existing entitlements and resources, or are new or expanded entitlements needed?					X	
e) Result in a determination by the wastewater treatment provider which serves or may serve the project that it has adequate capacity to serve the project's projected demand in addition to the provider's existing commitments?					X	
f) Be served by a landfill with sufficient permitted capacity to accommodate the project's solid waste disposal needs?					X	
g) Comply with Federal, State, and local statutes and regulations related to solid waste?					X	
XVIII. MANDATORY FINDINGS OF SIGNIFICANCE						
a. Does the project have the potential to degrade the quality of the environment, substantially reduce the habitat of a fish or wildlife species, cause a fish or wildlife population to drop below self-sustaining levels, threaten to eliminate a plant or animal community, reduce the number or restrict the range of a rare or endangered plant or animal or					X

eliminate important examples of the major periods of California history or prehistory?						
b. Does the project have impacts that are individually limited, but cumulatively considerable? ("Cumulatively considerable" means that the incremental effects of a project are considerable when viewed in connection with the effects of past projects, the effects of other current projects, and the effects of probable future projects.)					X	
c. Does the project have environmental effects which will cause substantial adverse effects on human beings, either directly or indirectly?					X	

* The Environmental Checklist questions above related to greenhouse gas emissions are not answered because GHG emissions was not an issue identified and analyzed in the May 2003 certified Final Environmental Impact Report (FEIR) for a general plan amendment (GPA) and zone change (ZC) to implement the development of the Orange County Great Park. At the time of the FEIR certification, GHG emissions has been recognized as an environmental issue since the 1970s when the United States Congress enacted the National Climate Program Act (92 Stat.601, 1978) which required the President to establish a program to assist in understanding and responding to natural and human-induced climate processes, and since the 1980s when the Intergovernmental Panel on Climate Change (IPCC) was formed to assess scientific information related to climate change. Thus, issues related to climate change were known, or could have been known, at the time of the certification of the FEIR.

When an EIR has been certified for a project, no subsequent environmental document needs to be prepared by the lead agency (City of Irvine) unless there is a substantial evidence that one or more of the following has occurred:

1. Substantial changes are proposed in the project involving new significant environmental effects or a substantial increase in the severity of previously significant effects;

3. Environmental Checklist

2. Substantial changes occur with response to the project due to involvement of new significant environmental effects or a substantial increase in the severity of previously identified significant effects; or
3. New information of substantial importance, which was unknown or could not have been known with the exercise of reasonable diligence at the time the previous EIR was adopted shows any of the following:
 - a. The project will have one or more significant effects not discussed in the previous EIR;
 - b. Significant effects previously examined will be substantially more severe than shown in the previous EIR.
 - c. Mitigation measures or alternatives previously found to be infeasible would be feasible, and would substantially reduce one or more significance effects of the project, but the project proponents declined to adopt the mitigation measure or alternative; or
 - d. Mitigation measures or alternatives which are considerably different from those analyzed in the previous EIR would substantially reduce one or more significant effects on the environment, but the project proponents declined to adopt the mitigation measure or alternative.

In this case, the proposed project does not meet the Section 15162 criteria for preparing a subsequent environmental document and no analysis of GHG emissions is required based on the following supporting information:

1. As documented throughout this Initial Study, the OCGP Master Plan Minor Modification and the Park Design does not include substantial changes proposed in or with respect to the proposed project that involve new significant environmental impacts or a substantial increase in the severity of previously identified significant effects. As for GHG emissions, the issue was not considered potentially significant in 2003 and the GHG emissions associated with the OCGP Master Plan Minor Modification and the Park Design have not increased beyond those expected with the 2003 approved project, because the development allowed by the OCGP Master Plan Minor Modification and the Park Design has not increased over that allowed by the 2003 approved project.
2. GHG emissions has been recognized as an environmental issue for at least three decades and the approved project contribution to GHG emissions is not new information that was unknown or could not have been known with the exercise of reasonable diligence at the time the EIR was certified in 2003.
3. A GHG analysis that analyzed the projected emissions for both the public and private development in Planning Areas 30 and 51 was prepared in connection with the Supplement to the OCGP FEIR (SEIR) that was circulated for public review on June 2, 2011. That analysis concludes that the emissions per service population falls below the 4.8 Mtons per service population threshold proposed by South Coast Air Quality Management District and utilized as a threshold of significance by the City in the SEIR.

3. Environmental Checklist

This page intentionally left blank.

4. Discussion of Checklist and Mitigation Measures

This section is intended to provide evidence to substantiate the conclusions set forth in the Environmental Checklist. The section will briefly summarize the conclusions of the Orange County Great Park FEIR, as updated by the prior Addenda and the SEIR (collectively, "OCGP FEIR"), and then discuss whether the proposed Project is consistent with the findings contained in the OCGP FEIR.

4.1 AESTHETICS

4.1.1 Environmental Setting

The OCGP FEIR addressed in detail the potential visual impacts associated with the development of the former MCAS El Toro. The OCGP FEIR discussed the project's visual setting associated with its location adjacent to various arterial and state and federal highways. None of these roadways is designated County or State scenic highways; however, Sand Canyon Avenue is designated as a highway with rural/natural character. The City's General Plan also designates I-5 as an urban character Scenic Highway.

Generally, views of the former military base are from the surrounding highways. From these highways, a variety of land uses, structures, and facilities of differing ages, sizes, and architectural styles can be viewed. Although agricultural areas are adjacent to and within the base, the predominant views are associated with the military use of the base, including runways, aprons, hangars, warehouses, barracks housing, recreational facilities, single-family housing, offices, and commercial structures.

The proposed Project site is developed with aircraft hangar (Hangar 244), Kids Rock interpretive playground, Great Park Carousel, Great Park Balloon, Visitors Center, warehouse buildings, storage areas, and paved areas for parking and circulation. The majority of the site has little topographic relief, with a slight slope (1.5 to 2.5 percent) to the west and southwest.

4.1.2 Impacts Identified in the OCGP FEIR and Addenda

The OCGP FEIR discussed the potential aesthetic effects associated with development of the site under the adopted Overlay Plan and found that future development of Planning Areas 51 and 30 would introduce new sources of light within the project area. These sources include street lighting along planned roadways and various forms of exterior lighting, including security lighting, parking lots, educational facilities, institutional and commercial developments, and lighting associated with athletic fields. The OCGP FEIR concluded that significant light impacts would occur if proposed light sources were directed into or located near existing or planned residential uses, which are sensitive to light intrusion during nighttime hours, but that, with the mitigation ultimately adopted by the City, these potential impacts would be less than significant. The OCGP FEIR and addenda further concluded that the proposed mitigation measures for the project would reduce potentially significant light impacts to less than significant levels.

4. Discussion of Checklist and Mitigation Measures

No other significant or potentially significant aesthetic impacts were identified in the OCGP FEIR. Those other thresholds primarily concern visual aesthetic impacts and include such evaluated factors as viewshed obstruction or impairment, landform alteration, and the degradation of valued or unique scenic resources or features.

4.1.3 Impacts Associated with the OCGP Master Plan Minor Modification and the Park Design Review

Similar to the approved OCGP Master Plan from 2007, the Project contains a Sports Park, an Aircraft Museum and portion of the Timeline Central and Timeline West circulation corridor; however, the components within the Project site have been modified for the Project. Modification of the OCGP Master Plan consists mainly of changes to the buildings proposed within the Project site. The previously proposed Air Museum, the Air Museum Hangar, and the Concessions/Retail at the Sports Park are now replaced with Hangar 244 and proposed uses such as an Artist in Residency Facility, a Community Ice Facility, and a Nature Education Garden. However, the overall square footage (494,000 square feet) of the buildings would remain the same as the size of the three Civic/Museums within the OCGP Master Plan would be reduced to accommodate the additional square footages of the new buildings.

There are no scenic routes, scenic resources, or unique geologic or topographic features within the Project site.

The Project would not introduce additional new light sources or highly reflective building materials that would result in new sources of potential glare beyond those already considered by the OCGP FEIR, because it includes the same land uses and intensity and physical area for future development as the adopted Overlay Plan. No other significant or potentially significant aesthetic impacts besides new sources of lighting are anticipated.

Major FEIR Revisions Not Required. Based on the foregoing analysis and information, there is no evidence that the changes to the project require a major change to the certified OCGP FEIR. The proposed Master Plan Minor Modification and the Park Design Review, which does not include any major changes to park development areas identified in the approved OCGP Master Plan, will not result in any new significant environmental impact nor is there a substantial increase in the severity of impacts from that described in the certified OCGP FEIR.

No Substantial Change in Circumstances Requiring Major FEIR Revisions. There is no information in the OCGP Master Plan Minor Modification and the Park Design Review or otherwise available indicating substantial changes in circumstances that would require major changes to the certified OCGP FEIR.

No New Information of Substantial Importance Showing Greater Significant Effects Than Previous FEIR. This Environmental Evaluation has analyzed all available relevant information and has determined that there is no new information of substantial importance, which was unknown and could not have been known with the exercise of reasonable diligence at the time the OCGP FEIR was approved, augmented, and/or updated, indicating that the project will have one more significant effects not discussed in the previous FEIR or result in a substantial increase in the severity of previously identified effects.

4. Discussion of Checklist and Mitigation Measures

No New Information of Substantial Importance Showing Ability to Reduce Significant Effects in Previous FEIR. This Environmental Evaluation has analyzed all available relevant information and has determined that there is no new information of substantial importance, which was unknown and could not have been known with the exercise of reasonable diligence at the time the OCGP FEIR was approved, augmented, and/or updated, indicating that: (1) mitigation measures or alternatives previously found not to be feasible would in fact be feasible, and would substantially reduce one or more significant effects of the project, but the project proponent declines to adopt the mitigation measures or alternatives; or (2) mitigation measures or alternatives that are considerably different from those analyzed in the previous FEIR would substantially reduce one or more significant effects on the environment, but the project proponent declines to adopt the mitigation measures or alternatives. There are no alternatives to the project or additional mitigation measures that would substantially reduce one or more of the significant aesthetic effects identified in and considered by the approved OCGP FEIR.

4.1.4 Mitigation from the OCGP FEIR and Applicability to the Master Plan Minor Modification and the Park Design Review

The OCGP FEIR identified mitigation measures A1 and A2, which, if implemented, would reduce the effects of development under the adopted Overlay Plan to a less than significant level. Those mitigation measures were modified in the SEIR, to make them consistent with the adopted conditions of approval. The proposed revisions do not result in any new significant impacts.

- A1** Prior to issuance of building permits, lighting plans and signage plans for residential or non-residential new development shall be reviewed by the Community Development Department to ensure that minimal light intrusion and spillover into adjacent residential areas occurs.
- A2** Prior to the issuance of building permits for residential and non-residential development, and during the master plan review process for future development in the project area, the Director of Community Development shall ensure that mirrored and highly reflective surfaces are discouraged or, where proposed, shall be accompanied by a design-level glare impact analysis that demonstrates no adverse visual impairment to motorists or other visual nuisance occurs.

4.2 AGRICULTURE AND FORESTRY RESOURCES

4.2.1 Environmental Setting

The OCGP FEIR identified approximately 659 acres of designated Prime Farmland, 70 acres of designated Unique Farmland, and 99 acres of designated Farmland of Statewide Importance (as defined below). The Orange County Board of Supervisors has not designated any farmland as being of Local Importance. The northwestern portion of the Project is designated as Prime Farmland; however no portion is currently within agricultural production. No agricultural land within the Project area is currently covered by Williamson Act contracts.

The OCGP FEIR described the Farmland Mapping and Monitoring Program (FMMP Program) of the California Department of Conservation Division of Land Resources Protection classifications of agricultural lands present within the project area as follows:

4. *Discussion of Checklist and Mitigation Measures*

- **Prime Farmland:** Land which has the best combination of physical and chemical features able to sustain long-term production of agricultural crops. This land has the soil quality, growing season, and moisture supply needed to produce sustained high yields. Land must have been used for production of irrigated supply needed to produce sustained high yields. Land must have been used for production of irrigated crops at some time during the previous two map updates.
- **Farmland of Statewide Importance:** Similar to Prime Farmland, except this land has minor shortcomings such as greater slopes or less ability to store soil moisture than Prime Farmland. This land has minor shortcomings, such as greater slopes or less ability to store soil moisture than Prime Farmland. Land must have been used for production of irrigated crops at some time during the previous two map updates.
- **Unique Farmland:** Lesser quality soils used for the production of the state's leading crops. This land is usually irrigated, but may include non-irrigated orchards or vineyards as found in some climate zones in California. This land is used for the production of specific high economic value crops such as oranges, olives, avocados, rice, grapes, or cut flowers. Land must have been cropped at some time during the two previous maps updates.
- **Farmland of Local Importance:** Land of importance to the local agricultural economy as determined by each county's board of supervisors and a local advisory committee.

City of Irvine Policies and Programs

The Project site was designated for a variety of urban uses in the City of Irvine General Plan. The Project encourages agriculture as an interim land use prior to development of the land. The City of Irvine General Plan Objective L-10, as amended in 2002 and presented in the OCGP FEIR, includes the following policies to "encourage the maintenance of agriculture in undeveloped areas of the City until the time of development, and in areas not available for development".

4.2.2 Impacts Identified in the OCGP FEIR and Addenda

The OCGP FEIR determined the Overlay Plan would preserve in perpetuity 303 acres¹ of land for agricultural use, of which 251 acres are classified as Prime Farmland, Unique Farmland, and Farmland of Statewide Importance. The locations of the 303 acres of permanent agricultural land are listed below, and the Farmlands Map is shown below (Figure 4.2-1) and can be found in the OCGP FEIR as Figure 5.8-1.

- **PA 30:** 13 acres within Planning Area Zone (PAZ) 26; and
- **PA 51:** 90 acres within PAZ 4; 200 acres within PAZ 1.

The Overlay Plan also resulted in the permanent loss of 802 acres of designated farmland comprised of 651 acres of Prime Farmland, 63 acres of Unique Farmland, and 88 acres of Farmland of Statewide Importance. This impact was considered significant and unavoidable in the OCGP FEIR.

¹ There is a typographical error within the OCGP FEIR: Table 1-2 on page 1-8 and Table 3-4 on pages 3-12 and 3-13 identify the total agricultural land as 303 acres; however on page 5.8-10 the agricultural use acreage is noted as 307.

4. Discussion of Checklist and Mitigation Measures

Figure 4.2-1
OCGP Agricultural Resources
 (Figure 5.8-1 in OCGP FEIR)

4. *Discussion of Checklist and Mitigation Measures*

It was determined the Overlay Plan resulted in a significant impact associated with the conversion of agricultural land to nonagricultural use. The OCGP FEIR noted the context of agricultural production in Orange County, including development pressures that have contributed to the decrease in agricultural production in the County over time, which suggested that conversion of agricultural land to urban uses would occur with or without the development of the OCGP.

Addendum No. 5 determined that the removal of 173 acres in PAZ 1 would not result in new significant impacts to agricultural resources (Section 4.2.3 of Addendum No. 5). Despite the Prime Farmland designation, none of the soils in PAZ 1 are currently used for agricultural production. In addition, existing regulatory programs, namely the City of Irvine General Plan Objective L-10 and establishment of the Irvine Agricultural Legacy Program, address and mitigate the loss of agricultural land. Since certification of the OCGP FEIR, an additional 508 acres within PAZ 1 has been designated “Exclusive Agriculture” and added to the Agricultural Legacy Program. As a result, overall acreage enrolled within the Agricultural Legacy Program is greater than that assumed in the certified OCGP FEIR.

4.2.3 Impacts Associated with the Master Plan Minor Modification and the Park Design Review

The Project consists mainly of changes to the proposed buildings within the Project site. The Project will affect the same proportion of the designated farmland as articulated in the OCGP FEIR and Addenda. Consequently, it has no additional impact, beyond that previously studied and disclosed, on agricultural resources. Since the overall square footage of the buildings within the OCGP Master Plan remains the same, the Project and the associated actions would not increase allowable intensities or areas planned for development. It would not result in conflicts with agricultural zoning, convert farmland to non-farmland uses, result in a loss of forest land, or create any new impacts to agriculture and forest resources beyond those evaluated in the OCGP FEIR and Addenda.

Major FEIR Revisions Not Required. Based on the foregoing analysis and information, there is no evidence that the changes to the project require a major change to the certified OCGP FEIR. The proposed Master Plan Minor Modification and the Park Design Review, which does not include any major change to park development areas identified in the approved OCGP Master Plan, will not result in any new significant environmental impact nor is there a substantial increase in the severity of impacts from that described in the certified OCGP FEIR.

No Substantial Change in Circumstances Requiring Major FEIR Revisions. There is no information in the OCGP Master Plan Minor Modification and the Park Design Review or otherwise available indicating substantial changes in circumstances that would require major changes to the certified OCGP FEIR.

No New Information of Substantial Importance Showing Greater Significant Effects Than Previous FEIR. This Addendum has analyzed all available relevant information and has determined that there is no new information of substantial importance that was unknown and could not have been known with the exercise of reasonable diligence at the time the OCGP FEIR was approved, augmented, and/or updated, indicating that the Project will have one or more significant effects not discussed in the previous FEIR or result in a substantial increase in the severity of previously identified effects.

4. Discussion of Checklist and Mitigation Measures

No New Information of Substantial Importance Showing Ability to Reduce Significant Effects in Previous FEIR. This Addendum has analyzed all available relevant information and has determined that there is no new information of substantial importance that was unknown and could not have been known with the exercise of reasonable diligence at the time the OCGP FEIR was approved, augmented, and/or updated, indicating that: (1) mitigation measures or alternatives previously found not to be feasible would in fact be feasible, and would substantially reduce one or more significant effects of the Project, but the Project proponent declines to adopt the mitigation measures or alternatives; or (2) mitigation measures or alternatives that are considerably different from those analyzed in the previous EIR would substantially reduce one or more significant effects on the environment, but the project proponent declines to adopt the mitigation measures or alternatives. There are no alternatives to the Project or additional mitigation measures that would substantially reduce one or more of the significant effects on agriculture and forest resources identified in and considered by the approved OCGP FEIR.

4.2.4 Mitigation from the OCGP FEIR and Applicability to the Master Plan Minor Modification and the Park Design Review

Mitigation Measures AG1 through AG3 will be implemented in conjunction with master plan review and subsequent development permits.

AG1 In order to encourage agriculture as an interim land use pending development on the project site by warning future residents that they are buying or renting a house adjacent to existing agricultural operators, City of Irvine Standard Discretionary Case Condition B.4 and City of Irvine Subdivision Condition 3.4 regarding disclosure statements shall be amended to include the following for subdivisions proposed adjacent to existing agricultural operations:

Prior to issuance of building permits, the applicant shall submit, and the Director of Community Development shall have approved, a completed occupancy disclosure form for the project. The approved disclosure form, along with its attachments, shall be included as part of the rental/lease agreement and as part of the sales literature for the project. The disclosure statement shall include the following information:

- Continuation of agricultural operations adjacent to the site and their potential effects (spraying of pesticides, noise, dust, odor, etc.) on future residents or tenants.

AG2 Heritage and community service/educational farming operations shall be encouraged within utility easements and other lands. Heritage farming is defined as small-scale specialty farming operations that can be accommodated in an urban environment. An example would be the Edible Landscape project located adjacent to Harvard Avenue within the Edison right-of-way.

AG3 Future landowners and the City shall work cooperatively with farmers to minimize conflicts between agricultural operation and adjacent urban uses.

4. Discussion of Checklist and Mitigation Measures

4.3 AIR QUALITY

4.3.1 Environmental Setting

The OCGP FEIR describes the air quality conditions regarding the following regulated pollutants: ozone (O₃), carbon monoxide (CO), suspended particulate matter (PM₁₀), nitrogen oxides (NO_x), sulfur dioxide (SO₂), lead, and reactive organic gases (ROG).

The proposed Project site is located in the Orange County portion of the South Coast Air Basin. Table 4.3-1 shows the pollutants and associated attainment status for the South Coast Air Basin. Orange County is designated as a federal and state non-attainment area for O₃, PM₁₀, and PM_{2.5}, maintenance for CO, and an attainment area for SO₂, NO₂, and lead.

Table 4.3-1. Attainment Status for the Orange County Portion of the South Coast Air Basin

Pollutant	Attainment Status	
	Federal	State
O ₃ – 1-Hour	--	Non-attainment
O ₃ – 8-hour	Nonattainment (Extreme)	Non-attainment
PM ₁₀	Nonattainment (Serious)	Non-attainment
PM _{2.5}	Nonattainment	Non-attainment
CO	Attainment/Maintenance	Attainment
NO ₂	Attainment	Attainment
SO ₂	Attainment	Attainment
Lead	Attainment	Attainment

Sources: EPA 2010; ARB 2010.

4.3.2 Impacts Identified in the OCGP FEIR and Addenda

The OCGP FEIR identifies significant air quality impacts associated with construction and operation of the Overlay Plan. The OCGP FEIR describes the construction air impacts after mitigation as significant and unavoidable. Addenda No. 3 and 4 included an analysis to determine the projected emissions associated with more recent, precise and refined information regarding the Overlay Plan and OCGP Conceptual Master Plan. The Addenda determined that earthmoving activities would be consistent with the emissions inventory assumed in the certified OCGP FEIR and within the scope of the original air quality analysis.

The analysis was conducted using URBEMIS 2007 Version 9.2, which was in accordance with SCAQMD's recommendations for preparation of air quality analyses at the time the document was developed. The emission estimates from Addendum No. 4 are provided in Table 4.3-2.

4. Discussion of Checklist and Mitigation Measures

Table 4.3-2. Comparison of Daily Construction Emissions for OCGP Construction Activities

Emission Totals, lbs./day [tons per day]					
Emissions Inventory	CO	NOx	PM ₁₀	VOC	SOx
OCGP FEIR	280	840	1440	4660c	40
OCGP Site Grading	174	343	663	37	<1
SCAQMD Significance Threshold	550	100	150	75	150
Over (Under)	(376)	243	513	(38)	(149)
Significant for OCGP FEIR?	No	Yes	Yes	Yes	No
Significant for OCGP Equipment Mix?	No	Yes	Yes	No	No
Source: PCR Services Corporation 2007.					

As shown in Table 4.3-2 above and as Addendum No. 4 concluded, no new significant impacts and no substantial increase in the severity of previously identified impacts would occur as a result of implementation of the OCGP.

The site grading and demolition would most likely occur in a phased approach, over the course of numerous years. A technical consultant (PCR) also conducted an analysis for Addendum No. 4 to determine whether the construction emissions inventory for a maximum worst case day (consisting of concurrent grading of the OCGP Master Plan along with site grading activities for Heritage Fields, the Agua Chionon, and the wildlife corridor and runway demolition activities) is consistent with the emissions inventory presented in the OCGP FEIR and is within the scope of the original air quality impact assessment.

The emissions from the concurrent construction activities are presented in Table 4.3-3. Concurrent grading and demolition activities estimated for Addendum No. 4 resulted in a slight decrease in equipment exhaust emissions and fugitive dust PM₁₀ emissions, as compared to those levels estimated for the OCGP FEIR.

Table 4.3-3. Comparison of Daily Construction Emissions for Concurrent OCGP Construction Activities

Emission Totals, lbs./day [tons per day]					
Emissions Inventory	CO	NOx	PM ₁₀	VOC	SOx
Certified EIR	280	840	1440	4660c	40
OCGP Site Grading	174	343	663	37	<1
Heritage Fields Site Grading	171	332	663	37	<1
Runway Demolition	66	165	76	17	<1
Total	411	839	1402	91	<1
SCAQMD Significance Threshold	550	100	150	75	150
Over (Under)	(139)	739	1252	16	(149)

4. *Discussion of Checklist and Mitigation Measures*

Emission Totals, lbs./day [tons per day]					
Emissions Inventory	CO	NOx	PM10	VOC	SOx
Significant for OCGP	No	Yes	Yes	Yes	No
Significant for concurrent activities?	No	Yes	Yes	Yes	No

Source: PCR Services Corporation 2007.

Among the various sources of a project's operational emissions, those attributable to mobile sources (i.e. vehicular traffic) comprise the largest proportion of emissions. Mobile source emissions are a function of both the number and trip length characteristics of vehicle trips directly and indirectly associated with the project under consideration. Operational emissions for project area and mobile sources were estimated at above the significance thresholds for ROG, NOX, CO, and PM10, and are described in the OCGP FEIR and Addenda as significant and unavoidable after mitigation. In addition, the OCGP FEIR included the results of the CO "hotspots" analysis, in which no intersections in the traffic study area were expected to result in one-hour or eight-hour CO concentrations above the state standard of 20 parts per million (ppm) for one-hour concentrations and 9 ppm for eight-hour concentrations.

No other construction- and operations-related significant air quality impacts were identified in the OCGP FEIR. As part of the certification of the OCGP FEIR, Findings of Fact and a Statement of Overriding Considerations were adopted for environmental effects, including air quality that could not be mitigated below the thresholds of significance.

4.3.3 Impacts Associated with the Master Plan Minor Modification and the Park Design Review

Regional Construction Impacts

The OCGP Master Plan is comprised of approximately 1,145.3 acres, of which approximately 245.4 acres are the "Western Sector Park Development Plan" and is located in the southwestern portion of the OCGP Master Plan. The Project components within the site have been modified for the OCGP Master Plan. However, the overall square footage of the buildings within the OCGP Master Plan remains the same since the size of the three Civic/Museums within the OCGP Master Plan have been reduced to accommodate the additional square footages of the new buildings within the Western Sector Park Development Plan.

Construction activities associated with the proposed Project would have a short-term impact on air quality. The analytical assumptions concerning construction, development phasing, and operations of the adopted OCGP Master Plan remain consistent with all prior assumptions, since there is no change in overall square footage or development within the Project area.

Consequently, the Project would not increase the maximum daily air pollutant emissions generated during construction and demolition activities. The OCGP FEIR concluded that air pollutant emissions associated with construction and demolition activities of the Overlay Plan were considered a significant and unavoidable impact. The construction air emissions associated with the Project are anticipated to be similar to those addressed in the OCGP FEIR, and therefore would not result in any new significant impacts.

4. Discussion of Checklist and Mitigation Measures

Regional Operation Impacts

Operation of the Project would result in long-term regional emissions of ROG, NO_x, and PM₁₀ associated with area sources, such as natural gas emissions, landscaping, applications of architectural coatings, in addition to operational vehicle-exhaust emissions. Regional area- and mobile-source emissions of ROG, NO_x, and PM₁₀ were modeled using the URBEMIS 2007 Version 9.2.4 computer program. URBEMIS accounts for area-source emissions from the use of natural gas, wood stoves, fireplaces, landscape maintenance equipment, and consumer products. The model also considers mobile source emissions associated with vehicle trip generation.

Regional area- and mobile-source emissions were modeled based on proposed land use types and sizes as indicated in the Project Description and the change in trip generation from the Orange County Great Park Trip Generation and Parking Demand Analysis (LSA, August 2011). According to the traffic data used to prepare this Addendum, full build-out of the Great Park Master Plan would result in a total of 13,537 vehicle trips on a typical weekday and 19,083 vehicle trips on the weekend. The reason that weekend conditions are not considered in the environmental analysis is that weekday capacities are based on a.m. and p.m. peak hour factors. These weekday a.m. and p.m. peak period factors are the result of a high percent of work trips that occur during these peak hours, coupled with low vehicle occupancy. This condition would be characteristic of the Great Park study area, where a significant number of weekday work trips travel to and from the various commercial office and industrial uses within the study area. The pronounced a.m. and p.m. peak hour conditions used to derive weekday daily capacities do not occur during the weekend.

Table 4.3-4. Summary of Modeled Long-Term Operational Emissions

Source	Emissions (lb/day)				
	ROG	NO _x	CO	PM ₁₀	PM _{2.5}
Approved Master Plan	151.10	72.62	664.39	225.89	43.87
Master Plan Minor Modifications	149.54	70.72	654.66	221.18	42.97
Net Change	(1.56)	(1.90)	(9.73)	(4.71)	(0.90)
Source: AECOM 2011					

As shown in Table 4.3-4, the modifications to the Master Plan would decrease the maximum daily air pollutant emissions generated during operational activities compared to the approved Master Plan. The OCGP FEIR concluded that air pollutant emissions associated with operational activities of the Overlay Plan were considered a significant and unavoidable impact. The operational air emissions associated with the Project are anticipated to be less than those addressed in the OCGP FEIR, and therefore would not adversely contribute to the impacts otherwise caused by the project analyzed in the OCGP FEIR.

Consistency Determination with the Air Quality Management Plan

The OCGP FEIR included a consistency evaluation with the SCAQMD's Air Quality Management Plan (AQMP). The consistency evaluation concluded development of the adopted Overlay Plan would have a negligible impact on the overall air quality within the South Coast Air Basin. The Project would not result in new activities or new land uses that would change the consistency evaluation in the OCGP FEIR.

4. *Discussion of Checklist and Mitigation Measures*

Localized Construction Impacts

As stated previously, the Project would not increase the maximum daily air pollutant emissions generated during construction activities. However, the OCGP FEIR identified significant localized air quality impacts based on the extent and schedule of construction activities, primarily from particulate matter (PM₁₀ and PM_{2.5}) emissions associated with fugitive dust. The OCGP FEIR concluded that air pollutant emissions were considered a significant unavoidable adverse impact. The construction air emissions associated with the Project are anticipated to be less than those addressed in the OCGP FEIR, and therefore would not adversely contribute to the impacts otherwise caused by the project analyzed in the OCGP FEIR.

Localized Operational Impacts

The OCGP FEIR did not identify significant localized air quality impacts for either mobile sources or stationary sources. Because the Project would not result in an increase of the number of units or permitted square footage of buildings on-site, the Project would not increase the concentrations of stationary-source air pollutant emissions generated during operational activities.

Odors

The OCGP FEIR identified that development of Planning Areas 30 and 51 would not handle large amounts of solid waste, chemicals associated with heavy industry, or other uses that would generate objectionable odors and that no significant odor impacts would occur. The Project would not result in new activities or new land uses that would change the odor evaluation in the OCGP FEIR and Addenda.

Major EIR Revisions Not Required. Based on the foregoing analysis and information, there is no evidence that the changes to the project require a major change to the certified OCGP FEIR. The proposed Master Plan Minor Modification and the Park Design Review, which does not include any major change to park development areas identified in the approved OCGP Master Plan, will not result in any new significant environmental impact nor is there a substantial increase in the severity of impacts from that described in the certified OCGP FEIR.

No Substantial Change in Circumstances Requiring Major EIR Revisions. There is no information in the OCGP Master Plan Minor Modification and the Park Design Review or otherwise available indicating substantial changes in circumstances that would require major changes to the certified OCGP FEIR.

No New Information of Substantial Importance Showing Greater Significant Effects Than Previous EIR. This Addendum has analyzed all available relevant information and has determined that there is no new information of substantial importance, that was unknown and could not have been known with the exercise of reasonable diligence at the time the OCGP EIR was approved, augmented, and/or updated, indicating that the Project would have one or more significant effects not discussed in the previous EIR or result in a substantial increase in the severity of previously identified effects.

No New Information of Substantial Importance Showing Ability to Reduce Significant Effects in Previous EIR. This Addendum has analyzed all available relevant information and has determined that there is no new information of substantial importance, that was unknown and could not have been known with the exercise of reasonable diligence at the time the OCGP FEIR was approved, augmented, and/or updated, indicating that; 1) mitigation measures or alternatives previously found not to be feasible would

4. Discussion of Checklist and Mitigation Measures

in fact be feasible, and would substantially reduce one or more significant effects of the project, but the project proponent declines to adopt the mitigation measures or alternatives; or 2) mitigation measures or alternatives that are considerably different from those analyzed in the previous EIR would substantially reduce one or more significant effects on the environment, but the Project proponent declines to adopt the mitigation measures or alternatives. There are no alternatives to the Project or additional mitigation measures that would substantially reduce one or more of the significant air quality effects identified in and considered by the certified OCGP FEIR.

4.3.4 Mitigation from the OCGP FEIR and Applicability to the Master Plan Minor Modification and the Park Design Review

The OCGP FEIR identified mitigation measures AQ1 through AQ5, which reduce the air quality effects of construction and operations of development under the adopted Plan. However, as noted above, the OCGP FEIR found that short-term and long-term air quality impacts would remain significant and unavoidable. The measures are applicable to future development under the Project. However, the mitigation measures were modified in the SEIR to account for the latest improvements in emission control technologies and updated SCAQMD recommendations for reducing air pollutant emissions.

AQ1 Prior to the start of demolition and construction within the project area, adjacent sensitive receptors shall be informed of the planned demolition and construction activities. Measures to avoid significantly impacting these receptors shall be developed and implemented by the project proponent in coordination with these uses. Other applicable mitigation measures such as erection of fences around construction areas; staggered use of equipment near sensitive receptors; diversion of truck trips away from receptors; etc.; shall be employed as necessary. Compliance with this measure shall be verified by the Director of Community Development.

AQ2 Prior to the commencement of construction activities required to demolish and/or remove existing DON structure, including, runways, the Director of Community Development shall receive and approve a construction emissions mitigation plan from the chosen demolition contractor. Prior to the issuance of grading permits, the applicant of any future development project shall submit, and the Director of Community Development shall approve a construction emissions mitigation plan. The plans shall identify implementation procedures for each of the following emissions reduction measures and all feasible mitigation measures shall be implemented. If certain measures are determined infeasible, an explanation thereof shall be provided.

- Utilize off-road construction equipment that conforms to Tier 3 of the United States Environmental Protection Agency, or higher emissions standards for construction equipment over 50 horsepower that are commercially available. The construction contractor shall be made aware of this requirement prior to the start of construction activities. Use of commercially available Tier 3 or higher off-road equipment, which is:
 - Year 2006 or newer construction equipment for engines rated equal to 175 horsepower (hp and greater);
 - Year 2007 and newer construction equipment for engines rated equal to 100 hp but less than 175 hp; and
 - Year 2008 and newer construction equipment for engines rated equal to or greater than 50 hp but less than 100 hp.

4. *Discussion of Checklist and Mitigation Measures*

- The use of such equipment shall be stated on all grading plans. The construction contractor shall maintain a list of all operating equipment in use on the project site. The construction equipment list shall state the makes, models, and numbers of construction equipment on-site.
- Water exposed soils at least three times daily and maintain equipment and vehicle engines in good condition and in proper tune.
 - Wash off trucks leaving the site.
 - Replace ground cover on construction sites when it is determined that the site will be undisturbed for lengthy periods.
 - Reduce speeds on unpaved roads to less than 15 miles per hour.
 - Halt all grading and excavation operations when wind speeds exceed 25 miles per hour.
 - Suspend all emission generating activities during smog alerts.
 - Use propane- or butane-powered on-site mobile equipment instead of diesel/gasoline, whenever feasible.
 - Properly maintain diesel-powered on-site mobile equipment.
 - Prohibit nonessential idling of construction equipment to five minutes or less in compliance with California Air Resources Board's Rule 2449.
 - Sweep streets with SCAQMD Rule 1186 compliant PM₁₀-efficient vacuum units at the end of the day if substantial visible soil material is carried over to the adjacent streets.
 - Use electricity from power poles rather than temporary on-site diesel- or gasoline-powered generators, whenever feasible.
 - Use of low-VOC asphalt.
 - Maintain a minimum 24-inch freeboard on trucks hauling dirt, sand, soil, or other loose materials and tarp materials with a fabric cover or other suitable means. Provide temporary traffic controls (e.g., flag persons) during all phases of construction to ensure minimum disruption of traffic.
 - Schedule construction activities that affect traffic flow on adjoining streets to off-peak hours to the extent possible.
 - Reroute construction trucks away from congested streets, whenever feasible.
 - Provide dedicated turn lanes for movement of construction trucks and equipment on- and off-site, whenever feasible.
 - Use coatings and solvents with a volatile organic compound (VOC) content lower than required under SCAQMD Rule 1113 (i.e., Super Compliant Paints). All architectural coatings shall be applied either by (1) using a high-volume, low-pressure spray method operated at an air pressure between 0.1 and 10 pounds per square inch gauge to achieve a 65 percent application efficiency; or (2) manual application using a paintbrush, hand-roller, trowel, spatula, dauber, rag, or sponge, to achieve a 100 percent applicant efficiency. The construction contractor shall also use precoated/natural colored building, where feasible. Use of low-VOC paints and spray method shall be included as a note on architectural building plans.

AQ3 Prior to the issuance of building permits for any future development, the applicant shall submit, and the Director of Community Development shall have approved, an operation-emissions mitigation plan. The plan shall identify implementation procedures for each of the following emissions reduction measures and all feasible mitigation measures shall be implemented. If certain measures are determined infeasible, an explanation thereof shall be provided.

4. Discussion of Checklist and Mitigation Measures

- Utilize built-in energy-efficient appliances to reduce energy consumption and emissions.
- Utilize energy-efficient and automated controls for air conditioners and lighting to reduce electricity consumption and associated emissions.
- Install special sunlight-filtering window coatings or double-paned windows to reduce thermal loss, whenever feasible.
- Utilize light-colored roofing materials as opposed to dark roofing materials to conserve electrical energy for air-conditioning.
- Provide shade trees in residential subdivisions as well as public areas, including parks, to reduce building heating and cooling needs, whenever feasible.
- Ensure that whenever feasible, commercial truck traffic is diverted from local roadways to off-peak periods.
- Centralize space heating and cooling for multiple-family dwelling units and commercial space.
- Orient buildings north/south for reducing energy-related combustion emissions.
- Use solar energy, when feasible.
- Use high rating insulation in walls and ceilings.

AQ4 Prior to the issuance of building permits, future sales information on available housing and employment opportunities within the project area shall be provided to employees and residents of the project area, so as to encourage employees to live within the residential developments planned on-site and future residents to find employment nearby.

AQ5 Prior to the issuance of building permits, the applicant shall demonstrate to the satisfaction of the Director of Community Development that future employment generating non-residential development shall include measures to reduce vehicle trips including: the promotion of carpool incentives and alternative work schedules, easy access to public transit systems, trail linkages between uses, low-emissions vehicle fleets, and the provision of on-site facilities such as banking and food courts, and bicycle parking facilities, and other transportation demand management measures, as deemed appropriate.

4.4 BIOLOGICAL RESOURCES

4.4.1 Environmental Setting

The OCGP FEIR describes the biological resources within Planning Areas 30 and 51, including a 995-acre parcel of land in the easternmost portion of Planning Area 51 retained in federal ownership and designated as both "habitat reserve" and a part of the Orange County Central-Coastal Sub-region Natural Community Conservation Plan/Habitat Conservation Plan (NCCP/HCP). The areas outside the habitat reserve were described as: 1) providing minimal native or undisturbed habitat, and, 2) consisting of agricultural, ornamental, and domestic landscapes.

The OCGP FEIR identifies nine vegetative communities within the project site, including Venturan-Diegan sage scrub, southern cactus scrub, chaparral, woodland, riparian scrub, grassland, open water, agriculture, and predominately disturbed or developed areas. Several sensitive plant species and a large number of mature trees also were identified as potentially occurring within the project site. The sensitive plant species potentially occurring in Planning Areas 30 and 51 include the southern tarplant, Palmer's grappling hook, many-stemmed dudleya, Coulter's Matilija poppy, Catalina mariposa lily, and intermediate

4. Discussion of Checklist and Mitigation Measures

mariposa lily. The OCGP FEIR also notes the Coulter's saltbush, Laguna Beach dudleya, San Fernando Valley spineflower, and the Lewis's evening-primrose as having a moderate potential for occurrence. Species with a low potential for occurrence include the Los Angeles sunflower, south coast saltscale, Santa Monica Mountains dudleya, heart-leafed pitcher sage, coast wooly-heads, slender-horned spineflower, Santa Barbara morning glory, tecate cypress, and salt spring checkerbloom.

The OCGP FEIR documents an observation made of one sensitive wildlife species, a burrowing owl. This individual, observed during the protocol focus studies for a nearby development proposal, was outside the habitat reserve at the southwest end of Planning Areas 30 and 51 along Serrano Creek. Forty other sensitive wildlife species or species of local concern were identified as having a potential to occur on the site.

The OCGP FEIR also describes the Wildlife Corridor Concept Plan that would be incorporated into the eastern portion of the project site (Refer to pp. 5.9-9 through 5.9-14 of the OCGP FEIR) and explains the guidelines pursuant to which the ultimate corridor will be designed and constructed. The subject guidelines are primarily concerned with the creation and re-vegetation of wildlife habitats that would flourish in the proposed areas and serve as protective cover for target wildlife species that will presumably utilize the proposed corridor. A preliminary design concept for the creation and/or re-vegetation of the proposed route has also been prepared which is consistent with the guidelines described below (Draft Irvine Wildlife Corridor Master Plan, November 2002). The draft recommends a series of actions to improve the environmental quality for wildlife:

- Creation (establishes historical ecosystems on lands that did not previously support that ecosystem or on severely altered sites)
- Revegetation
- Reduce the amount of noise pollution and urban influence.
- Remove and restore the unnecessary developed (paved) areas within the corridor right-of-way.
- Create a protective habitat along the entire length of the corridor.
- Apply minimum height/width requirements based on the specific wildlife species.

OCGP FEIR Mitigation Measure BIO3, which continues to apply to this Addendum, ensures that the City of Irvine will continue to work with State and federal agencies to implement the revegetation/restoration plan necessary to create a viable wildlife corridor within the project area. The City has already engaged in this process as is demonstrated through the preparation of the Irvine Wildlife Corridor Master Plan, which is independent of this project.

4.4.2 Impacts Identified in the OCGP FEIR and Addenda

The OCGP FEIR concludes that implementation of the overall project could result in the occurrence of the following potentially significant effects:

- The southern tarplant, a federal species of concern, might be adversely affected by the overall OCGP Master Plan project development.

4. *Discussion of Checklist and Mitigation Measures*

- Although very limited in aerial extent and highly disturbed, isolated riparian habitat remnants that could be adversely impacted by the OCGP Master Plan project implementation.

The Project site contains a large number of trees, many of them mature, representing a wide range of species. The OCGP project implementation may result in damage and destruction to the trees. A significant impact related to conflicts with the City of Irvine's Urban Forestry Ordinance could occur.

4.4.3 Impacts Associated with the Master Plan Minor Modification and the Park Design Review

The Project encompasses the same land area proposed for park development as depicted in the OCGP FEIR. Therefore, the OCGP FEIR adequately describes the nature and severity of the environmental effects of OCGP Master Plan and its current minor modification and the Park Design Review associated with the "Western Sector Park Development Plan", the subject of this Addendum, on biological resources.

OCGP FEIR Mitigation Measure (MM) BIO1 stated that prior to approval of a subdivision map for each project area, a focused survey for the southern tarplant, mountain plover, and burrowing owl shall be conducted. MM BIO1 also stated that prior to approval of a subdivision map for development within, or in proximity to Serrano Creek, a focused survey shall be conducted for the least Bell's vireo and southwestern willow flycatcher. Should the focused survey identify a significant population of southern tarplant or mountain plover, or the presence of burrowing owl, least Bell's vireo, or southwestern willow flycatcher in an area proposed for development, impacts shall be avoided through incorporation of the species into an open space easement or, if impacts cannot be avoided, then mitigation shall be negotiated through consultation with the United States Fish and Wildlife Service (USFWS) and the California Department of Fish and Game (CDFG). Mitigation Measure BIO1 would continue to apply to this proposed Project (see Mitigation Measure BIO1, below).

The OCGP FEIR also stated that prior to approval of a subdivision map for each project area, a jurisdictional wetland delineation shall be performed for all areas within the Master Plan sub-area that contain the potential for wetland habitat and/or jurisdictional waters. The loss of impacted wetlands shall be mitigated through the implementation of a Wetland Mitigation Plan prepared and accepted by the appropriate agency (i.e., U.S. Army Corps of Engineers, U.S. Fish and Wildlife Service, California Department of Fish and Game). For wetlands impacted on-site replacement, recreation (i.e., within the proposed wildlife corridor), and/or re-vegetation is deemed acceptable by the appropriate jurisdictional agencies. Accordingly, Mitigation Measure BIO2 below would also continue to apply to the proposed Project.

The OCGP FEIR required that several focus surveys be conducted on Planning Areas 30 and 51 for sensitive plant and wildlife species prior to development. PCR Services prepared a *Biological Resources Assessment for Lennar Heritage Fields, Orange County, California* in November of 2005 and an updated assessment was prepared in June of 2006.² This biological resources assessment complies with mitigation measures BIO1, requiring a focus survey for the southern tarplant, mountain plover, and burrowing owl, and BIO2 requiring a wetlands delineation to be prepared for all areas within the Master Plan sub-area that contain the potential for wetland habitat and/or jurisdictional waters. The subject study

² This report is available for review at the City of Irvine.

4. Discussion of Checklist and Mitigation Measures

and each of its constituent focused technical studies cover a land area of approximately 3,700 acres and includes the OCGP Master Plan.

Jurisdictional Wetlands and “Waters of the U.S.”

A Jurisdictional Delineation for the site has been performed (*Investigation of Jurisdictional Wetlands and Waters of the U.S. Lennar Heritage Fields*, June 2006 PCR). The property supports six intermittent drainage systems and a variety of associated ephemeral tributaries. Five of the drainages have their headwaters in undeveloped areas of the Lomas de Santiago Foothills to the north. San Diego Creek originates in an eastern portion of the watershed that is occupied by substantial residential and commercial development. Disturbances such as channelization of large stretches of the drainages and dumping of debris and trash into portions of drainages have significantly altered several waterways and obscured many drainage features. Other disturbances on site include vegetation clearing to create roads and structures, agricultural runoff, and invasion by exotic species. Current and historic land uses associated with the establishment of MCAS El Toro (military structures, roads, agriculture, and residential development) have significantly changed the overall drainage patterns within the San Diego watershed. The cumulative impact to each wash or creek has resulted in habitat and water quality impairment within the San Diego Creek watershed.

These impacts include increased sediment and debris transport due to concrete-lined stream channels, increased flow velocities and scouring, increased bank erosion, increases in the presence of non-native plant species, and an overall reduction in the amount and the quality of the riparian habitat within the watershed. Alternatively, the disturbances have increased the amount of jurisdictional areas due to the creation of freshwater marsh habitat resulting from impoundment of storm water runoff within and adjacent to drainages. In total, the site contains 31,102.11 linear feet of jurisdictional streambed that includes 22.02 acres of U.S. Army Corps of Engineers (USACE) jurisdictional “Waters of the U.S.,” and, of which, 1.66-acres meet the three parameter definition of a jurisdictional wetland. CDFG jurisdictional streambed and associated riparian habitat total 38.61 acres.

Sensitive Biological Resources

There are numerous plant and wildlife species present, or potentially present within the study area that have received special recognition by federal, State, or local resource conservation agencies and organizations. Their status is principally due to the species decline or limited population size, usually resulting from habitat loss. Protected sensitive species are those species identified by either State or federal resource management agencies, or both, as threatened or endangered under provisions of the California and Federal Endangered Species Acts, respectively.

Sensitive species that occur or could potentially occur within the study area are based on one or more of the following:

- The direct observation of the species within the study area during one of the biological surveys.
- A record reported in the California Natural Diversity Database (CNDDB).
- The study area is within a known distribution of a species and contains appropriate habitat.

4. *Discussion of Checklist and Mitigation Measures*

Sensitive Plant Communities

The study area is dominated by highly disturbed habitat types and only small areas of native vegetation exist. A total of 9.7 acres of southern willow scrub occurs in scattered patches throughout the study area. Southern willow scrub is a high priority inventory community in the CNDDDB. This community is considered sensitive because it has experienced a sharp decline in California and because it has the ability to support a number of sensitive bird species such as least Bell's vireo and southwestern willow flycatcher.

Sensitive Plant Species

Sensitive plants include those that are either candidates or are currently listed by the CDFG and USFWS and those that are considered sensitive by the California Native Plant Society (CNPS). Several sensitive plant species were reported in the CNDDDB from the surrounding region. In accordance with the mitigation measures of the OCGP FEIR, focused surveys for southern tarplant were conducted on June 3 and June 8, 2005. No species were found. The highly disturbed character of the site and reduced presence of habitat capable of supporting sensitive plant species make it highly unlikely that any listed plant species will occur on the site.

Sensitive Wildlife Species

Forty-nine sensitive wildlife species were reported in the CNDDDB as occurring with the USGS 7.5-minute El Toro quadrangle map and the eight surrounding maps. Habitat suitability assessments for these species were conducted concurrently with the site investigation throughout the 2005 fieldwork. The intent of the habitat assessment was to evaluate habitat for its ability to support sensitive species and ascertain which sensitive species are likely to be present within the study area based on expected habitat use, geographic range, and information collected in the vicinity of the study area.

The OCGP Master Plan is not within a proposed or listed critical habitat area. Six sensitive wildlife species were observed within the study area during initial field investigations: northern harrier (*Circus cyaneus*), merlin (*Falco columbarius*), Cooper's hawk (*Accipiter cooperii*), California horned lark (*Eremophila alpestris actia*), cactus wren (*Campylorhynchus brunneicapillus*), and loggerhead shrike (*Lanius ludovicianus*). Three of these species (northern harrier, merlin, and Cooper's hawk) were also observed during wintering bird surveys. In addition, the golden eagle (*Aquila chrysaetos*), burrowing owl (*Athene cunicularia*), and ferruginous hawk (*Buteo regalis*) were observed utilizing the site during these subsequent wintering bird surveys. Surveys for mountain plover (*Charadrius montanus*), in accordance with the OCGP FEIR mitigation measures, were conducted during the wintering bird surveys as a part of Addendum No. 3. No they were observed on site during those field investigations.

In a follow-up report ³on wintering birds dated October 30, 2006 with surveys conducted between October 2005 and March 2006, PCR Services searched the site for activity. No burrowing owls were observed until February 2006. Although the project site is open, its vegetation becomes dense and over two feet tall in most areas. A single owl occupied a burrow during the late winter but abandoned the area as the vegetation surrounding the burrow became three feet high and very dense. There was no indication that

³ This report is available for review at the City of Irvine.

4. Discussion of Checklist and Mitigation Measures

breeding activity had been initiated. Because the habitat became unsuitable as a natural result of not being mowed, PCR Services determined that no mitigation would be required.

Summary of the Biological Status of the Site

The OCGP FEIR required that focus surveys be conducted on the project site for several sensitive plant and wildlife species prior to development. The required surveys were carried out during 2005 and 2006. No species of endangered plants or wildlife were recorded on site during these investigations, conducted by PCR Services. The sensitive plant community of willow scrub extant on site is heavily disturbed and fragmented. As such, PCR Services did not recommend attempting to preserve any of the remnant stands or streambeds as they currently exist. It was also determined that the presence of several sensitive species would be addressed through mitigation designed to avoid disturbance of nesting avian species. PCR Services' findings did not indicate a need to consult formally with the USFWS.

Major FEIR Revisions Not Required. Based on the foregoing analysis and information, there is no evidence that the changes to the project require a major change to the certified OCGP FEIR. The proposed Master Plan Minor Modification and the Park Design Review, which does not include any major change to park development areas identified in the approved OCGP Master Plan, will not result in any new significant environmental impact nor will there be a substantial increase in the severity of impacts from that described in the certified OCGP FEIR.

No Substantial Change in Circumstances Requiring Major FEIR Revisions. There is no information in the OCGP Master Plan Minor Modification and the Park Design Review or otherwise available indicating substantial changes in circumstances that would require major changes to the certified OCGP FEIR.

No New Information of Substantial Importance Showing Greater Significant Effects Than Previous FEIR. This Environmental Evaluation has analyzed all available relevant information and has determined that there is no new information of substantial importance, which was unknown and could not have been known with the exercise of reasonable diligence at the time the OCGP FEIR was approved, augmented, and/or updated, indicating that the Project will have one or more significant effects not discussed in the previous FEIR or result in a substantial increase in the severity of previously identified effects.

No New Information of Substantial Importance Showing Ability to Reduce Significant Effects in Previous FEIR. This Environmental Evaluation has analyzed all available relevant information and has determined that there is no new information of substantial importance, which was unknown and could not have been known with the exercise of reasonable diligence at the time the OCGP FEIR was approved, augmented, and/or updated, indicating that: (1) mitigation measures or alternatives previously found not to be feasible would in fact be feasible, and would substantially reduce one or more significant effects of the project, but the project proponent declines to adopt the mitigation measures or alternatives; or (2) mitigation measures or alternatives that are considerably different from those analyzed in the previous FEIR would substantially reduce one or more significant effects on the environment, but the project proponent declines to adopt the mitigation measures or alternatives. There are no alternatives to the project or additional mitigation measures that would substantially reduce one or more of the significant biological effects identified in and considered by the certified OCGP FEIR.

4. Discussion of Checklist and Mitigation Measures

4.4.4 Mitigation from the OCGP FEIR and Applicability to the Master Plan Minor Modification and the Park Design Review

Mitigation measures BIO1 through BIO4 will be implemented in conjunction with master plan review and subsequent development permits.

- BIO1** Prior to approval of a subdivision map for each project area, a focused survey for the southern tarplant, mountain plover, and burrowing owl shall be conducted. Prior to approval of a subdivision map for development within or in proximity to Serrano Creek, a focused survey shall be conducted for the least Bell's vireo and southwestern willow flycatcher. Should the focused survey identify a significant population of southern tarplant or mountain plover, or the presence of burrowing owl, least Bell's vireo, or southwestern willow flycatcher in an area proposed for development, impacts shall be avoided through incorporation of the species into an open space easement, or if impacts cannot be avoided, then mitigation shall be negotiated through consultation with the United States Fish and Wildlife Service (USFWS) and the California Department of Fish and Game (CDFG).
- BIO2** Prior to approval of a subdivision map for each project area, a wetland delineation shall be performed for all areas within the master plan sub-area that contain the potential for wetland habitat and/or jurisdictional waters. The loss of impacted wetlands shall be mitigated through the implementation of a wetland mitigation plan prepared and accepted by the appropriate agency (i.e., U.S. Army Corps of Engineers, U.S. Fish and Wildlife Service, California Department of Fish and Game). Wetlands impacted on-site shall be mitigated through on-site or off-site replacement, recreation (i.e., within the proposed wildlife corridor), and/or re-vegetation as deemed acceptable by the appropriate jurisdictional agencies.
- BIO3** The City shall continue to work with State and federal agencies during the implementation of the proposed project to implement the revegetation/restoration plan for the wildlife corridor. Measures such as sight and sound barriers, including artificial sound walls and natural diversions (e.g., hedges and tree lines) shall be incorporated into corridor design to ensure the viability of the corridor. The City shall implement the corridor consistent with the design criteria and viability analysis established in the Final FEIR.
- BIO4** Prior to issuance of a grading permit for each project area, a complete inventory of all trees of trunk diameter at breast height (DBH) greater than six inches and any significant (as determined by a certified arborist selected by the City) plants on the project site, excluding those within the habitat preserve shall be prepared. This inventory shall be prepared by an arborist certified by the International Society of Arboriculture and shall include (but not be limited to) data for each tree such as species, variety, DBH, condition (excellent, good, fair, poor, dead), and any recommendations. All trees in this inventory shall be considered "Significant Trees" under the City of Irvine's Urban Forestry Ordinance (UFO) (Sections 5-7-401 et al.) and the UFO shall apply to all trees included in this inventory.

4. Discussion of Checklist and Mitigation Measures

4.5 CULTURAL RESOURCES

4.5.1 Environmental Setting

Archaeological and Historical Resources

This discussion of cultural resources includes archaeological and historical resources. The OCGP FEIR presented information pertaining to the regional setting of former MCAS EI Toro from both a prehistoric and historic perspective. The OCGP FEIR reported the presence of ten prehistoric archaeological sites and eight isolated prehistoric artifacts that have been recorded in the northeastern habitat preserve portions of PA 51. These sites are generally on the ridges between Borrego Canyon Wash and the Agua Chinon Wash.

The former MCAS EI Toro was surveyed to determine whether any of the structures would be eligible for the National Register. Generally, a structure that has achieved significance in the past 50 years is not considered eligible for the National Register unless it is of exceptional importance. The evaluation was expanded to include eligibility under the Legacy Cold War Project (Public Law No. 101-511, Section 8120). Portions of PA 30 and 51 (the former MCAS EI Toro) were established during WWII, and no structure earlier than this period is at the former MCAS EI Toro. Therefore, the historical significance of any structures at the former military base would be as part of the Cold War Legacy. Surveys conducted by the US Army Corps of Engineers and the Department of the Navy in conjunction with the base's closure concluded there were no structures eligible for designation as Cold War Legacy or for inclusion in the National Register of Historic Places.

Paleontological Resources

The OCGP FEIR reported that a majority of Planning Areas 30 and 51 is on the Tustin Plain, a coastal alluvial plain. Alluvium from the Late Pleistocene to Holocene Epochs immediately underlies the majority of the project area, including the part occupying the coastal plain and washes in the eastern portion of PA 51. The Pleistocene Alluvium formation is widespread and believed to extend to depths of 1,000 feet in PA 30. A significant deposit of Pleistocene terrestrial vertebrates was recovered during excavation of a flood control basin four miles from PA 30; thus, it is possible that similar beds underlie PA 30 (OCGP FEIR 5.10-2).

The eastern portion of PA 51 is in the western foothills of the northern Santa Ana Mountains. The hills and ridges in the eastern part of PA 51 are composed of older, underlying marine and non marine rock units of early Oligocene to late Pleistocene (23 million to 2 million years ago). In order of decreasing geologic age, these latter rock units include the undifferentiated Sespe and Vaqueros Formations, Topanga and Monterey Formations, Oso Member of the Capistrano Formation, Niguel Formation, and Non marine Terrace Deposits. Non marine Terrace Deposits also underlie the terraces at the south corner of PA 51.

The northwestern corner of PA 51 contains a small portion of the Santa Ana Mountains foothills, which were separated from the main formation by erosion. This small portion is composed of undifferentiated late Cretaceous (135 million years ago) Marine Williams Formation. The rock units underlying portions of PA 51 have previously yielded important fossil remains at recorded fossil sites on and near the site. There

4. Discussion of Checklist and Mitigation Measures

are three recorded fossil sites in PA 51. These sites occur in undifferentiated Sespe and Vaqueros Formations and in the Topanga Formation. Fossil types include marine invertebrates and vertebrates, continental vertebrates, land plants, and land mammals. The three recorded fossil sites lie within the proposed habitat preserve portion of PA 51.

4.5.2 Impacts Identified in the OCGP FEIR and Addenda

Archaeological and Historical Resources

The OCGP FEIR determined that development according to the adopted Overlay Plan would not cause a substantial adverse change in the significance of any historical structure. The consequence of grading activities associated with future development, however, could potentially result in a substantial adverse change in the significance of an archaeological resource. The OCGP FEIR also stated that grading activities could uncover previously unknown human remains, including those interred outside formal cemeteries.

Although the entire project area was the subject of previous cultural resources investigations as part of the Base Realignment and Closure process, it was later determined that an updated survey and report was necessary to supplement the previous work. PCR Services performed an additional Phase I and II cultural resources investigation, the results of which can be found in the *Cultural Resources Update and Review, Heritage Fields/The Great Park, City of Irvine, Orange County, California* report dated September 2006.

Paleontological Resources

The OCGP FEIR stated that earthmoving operations associated with grading and trenching have the greatest potential to impact buried paleontological resources in the moderately to highly sensitive areas in the coastal plain and washes, northeastern, northwestern, and southern portions of Planning Area 51. The OCGP FEIR considered the potential impact associated with earthmoving operations as a significant impact for which mitigation was necessary.

4.5.3 Impacts Associated with the Master Plan Minor Modification and the Park Design Review

The Project encompasses the same land area proposed for park development as depicted in the OCGP FEIR. Therefore, the OCGP FEIR adequately describes the nature and severity of the environmental effects of OCGP Master Plan and its current minor modification and the Park Design Review associated with the “Western Sector Park Development Plan”, the subject of this Addendum, on cultural resources.

Archaeological and Historical Resources

The OCGP Master Plan and the proposed minor modification and the Park Design Review associated with the “Western Sector Park Development Plan” reflect a development program that is consistent with the General Plan Land Use and Zoning designations for Planning Area 51. Further, the extent of earth movement activities required to facilitate development of the Great Park, as depicted in the OCGP Master Plan, is projected to be essentially the same as that assessed and presented in the OCGP FEIR. Given

4. Discussion of Checklist and Mitigation Measures

the foregoing, the discussion of impacts on archaeological and historical resources attributable to the Great Park portion of the overall OCGP project disclosed in the OCGP FEIR remains valid.

As with the project's component of the Revised Overlay Plan in the OCGP FEIR, the OCGP Master Plan as currently proposed would still not cause a substantial adverse change in the significance of any historical structure, but grading associated with future development could still potentially result in a substantial adverse change in the significance of an archaeological resource, or uncover previously unknown human remains. As such, the cultural resources mitigation measures developed for the OCGP FEIR remains applicable to, and sufficient to mitigate impacts of, future development pursuant to the OCGP Master Plan.

Paleontological Resources

The OCGP Master Plan and the proposed minor modification and the Park Design Review associated with the "Western Sector Park Development Plan" reflect a development program that is consistent with the General Plan Land Use and Zoning designations for Planning Area 51. Further, the extent of earth movement activities required to facilitate development of the Great Park, as depicted in the OCGP Master Plan is projected to be essentially the same as that assessed and presented in the OCGP FEIR. Given the foregoing, the discussion of potential impacts on paleontological resources attributable to the Great Park portion of the overall OCGP Project disclosed in the OCGP FEIR remains valid. As such, the paleontological mitigation measure developed for the OCGP FEIR remains applicable to, and sufficient to mitigate impacts of, future development pursuant to the OCGP Master Plan.

Major FEIR Revisions Not Required. Based on the foregoing analysis and information, there is no evidence that the changes to the project require a major change to the certified OCGP FEIR. The proposed Master Plan Minor Modification and the Park Design Review, which does not include any major change to park development areas identified in the approved OCGP Master Plan, will not result in any new significant environmental impact nor is there a substantial increase in the severity of impacts from that described in the certified OCGP FEIR.

No Substantial Change in Circumstances Requiring Major FEIR Revisions. There is no information in the OCGP Master Plan Minor Modification and the Park Design Review or otherwise available indicating substantial changes in circumstances that would require major changes to the certified OCGP FEIR.

No New Information of Substantial Importance Showing Greater Significant Effects Than Previous FEIR. This Environmental Evaluation has analyzed all available relevant information and has determined that there is no new information of substantial importance, which was unknown and could not have been known with the exercise of reasonable diligence at the time the OCGP FEIR was approved, augmented, and/or updated, indicating that the project will have one or more significant effects not discussed in the previous FEIR or result in a substantial increase in the severity of previously identified effects.

No New Information of Substantial Importance Showing Ability to Reduce Significant Effects in Previous FEIR. This Environmental Evaluation has analyzed all available relevant information and has determined that there is no new information of substantial importance, which was unknown and could not have been known with the exercise of reasonable diligence at the time the OCGP FEIR was approved,

4. Discussion of Checklist and Mitigation Measures

augmented, and/or updated, indicating that: (1) mitigation measures or alternatives previously found not to be feasible would in fact be feasible, and would substantially reduce one or more significant effects of the project, but the project proponent declines to adopt the mitigation measures or alternatives; or (2) mitigation measures or alternatives that are considerably different from those analyzed in the previous FEIR would substantially reduce one or more significant effects on the environment, but the project proponent declines to adopt the mitigation measures or alternatives. There are no alternatives to the project or additional mitigation measures that would substantially reduce one or more of the significant biological effects identified in and considered by the certified OCGP FEIR.

4.5.4 Mitigation from the OCGP FEIR and Applicability to the Master Plan Minor Modification and the Park Design Review

Cultural Resources

The OCGP FEIR identified mitigation measures CULT1 through CULT4 which, if fulfilled, would reduce the effects of development under the adopted Plan to a level less than significant.

CULT1 Prior to subdivision for development, a detailed archaeological report(s) shall be prepared within PAs 51 and 30. This report(s) shall specifically address the potential for encountering archaeological resources at the time specific development is proposed. The report(s) shall provide recommendations to prevent degradation of archaeological resources such as site avoidance and data recovery. Recommendations contained in the report shall be implemented. Compliance with this measure shall be verified by the Community Development Department.

CULT2 Monitoring of excavation and grading activities associated with future development in PAs 51 and 30 shall be conducted by a certified archaeologist in accordance with the report required in Mitigation Measure CULT1. If resources are encountered in the course of ground disturbance, the archaeological monitor shall be empowered to halt grading and to initiate an archaeological testing program. The testing shall include recordation of artifacts, controlled removal of the materials, and an assessment of their importance under CEQA and the City's local guidelines. Compliance with this measure shall be verified by the Community Development Department.

CULT3 Prior to the issuance of grading permits and/or building permits for any future development in PAs 51 and 30, a detailed mitigation program shall be submitted by the applicant to the City of Irvine to address archaeological resources discovered during grading. Provisions of the program shall include an immediate evaluation of the find by a qualified archaeologist. If the find is determined to be a unique archaeological resource, contingency funding and a time allotment sufficient to allow for implementation of avoidance measures or appropriate mitigation shall be available. Work may continue on other parts of the construction site while archaeological resource mitigation takes place. The City of Irvine has standard conditions applied prior to the issuance of grading permits when a project includes potentially significant archaeological sites. These include retaining a qualified archaeologist, establishing procedures for cultural and scientific resource surveillance, and protection of any resources discovered during the grading process. Compliance with this measure shall be verified by the Community Development Department.

4. Discussion of Checklist and Mitigation Measures

CULT4 Prior to the issuance of any grading and/or building permits, a mitigation program shall be submitted by the developer to the City of Irvine to address the accidental discovery or recognition of any human remains. The program shall include the following:

There shall be no further excavation or disturbance of the site or any nearby area reasonably suspected to overlie adjacent human remains until:

- The county coroner must be contacted to determine that no investigation of the cause of death is required, and

If the coroner determines the remains to be Native American:

- The coroner shall contact the Native American Heritage Commission within 24 hours.
- The Native American Heritage Commission shall identify the person or persons it believes to be the most likely descended from the deceased Native American.
- The most likely descendent may make recommendations to the landowner or the person responsible for the excavation work, for the means of treating or disposing of, with appropriated dignity, the human remains and any associated grave goods as provided in Public Resources Code Section 5097.98, or
- Where the following conditions occur, the landowner or his authorized representative shall rebury the Native American human remains and associated grave goods with appropriate dignity on the property in a location not subject to further subsurface disturbance.
 - The Native American heritage Commission is unable to identify a most likely descendent or the most likely descendent failed to make a recommendation within 24 hours after being notified by the commission.
 - The descendant identified fails to make a recommendation; or
 - The landowner or his authorized representative rejects the recommendation of the descendant, and the mediation by the Native American Heritage commission fails to provide measures acceptable to the landowner.

Compliance with this measure shall be verified by the Community Development Department.

Paleontological Resources

The OCGP FEIR identified mitigation measure P1, which, if fulfilled, would reduce the effects of development under the adopted Overlay Plan to a level less than significant.

P1 Prior to issuance of a grading permit for any portion of the project area, a qualified paleontologist shall be retained by the City or designee to carry out an appropriate paleontology investigation of the area proposed for grading. (A qualified paleontologist is defined as an individual with an M.S. or Ph.D. in paleontology or geology who is familiar with paleontological procedures and techniques.) The City of Irvine has standard conditions applied prior to the issuance of grading permits when a project site includes potentially significant paleontological sites, and paleontological monitoring conditions have not been attached to the previous map approval.

4. Discussion of Checklist and Mitigation Measures

These standard conditions include retaining a qualified paleontologist, establishing procedures for cultural and scientific resource surveillance, and protection of any resources discovered during the grading process.

When fossils are discovered, the paleontologist (or paleontological monitor) shall recover them. In most cases, this fossil salvage can be completed in a short period of time. However, some fossil specimens (such as a complete large mammal skeleton) may require an extended salvage period. In these instances the paleontologist (or paleontological monitor) shall be allowed to temporarily direct, divert or halt grading to allow recovery of fossil remains in a timely manner. Because of the potential for the recovery of small fossil remains, such as isolated mammal teeth, it may be necessary in certain instances to set up a screening-washing operation on-site.

Fossil remains collected during the monitoring and salvage portion of the mitigation program shall be cleaned, repaired, sorted, and cataloged. Compliance with this measure shall be verified by the Community Development Department.

4.6 GEOLOGY AND SOILS

4.6.1 Environmental Setting

The OCGP FEIR describes the topography of the OCGP as nearly flat and gently sloping down to the west to southwest with elevations ranging from 450 feet above mean sea level (msl) to 200 feet above msl. The Project is located in Planning Area 51 (PA 51), which includes some slopes of the Santa Ana foothills which reach elevations of 750 feet above msl. Alluvial soils of six major soil associations consisting predominantly of varying sands, silts, and clayey silty sands are present within PA 51. The foothill portions of the Project area are underlain by sedimentary bedrock units, mantled by only a thin soil cover.

The OCGP FEIR identified the primary potential seismic hazard in the area as ground motion. Seismic Response Area (SRA) designations are used by the City to assess the geologic and seismic risk associated with potential development. A majority of PA 51 is within SRA-2 (denser soils/deeper groundwater) and is considered suitable for development.

No known active faults crossing or projecting into the Project area were identified; however, the Project site is within the seismically active southern California region and two active faults, Whittier-Elsinore Fault and Newport-Inglewood Fault, are located within 14 miles of the site.

4.6.2 Impacts Identified in the OCGP FEIR and Addenda

The OCGP FEIR disclosed the potential for future development of the OCGP area to result in the exposure of people or structures to strong ground shaking in the event of a major earthquake along anyone of the active faults in the region. The OCGP FEIR noted that new construction would be required to adhere to current seismic safety building codes which address seismic concerns. Existing buildings within current PA 51 do not meet current seismic codes; therefore, the temporary or permanent reuse of the existing buildings and the associated exposure of people or structures to potential substantial adverse effects due to strong seismic-related ground shaking were considered significant impacts.

4. Discussion of Checklist and Mitigation Measures

Because of the documented landslides in the northeastern Santa Ana foothills area of the Site, the OCGP FEIR analysis concluded that the OCGP project would result in a significant impact associated with landslides in the affected area of Planning Area 51 east of Irvine Boulevard, where future development of habitable structures could occur under the adopted Overlay Plan. The OCGP FEIR also concluded future development has the potential to result in soil erosion or the loss of topsoils and risk to life and property with the presence of expansive soils, and that these impacts are considered significant.

4.6.3 Impacts Associated with the Master Plan Minor Modification and the Park Design Review

The Project includes the same land uses and development areas as the adopted Overlay Plan and does not provide additional development intensity. Impacts related to seismic hazards, landslides, expansive soils, and loss of topsoil or soil erosion are not intensified by the Project; therefore the conclusions drawn in the OCGP FEIR adequately describe the environmental effects of the Project relative to soils, geologic hazards, and seismic safety, as well as the severity of the impacts.

Major FEIR Revisions Not Required. Based on the foregoing analysis and information, there is no evidence that the changes to the project require a major change to the certified OCGP FEIR. The proposed Master Plan Minor Modification and the Park Design Review, which does not include any major change to park development areas identified in the approved OCGP Master Plan, will not result in any new significant environmental impact nor is there a substantial increase in the severity of impacts from that described in the certified OCGP FEIR.

No Substantial Change in Circumstances Requiring Major FEIR Revisions. There is no information in the OCGP Master Plan Minor Modification and the Park Design Review or otherwise available indicating substantial changes in circumstances that would require major changes to the certified OCGP FEIR.

No New Information of Substantial Importance Showing Greater Significant Effects Than Previous FEIR. This Addendum has analyzed all available relevant information and has determined that there is no new information of substantial importance that was unknown and could not have been known with the exercise of reasonable diligence at the time the OCGP FEIR was approved, augmented, and/or updated, indicating that the Project will have one or more significant effects not discussed in the previous FEIR or result in a substantial increase in the severity of previously identified effects.

No New Information of Substantial Importance Showing Ability to Reduce Significant Effects in Previous FEIR. This Addendum has analyzed all available relevant information and has determined that there is no new information of substantial importance that was unknown and could not have been known with the exercise of reasonable diligence at the time the OCGP FEIR was approved, augmented, and/or updated, indicating that: (1) mitigation measures or alternatives previously found not to be feasible would in fact be feasible, and would substantially reduce one or more significant effects of the Project, but the Project proponent declines to adopt the mitigation measures or alternatives; or (2) mitigation measures or alternatives that are considerably different from those analyzed in the previous EIR would substantially reduce one or more significant effects on the environment, but the project proponent declines to adopt the mitigation measures or alternatives. There are no alternatives to the Project or additional mitigation measures that would substantially reduce one or more of the significant geological effects identified in and considered by the approved OCGP FEIR.

4. Discussion of Checklist and Mitigation Measures

4.6.4 Mitigation from the OCGP FEIR and Applicability to the Master Plan Minor Modification and the Park Design Review

The OCGP FEIR identified four mitigation measures (GS1 through GS4) to reduce the effects of the adopted Overlay Plan on soils, geologic hazards and seismic safety.

GS1 Prior to issuance of a building permit, the City of Irvine shall require that all development be designed in accordance with the seismic design provisions outlined in future proposed development geotechnical reports and specified in the latest Building Codes adopted by the City of Irvine. Compliance with this measure shall be verified by the Community Development Department.

GS2 Prior to issuance of a building permit, as per existing City policies, geotechnical studies shall be prepared at the time specific development projects are proposed to address site specific geotechnical considerations. The scope of each geotechnical study is based on the underlying geotechnical conditions of the individual site. These reports will provide measures to prevent settlement.

1. Prior to design and construction of any future developments within the project area, a comprehensive geotechnical evaluation, including development-specific subsurface exploration and laboratory testing, shall be conducted. The purpose of the subsurface evaluation is to:
 - a. Further evaluate the subsurface conditions in the area of the proposed structures.
 - b. Provide specific data on potential geologic and geotechnical hazards.
 - c. Provide information pertaining to the engineering characteristics of earth materials in the project area.

From this data, recommendations for grading/earthwork, surface, and subsurface drainage, temporary and/or subsurface drainage, temporary and/or permanent dewatering, foundations, pavement structural section, and other pertinent geotechnical design considerations may be formulated and shall be included in the grading and building plans for individual developments. General recommendations are as follows:

- Seismic Ground Shaking - Measures to prevent risk of loss, injury or death involving seismic ground shaking include constructing new development to the latest adopted building codes. In addition, new development should not be located near active earthquake faults.
- Erosion or Loss of Topsoil - Erosion and sediment control measures shall be implemented as required by the City's Grading and Water Quality ordinances.
- Where Expansive Soils Exist - Measures for the design of foundation, slabs, flatwork and other improvements subject to drainage from expansive soils.

Compliance with this measure shall be verified by the Community Development Department.

GS3 Prior to issuance of building permits for the occupancy of any existing structure at the former MCAS El Toro, or occupancy of any existing structure if a building permit is not issued, a seismic

4. *Discussion of Checklist and Mitigation Measures*

evaluation of the structure including recommendations for seismic improvements required for compliance with current Building Codes for use of existing structures adopted by the City of Irvine and plans for any required seismic improvements shall be submitted to the Chief Building Official for review and approval.

- GS4** Prior to issuance of a grading permit, detailed geotechnical and hydrology reports shall be prepared prior to any development approval or grading activities. These reports shall specifically address erosion control and surface runoff for both construction and long-term operations on the site. Recommendations contained in these reports to prevent soil erosion, siltation, and debris influx into the drainage system shall be implemented. Compliance with this measure shall be verified by the Community Development Department.

4.7 GREENHOUSE GAS EMISSIONS

Please see Section 3.4 for an explanation of GHG topic.

4.8 HAZARDS AND HAZARDOUS MATERIALS

4.8.1 Environmental Setting

Hazardous Materials and Hazardous Wastes

The OCGP FEIR discussed an environmental baseline survey (EBS) that was conducted for the project area. Information was used from the Base Realignment and Closure Business Plan for Marine Corps Air Station (MCAS) EI Toro dated May 2002; the EBS dated 1995; and an update to the EBS-April 2003 Draft Final EBS. The 2003 EBS identified "76 potential release locations, all of which require further evaluation for potential releases to the environment and subsequent remediation, if required" (Refer to OCGP FEIR p.5.5-5).

Regarding the Installation Restoration Program (IRP), the OCGP FEIR summarized the status of each IRP site based on the information available at the time the EIR was prepared. Ten IRP sites were identified as requiring "No Further Action," including sites 4, 6, 7, 9, 10, 13, 14, 15, 19, 20, 21, 22 and 25. The IRP sites identified as "Action Required" included sites 1, 2, 3, anomaly 3, 5, 8, 11, 12, 16, 17, 18 (plume), and 24 (Refer to OCGP FEIR pp. 5.5-6 through 5.5-9).

Of the 404 underground storage tanks (USTs) identified, 357 had been remediated and received findings of "no further action" at the time the OCGP FEIR was prepared. Of the 39 aboveground storage tanks (ASTs) on the property, 36 had been remediated and received findings of "no further action".

Evaluation and remediation of previously identified IRP sites within the project site continues with the resulting changes in the condition of the property largely anticipated in the OCGP FEIR. Subsequent to certification of the OCGP FEIR, the DON completed environmental related findings that support the suitability to transfer (FOST) real property made available through the Base Realignment and Closure

4. *Discussion of Checklist and Mitigation Measures*

process and to support of the lease of areas not yet suitable for transfer.⁴ Please see Figure 4.8-1 for Installation Restoration Program (IRP) Locations.

The areas suitable for lease encompass locations of concern identified in the 1995 and 2003 EBS, and in the OCGP FEIR, where future evaluation and/or actions are ongoing or required. These areas were identified as "carve-outs" in the DON documentation.⁵

Progress relative to conveyance of the carve-outs includes DON transfer of approximately eight acres of the project site to Heritage Fields and the Great Park Corporation on March 22, 2006. At the time of the initial land sale, these properties (carve-outs) were retained by the DON in order to complete environmental cleanup, and have since been approved by the regulatory agencies for transfer (FOST #2). The following sites were included in this transfer:

- **Carve-out parcel III-J** consists of approximately 0.2 acre in the central portion of former MCAS El Toro. It contains one building-Building No. 860-and 1 location of concern.
- **Carve-out parcel III-Q (portion)** consists of approximately 5 acres in the eastern portion of the former MCAS El Toro. It is an abandoned jet fuel (JP-5) pipeline.
- **Carve-out parcel III-S** consists of approximately 1 .3 acres in the southeastern portion of former MCAS El Toro. It contains 6 buildings (347, 377, 447, 448, 566, and 726) and 13 locations of concern.
- **Carve-out parcel III-T** consists of approximately 0.5 acre in the southeastern portion of former MCAS El Toro. It contains 1 building-Building No. 761-and 4 locations of concern. The facility was a former aircraft wash rack.
- **Carve-out parcel III-C** consists of approximately 1 acre in the western portion of the former MCAS El Toro. It contains 1 building-Building No. 240-and 7 locations of concern. This site was a former ordnance storage facility.

Emergency Plans

The OCGP FEIR described the former MCAS El Toro site (Planning Areas 30 and 51) as a potential emergency response staging area because of its capacity for processing and storing large quantities of cargo. The Orange County Emergency Plan, which incorporates the statewide standardized emergency management system (SEMS), guides multijurisdictional response to emergency conditions. No substantial change to the description of the setting regarding emergency plans has occurred that would alter the analysis and conclusions of the OCGP FEIR on emergency plans and response.

⁴ U.S. Department of the Navy, 2004. *Final Finding of Suitability to Transfer, Parcel IV and Portions of Parcels I, II, and III, Former Marine Corps Air Station, El Taro, California, July 2004; Final Finding of Suitability to Lease for Carve-outs Within Parcels I, II, and III, Former Marine Corps Air Station, El Taro, California, July 2004.*

⁵ U.S. Department of the Navy, 2004a. *Final Finding of Suitability to Lease for Carve-outs within Parcels I, II, and III, Former Marine Corps Air Station, El Taro, California, July 2004.*

4. Discussion of Checklist and Mitigation Measures

Wild Land Fires

The OCGP FEIR identified high fire hazard areas within open space, undeveloped land northeast of and adjacent to Planning Area 51. The City has no construction records of existing buildings and structures on the property. No substantial change to the description of the setting relative to wild land fires has occurred that would alter the analysis and conclusions of the OCGP FEIR regarding wild land fires.

4.8.2 Impacts Identified in the OCGP FEIR and Addenda

Hazardous Materials and Wastes

The OCGP FEIR identified no significant impacts associated with the No Further Action IRP sites, which are listed in Table 4.8-1. Table 4.8-2 identifies each Action Required IRP site and its location relative to the adopted Overlay Plan. The OCGP FEIR disclosed the following environmental consequences of the adopted Overlay Plan as significant impacts:

- Construction activities involving demolition and possible substantial remodeling of existing structures in the project area as the project area develops could result in the disturbance of structures and soils containing asbestos-containing building materials (ACM) and lead-based paint.
- IRP site 24 is located in the 6.1 Institutional and 1.9 Orange County Great Park zoning districts. The site may be conveyed with temporary restrictions on use that are not appropriate for transportation facility use. This is considered a significant impact.
- Future uses of IRP site 3 may be potentially constrained by the implementation of institutional controls.
- IRP site 16 (Crash Crew Pit No.2) is located in the 1.9 Orange County Great Park zoning district. The site may be conveyed with temporary restrictions on use that are not appropriate for recreational land uses.

Table 4.8-1. No Further Action IRP Sites and Zoning

IRP Site	IRP Designation	Adopted Overlay Plan Zoning District

16	Crash Crew Pit No. 2	1.9 Orange County Great Park
17	Communications Station Landfill	1.4 Preservation
24	VOC Source Area	6.1 Institutional/ 1.9 Orange County Great Park/ 3.2 Transit Oriented Development
<i>Source: OCGP FEIR, Table 5.5-4, p. 5.5-22; SEMA Associates (June 7, 2006) (rev June 2008).</i>		

Emergency Plans

The OCGP FEIR determined the Overlay Plan would not be expected to interfere with emergency response and evacuation plans on the basis that other sites within Orange County are already designated as emergency staging areas and portions of the OCGP would remain available to non-aviation emergency response equipment. Accordingly, the OCGP FEIR concluded that the adopted Overlay Plan would not result in a significant impact related to emergency response and evacuation plans.

Wild Land Fires

The OCGP FEIR concluded that the Habitat Reserve, Wildlife Corridor, and Recreational areas in the northeastern portion of Planning Area 51 would be exposed to the highest level of fire risk from wildland fires under the adopted Overlay Plan, and that reuse of existing buildings require inspection for conformance to fire life safety code requirements. The OCGP FEIR identified the wild land fire impacts as potentially significant.

4.8.3 Impacts Associated with the Master Plan Minor Modification and the Park Design Review

The Project encompasses the same land area proposed for park development as depicted in the OCGP FEIR. Therefore, the OCGP FEIR adequately describes the nature and severity of the environmental effects of OCGP Master Plan and its current minor modification and the Park Design Review associated with the “Western Sector Park Development Plan”, the subject of this Addendum, on hazardous materials and wastes.

4. Discussion of Checklist and Mitigation Measures

Hazardous Materials and Wastes

In July 2004, two reports were completed under the auspices of the DON for the property. The Finding of Suitability to Transfer (FOST) documented the environmental condition of the property and the appropriateness of its conveyance. The FOST concluded that 2,798 acres are suitable for transfer by deed for residential purposes and that the parcels can be used with acceptable risk to human health and the environment, and without interference with the environmental restoration process. The companion report, the Finding of Suitability for Lease (FOSL) documents the suitability for lease of 41 carve-out areas totaling approximately 921 acres (refer to the FOSL p. 2-2). The carve-outs are locations within the Property where the potential or known release or disposal of hazardous substances or petroleum products has occurred. Based on the information provided in the FOSL, carve-outs have been deemed suitable for lease subject to specified conditions, notifications, and restrictions set forth in the FOSL and the terms of the leases. Use of these sites has been determined by the DON to be appropriate, subject to use restrictions in the leases, with acceptable risk to human health and the environment and without interference with the environmental restoration process. Overall, the proposed Master Plan Minor Modification and the Park Design Review would not change the OCGP FEIR conclusions; with mitigation measures HH1, HH2, HH5, and HH6, the Project would result in less than significant impacts related to hazardous materials and wastes. No new or modified mitigations measures are required.

Emergency Plans

Like the Overlay Plan, the proposed implementation of the OCGP Master Plan would not be expected to interfere with emergency response and evacuation plans on the base since other sites within Orange County are already designated emergency staging areas and portions of the OCGP would remain available to emergency response equipment. Accordingly, the proposed OCGP Master Plan Minor Modification and the Park Design Review would not change the OCGP FEIR conclusions; the Project would not result in a significant impact related to emergency response and evacuation plans.

Wild Land Fires

Under the OCGP Master Plan the Habitat Reserve, Wildlife Corridor, and recreational areas in the northeastern portion of Planning Area 51 would be exposed to the highest level of fire risk from wildland fires and would require inspection for conformance to fire life safety code requirements.

As the potential significant wildland fire impacts of the OCGP Master Plan are similar to those disclosed in the OCGP FEIR, the OCGP Master Plan Minor Modification and the Park Design Review would not substantially change the findings and conclusions of the OCGP FEIR regarding wild land fires.

Major FEIR Revisions Not Required. Based on the foregoing analysis and information, there is no evidence that the changes to the project require a major change to the certified OCGP FEIR. The proposed Master Plan Minor Modification and the Park Design Review, which does not include any major change to park development areas identified in the approved OCGP Master Plan, will not result in any new significant environmental impact nor is there a substantial increase in the severity of impacts from that described in the certified OCGP FEIR.

4. *Discussion of Checklist and Mitigation Measures*

No Substantial Change in Circumstances Requiring Major FEIR Revisions. There is no information in the OCGP Master Plan Minor Modification and the Park Design Review or otherwise available indicating substantial changes in circumstances that would require major changes to the certified OCGP FEIR.

No New Information of Substantial Importance Showing Greater Significant Effects Than Previous FEIR. This Environmental Evaluation has analyzed all available relevant information and has determined that there is no new information of substantial importance, which was unknown and could not have been known with the exercise of reasonable diligence at the time the OCGP FEIR was approved, augmented, and/or updated, indicating that the project will have one or more significant effects not discussed in the previous FEIR or result in a substantial increase in the severity of previously identified effects.

No New Information of Substantial Importance Showing Ability to Reduce Significant Effects in Previous FEIR. This Environmental Evaluation has analyzed all available relevant information and has determined that there is no new information of substantial importance, which was unknown and could not have been known with the exercise of reasonable diligence at the time the OCGP FEIR was approved, augmented, and/or updated, indicating that: (1) mitigation measures or alternatives previously found not to be feasible would in fact be feasible, and would substantially reduce one or more significant effects of the project, but the project proponent declines to adopt the mitigation measures or alternatives; or (2) mitigation measures or alternatives that are considerably different from those analyzed in the previous FEIR would substantially reduce one or more significant effects on the environment, but the project proponent declines to adopt the mitigation measures or alternatives. There are no alternatives to the project or additional mitigation measures that would substantially reduce one or more of the significant biological effects identified in and considered by the certified OCGP FEIR.

4.8.4 Mitigation from the OCGP FEIR and Applicability to the Master Plan Minor Modification and the Park Design Review

The OCGP FEIR identified six mitigation measures to reduce the effects of the adopted Overlay Plan on public health and safety—specifically, environmental effects associated with hazardous materials and waste, emergency response, and wild land fires—to a level less than significant. However, the mitigation measures were modified and new measures were adopted in the SEIR. An explanation for the new mitigation measures is set forth below.

The certified OCGP FEIR's Mitigation Measure HH1 was updated because much of the abatement it required has been completed. In addition, many of its requirements are triggered upon the transfer of the property from the Navy to the City of Irvine, and that transfer has already occurred for a substantial portion of the property associated with the Modified Project. The new Mitigation Measure HH1 is provided below:

HH1 For any remaining structures known to contain asbestos-containing materials ("ACMs") that will be renovated and/or demolished, Heritage Fields shall ensure that all asbestos is removed and disposed of in accordance with applicable federal, state and local regulatory requirements.

Prior to occupancy, renovation or demolition of any remaining structures constructed before October 1988, and in which the presence of ACMs is unknown, an asbestos survey shall be

4. *Discussion of Checklist and Mitigation Measures*

conducted by Heritage Fields. This requirement can be waived if an architect or project engineer responsible for the construction of the structure or an accredited asbestos inspector signs a statement that no ACM was specified as a building materials, and to the best of their knowledge, no ACMs were used as a building materials, if the asbestos survey identifies ACMs, the applicant shall ensure that all asbestos is removed and disposed of in accordance with applicable federal, state and local regulatory requirements.

Any existing structures in which ACMs have been identified and which will remain in use shall be addressed in an Operation and Maintenance Plan and must be managed in accordance with applicable laws.

Any renovation and/or lead-based paint ("LBP") abatement activities on residential units at former MCAS El Toro, shall be conducted in accordance with all applicable federal, state and local regulatory requirements.

The certified OCGP FEIR's Mitigation Measure HH2 required updating because its requirements were triggered upon the transfer of the property from the Navy to the City of Irvine, and that transfer has already occurred for a substantial portion of the property associated with the Modified Project. In addition, since the certified OCGP FEIR was prepared, FOSTs 4, 5 and 6 have been issued and each of them specifies in detail the nature of the restrictions and institutional controls that must be implemented. The new Mitigation Measure HH2 is provided below:

- HH2** The portions of the Proposed Project Site located on the active Installation Restoration Program ("IRP") Sites listed in Table 4.8-2, *Action Required IRP Sites and Zoning – Modified Project*, of the DSEIR for the Modified Project shall be used only in accordance with the requirements of the applicable Final Finding of Suitability for Transfer or Finding of Suitability to Lease, including in strict compliance with all lease restrictions (such as restrictions against soil or groundwater disturbance without approval from the Department of the Navy and regulators) and all institutional controls (such as restrictions against disturbing the integrity of physical remedial components like caps or groundwater treatment systems and other restrictions imposed by the Department of the Navy).
- HH3** The Community Development Department, in coordination with the Orange County Fire Authority (OCFA), will be responsible for review of all development plans, which would include evaluation of very high fire severity zones, special fire protection plans, and any requirements for fuel modification zones. Projects potentially impacted by wild land fire hazards will be subject to OCFA Guidelines for "Development Within and Exclusion from Very High Fire Severity Zones" and "Fuel Modification Plans and Maintenance." Additionally, all demolition, renovation, and construction activities in the project area will be subject to review by OCFA to ensure adequate fire protection, water flow, emergency access, design features, etc., according to the standards of the Uniform Fire Code and the California Fire Code. Due to the implementation of these standard fire protection procedures, the proposed project is not anticipated to result in significant short- or long-term adverse impacts related to fire hazards.
- HH4** Prior to issuance of occupancy permits of any existing structure at the former MCAS El Toro, a fire life-safety evaluation of the structure including recommendations for improvements required

4. *Discussion of Checklist and Mitigation Measures*

for compliance with current Building Codes for use of existing structures adopted by the City of Irvine and plans for any required improvements shall be submitted to the Chief Building Official for review and approval.

HH5 Prior to the issuance of a grading permit, the applicant shall prepare and the Director of Community Development shall approve a protocol plan (including but not limited to worker training, health and safety precautions, additional testing requirements, and emergency notification procedures) in the event that unknown hazardous materials are discovered during grading, construction, and/or related development activities. Additionally, said protocol plan will be revised should the discovery of previously unknown hazardous materials be made during any of the above mentioned development activities. The applicant and/or property owner that discovers contamination due to past military operations not previously identified by the Department of Navy ("DON") shall be responsible for notifying the DON, appropriate regulatory agencies, and the Director of Community Development of the City of Irvine in a timely manner. Additionally, said Protocol Plan shall be revised should the discovery of previously unknown hazardous materials be made during any of the above mentioned development activities.

HH6 The City of Irvine shall develop and maintain the location and status, as well as other pertinent information, of all monitoring wells on the former MCAS El Toro in a geographic information systems database ("GIS"). The City will review all permit applications on the former air station for monitoring well locations that may be affected by a permit, and require applicants to maintain appropriate access. Access to monitoring wells will be limited to authorized personnel.

4.9 HYDROLOGY AND WATER QUALITY

4.9.1 Environmental Setting

The OCGP FEIR describes the project site as within the San Diego Creek watershed, which includes the San Diego Creek, Peters Canyon Channel, and the tributaries to these water courses. The major drainage channels that traverse the site (PA 51) are the Marshburn Channel, Bee Canyon Channel, Agua Chinon Channel, and Borrego Canyon Channel. Serrano Creek and Upper San Diego Creek Channel traverse PA 30 in the southern tip of the project site, south of the existing SCRRA Metrolink railroad tracks.

San Diego Creek and Upper Newport Bay are listed as impaired water bodies under Section 303(d) of the Clean Water Act. Accordingly, Total Maximum Daily Load (TMDL) for pollutants that have impaired these water bodies has been established and was included in the OCGP FEIR (OCGP FEIR Table 5.7-2). The OCGP FEIR also noted that the County of Orange and the City of Irvine hold a Nationwide Pollution Discharge Elimination System (NPDES) permit for the storm drain systems, and that the State has issued a NPDES general permit relating to construction activities on sites over five acres in the area. Lastly, the flood control improvements associated with the SR-133 toll road were noted in the OCGP FEIR as having reduced the 100-year flood zone north and west of the property.

4. Discussion of Checklist and Mitigation Measures

4.9.2 Impacts Identified in the OCGP FEIR and Addenda

The OCGP FEIR identified several significant impacts on hydrology and water quality associated with future development under the adopted Overlay Plan before mitigation. First, grading and excavation activities required for future development could result in the exposure of bare soils to both wind- and water-related erosion and associated significant water quality impacts (specifically, a violation of water quality standards or waste discharge requirements). Compliance with City grading and water quality regulations-including the NPDES discharge permitting requirements and preparation of a Storm Water Pollution Prevention Plan (SWPPP) and a Water Quality Management Plan (WQMP)-are the primary means of controlling the potential impacts of grading and excavation activities. These City requirements, which are described in mitigation measures H/WQ1 and H/WQ2, will reduce the impact to a less-than significant level.

According to the OCGP FEIR, the existing drainage patterns and stream courses would not be substantially altered by future development under the adopted Overlay Plan. In addition, the potential for inundation is reduced by improvements to upstream flood-control facilities. Without project-related flood-control facilities, the rate or amount of surface runoff due to new development would result in flooding on- and off-site, depending on the nature of the specific development. Although this impact was identified as significant, the effect of increased runoff would be reduced to a less-than-significant level through preparation and implementation of hydraulic studies and recommendations for the specific development and the construction of flood-control improvements commensurate with the specific development (Mitigation Measure H/WQ3).

The impact analysis for the Overlay Plan assumed development of the land use patterns created by the zoning designations for the Overlay Plan area and a backbone storm drain system. The storm drain system took into consideration and included improvements identified in the San Diego Creek Flood Control Master Plan. The drainage plan for the Overlay Plan area included improvements to the major drainages, including Marshburn Channel, Bee Canyon Channel, Agua Chinon Channel, and the Borrego Channel, Wildlife Corridor and Serrano Creek, and San Diego Creek, as described in the OCGP FEIR and addenda.

While conceptually defined in the OCGP FEIR, the foregoing area-wide drainage and flood control facility system has since been undergoing increasingly more definitive design engineering refinement. The latest formal expression of these system enhancements is memorialized in the following documents: Master Plan of Drainage, Fuscoe Engineering February 23, 2007,⁶ Orange County Great Park - Hydrology/Hydraulic Report, Fuscoe Engineering June 12, 2007 (collectively, Fuscoe Reports); Planning Area 51 and Planning Area 30 Bee Canyon, Agua Chinon, Borrego, Serrano and Upper San Diego Creek Update, RBF Consulting February 27, 2008, and Planning Area 51 Marshburn Watershed Update, RBF Consulting March 14, 2008 (collectively, RBF Reports). These reports merely refine the drainage control system components described in the OCGP FEIR. The on-site channels will continue to drain the project site under existing conditions. Additional backbone storm drain facilities will be designed to accommodate the changes in the land use surface runoff within the Great Park Neighborhoods development. The post development hydrology was analyzed per the Orange County Hydrology Manual for a 100-year peak storm design event.

⁶ This report was submitted to the City of Irvine as a part of the Master Subdivision Map application.

4. *Discussion of Checklist and Mitigation Measures*

OCGP FEIR Mitigation Measure H/WQ3 states that prior to approval of the first tentative tract or parcel map in the project area, detailed hydrologic and hydraulic analysis shall be conducted. Studies and analyses shall be prepared in accordance with Orange County Flood Control District (OCFCD) methodologies and standards and the Flood Control Master Plan for San Diego Creek, as well as any additional guidelines in effect at the time of project design. Recommendations contained in the hydrology studies and/or hydraulic analysis to address drainage/flooding issues related to proposed development shall be implemented. In compliance with the mitigation measure, the Fuscoe Reports, and RBF Reports were prepared. The primary focus of these reports was to evaluate the proposed drainage concept for the Great Park Neighborhoods development with respect to surface water hydrology.

4.9.3 Impacts Associated with the Master Plan Minor Modification and the Park Design Review

The OCGP Master Plan Minor Modification and the Park Design Review encompass the same land area proposed for park development as depicted in the OCGP FEIR. The total square footage of buildings has not been increased with this minor modification. Therefore, the OCGP FEIR adequately describes the nature and severity of the environmental effects of OCGP Master Plan and its current minor modification, the subject of this Addendum, on hydrology and water quality.

However, just as the area-wide and off-site drainage and flood control system facility components have undergone continued design engineering refinement, so has the concurrent refinement of on-site drainage and flood control systems.

Major FEIR Revisions Not Required. Based on the foregoing analysis and information, there is no evidence that the changes to the project require a major change to the certified OCGP FEIR. The proposed Master Plan Minor Modification and the Park Design Review, which does not include any major change to park development areas identified in the approved OCGP Master Plan, will not result in any new significant environmental impact nor is there a substantial increase in the severity of impacts from that described in the certified OCGP FEIR.

No Substantial Change in Circumstances Requiring Major FEIR Revisions. There is no information in the OCGP Master Plan Minor Modification and the Park Design Review or otherwise available indicating substantial changes in circumstances that would require major changes to the certified OCGP FEIR.

No New Information of Substantial Importance Showing Greater Significant Effects Than Previous FEIR. This Environmental Evaluation has analyzed all available relevant information and has determined that there is no new information of substantial importance, which was unknown and could not have been known with the exercise of reasonable diligence at the time the OCGP FEIR was approved, augmented, and/or updated, indicating that the project will have one or more significant effects not discussed in the previous FEIR or result in a substantial increase in the severity of previously identified effects.

No New Information of Substantial Importance Showing Ability to Reduce Significant Effects in Previous FEIR. This Environmental Evaluation has analyzed all available relevant information and determined that there is no new information of substantial importance, which was unknown and could not have been known with the exercise of reasonable diligence at the time the OCGP FEIR was approved, augmented, and/or updated, indicating that: (1) mitigation measures or alternatives previously found not

4. Discussion of Checklist and Mitigation Measures

to be feasible would in fact be feasible, and would substantially reduce one or more significant effects of the project, but the project proponent declines to adopt the mitigation measures or alternatives; or (2) mitigation measures or alternatives that are considerably different from those analyzed in the previous FEIR would substantially reduce one or more significant effects on the environment, but the project proponent declines to adopt the mitigation measures or alternatives. There are no alternatives to the project or additional mitigation measures that would substantially reduce one or more of the significant effects on hydrology and/or water quality identified in and considered by the certified OCGP FEIR.

4.9.4 Mitigation from the OCGP FEIR and Applicability to the Master Plan Minor Modification and the Park Design Review

The OCGP FEIR identified four mitigation measures to reduce the effects of the project on hydrology and water quality. All of the mitigation measures are applicable to implementation of the Project and would be carried forward to future development of the project site. Implementation of measures H/WQ 1 through H/WQ 4 (listed below) would reduce project impacts to a less than significant level. However, the mitigation measures were modified in the SEIR to read as follows.

H/WQ1 Prior to issuance of a grading permit, the applicant shall provide evidence that the development of the project area shall comply with City of Irvine adopted Grading and Water Quality Ordinances to ensure that the potential for soil erosion is minimized on a project-by-project basis. Specifically, the NPDES discharge permitting requirements to which the City is obligated will ensure that construction activities reduce, to the maximum extent feasible, the water quality impacts of construction activities. The NPDES permit guidance states that "industrial/commercial construction operations that result in a disturbance of one acre or more of total land area ... and residential construction sites that result in the disturbance of five acres or more ... shall be required to develop and implement BMPs ... to control erosion and siltation and contaminated runoff from the construction sites." Note: In March 2003 this provision will apply to residential construction sites that result in the disturbance of one acre or more.

The City's standard conditions of approval indicate that a Storm Water Pollution Prevention Plan (SWPPP) shall be prepared prior to the approval of grading permits for any project site in order to reduce sedimentation and erosion. The SWPPP shall include the adoption of erosion and sediment control practices such as desilting basins and construction site chemical control management measures.

Additionally, prior to the issuance of a grading permit, project applicants must submit, and the Director of Community Development or designee must have approved, a Water Quality Management Plan (WQMP). The WQMP must identify the Best Management Practices (BMPs) that will be used on the site to control predictable pollutant runoff after the site is occupied. Ongoing operations after construction would be subject to the Countywide Municipal NPDES Stormwater Permit, for which the City is a Co-Permittee. This WQMP shall identify, at a minimum, the routine, structural, and non-structural measures specified in the Countywide NPDES DAMP Appendix which they are applicable to a project, the assignment of long-term maintenance responsibilities (specifying the developer, parcel owner, maintenance association, lessee, etc.), and shall reference the location(s) of structural BMPs.

4. *Discussion of Checklist and Mitigation Measures*

Also in accordance with standard City project permitting and approval procedures, Notices of Intent (NOI) for coverage of projects under the General Construction Activity Storm Water Runoff Permit will be submitted to the State Water Resources Control Board prior to issuance of grading permits in the project area. This requirement will be met to the satisfaction of the Director of Community Development of any disturbance of one acre or more of soil in the project area. Also in force during the period of construction would be the General Dewatering NPDES permit of the Santa Ana RWQCB, as well as the provisions of the Countywide Permit.

The Mitigation Measures will be implemented in accordance with local and State regulatory requirements. As future projects are planned and designed in the project area, specific BMPs and other water quality control methods will be utilized to reduce water quality degradation in the Newport Bay watershed. Future projects in the proposed project area will acknowledge and implement those additional requirements that may be imposed by RWQCB in the future. Compliance with these measures shall be verified by the Community Development Department.

H/WQ2 Prior to issuance of a grading permit, evidence (e.g., in the form of a construction management plan) shall be provided that demonstrates that all stormwater runoff and dewatering discharges from the project area shall be managed to the maximum extent practicable or treated as appropriate to comply with water quality requirements identified in the Santa Ana Regional Water Quality Control Board Basin Plan, including Total Maximum Daily Load (TMDL) Implementation Plan adopted for this watershed.

H/WQ3 Prior to approval of the first tentative tract or parcel map in the project area, detailed hydrologic and hydraulic analysis shall be conducted. Studies and analysis shall be prepared in accordance with OCFCD methodologies and standards and the Flood Control Master Plan for San Diego Creek, as well as any additional guidelines in effect at the time of project design. Recommendations contained in the hydrology studies and/or hydraulic analysis to address drainage/flooding issues related to proposed development shall be implemented. Compliance with this measure shall be verified by the Community Development Department.

H/WQ4 Prior to issuance of a building permit for any unit within the 100-year floodplain, developers with property located in the newly delineated 100-year floodplain shall be required to construct such improvements as necessary to remove the property from the 100-year floodplain. Additionally, the developer shall prepare a Letter of Map Revision (LOMR) request to have the FIRMs revised to remove the development areas from the 100-year floodplain upon completion of the approved flood control facilities. The LOMR request shall be filed upon completion of design of the flood control improvements to contain or redirect the 100-year flood flows away from the property.

After the improvements are constructed, Record Drawings and a maintenance agreement with, or letter from, a public agency shall be submitted to FEMA to complete the LOMR process.

4. Discussion of Checklist and Mitigation Measures

4.10 LAND USE AND PLANNING

4.10.1 Environmental Setting

The OCGP FEIR described the existing and former land uses in Planning Areas 30 and 51, and other areas adjoining and surrounding these planning areas. Subsequent to the City's approval of the General Plan Amendment and Zone Change for the Overlay Plan, DON initiated an auction process for the sale of the former MCAS El Toro property. To facilitate the transfer, the property was divided and presented to prospective buyers as four distinct parcels. Interested parties were invited to bid on one or more of the parcels. In 2005, Heritage Fields, El Toro, LLC successfully purchased all four parcels from the DON (3,671 acres), and entered into a Development Agreement with the City of Irvine on July 12, 2005. The Development Agreement sets forth the terms and conditions of subsequent development and implementation of the Great Park, including dedication in fee of 1,096 acres of the property for development of the Great Park Master Plan.

Consistent with a provision in the Zoning Code, there are interim uses that reuse existing buildings on-site in Planning Area 51. These uses include offices occupied by the Great Park Corporation (GPC). Other tenants include Second Harvest Food Bank and Families Forward. A few parcels, such as Tierra Verde Industries, have been leased and are operating on an interim basis.

4.10.2 Impacts Identified in the OCGP FEIR and Addenda

The OCGP FEIR identified no significant impact to established communities. There were no residents living within the Planning Areas 30 and 51 at the time the OCGP FEIR was prepared and there has been no change in this regard; there are no residents living within the OCGP project site. The OCGP FEIR analyzed certain amendments to the City's General Plan that were adopted on May 27, 2003, as part of the City's adoption of the Overlay Plan. The adopted Overlay Plan was determined to be consistent with each element of the General Plan, as summarized below.

Land Use Element: The goal of the Land Use Element is to "promote land use patterns that maintain safe residential neighborhoods, bolster economic prosperity, preserve open space, and enhance the overall quality of life in Irvine." The "OCGP, Orange County Great Park" land use category was created to reflect the types, intensity, and density of uses and activities contemplated in the OCGP and was determined to be consistent with the goal of the Land Use Element.

Circulation Element: The Circulation Element's goal is to "provide a balanced transportation system." Adoption of the Overlay Plan included the following modifications to the General Plan Circulation Element:

- Policy B-1 (c) was changed to include the following provision:
"In conjunction with individual subdivision map level traffic studies for development proposed in the Overlay Plan area, a LOS [level of service] 'E' would be considered acceptable for application to intersections impacted in Planning Areas 13, 30, 31, 32, 34, 35, and 39."
- Figure B-1 (Master Plan of Arterial Highways) and Figure B-2 (Operational Characteristics) were amended to reflect the alignment of roadways within the OCGP, including:

4. *Discussion of Checklist and Mitigation Measures*

- Marine Way is aligned to join the Bake Parkway northbound exit ramp from Interstate 5 and terminate at Sand Canyon Avenue at Interstate 5.
- Trabuco Road terminates at proposed Meadows Loop Road.
- Rockfield Boulevard is realigned to terminate at Marine Way.
- On-site circulation includes a new commuter highway/collector (Y Street [Ridge Valley]).
- Research Parkway is renamed College Road and modified to extend from Irvine Boulevard to Marine Way.
- Figure B-3 (Public Transit) was amended to reflect the alignment of roadways within the OCGP.
- Figure B-4 (Trails Network) was amended to reflect the alignment of roadways within the OCGP.

Housing Element: The goal of the Housing Element is to "provide for safe and decent housing for all economic segments of the community." The adopted Overlay Plan would add up to 3,625 new dwelling units and carry forward all adopted policies and objectives of the Housing Element; specifically, the residential development component would explore opportunities for maintenance of the housing stock and help the City meet its Regional Housing Needs Assessment through year 2025.

Conservation and Open Space Element: The goal of this element is to "maintain and preserve the environmental systems as a major feature in the City." This goal would be achieved through the implementation of Objectives L-1 through L-12 and corresponding policies. Objective L-10 encourages "the maintenance of agriculture in undeveloped areas of the City until the time of development, and in areas not available for development." The adopted Overlay Plan includes 1,096 acres of Great Park recreational land, 290 acres of permanent agricultural land, and 974 acres of Habitat Preserve.

Cultural Resources: The goal of the Cultural Resources Element is to "ensure the proper disposition of historical, archaeological, and paleontological resources to minimize adverse impacts, and to develop an increased understanding and appreciation for the community's historic and prehistoric heritage, and that of the region." The OCGP FEIR identified the flatland area of the property as a low paleontological sensitivity zone and the hillside areas north of Irvine Boulevard as a high paleontological sensitivity zone. No objective of this element was amended by the adopted Overlay Plan and all of the objectives and implementing policies were to be implemented as part of the adopted Overlay Plan.

Noise Element: The Noise Element's goal is to "contribute to a healthy and safe environment by minimizing noise impacts." The adopted Overlay Plan would not affect the mobile noise, stationary noise, and noise abatement objectives and implementing policies of the Noise Element.

Public Facilities and Services Element: The goal of this element is to "provide a full range of necessary public facilities and services that are convenient to users, economical, reinforce City and community identity, and reflect the participation of citizens." The facilities and services described in the Urban Service Plan for the adopted Overlay Plan were formulated through a public participatory process and found to implement the goal and adopted objectives and related policies of this element.

Integrated Waste Management Element: This element seeks to "encourage solid waste reduction and provide for the efficient recycling and disposal of refuse and solid waste material without deteriorating the environment." The OCGP FEIR disclosed that the Overlay Plan would not affect the adopted objectives and implementing policies regarding solid waste, waste, wastewater, and solid waste facility siting

4. Discussion of Checklist and Mitigation Measures

requirements; rather, it would provide the opportunity to better respond to the City's solid waste reduction requirements and other provisions of the element by broadening the range of design options.

Growth Management Element: The goal of the Growth Management Element is to "ensure that growth and development are integrally planned with, and phased concurrently with, the City of Irvine's ability to provide an adequate circulation system and public facilities." When the OCGP FEIR was certified, it was disclosed that though the project made changes to the *Master Plan of Arterial Highways*, the project would not change any of the objectives or implementing policies of the Growth Management Element.

Parks and Recreation Element: The goal of the Parks and Recreation Element is to "provide park and recreation opportunities at a level that maximizes available funds and enables residents of all ages to utilize their leisure time in a rewarding, relaxing, and creative manner." The OCGP FEIR reported that there would be no change to the objectives or implementing policies of this element.

Seismic Element: The goal of the Seismic Element is to "minimize the loss of life, disruption of goods and services, and the destruction of property associated with an earthquake." Five Seismic Response Area (SRA) designations are used to describe the magnitude and types of potential seismic hazards present within the City, and to provide policy guidance. The OCGP FEIR reported that the majority of the El Toro property was in category SRA-2 and that no objectives or implementing policies would be changed as a result of the project.

Safety Element: The goal of the Safety Element is to "minimize the danger to life and property from manmade and natural hazards, including fire hazards, flood hazards, non-seismic geologic hazards and air hazards." The OCGP FEIR disclosed the need for fuel modification to mitigate potential wildland fire hazards and drainage improvements to lessen flood hazards associated with implementation of the adopted Overlay Plan, and concluded no objectives or implementing policies would be changed as a result of the adopted Overlay Plan.

4.10.3 Impacts Associated with the Master Plan Minor Modification and the Park Design Review

The Project is consistent with the land uses approved in concert with the certification and updates to the OCGP FEIR. The Project would implement approved development, and therefore would not affect the goals, objectives or policies, or the facilities and services described in any of the General Plan Elements. No changes or new impacts would occur. In addition, the Project does not contain elements that would alter the findings, conclusions and mitigation measures since all Project development remains within the previously established project boundaries. The following analysis discussed the Project in consideration of each General Plan Element:

Circulation Element: The goal of the Circulation Element is "to provide a balanced transportation system." The Project would not alter the planned network of arterials and connections to roadways in the surrounding area; nor would they materially change the riding and hiking trails and trail linkages; pedestrian and bicycle circulation; and transit, air transportation, and telecommunication opportunities.

Housing Element: The goal of the Housing Element is to "provide for safe and decent housing for all economic segments of the community." The Project would not permit new residential units or increase allowable development intensity.

4. *Discussion of Checklist and Mitigation Measures*

Cultural Resources: The Project would not affect the adopted goals, objectives, and policies of this element. Development would be required to comply with this element's requirements and to implement mitigation measures found in the OCGP FEIR. With implementation of OCGP FEIR measures P1 and CULT1 through CULT4, the impacts of new development on paleontological and cultural resources would be less than significant. Furthermore, the proper disposition of such resources, if any are encountered prior to or during construction would be ensured; and through the information recovered, the community's understanding and appreciation for its historic and prehistoric heritage would have been enhanced.

Noise Element: The Project would not affect the goal of this element – “to contribute to a healthy and safe environment by minimizing noise impacts” – or the mobile noise, stationary noise, and noise abatement objectives and implementing policies of the element.

Public Facilities and Services Element: The Project would not affect facilities or services described in the Urban Service Plan for the adopted Overlay Plan. As no substantive change in the Urban Service Plan is necessary, and that plan was a principle means of demonstrating consistency with the Public Facilities and Services Element, the Project also is consistent with this element of the General Plan. Additionally, development would be required to implement the element's objectives and policies to ensure that a full range of necessary public facilities and services that are convenient to users are provided.

Integrated Waste Management Element: This element seeks to “encourage solid waste reduction and provide for the efficient recycling and disposal of refuse and solid waste material without deteriorating the environment.” The Project would not affect the adopted objectives and implementing policies regarding solid waste, waste, wastewater, and solid waste facility siting requirements.

Growth Management Element: The goal of the Growth Management Element is to “ensure that growth and development are integrally planned with, and phased concurrently with, the City of Irvine's ability to provide an adequate circulation system and public facilities.” When the OCGP FEIR was certified, it disclosed that though it included changes to the Master Plan of Arterial Highways, the OCGP project would not change any of the objectives or implementing policies of the Growth Management Element. The Project likewise would not alter any of the objectives or implementing policies because it would remain consistent with the development phasing already a part of the overall development plan.

Parks and Recreation Element: The goal of the Parks and Recreation Element is to “provide park and recreation opportunities at a level that maximizes available funds and enables residents of all ages to utilize their leisure time in a rewarding, relaxing, and creative manner.” The OCGP FEIR reported there would be no changes to the objectives or implementing policies of the Element. Furthermore, through the Great Park Development Agreement, Heritage Fields has dedicated 1,096 acres: 367 acres for the park, 165 acres for the sports park, 229 acres for the drainage corridor, 179 acres for the wildlife corridor, and 156 acres for the exposition center south.

Conservation and Open Space Element: The goal of this element is to “maintain and preserve the environmental systems as a major feature in the City.” This goal would continue to be achieved through the implementation of objectives L-1 through L-12 and corresponding policies. Objective L-10 encourages “the maintenance of agriculture in undeveloped areas of the City until the time of development, and in areas not available for development.” The Project would not alter any of the objectives or implementing policies.

4. Discussion of Checklist and Mitigation Measures

Seismic Element: The goal of the Seismic Element is to “minimize the loss of life, disruption of goods and services, and the destruction of property associated with an earthquake.” Five Seismic Response Area (SRA) designations are used to describe the magnitude and types of potential seismic hazards present within the City, and provide policy guidance. The OCGP FEIR reported that the majority of the El Toro property was in category SRA-2. The OCGP FEIR reported that no objectives or implementing policies would be changed as a result of the OCGP project. Likewise, the Project would not alter that finding/conclusion because all Project development remains within the previously established boundaries.

Safety Element: The goal of the Safety Element is to “minimize the danger to life and property from manmade and natural hazards, including fire hazards, flood hazards, non-seismic geologic hazards, and air hazards.” The OCGP FEIR disclosed the need for fuel modification to mitigate potential wildland fire hazards and drainage improvements to lessen flood hazards associated with implementation of the project, and concluded no objectives or implementing policies would be changed as a result of the adopted Overlay Plan. Likewise, the Project would not alter any of the objectives or implementing policies.

Major FEIR Revisions Not Required. Based on the foregoing analysis and information, there is no evidence that the changes to the project require a major change to the certified OCGP FEIR. The proposed Master Plan Minor Modification and the Park Design Review, which does not include any major change to park development areas identified in the approved OCGP Master Plan, will not result in any new significant environmental impact nor is there a substantial increase in the severity of impacts from that described in the certified OCGP FEIR.

No Substantial Change in Circumstances Requiring Major FEIR Revisions. There is no information in the OCGP Master Plan Minor Modification and the Park Design Review or otherwise available indicating substantial changes in circumstances that would require major changes to the certified OCGP FEIR.

No New Information of Substantial Importance Showing Greater Significant Effects Than Previous FEIR. This Addendum has analyzed all available relevant information and has determined that there is no new information of substantial importance that was unknown and could not have been known with the exercise of reasonable diligence at the time the OCGP FEIR was approved, augmented, and/or updated, indicating that the project will have one or more significant effects not discussed in the previous FEIR or result in a substantial increase in the severity of previously identified effects.

No New Information of Substantial Importance Showing Ability to Reduce Significant Effects in Previous FEIR. This Addendum has analyzed all available relevant information and has determined that there is no new information of substantial importance that was unknown and could not have been known with the exercise of reasonable diligence at the time the OCGP FEIR was approved, augmented, and/or updated, indicating that: (1) mitigation measures or alternatives previously found not to be feasible would in fact be feasible, and would substantially reduce one or more significant effects of the project, but the project proponent declines to adopt the mitigation measures or alternatives; or (2) mitigation measures or alternatives that are considerably different from those analyzed in the previous EIR would substantially reduce one or more significant effects on the environment, but the project proponent declines to adopt the mitigation measures or alternatives. Since the OCGP FEIR did not identify any significant land use impacts, there is no need for further alternatives to the project or the imposition of mitigation measure requirements.

4. Discussion of Checklist and Mitigation Measures

4.10.4 Mitigation from the OCGP FEIR and Applicability to the Master Plan Minor Modification and the Park Design Review

The OCGP FEIR identified no significant land use impacts; therefore no mitigation measures were proposed.

4.11 NOISE

4.11.1 Environmental Setting

The OCGP FEIR described mobile noise sources from nearby freeways, roadways, rail facilities, and vehicle use at adjacent commercial businesses, light industrial facilities, and agricultural lands as the dominate noise source in the project area. Stationary sources of noise included temporary and intermittent noise from construction activities and agricultural operations, noise associated with the industrial/business parks to the east and the business park and entertainment uses to the south.

The OCGP FEIR presented the results of a noise survey, in which noise measurements were conducted at nine locations. Ambient noise levels at the four surveyed representative residential locations ranged from 58 dBA to 65 dBA CNEL (Refer to OCGP FEIR p. 5.4-18, Figure 5.4-6, and Table 5.4-7). The audible noise sources included local traffic, distant traffic, birds, aircraft, and human voices, all of which were characterized as typical of suburban areas.

4.11.2 Impacts Identified in the OCGP FEIR and Addenda

The OCGP FEIR concluded that development of the Overlay Plan would not result in any significant noise effects. The noise assessment considered a worst-case condition of simultaneous demolition and construction activities with the combined sound level of 20 pieces of large mobile equipment operating at a distance of 5,000 feet; 5 concrete breakers operating at a distance of 6,000 feet; and 2 crusher plants operating at a distance of 10,000 feet from the nearest off-project area residential location. The distances represented the closest possible location of the construction equipment to the nearest off-project area residences during a heavy construction period. The nearest off-site residential uses (sensitive noise source) were located approximately 4,000 feet from the property boundary. Under this scenario, the analysis estimated sound levels of approximately 56 dBA at the nearest off-site residential location. (Refer to OCGP FEIR, p. 5.4-24 and Table 5.4-8.)

As buildout of the project site was assumed to occur over time (years 2007–2025), construction-related noise impacts on residential areas within the project site were also estimated. Using the same construction equipment assumptions and a distance of 600 feet from the nearest residential area, the combined effect of the equipment was estimated at a sound level of 70 dBA at the nearest on-site residential locations during a heavy construction period. While the City of Irvine Noise Ordinance does not specify a limit on construction noise levels, it stipulates the days and hours during which construction activities may occur and when construction would not be allowed unless a temporary waiver is requested and granted; specifically, construction is allowed Monday through Friday between 7:00 a.m. and 7:00 p.m., and on Saturdays between 9:00 a.m. and 6:00 p.m.; no construction is allowed outside those hours, on Sundays, or on federal holidays. (Refer to OCGP FEIR, p. 5.4-31.)

4. Discussion of Checklist and Mitigation Measures

4.11.3 Impacts Associated with the Master Plan Minor Modification and the Park Design Review

The OCGP FEIR noise assessment considered a worst-case condition of simultaneous demolition and construction activities. The worst-case assumptions described for the adopted Overlay Plan remain reasonable assumptions for the Project; no new information about future demolition and construction has become available that would increase the number of pieces of equipment to be operated simultaneously.

Construction Noise

Construction activities associated with the proposed Project would have a short-term impact on ambient noise levels in the Project vicinity. The OCGP Master Plan Minor Modification and the Park Design Review would not allow any additional development intensity (i.e., building square footage) beyond what is allowed by the adopted Overlay Plan, and therefore would not result in an increase in construction noise levels. In addition, the analytical assumptions concerning construction, development phasing, and operations of the adopted Overlay Plan remain appropriate for the Project. Consequently, the Project would not increase the noise levels generated during construction activities. Therefore, the construction noise levels associated with this component of the Project are anticipated to be similar to those addressed in the OCGP FEIR and Addenda and would not result in any new significant impacts.

Construction Vibration

The OCGP FEIR identified that nuisance vibration from construction activities associated with the adopted Overlay Plan would result in noticeable vibration levels. However, because vibration from construction activities would be temporary, nuisance vibration would be less than significant. The Project would not generate significantly higher levels of vibration. Therefore, the construction vibration levels associated with the Project are anticipated to be similar to those addressed in the OCGP FEIR and Addenda and would not result in any new significant impacts.

Operation

Current information regarding the noise impacts within the Project site were previously evaluated in the OCGP FEIR. The OCGP FEIR concluded that noise associated with land uses would not be significant with use of acoustical design features (e.g., sound insulating construction, perimeter barrier walls, acoustical equipment enclosures, and operational restrictions) incorporated to comply with the local regulations. The OCGP Master Plan Minor Modification and the Park Design Review would not result in land use changes that would increase project-related stationary or mobile source noise generated by the project. Therefore, noise levels associated with the Project are anticipated to be similar to those addressed in the OCGP FEIR and would not result in any new significant impacts.

Traffic Noise

The Environmental Noise Assessment prepared for the OCGP FEIR identified a traffic noise screening analysis threshold of 1.5 dBA for all project-related traffic noise level increases where the resulting noise levels would be in excess of 65 dBA, and required further analysis where that screening threshold was met within residential and other sensitive areas. Although changes in noise levels of 3 dBA are considered "barely perceptible," and changes of 5 dBA are considered "clearly noticeable," the OCGP

4. Discussion of Checklist and Mitigation Measures

FEIR used this 1.5 dBA noise level screening threshold to be conservative. The OCGP FEIR concluded that the development within Planning Areas 30 and 51 would cause no significant impact on account of traffic noise.

Traffic volumes have been predicted for on-site roadways within the Western Sector Park Development based on the minor modification to the Great Park Master Plan consisting mainly of changes to the proposed buildings. Two traffic analyses were conducted by a technical consultant (LSA Associates) for the minor modifications to the Master Plan and the Western Sector Park Development Plan-Phase 1 (LSA, August 2011). The August 2011 traffic analysis concluded that minor modification to the Great Park Master Plan would generate an additional 600 daily trips on a typical weekend day on all roadways in the study area. Project-generated, operation-related noise from roadway traffic on roadways was modeled. Inputs and assumptions applied to traffic noise predictions are shown in Appendix C.

Based on the traffic noise modeling, traffic noise level increases for on-site Project roadways would range from 0 dBA to 6 dBA. The OCGP Master Plan Minor Modification and the Park Design Review would not, however, result in traffic noise level changes that would increase project-related traffic noise generated by the Project or result in traffic noise levels that exceed 65 dBA at noise sensitive receptors. The land uses along these specific roadway segments are not considered noise sensitive. Therefore, noise levels associated with the Project are anticipated to be similar to those addressed in the OCGP FEIR and would not result in any new significant impacts.

Airport Noise

The former MCAS El Toro operations have ceased and no public airport, public use airport, or airport land use plan exists in the Project vicinity.

Land Use Compatibility

The minor modification would consist of changes to proposed buildings within the project. Buildings that would be no longer part of the OCGP Master Plan Minor Modification and the Park Design Review include the Air Museum, Air Museum Hangar, and Concessions / Retail at the Sports Park. These buildings would be replaced by an Artist in Residency Facility, Hangar 244, Community Ice Facility, and Nature Education Garden. The overall square footage of the buildings within the OCGP Master Plan Minor Modification and the Park Design Review would remain the same because the size of the three Civic / Museums within the OCGP Master Plan would also be reduced to accommodate the additional square footages of the new buildings. Specific to the Artist in Residency Facility, these studios would be used as work-places for artists but would not be used as residences. In addition, normal activities would occur during business hours. For these reasons, studios at the Artist in Residency Facility are not considered noise-sensitive receptors.

Although the Project would result in changes to buildings in the Master Plan Development, overall land use types and activities would remain substantially similar to the adopted Overlay Plan. Because the OCGP FEIR and Addenda did not identify any significant impacts related to land use compatibility, the proposed Project is also compatible with the Irvine General Plan and zoning code for noise and vibration compatibility.

4. Discussion of Checklist and Mitigation Measures

Major FEIR Revisions Not Required. Based on the foregoing analysis and information, there is no evidence that the changes to the project require a major change to the certified OCGP FEIR. The proposed Master Plan Minor Modification and the Park Design Review, which does not include an major change to park development areas identified in the approved OCGP Master Plan, will not result in any new significant environmental impact nor is there a substantial increase in the severity of impacts from that described in the certified OCGP FEIR.

No Substantial Change in Circumstances Requiring Major FEIR Revisions. There is no information in the OCGP Master Plan Minor Modification and the Park Design Review or otherwise available indicating substantial changes in circumstances that would require major changes to the certified OCGP FEIR.

No New Information of Substantial Importance Showing Greater Significant Effects Than Previous FEIR. This Initial Study/Addendum has analyzed all available relevant information and has determined that there is no new information of substantial importance, which was unknown and could not have been known with the exercise of reasonable diligence at the time the OCGP EIR was approved, augmented, and/or updated, indicating that the project will have one or more significant effects not discussed in the previous EIR or result in a substantial increase in the severity of previously identified effects.

No New Information of Substantial Importance Showing Ability to Reduce Significant Effects in Previous FEIR. This Initial Study/Addendum has analyzed all available relevant information and has determined that there is no new information of substantial importance, which was unknown and could not have been known with the exercise or reasonable diligence at the time the OCGP FEIR was approved, augmented, and/or updated, indicating that; (1) mitigation measures or alternatives previously found not to be feasible would in fact be feasible, and would substantially reduce one or more significant effects of the project, but the project proponent declines to adopt the mitigation measures or alternatives; or (2) mitigation measures or alternatives that are considerably different from those analyzed in the previous EIR would substantially reduce one or more significant effects on the environment, but the project proponent declines to adopt the mitigation measures or alternatives. There are no alternatives to the project or additional mitigation measures that would substantially reduce one or more of the significant noise effects identified in and considered by the certified OCGP FEIR.

4.11.4 Mitigation from the OCGP FEIR and Applicability to the Master Plan Minor Modification and the Park Design Review

The OCGP FEIR identified no significant noise impacts; therefore no mitigation measures were proposed and none is required for the proposed project.

4.12 POPULATION AND HOUSING

4.12.1 Environmental Setting

The OCGP FEIR discussed the caretaker status of the MCAS El Toro base following its closure. At the time the OCGP FEIR was prepared, there was a limited number of military and civilian staff working on the base; however, currently, there are no residents living on the former base. Consequently, there were 4,380 vacant group quarters units and 1,209 residential dwelling units. The OCGP FEIR examined

4. *Discussion of Checklist and Mitigation Measures*

demographics in the context of the existing and projected population of the Orange County region and the City of Irvine. Population and housing information was developed based on the 2000 United States Bureau of Census population, household, and employment census information. The most recent Census was conducted in 2010 ("2010 Census") and this data is used, when available, for analysis in this section. The areas surrounding the former base and the Orange County subregion are considered jobs-rich and housing-poor. The Southern California Association of Governments (SCAG) seeks to encourage housing growth over job growth in the Orange County subregion. At the same time, Southern California has been profoundly impacted by the current recession and housing crises, indicative of a higher unemployment rate and a distressed housing market. Despite the recent fluctuations in the job and housing markets, SCAG continues its efforts to improve the jobs-to-housing ratio in Orange County.

The OCGP FEIR reported that the ratio of jobs to housing in the area has environmental implications related to transportation and air quality. Thus, a major focus of the regional planning efforts has been to improve the ratio of jobs to housing in all affected subregions in order to reduce the vehicular trips, costly infrastructure improvements, and resultant air emissions.

4.12.2 Impacts Identified in the OCGP FEIR and Addenda

As noted above, the area surrounding the former MCAS El Toro and the Orange County subregion are considered jobs-rich and housing-poor. SCAG seeks to improve the jobs-to-housing ratio in the Orange County subregion. The OCGP FEIR reported that regional projections are dynamic and, as a compilation of local land use projections, reflect changing community views on the location and the types of growth desired. The Orange County Council of Governments (OCCOG) adopted the Orange County Projections 2010 report (OCP-2010), which provides projections of anticipated growth for Orange County in terms of population, housing and employment based on detailed information about growth trends, development and local land use provided by Orange County jurisdictions and public agencies; infrastructure, utility and service providers; and the private sector. OCP-2010 accounts for projects in progress, including the 1,269 density bonus units. According to the OCP-2010, forecast growth rates for population, dwelling units, and employment in Irvine over the 2008-2035 period are all higher than the corresponding rates for the entire Orange County area, as shown in Table 4.12-1.

Table 4.12-1. OCP-2010 Projections for Orange County and the City of Irvine, 2008-2035

	2008	2010	2020	2035	Change, 2010-2035	
					Total	Percent
Orange County						
Population	3,123,058	3,182,061	3,430,505	3,582,266	400,205	12.6%
Dwelling Units	1,035,005	1,045,959	1,100,260	1,174,912	128,953	12.3%
Employment	1,624,061	1,510,928	1,646,437	1,799,477	288,549	19.1%
City of Irvine						
Population	210,761	223,024	271,340	309,977	86,953	39.0%
Dwelling Units	78,955	83,103	100,572	117,427	34,324	41.3%
Employment	223,480	203,831	236,641	286,492	82,661	40.6%
Source: OCGP DSEIR, Table 5.8-3, p. 5.8-3; Center for Demographic Research, Cal State Fullerton. "2010 Orange County Projections", released January 27, 2011.						

4. Discussion of Checklist and Mitigation Measures

According to OCP-2000, as of June 2000, Orange County had approximately 1.5 million jobs. According to OCP-2010, that number was projected to increase to approximately 1.51 million by 2010. OCP-2010 projects that jobs in Orange County will grow by 288,549 between 2010 and 2035, which amounts to an average of 11,542 jobs per year (a 19.1 percent increase in jobs over the 25-year period).

Although implementation of the Overlay Plan would not have exceeded the OCP-2010 employment projections, its impact on employment was considered significant because the Orange County subregion is anticipated to become increasingly jobs-rich over the next 20 years and the Overlay Plan-related employment would exacerbate the subregional jobs/housing imbalance. As discussed in the OCGP FEIR, the Overlay Plan is expected to result in:

- An increase of up to 9,000 residents
- A provision of 3,625 dwelling units
- An approximate increase of 16,510 jobs
- An on-site jobs-housing ratio of 4.55

The increase in population would not substantially exceed projections contained for the site in OCP-2010. The increase in jobs, however, would contribute to worsening Orange County's jobs/housing ratio imbalance and is therefore considered a significant impact. The OCGP FEIR identified less than significant impacts for population and housing, and a significant and unavoidable impact for employment.

In 2008, the City granted 1,269 density bonus residential units to Heritage Fields pursuant to state law. Consequently, the Overlay Plan now includes a total of 4,894 residential units, and a total of 12,462 residents, based on estimates of persons per household in the City's General Plan. The Overlay Plan, including the 1,269 density bonus units, was included in the City's data for OCP-2010, which will in turn be used by SCAG to establish regional growth forecasts. Therefore, the population, housing and employment growth created by the Overlay Plan is consistent with OCP-2010 regional planning projections, and will be consistent with anticipated forecasts forthcoming from SCAG. OCP-2010 estimates a jobs-housing balance of 2.45 in Irvine in 2010 and 2.44 in 2035, as shown in Table 4.12-2. The Overlay Plan would contribute to making the community more jobs-housing balanced over time.

Table 4.12-2. OCP-2010 Jobs to Housing Ratio for Orange County and the City of Irvine, 2008-2035

	2008	2010	2020	2035
Orange County				
Dwelling Units	1,035,005	1,045,959	1,100,260	1,174,912
Employment	1,624,061	1,510,928	1,646,437	1,799,477
<i>Jobs-Housing Ratio</i>	<i>1.57</i>	<i>1.44</i>	<i>1.50</i>	<i>1.53</i>
City of Irvine				
Dwelling Units	78,955	83,103	100,572	117,427
Employment	223,480	203,831	236,641	286,492
<i>Jobs-Housing Ratio</i>	<i>2.83</i>	<i>2.45</i>	<i>2.35</i>	<i>2.44</i>
<i>Source: OCGP DSEIR, Table 5.8-7, p. 5.8-8; Center for Demographic Research, Cal State Fullerton. "2010 Orange County Projections", released January 27, 2011.</i>				

4. Discussion of Checklist and Mitigation Measures

The 16,510 new jobs contemplated in the Certified EIR will still be generated under the Overlay Plan. Therefore, the Overlay Plan, which includes 4,894 residential units, would have an on-site jobs-housing ratio of 3.37, which is substantially improved from the 4.55 ratio associated with the 3,625 units analyzed in the Certified EIR. However, since the 3.37 jobs-housing ratio is still greater than Irvine's existing jobs-housing ratio of 2.45, the Overlay Plan's significant impact to the jobs-housing balance remains.

4.12.3 Impacts Associated with the Master Plan Minor Modification and the Park Design Review

The Project would not alter the population, housing, and employment information contained in the OCGP FEIR. The Project would not introduce new levels of development that would improve the ratio of jobs to housing beyond that already analyzed in the OCGP FEIR. The Project's impacts would be the same as those identified in the OCGP FEIR, less than significant for population and housing, and significant and unavoidable for employment.

Major FEIR Revisions Not Required. Based on the foregoing analysis and information, there is no evidence that the changes to the project require a major change to the certified OCGP FEIR. The proposed Master Plan Minor Modification and the Park Design Review, which does not include any major change to park development areas identified in the approved OCGP Master Plan, will not result in any new significant environmental impact nor is there a substantial increase in the severity of impacts from that described in the certified OCGP FEIR.

No Substantial Change in Circumstances Requiring Major FEIR Revisions. There is no information in the Master Plan Minor Modification and the Park Design Review or otherwise available indicating substantial changes in circumstances that would require major changes to the certified OCGP FEIR.

No New Information of Substantial Importance Showing Greater Significant Effects Than Previous FEIR. This Addendum has analyzed all available relevant information and has determined that there is no new information of substantial importance that was unknown and could not have been known with the exercise of reasonable diligence at the time the OCGP FEIR was approved, augmented, and/or updated, indicating that the Project will have one or more significant effects not discussed in the previous FEIR or result in a substantial increase in the severity of previously identified effects.

No New Information of Substantial Importance Showing Ability to Reduce Significant Effects in Previous FEIR. This Addendum has analyzed all available relevant information and has determined that there is no new information of substantial importance that was unknown and could not have been known with the exercise of reasonable diligence at the time the OCGP FEIR was approved, augmented, and/or updated, indicating that: (1) mitigation measures or alternatives previously found not to be feasible would in fact be feasible, and would substantially reduce one or more significant effects of the Project, but the Project proponent declines to adopt the mitigation measures or alternatives; or (2) mitigation measures or alternatives that are considerably different from those analyzed in the previous EIR would substantially reduce one or more significant effects on the environment, but the project proponent declines to adopt the mitigation measures or alternatives. There are no alternatives to the Project or additional mitigation measures that would substantially reduce one or more of the significant effects on population and housing identified in and considered by the approved OCGP FEIR.

4. Discussion of Checklist and Mitigation Measures

4.12.4 Mitigation from the OCGP FEIR and Applicability to the Master Plan Minor Modification and the Park Design Review

The OCGP FEIR identified a significant impact associated with the jobs/housing ratio. The OCGP FEIR also stated that no mitigation is available to rectify conflicts between the numerical objectives of regional planning documents including the jobs/housing ratio. This finding remains applicable to the OCGP Master Plan Minor Modification including the park design review.

4.13 PUBLIC SERVICES

4.13.1 Environmental Setting

Law Enforcement

At the time of the certification of the OCGP FEIR, law enforcement was provided by the Orange County Sheriff through a contract with the Department of the Navy (DON) in Planning Area 51. Subsequent to the annexation of the property not within the City limits, the City of Irvine Police Department has assumed law enforcement responsibility within Planning Area 51. The Irvine Police Department is headquartered at the Irvine Civic Center Complex and also has a satellite facility in the Irvine Spectrum Entertainment Complex. The OCGP FEIR concluded that the police facilities were adequate to handle the personnel and equipment that were employed and utilized by the department. The OCGP FEIR also stated that the Irvine Police Department was researching the expansion of their facilities, although the specific details of constructing a substation were not known.

Fire and Emergency Medical Services

At the time of the certification of the OCGP FEIR, primary fire protection to Planning Area 51 was provided by Orange County Fire Authority (OCFA) under contract to the County of Orange on an interim basis. Subsequent to the annexation of the property, OCFA has continued to provide fire protection service to the project area. The OCGP FEIR stated that OCFA was planning two additional fire stations in the general vicinity to serve Planning Area 51. OCFA also has in place an agreement with the Irvine Company as part of the Northern Sphere Area that should provide adequate service to all areas surrounding the project.

Parks and Recreation

A portion of the OCGP is currently operating on an interim basis with recreation facilities that are open to the public. The proposed park design plans will formalize these interim uses as well as conceptually approve others. In addition, many public facilities are located within five miles of the OCGP including neighborhood and community parks, recreational trails, and open space.

There are approximately 506 acres of neighborhood and community parks and recreational trails in the City of Irvine's public park system, including one aquatic complex containing three competition size pools. William R. Mason Regional Park, a County of Orange facility, and numerous private parks and recreation facilities are also available throughout Irvine that provide additional recreational opportunities for the City's residents.

4. Discussion of Checklist and Mitigation Measures

The City of Irvine, through its Conservation and Open Space Element has established an open space program comprehensively aggregating open space, adjoining other regional open space, and promoting conservation and passive recreational opportunities (e.g. Bommer Canyon, Shady Canyon and Limestone Canyon).

At the time of the certification of the OCGP FEIR, Department of the Navy (DON), acting in a caretaker's role, offered public access to a variety of existing recreational facilities including the existing Marine Memorial Golf Course and equestrian stables. Currently, these facilities remain closed and are under demolition and preparation for future development.

School Services

Planning Area 51 is within the school service boundaries of the Irvine Unified School District (IUSD) and the Saddleback Valley Unified School District (SVUSD). Prior to the closure of the base, an IUSD elementary school with a 600-student capacity was operating on the former base property.

4.13.2 Impacts Identified in the OCGP FEIR and Addenda

Law Enforcement

The OCGP FEIR discussed the law enforcement needs of Planning Area 51 and stated that following annexation, the Irvine Police Department would provide law enforcement for the entire project area. The OCGP FEIR also analyzed the number of police officers, police supervisors and support staff, as well as the number of vehicles, equipment, and services. The OCGP FEIR stated that police protection for the park area would be funded through the use of a special park assessment. As stated in the OCGP FEIR, the general impacts associated with construction and operation of public facilities were analyzed in the OCGP FEIR as part of the planned land uses which also included the construction of a new Police substation.

Fire and Emergency Medical Services

Subsequent to annexation of the property, Planning Area 51 would continue to be served by OCFA. The OCGP FEIR stated that it was likely that additional fire services infrastructure would be required to support the proposed project. OCFA had not provided the detailed calculations of the extent of new services. The OCGP FEIR stated that the final determination of fire station needs and locations would be made at a future date when more information is known about risk, layout, and types of occupancy. The specific environmental impact of constructing the new fire facilities to serve the project could not be determined at the General Plan level of analysis as specific site plans and locations had not been prepared. However, the general impacts associated with the construction and operation of public facilities were addressed within the OCGP FEIR. A temporary fire station is currently located a short distance from the main entrance to the OCGP.

Parks and Recreation

As discussed in detail in OCGP FEIR, the parkland acreage under the project would greatly exceed the existing City of Irvine's standards, and would provide a regional open space amenity for the benefit of

4. Discussion of Checklist and Mitigation Measures

Orange County. The OCGP FEIR calculated a total of 45.1 acres of parkland required for the proposed development. A portion of that acreage would be in neighborhood parks.

The community park requirement for the future Great Park Neighborhoods development has been addressed through the Development Agreement between the City and Heritage Fields (Recorded on July 12, 2005) and reflected in the amended and Restated Development Agreement (December 2010). Conveyance of the OCGP to the City satisfied any requirement imposed on the developer for the dedication or development of community parks as required by the City's General Plan and Municipal Ordinance. The neighborhood park requirements for the future Great Park Neighborhoods development would be met within the Great Park Neighborhoods development, outside the OCGP. Details of specific park locations, ownership, sizes, and improvements would be presented to the Community Services Commission as a part of the Park Plan for the new residential developments. Since the OCGP Master Plan does not create a demand for parks and recreation but is itself a park and recreation amenity, no new impacts on parks and recreation are anticipated. This is consistent with the findings of the OCGP FEIR.

School Services

The OCGP FEIR discussed in detail the proposed project, the related student generation, and the required school facilities. Based on an initial analysis, the IUSD estimated the need for one 13-acre K-8 site as well as funding for expansion and modernization of existing middle and high school facilities by project buildout.

4.13.3 Impacts Associated with the Master Plan Minor Modification and the Park Design Review

Law Enforcement

The Project does not change the intensity or type of the land uses and therefore, the demand on law enforcement is within the envelope of analysis presented in the OCGP FEIR.

Fire and Emergency Medical Services

Since the Project does not change the intensity or type of land uses, the demand on fire protection is consistent with the analysis presented in the OCGP FEIR.

Parks and Recreation

The Project does not propose changes to the land use intensity and type. Therefore, the demand and potential impact on parks and recreation remains consistent with the analysis contained in the OCGP FEIR.

School Services

The Project does not propose changes to the land use intensity and type. Therefore, the demand and potential impact on school services remains consistent with the analysis contained in the OCGP FEIR.

4. *Discussion of Checklist and Mitigation Measures*

Major FEIR Revisions Not Required. Based on the foregoing analysis and information, there is no evidence that the changes to the project require a major change to the certified OCGP FEIR. The proposed Master Plan Minor Modification and the Park Design Review, which does not include any major change to park development areas identified in the approved OCGP Master Plan, will not result in any new significant environmental impact nor is there a substantial increase in the severity of impacts from that described in the certified OCGP FEIR.

No Substantial Change in Circumstances Requiring Major FEIR Revisions. There is no information in the Master Plan Minor Modification and the Park Design Review or otherwise available indicating substantial changes in circumstances that would require major changes to the certified OCGP FEIR.

No New Information of Substantial Importance Showing Greater Significant Effects Than Previous FEIR. This Environmental Evaluation has analyzed all available relevant information and has determined that there is no new information of substantial importance, which was unknown and could not have been known with the exercise of reasonable diligence at the time the OCGP FEIR was approved, augmented, and/or updated, indicating that the project will have one or more significant effects not discussed in the OCGP FEIR or result in a substantial increase in the severity of previously identified effects.

No New Information of Substantial Importance Showing Ability to Reduce Significant Effects in Previous FEIR. This Environmental Evaluation has analyzed all available relevant information and has determined that there is no new information of substantial importance, which was unknown and could not have been known with the exercise of reasonable diligence at the time the OCGP FEIR was approved, augmented, and/or updated and addenda were approved, indicating that: (1) mitigation measures or alternatives previously found not to be feasible would in fact be feasible, and would substantially reduce one or more significant effects of the project, but the project proponent declines to adopt the mitigation measures or alternatives; or (2) mitigation measures or alternatives that are considerably different from those analyzed in the OCGP FEIR would substantially reduce one or more significant effects on the environment, but the project proponent declines to adopt the mitigation measures or alternatives. There are no alternatives to the project or additional mitigation measures that would substantially reduce one or more of the significant public services-related effects identified in and considered by the certified OCGP FEIR.

4.13.4 Mitigation from the OCGP FEIR and Applicability to the Master Plan Minor Modification and the Park Design Review

The OCGP FEIR determined the mitigation measures identified in other sections of the OCGP FEIR (Sections 5.1-5.13) address the impacts associated with the construction and operation of public facilities. These measures would be applicable to any new construction and operation of facilities for police, fire protection, park and recreation, and education services.

4.14 RECREATION

Issues related to Recreation are discussed above under Section 4.13, *Public Services*.

4. Discussion of Checklist and Mitigation Measures

4.15 TRANSPORTATION/TRAFFIC

4.15.1 Environmental Setting

The OCGP FEIR describes the traffic and circulation conditions of a study area that encompassed 145 existing intersection analysis sites (2007) and an additional 11 future sites (Post 2025) in the City of Irvine, and portions of 7 adjacent jurisdictions including the Cities of Lake Forest, Mission Viejo, Laguna Hills, Laguna Woods, Aliso Viejo, Laguna Beach, and unincorporated areas of Orange County. Figure 4-4, OCGP FEIR – Traffic Impact Study Area depicts the study area covered by the traffic study contained in the OCGP FEIR.

The OCGP FEIR used the City of Irvine Traffic Performance Criteria, which establishes level of service (LOS) “A” to “D” as the peak-hour minimum acceptable service level. In its adoption of the Overlay Plan, the City General Plan Policy B-1(C), which identified LOS E as acceptable for application to intersections in Planning Areas 13, 31, 32, 34, 35 and 39, was changed to include the effects of future development in Planning Areas 30 and 51 on the intersections in those Planning Areas.

The City’s performance criteria also includes a standard of 0.02—roadway volume to capacity (V/C) ratio or the intersection capacity utilization (ICU)—to identify significant project impacts and associated need for improvements at both roadways and intersections.

4.15.2 Impacts Identified in the OCGP FEIR

The OCGP FEIR concluded that the adopted Overlay Plan would cause an increase in traffic which would be substantial in relation to the existing traffic load and capacity of the street system—that is, a substantial increase in either the number of vehicle trips, the V/C on roadways, or congestion at intersections—in the year 2007, year 2025, and post-2025 scenarios (OCGP FEIR page 5.2-66):

Year 2007

- I-5 Freeway at Alton Parkway—southbound off-ramp (A.M.)
- I-405 Freeway at Irvine Center Drive—southbound off-ramp (A.M.)

Year 2025

- University Drive from the I-405 Freeway to Michelson Drive (A.M.)
- I-5 Freeway from Sand Canyon Avenue to Jeffrey Road—northbound (P.M.)
- I-5 Freeway from Jeffrey Road to Sand Canyon Avenue—southbound (A.M.)
- I-405 Freeway from Jeffrey Road to Sand Canyon Avenue—southbound (A.M.)
- I-5 Freeway at Jeffrey Road—southbound on-ramp (A.M.)
- I-5 Freeway at Sand Canyon Avenue—northbound on-ramp (P.M.)
- I-5 Freeway at Sand Canyon Avenue—southbound off-ramp (A.M.)
- I-5 Freeway at Alton Parkway—southbound off-ramp (A.M.)
- I-5 Freeway at Bake Parkway—southbound off-ramp (A.M.)
- I-405 Freeway at Sand Canyon Avenue—northbound direct on-ramp (P.M.)

4. *Discussion of Checklist and Mitigation Measures*

- I-405 Freeway at Sand Canyon Avenue—southbound off-ramp (A.M.)
- I-405 Freeway at Irvine Center Drive—southbound off-ramp (A.M.)
- SR-241 Tollway at Lake Forest Drive—southbound off-ramp (A.M.)
- SR-133 Freeway at Barranca Parkway—northbound direct on-ramp (P.M.)

Post-2025

- I-5 Freeway from Sand Canyon Avenue to Jeffrey Road—northbound (P.M.)
- I-5 Freeway from Jeffrey Road to Sand Canyon Avenue—southbound (A.M.)
- I-405 Freeway from Jeffrey Road to Sand Canyon Avenue—southbound (A.M.)
- I-5 Freeway at Jeffrey Road—southbound on-ramp (A.M.)
- I-5 Freeway at Jeffrey Road—northbound off-ramp (P.M.)
- I-5 Freeway at Sand Canyon Avenue—northbound on-ramp (P.M.)
- I-5 Freeway at Sand Canyon Avenue—southbound off-ramp (A.M.)
- I-5 Freeway at Alton Parkway—southbound off-ramp (A.M.)
- I-5 Freeway at Bake Parkway—southbound off-ramp (A.M.)
- I-5 Freeway at El Toro Road—southbound off-ramp (P.M.)
- I-405 Freeway at Sand Canyon Avenue—northbound direct on-ramp (A.M. /P.M.)
- I-405 Freeway at Sand Canyon Avenue—southbound off-ramp (A.M.)
- I-405 Freeway at Irvine Center Drive—southbound off-ramp (A.M.)

Intersections

For the list of impacted intersections by analysis year, please refer to the following OCGP FEIR tables:

- Table 5.2-12 for year 2007
- Table 5.2-13 for year 2025
- Table 5.2-15 for post 2025

Freeway/Tollway Locations

The OCGP FEIR concluded that the adopted Overlay Plan would exceed, either individually or cumulatively, a level of service standard established by the county congestion management agency for designated roads or highways in the 2007 and 2025 scenarios. The Overlay Plan will impact the following:

Year 2025

- I-5 from Sand Canyon Avenue to Jeffrey Road – northbound (PM)
- I-5 from Jeffrey Road to Sand Canyon Avenue – southbound (AM)
- I-405 from Jeffrey Road to Sand Canyon Avenue – southbound (AM)

4. Discussion of Checklist and Mitigation Measures

Intersections

Year 2007

- El Toro Road/Avenida de la Carlota

Year 2025

- El Toro Road/Avenida de la Carlota

4.15.3 Impacts Analyzed in the OCGP FEIR and Addenda

The OCGP FEIR utilized trip thresholds (also known as “trip caps”) for each of the planning areas within the Great Park area. The trip cap is based on socioeconomic data average daily trip generation for the approved Orange County Great Park plan (the Overlay Plan area), which includes the Heritage Fields development. The traffic impacts of the 2006 GPA/ZC project were analyzed in Addendum No. 2 by distributing project-related traffic over existing and future traffic conditions. The three future conditions (year 2010, year 2025 and post-2025) are based on the existing circulation system plus fully funded intersection improvements that were planned to be in place in each future time frame and the land use and development growth that is projected in each future time frame. In each case, project impacts were identified by comparing traffic conditions with and without the 2006 GPA/ZC project.

The circulation system performance criteria applied in the analysis were the criteria approved in the 2003 North Irvine Transportation Model (NITM) Program Nexus Study. The performance criteria were also consistent with the criteria adopted by the jurisdictions that are within the project study area. The criteria include components for arterial roadways, intersections, freeway/tollway ramps, and freeway/tollway mainline segments.

The results of the year 2010, year 2025 and post-2025 analysis indicated that the proposed 2006 GPA/ZC project was not forecast to significantly impact any roadway segment based on the second level of analysis (the City’s peak hour link capacity analysis methodology), intersection, freeway/tollway ramp, or any freeway/tollway mainline segment.

Subsequently, as addressed in Addendum No. 3, a Traffic Study (Appendix C of Addendum No. 3) for the Master Subdivision Map was prepared by Austin-Foust Associates, Inc. to address the transportation impacts for the “project,” i.e. backbone infrastructure with no new land use development in an interim year timeframe consistent with the TTM scope of work of the North Irvine Transportation Mitigation (NITM) Program Ordinance. The Traffic Study analyzed the impacts of the Master Subdivision Map (MSM) application based on Year 2010 traffic conditions in the traffic analysis study area.

That project was presented in Figure 4-2 to Addendum No. 3, and included Marine Way from Sand Canyon Avenue to Bake Parkway, Trabuco Road from the SR-133 to “O” Street, and the extension of Rockfield Boulevard to Marine Way as four-lane primary arterials, Ridge Valley (formerly “Y” Street) from Portola Parkway to Irvine Boulevard and “O” Street (formerly College Road) as four-lane secondary arterials between Irvine Boulevard and Trabuco Road, Trabuco Road east of “O” Street, “A” Street, “B”

4. Discussion of Checklist and Mitigation Measures

Street, “C” Street and “D” Street as two-lane local road ways. The mid-block lanes were shown in Figure 4-3 to Addendum No. 3. It should be noted that the project included the construction of two lanes on “O” Street between Trabuco Road and Marine Way. Two additional lanes would be built by the owner of the adjacent property (west side of “O” Street) when that property is developed.

An Internal Circulation Analysis (Appendix D to Addendum No. 3) for the Master Subdivision Map in the Overlay Plan area was prepared by Austin-Foust Associates, Inc. to analyze the access and internal circulation for the Heritage Fields project. The project traffic loaded directly onto the surrounding arterial system at several locations. These include access to Irvine Boulevard via Ridge Valley; “O” Street (formerly College Road), “A” Street and “B” Street to Sand Canyon Avenue via Trabuco Road and Marine Way (and indirectly via Irvine Boulevard); and to Alton Parkway, Barranca Parkway, and Bake Parkway via Marine Way. Project access to the SR-133 is provided directly via a planned interchange at Trabuco Road and indirectly via “O” Street to the Irvine Boulevard interchange.

The intersections shown in Figure 4-5 in Addendum No. 3 were analyzed using intersection capacity utilization (ICU) values to determine level of service (LOS). The results of this analysis showed that all intersections operate at an acceptable level of service under Post-2025 buildout conditions. The intersections were then analyzed for signalization needs. Traffic signal warrants based on peak hour volumes (as adopted by the Federal Highway Administration and Caltrans) were used to determine the need for signalization. The results of this analysis were illustrated in the Figure 4-4 in Addendum No. 3. Based on the application of the warrants, it was determined that traffic signals should be installed at all of the analyzed intersections except for the intersections of “C” Street and “D” Street at Marine Way.

Recommended on-site traffic-control measures included one-way stop signs, signals, and roundabouts. Left-turn pocket lengths for project access intersections with exclusive left-turn lanes were estimated using the County of Orange Environmental Management Agency (EMA) Highway Design Manual. The estimated left-turn storage length requirements for the analyzed intersections were based on peak hour volumes.

Right-turn lanes were proposed to be provided for select project access locations on site where additional intersection capacity is needed. The length of the right-turn lane is a function of the adjacent through-traffic queue and LOS at the intersection. A minimum length of 250 feet plus a 120-foot transition would be provided at these locations. Right-turn deceleration lanes are provided along the periphery of the project site and along major roadways within the project site where higher speeds prevail (i.e., Irvine Boulevard, Trabuco Road, and on Marine Way with the exception of locations within the TOD District). The right-turn deceleration lane would be a minimum of 150 feet with a 120-foot transition, in order to provide a safe transition from the through lane to the right-turn lane.

Addendum No. 4 analyzed the impacts of the proposed OCGP Master Plan. Since the proposed land uses within the OCGP Master Plan were consistent with those analyzed in the OCGP FEIR and the updated traffic study for the Revised Overlay Plan, no additional traffic analysis was found to be necessary(for Addendum 4) and no new significant impacts related to traffic were anticipated.

Addendum No. 5 analyzed the impacts associated with realignment of the Marine Way/Bake Parkway intersection and concluded that the project would not produce or substantially worsen significant impacts identified in the OCGP FEIR. Consistent with the conclusions in the OCGP FEIR, traffic and circulation

4. Discussion of Checklist and Mitigation Measures

impacts associated with the project would be less than significant, as the future development would implement all applicable laws and regulations to reduce impacts on traffic and circulation. However, the following project design features would need to be implemented as part of the project:

Bake Parkway/I-5 Northbound Ramp

The General Plan approved Bake Parkway at Marine Way intersection provides direct access from the Bake Parkway at the I-5 northbound ramps intersection onto Marine Way. The proposed Bake Parkway at Marine Way intersection is relocated north (east) of the General Plan approved Bake Parkway at Marine Way intersection on Bake Parkway. The relocation of the Bake Parkway at Marine Way intersection includes project design features along Bake Parkway. Specifically, Bake Parkway is proposed to be widened north (east) of the existing I-5 bridge to provide four through lanes to Rockfield Boulevard while southbound (westbound) Bake Parkway from Rockfield Boulevard would be widened to provide four through lanes which reduces to three through lanes at the I-5 NB on-ramp. In addition, the proposed Bake Parkway at Marine Way relocation is also accompanied by improvements at the I-5 northbound off-ramp. The I-5 northbound off-ramp at Bake Parkway would be widened to provide one left-turn lane and three right-turn lanes. The project design features at this location needed for Year 2030 and Post-2030 operations, tied to the construction of the Bake Parkway and Marine Way intersection would provide acceptable levels of service at this intersection.

Sand Canyon/I-5 Northbound Ramp

The proposed relocation of the Bake Parkway/Marine Way intersection resulted in the need for restriping at the eastbound approach or the southbound approach of the Sand Canyon/I-5 Northbound Ramp intersection under Post-2030 conditions. As part of the project design features, the southbound approach at this intersection would be restriped to provide two left-turn lanes, four through lanes, and one right-turn lane. The restriping improvement provides an improved operational condition.

Addendum No. 6 analyzed the potential impacts of Vesting Tentative Tract Map 17283 (VTTM 17283) for a portion of the Lifelong Learning District (LLD) of the Heritage Fields site located in Planning Area (PA) 51 in the City of Irvine. The purpose of the study was to provide traffic analysis data for the VTTM 17283 application for this development for the year 2012 horizon. The study presented data that was the basis of design for key on-site project roadways in support of the VTTM 17283 application. The study also identified the location, timing and prioritization of NITM improvements related to potential impacts caused by traffic from the project.

The results of the year 2012 analysis indicated that the project is forecast to result in the need for improvements at two freeway ramps within the NITM study area based on peak hour intersection and ramp performance criteria. The ramp locations requiring improvements are:

- I-405 at Sand Canyon - NB Direct On-Ramp (Convert the HOV lane to a second metered mixed flow lane)
- I-405 at Sand Canyon - SB Off-Ramp (Add a second drop lane from I-405 to the off ramp)

4. Discussion of Checklist and Mitigation Measures

The proposed improvements would bring the ramp locations to an acceptable level of service. These improvements have been previously identified as mitigation requirements in the underlying EIR and are included in the NITM Program. The development of VTTM 17283 requires the advancement of these NITM improvements from 2025 to 2012 in the NITM Program. The NITM Program allocates a fair share portion of the improvement costs at these freeway ramp locations to this development. Therefore the projects participation in the NITM Program fulfills the project's mitigation requirement at these ramp locations.

Addendum No. 7 analyzed potential impacts associated with the removal of certain NITM Improvements from the OCGP FEIR that were determined to no longer be necessary. Based on the findings of the NITM Five-Year Review Traffic Study and subsequent analysis utilizing ITAM 8.4-10, it was determined that previously proposed traffic mitigation strategies were not required for seven intersections and one ramp since they operate at an acceptable LOS under all interim year and build-out conditions. In addition, improvements above and beyond the baseline conditions for these locations were not warranted based on forecast future traffic activity. These intersections include: Alton Parkway & Barranca Parkway; Ridge Route Drive & Moulton Parkway; Santa Maria Drive & Moulton Parkway; Los Alisos Boulevard & Trabuco Road; Moulton Parkway & Glenwood Drive/Indian Creek Lane; Moulton Parkway & Laguna Hills Drive; Lake Forest & Irvine Center Drive; and SR-241 Southbound Off-ramp at Lake Forest Drive.

The SEIR analyzed the potential impacts of the 2nd Amended VTTM 17008, Amended TTM 17283, TTM 17202, TTM 17364, TTM 17366 and TTM 17368 within the Heritage Fields site located in Planning Areas (PA) 51 and 30 in the City of Irvine. The purpose of the comprehensive and tract map-level NITM traffic studies was to identify the location, timing and prioritization of applicable NITM improvements and any necessary project-related improvements that address potential impacts caused by project traffic.

The results of the analyses indicated the need for the following NITM improvements:

- Alton & Technology (2030): Westbound Technology restripe to include 2.5 left turn lanes, 1.5 through lanes, and a defacto right turn lane.
- El Toro & Jeronimo (2030): Add second southbound El Toro left turn lane.
- Alicia & Muirlands (2015): Add second southbound Alicia left turn lane.
- I-5 Southbound off-ramp to Sand Canyon (Post-2030): Add a second drop lane from the I-5 to the off-ramp.
- I-5 Southbound off-ramp to Alton (Post-2030): Add a second auxiliary lane from the I-5 to the off-ramp.
- I-5 Southbound off-ramp to El Toro (2030): Add a second drop lane from the I-5 to the off-ramp.

Additional improvements needed to address traffic impacts caused by the project include:

- Jeffrey & Roosevelt (2030): Restripe eastbound Roosevelt approach to provide a shared through/right turn lane.
- Bake & Portola (Post-2030): Restripe the northbound Bake approach to provide a shared through/left lane (which currently exists as a through lane) and modify the traffic signal for a north/south split phase signal operation. Alternatively, restripe the northbound approach to provide dual left turn lanes in combination with a single through lane and single right turn lane, and modify signal operation to include northbound right turn overlap.

4. Discussion of Checklist and Mitigation Measures

- Lake Forest & Portola (2030, fair-share): Conversion of the northbound Lake Forest approach from de-facto right-turn to dedicated right-turn, and modification of the traffic signal to include right turn overlap phase.

Mitigation measures approved as part of the SEIR include:

TRAN1 Prior to the approval of any final map (other than a financing and conveyance map) allocating building intensity within Planning Areas 30 and 51, and prior to issuances of any building permits for permanent improvements within Planning Areas 30 and 51, the landowner or subsequent project applicant shall either (i) apply for annexation of any areas within the final map to the Irvine Spectrum Transportation Management Association (TMA) ("Spectrumotion") in accordance with Article X of the recorded Declaration of Covenants, Conditions and Restrictions (CC&Rs) for the Irvine Spectrum TMA, including any supplementary or amended CC&Rs, to reduce traffic, air quality and noise impacts or (ii) develop and implement a similar transportation management plan containing the elements and meeting the criteria described below as approved by the Director of Public Works:

Transportation Management Plan (TMP)

The development and implementation of a Transportation Management Plan is an identified mitigation measure to manage transportation access for Planning Areas 30 and 51. This document summarizes the key elements of the TMP.

A. Introduction

The purpose of this document is to provide an outline for a comprehensive TMP for the Planning Areas 30 and 51 ("Great Park TMP"). This report is not intended to provide the specific details of the plan, but rather to highlight the key components and provide direction for subsequent detailed planning and implementation activities. When preparation of the TMP is undertaken, all of the agency and stakeholders will be invited to provide input.

The applicant may elect to annex Planning Area 51 and a portion of Planning Area 30 into the Irvine Spectrum Transportation Management Association (Spectrumotion). Spectrumotion is a private, non-profit Transportation Management Association (TMA) formed to reduce traffic congestion in Irvine Spectrum. Spectrumotion promotes, markets, and subsidizes alternatives to solo-commuting and assists the business community in complying with trip reduction related requirements. Membership is mandatory to property owners with deed restrictions requiring participation in the TMA. Membership dues provide the funding for the Association and its programs, which offer a variety of employer and commuter services focused on reducing vehicular trip generation.

In the event that the applicant elects not to annex into Spectrumotion, a TMP similar to that provided by Spectrumotion will be developed and implemented. This document sets forth the components of the TMP should it be necessary.

4. *Discussion of Checklist and Mitigation Measures*

B. Transportation Management Plan Framework

The key elements of the Great Park TMP are set forth below:

New Hire Orientation: Inform newly hired employees of commuting services available to them.

Public Transportation Pass Sales: Provide a central location for purchase of passes to available transit services (i.e., OCTA buses, Metrolink, Amtrak, etc.).

Vanpool and Carpool Formation Assistance: Perform all of the administrative work necessary to establish van pools and car pools.

On-site Promotions: Hold rideshare promotions at work sites and assist in employer assistance promotions.

Telecommuting/Alternative Work Schedule Consulting: Assist employers in developing and implementing a telecommuting or alternative work schedule program.

Personalized Commute Consulting: Provide a personalized commute profile to any commuter, which includes carpool match list containing the names of other commuters in the North Irvine Sphere that live and work near each other.

Website: Maintain a website with all of their program information available.

Rideshare Promotions: Conduct high visibility rideshare promotions as a means to advertise its services.

Subsidies: To the extent financially feasible, offer subsidies to assist in the formation of vanpools, the formation of carpools, and to encourage the trying of transit services.

Public Agency Coordination: Work closely with various public and quasi-public agencies to improve bus and commuter rail service to the Spectrum and North Irvine Sphere areas.

C. Transportation Management Plan Implementation

As part of the TMP, a process will be established to monitor its effectiveness in reducing peak hour trip generation in the Planning Areas 30 and 51. Provision shall be made for the Plan to be modified as appropriate to enhance its effectiveness.

TRAN2 Following adoption of a land use plan and circulation plan for the Great Park property and before the issuance of any building permits within the base property, the City of Irvine shall request a cooperative study with OCTA and other affected jurisdictions to amend the Orange County Master Plan of Arterial Highways (MPAH). Marine Way, Trabuco Road from the SR-133 toll way to "O" Street (formerly College Road), and Ridge Valley (formerly Y Street) should be included on the MPAH.

4. Discussion of Checklist and Mitigation Measures

TRAN3 Prior to issuance of the first building permit for dwelling units or non-residential square footage, a Fee Reallocation Study shall be completed to recalculate the NITM Fees, reflecting any fair share allocation modifications. The landowner or subsequent property owner shall submit the Fee Reallocation Study under a separate cover to be approved by the Director of Public Works in consultation with the NITM Advisory Committee.

TRAN4 Prior to approval of the last final map for the Modified Project (or any portion thereof in the event that the final map is approved in multiple phases), the landowner or subsequent property owner shall pay the costs of the following mitigation in an amount to be mutually agreed upon between the landowner or subsequent property owner and the City and reflective of the costs of the mitigation at the time of payment:

- 286 Jeffrey Road & Roosevelt: Restripe the eastbound approach to provide a shared through/right turn lane.
- 361 Bake Parkway & Portola Parkway: Restripe the northbound approach to provide a share through/left lane (which currently exists as a through lane) and modify the traffic signal for a north/south split phase signal operation. Alternatively, restripe the northbound approach to provide dual left-turn lanes in combination with a single through lane and single right-turn lane, and modify signal operation to include northbound right-turn overlap phase.
- 374 Lake Forest & Portola Parkway (Pending Projects analysis impact): Convert the existing northbound approach from de-facto right-turn to a dedicated right-turn, and modify the existing traffic signal operation to include right-turn overlap phase.

4.15.4 Impacts Associated with the Master Plan Minor Modification and the Park Design Review

Two traffic studies were completed by LSA in August 2011. The studies analyzed the proposed OCGP Western Sector Development Plan located in Planning Area 51 in the City of Irvine. The Master Plan Minor Modification and Park Design Review fall within the scope of the Western Sector Park Development Plan.

Master Plan Modification Parking Demand and Trip Generation

The Master Plan Modification Parking Demand and Trip Generation analysis, dated August 2011, is an update to the June 2007 report also prepared by LSA. The report provides a summary of trip and parking generation estimated from the revised Great Park Master Plan conceptual design (Minor Modification). The report includes a summary trip and parking generation for build-out of the park, for both weekday and weekend days, as well as an estimation of parking demand by time of day. The tables and assumptions used therein are described in detail within Appendix D of this Addendum.

The results of the August 2011 parking and traffic generation analysis indicate that 2,804 parking spaces would be necessary to accommodate the park visitors on a weekday and 3,842 spaces would be required on a weekend. The conceptual Great Park design includes regular day-to-day parking for 5,505 vehicles. This supply of parking will be more than sufficient to accommodate the parking demand for the entire park at any given time on a typical weekday or weekend.

4. Discussion of Checklist and Mitigation Measures

The August 2011 analysis also found that the maximum daily trip generation of the park modification would be 13,537 trips on a typical weekday. This is below the 19,083 weekday trips calculated in the OCGP FEIR, and therefore no changes to the impact analysis occur.

According to the traffic data used to prepare this Addendum, full build-out of the Great Park Master Plan would result in a total of 19,030, which is below the EIR maximum; however, the EIR traffic analysis is not based on weekend conditions. The weekend trip analysis was conducted for the parking demand calculations and was not included in the original OCGP Final EIR. Weekend conditions are not considered in the environmental analysis because weekday capacities are based on a.m. and p.m. peak hour factors. These weekday a.m. and p.m. peak period factors are the result of a high percent of work trips that occur during these peak hours, coupled with low vehicle occupancy. This condition would be characteristic of the Great Park study area on a typical weekday where a significant number of weekday work trips travel to and from the various commercial office and industrial uses within the study; however, the pronounced a.m. and p.m. peak hour conditions used to derive weekday daily capacities do not occur during the weekend. Please refer to the Land Use Section 4.10 of this document for a description of various OCGP land uses.

Western Sector Development Plan

The Western Sector Development Plan analysis, dated August 2011, identifies potential impacts of the Western Sector Development Plan Project in the study area based on Existing (2008) and Future Year (2015) traffic conditions using the Irvine Transportation Analysis Model (ITAM 8.4).

The Great Park Western Sector Park Development Plan Trip Generation is presented in Table 4.15-1. As presented in the table, the majority of the trip generation rates were based on the Trip Generation Rates developed in the Orange County Great Park Trip Generation and Parking Demand Analysis prepared by LSA Associates, Inc., dated June 18, 2007 and updated in August 2011. The trip generation is also consistent with the previously prepared Great Park Interim Use Permit Traffic Studies including the Preview Park Update for Hangar 244 Traffic and Parking Study (October 21, 2009), the Agricultural IUP Traffic Study (March 27, 2010) and the Western Sector Park Development Plan IUP Traffic and Parking Analysis (April 12, 2010). The trip generation assumptions for the Ice Rink are from the Rinks in Westminster (Appendix L of the Traffic Report).

As presented in the August 2011 traffic study, the proposed Western Sector Development Plan Project would generate approximately 4,635 daily trips, which is significantly below the 19,083 daily trips approved as part of the Great Park EIR. The AM peak hour is forecast at 184 and the PM peak hour at 659.

4. Discussion of Checklist and Mitigation Measures

Table 4.15-1. Great Park Western Sector Development Plan Trip Generation

Traffic Analysis Zone	Use	Size	Units	Trips Generation	
				Daily Auto Trip Generation Rate per Units	Average Daily Trips
931	A. Agriculture	114.0	acres	2.00	228
933	E. Western Picnic Area	6.8	acres	13.71	93
	K. NEG Building (0.5 acres)	22,500	sf	18.90	425
	L. Ice Rink – Sheets of Ice	3	sheets	240.00	720
	Total TAZ 993				1,238
991	C. North Lawn (Passive Recreation)	18.5	acre	13.71	254
	G. Timeline Central & Timeline West	5.1	acres	4.57	23
	H. South Lawn (Soccer Fields)	4.0	fields	140	560
	Total TAZ 991				837

	I. Promenade	2.4	acres	4.57	11
	J. Existing Balloon, Tent and Misc. Uses.				660
	Total TAZ 992				2,283
Total Great Park Western Sector Park Development Plan					4,586
AM/PM Peak Period/Hour		Peak Period		Peak Hour	
		Number	% of ADT	Number	% of ADT
AM Peak Period/Hour	AM Inbound	259	5.6%	158	3.4%
	AM Outbound	60	1.3%	26	0.6%
	AM Total	319	6.9%	184	4.0%
	PM Inbound	844	18.4%	253	5.5%
	PM Outbound	1,044	22.8%	377	8.2%
	PM Total	1,888	41.2%	630	13.7%

Notes:

- A. Based on Agricultural use per ITAM which is 2.0 trips per acre.
- B. The Palm Court Open Space, Hardscape and Buildings 242 and 245 were based on proposed Great Park Program, Western Sector Park Development Plan Phase I IUP Traffic and Parking Analysis, April 12, 2010. The Hangar 244 trip generation from the Preview Park Update for Hangar 244 Traffic and Parking Study, October 21, 2009.
- C. Based on Western Sector Park Development Plan Phase 1 IUP Traffic and Parking Analysis dated April 12, 2010.
- D. The Farm and Food Lab/Community Gardens trip generation from the Western Sector Park Development Plan Phase 1 IUP Traffic and Parking Analysis, April 12, 2010.
- E. Based on Western Sector Park Development Plan Phase 1 IUP Traffic and Parking Analysis dated April 12, 2010.
- F. C Street: Not a Trip Generator
- G. Great Park Trip Generation and Parking Analysis, August 2007. This trip generation based on ITE rate for Regional Park rate of 4.57 trips per acre per net acre.

4. *Discussion of Checklist and Mitigation Measures*

- H. Great Park Trip Generation and Parking Analysis, August 2007. Area contains three soccer fields and four basketball courts. Trip generation rate based on 35 vehicles per game, 2 games per weekday.
- I. Great Park Trip Generation and Parking Analysis, August 2007. This trip generation based on ITE rate for Regional Park rate of 4.57 trips per acre per net acre.
- J. The daily trip generation for the balloon ride and support uses is based on the highest count day over three weekdays along C Street, north of Marine Way.
- K. The Nature Education Gardens building and maintenance/nursery area are based on the Exhibition Space from the Great Park Trip Generation and Parking Analysis, August 2007.
- L. Irvine Ice Rink daily and peak hour generation based on traffic count and study of the Rinks in Westminster.

The following summarizes the alternatives that were evaluated and included in the August 2011 traffic study. Please note, the August 2011 Traffic Study was initiated prior to submittal of the recently approved Five Point Great Park Neighborhood (GPN) project and SEIR. Alternatives 3A and 4A are not listed below due to the fact that they were associated with the prior Lifelong Learning District and are no longer relevant to the analysis contained in this document.

Alternative 1	Existing Conditions
Alternative 2	Existing plus Western Sector Park Development Plan
Alternative 3B	2015 with Existing Roadway Network and Land Use
Alternative 4B	2015 with Existing Roadway Network and Land Use plus Western Sector Park Development Plan
Alternative 4C	2015 With Existing Roadway Network and Land Use plus Western Sector Park Development Plan plus TVI at 3000 tons per day
Alternative 5A	2015 With Existing Roadway Network and Land Use plus Western Sector Park Development Plan with additional access via Trabuco Road and "C" Street

Alternative 1: Existing Daily Traffic Volumes and Levels of Service

The Existing AM and PM peak hour intersection ICU level of service analysis without the Project is presented in Table 4.15-2. This ICU analysis is based on recent peak hour intersection turn movement counts collected within the past year. These counts and ICU calculation sheets are presented in Appendix B of the Traffic Report (Appendix D of this document). It should also be noted that intersections within the study area but in the City of Lake Forest utilized traffic data from LFTAM.

Based on the Existing Conditions ICU level of service analysis, there are no intersections that exceed the acceptable level of service threshold during the AM or PM peak hour. The addition of the proposed Project does not result in any intersections failing the City's level of service standards. The unsignalized intersection of Marine Way and "C" Street resulted in levels of service within the acceptable thresholds established by the City of Irvine.

Alternative 2: Existing Plus Western Sector Park Development Plan

The second alternative adds the proposed Great Park Western Sector Park Development Plan development traffic to the existing daily and peak hour traffic counts. The forecast additional traffic from the Project is based on the ITAM 8.4 Base Year traffic model. The model changes included the traffic analysis zone splits and network adjustments described in Section IV, plus the addition of Great Park Development Plan daily trips. With a total project increase of 4,586 trips, no significant impacts are anticipated.

4. Discussion of Checklist and Mitigation Measures

The forecast Western Sector Park Development Plan Trip Distribution percentages with the existing network is presented in Figure VI-1 of the August 2011 LSA Traffic Report (Appendix D of this Addendum). The forecast existing plus Western Sector Park Development Plan daily traffic volumes and the resulting daily volume to capacity ratios are presented in Figure VI-2 and Figure VI-3 of the August 2011 LSA Traffic Report respectively. When comparing these forecasts with the Existing daily traffic volumes and volume to capacity ratios presented above, the differences are negligible. The ten links identified to exceed the acceptable level of service (LOS) threshold in the Existing condition also exceed acceptable LOS in the Existing Plus Project condition.

The peak hour link volume to capacity ratio analysis for these ten deficient links is presented in Table VI-1 of the August 2011 LSA Traffic Report. All links which exceed the daily volume to capacity thresholds resulted in acceptable peak hour volume to capacity ratios.

Figure VI-4 of the August 2011 LSA Traffic Report presents the Alternative 2 peak hour intersection turn movements for key intersections within close proximity to the Project. The peak hour intersection level of service analysis is presented in Table 4.15-3. This table represents the Existing and the Existing plus Western Sector Park Development Plan ICUs and LOS for comparison. As can be seen, the differences are negligible and the addition of the Project does not create any impacts.

Note: ¹ ICU is reported for signalized intersection. Delay is reported for unsignalized intersections.										

Alternative 3B: 2015 with Existing Roadway Network and Land Use

This alternative is the ITAM 8.4 2015 baseline land use and roadway alternative assuming existing land uses and roadway network within the Great Park Neighborhoods Lifelong Learning District and assuming the land uses within the Great Park Western Sector Park Development area is limited to existing uses and does not include the proposed development.

This alternative does not include "O" Street between Irvine Boulevard and Marine Way and other Great Park Neighborhoods Lifelong Learning District roadway improvements. Therefore, all traffic from the Great Park Western Sector Park Development Plan area must traverse through the existing intersection of Marine Way and "C" Street/Perimeter Road. This is consistent with the existing roadway network.

The forecast Alternative 3B daily traffic volumes and the resulting daily volume to capacity ratios are presented in Figure VI-12 and Figure VI-13 of the August 2011 LSA Traffic Report respectively.

4. Discussion of Checklist and Mitigation Measures

There are 41 links in which daily volumes exceed the acceptable daily volume to capacity level of service threshold.

The peak hour link volume to capacity ratio analysis is presented in Table VI-7 of the August 2011 LSA Traffic Report. All links which exceed the daily volume to capacity thresholds resulted in acceptable peak hour volume to capacity ratios; therefore no link impacts were identified.

Figure VI-14 of the August 2011 LSA Traffic Report presents the Alternative 3B peak hour intersection turn movements for key intersections within close proximity to the Project. The peak hour intersection level of service analysis is presented in Table 4.15-4. All intersections result in acceptable AM and PM peak hour intersection level of service for all intersections.

Alternative 4B: 2015 with Existing Roadway Network and Land Use plus Western Sector Park Development Plan

This alternative is the ITAM 8.4 2015 baseline land use and roadway alternative assuming existing land uses and roadway network within the Great Park Neighborhoods Lifelong Learning District with the addition of the Great Park Western Sector Park Development Plan proposed land uses.

Consistent with Alternative 3B, this alternative does not include "O" Street between Irvine Boulevard and Marine Way. Therefore all traffic from the Great Park Western Sector Park Development Plan must traverse through the existing intersection of Marine Way and "C" Street/Perimeter Road and the existing on-site roadway network.

The Project trip distribution is presented in Figure VI-15 of the August 2011 LSA Traffic Report. The forecast Alternative 4B daily traffic volumes and the resulting daily volume to capacity ratios are

4. Discussion of Checklist and Mitigation Measures

presented in Figure VI-16 and Figure VI-17 of the August 2011 LSA Traffic Report respectively. When comparing these forecasts with Alternative 3B: 2015 With Existing Roadway Network and Land Use, the same 41 links that exceed the daily volume to capacity ratio result.

The peak hour link volume to capacity ratio analysis is presented in Table VI-9 of the August 2011 LSA Traffic Report. All links which exceed the daily volume to capacity thresholds resulted in acceptable peak hour volume to capacity ratios; therefore no link impacts were identified.

Figure VI-18 of the August 2011 LSA Traffic Report presents the Alternative 4B peak hour intersection turn movements for key intersections within close proximity to the Project. The peak hour intersection level of service analysis is presented in Table 4.15-5. This table presents both Alternative 3B, the 2015 Baseline with Existing Roadway Network and Land Use and Alternative 4B which adds the Great Park Western Sector Park Development Plan. All intersections would result in acceptable levels of service for the AM and PM peak hours. The Project does not add any additional impact at this intersection.

Alternative 4C: 2015 With Existing Roadway Network and Land Use plus Western Sector Park Development Plan Plus TVI at 3,000 Tons Per Day

Tierra Verde Industries (TVI), a composting and materials recovery facility located along Marine Way, south and east of the Marine Way and "C" Street/Perimeter Road intersection is proposing to expand its existing facility. Their request for increase is to 3,000 tons per day.

Based on current daily traffic counts, TVI generates 1,556 daily trips. The expansion to 3,000 tons per day would equate to 3,423 total trips or an increase of 1,867 daily trips. The TVI expansion would also generate 138 AM and 152 PM peak hour trips.

These additional 1,867 daily trips were added to the 2015 With Existing Roadway Network and Land Use plus the Western Sector Park Development Plan.

The forecast Alternative 4C daily traffic volumes and the resulting daily volume to capacity ratios are presented in Figure VI-19 and Figure VI-20 of the August 2011 LSA Traffic Report respectively. When

4. Discussion of Checklist and Mitigation Measures

comparing these forecasts with Alternative 4B: 2015 Existing Roadway Network and Land Use plus the Great Park Western Sector Park Development Plan, the addition of the TVI development adds two additional links along Irvine Boulevard (43 instead of 41) to those links that exceed the daily volume to capacity ratio.

The peak hour link volume to capacity ratio analysis is presented in Table VI-11 of the August 2011 LSA Traffic Report. All 43 links which exceed the daily volume to capacity thresholds resulted in acceptable peak hour volume to capacity ratios.

The peak hour intersection turn movements for key intersections within proximity of the Project are presented in Figure VI-21. The peak hour intersection level of service analysis is presented in Table 4.15-6. This table presents both Alternative 4B, the 2015 With Existing Roadway Network and Land Use with the Great Park Western Sector Park Development Plan and Alternative 4C which adds the future traffic from the proposed TVI development. There were no intersections that resulted in unacceptable levels of service for Alternative 4B without the expanded TVI. However with the addition of TVI the intersection of Marine Way and "C" Street/Perimeter Road was found to have peak hour intersection delay during the PM peak hour. With signalization, this intersection would operate at acceptable levels of service with the additional TVI traffic.

4. Discussion of Checklist and Mitigation Measures

4. Discussion of Checklist and Mitigation Measures

Alternative 5A: 2015 With Existing Roadway Network and Land Use Plus Western Sector Park Development Plan With Additional Access Via Trabuco Road and “C” Street

All 2015 Baseline alternatives identified in this addendum require all Western Sector Park Development Plan traffic to travel through the Marine Way and “C” Street/Perimeter Road intersection. In this alternative, “C” Street continues north of the Western Sector Park Development Plan property line and continues until it intersects with Trabuco Road thereby allowing utilization of Trabuco Road as an access point for traffic to and from the Western Sector Park Development.

The Project trip distribution is presented in Figure VI-22. Based on the ITAM Traffic Model, 30 percent of the Great Park Western Sector Park Development Plan traffic would divert north to the new Trabuco connection, depending on AM or PM peak hour and inbound versus outbound.

The forecast Alternative 5A daily traffic volumes and the resulting daily volume to capacity ratios are presented in Figure VI-23 and Figure VI-24 of the August 2011 LSA Traffic Report respectively. When comparing these forecasts with Alternative 4B: 2015 Baseline With Existing Network and Land Use Plus the Great Park Western Sector Park Development Plan without the northerly connection, there are no changes to the number of links where the daily volume to capacity ratio exceeds the daily level of service threshold.

The peak hour link volume to capacity ratio analysis is presented in Table VI-13 of the August 2011 LSA Traffic Report. All links which exceed the daily volume to capacity thresholds resulted in acceptable peak hour volume to capacity ratios.

Figure VI-25 of the August 2011 LSA Traffic Report presents the Alternative 5A peak hour turn movements at intersections adjacent to the project. The peak hour intersection level of service analysis is presented in Table 4.15-7. This table presents both Alternative 4B, the 2015 With Existing Roadway Network and Land Use Plus Western Sector Park Development Plan without a connection to the north and 5A, with a connection to the north. As can be seen, the differences are negligible and connection to the north does not provide a major impact or benefit based on the ITAM travel model methodology. It should be noted, however, that the Great Park Western Sector Park Development Plan does have events where the peak is quite pronounced at times other than the traditional AM or PM peak hour. Under those conditions, a second access to the north would provide for improved traffic flow and better ingress and egress. It should be noted that future authorization from Heritage Fields would be required for access to Trabuco Road.

4. Discussion of Checklist and Mitigation Measures

SENSITIVITY ANALYSIS – BASKETBALL AND HANDBALL COURTS

In addition to the land uses proposed for the Western Sector Park Development Plan, four basketball courts and two handball courts are being proposed. A sensitivity analysis was conducted, which concluded a finding of no significant impact. Therefore, these amenities would not require any new mitigation.

SPECIAL EVENTS

- OCGP would need to acquire a Special Event Permit from the City for all special events, which would include proposed conditions that would be implemented to control excess event traffic.

Conclusion

The Project would not produce new or substantially increase the severity of significant impacts previously identified in the OCGP FEIR. Consistent with the conclusions in the OCGP FEIR, traffic and circulation impacts associated with the Project would be less than significant as the future development would implement all applicable laws and regulations to reduce impacts on traffic and circulation.

The OCGP FEIR also disclosed the traffic analysis assumption that the cumulative impact of the adopted Overlay Plan traffic along with other regional growth at the identified ramp and freeway locations would be mitigated through a combination of regional programs that are the responsibility of other agencies, and if said programs are not implemented the cumulative freeway/toll-way ramp impacts would remain significant and unavoidable (OCGP FEIR page 7-19). The proposed Project would not alter this conclusion.

The Western Sector Park Development Plan (WSPDP) Phase 1 Traffic Study was initiated and a scope of work was approved prior to submittal of the recently approved Five Point Great Park Neighborhood (GPN) project and SEIR. Therefore, the WSPDP traffic study assumed, as background traffic for 2015 conditions, the previously approved Lifelong Learning District land uses. The conclusions of the WSPDP 2015 traffic study are that there are no significant environmental impacts.

In addition, the results of the OCGP Traffic Generation and Parking Demand analysis demonstrated that the modified Master Plan generated less traffic than analyzed in the original EIR and concluded that no new impacts were identified.

The SEIR for GPN assumed the WSPDP Phase I project although at a lower PM peak hour trip generation. This occurred due to additional uses added to the WSPDP after the SEIR analysis was initiated. The additional PM peak hour trips that would be added to the adjacent circulation system have been analyzed.

A review of the GPN traffic report, Chapter 5, indicates that there are no intersections within the immediate vicinity that are near the thresholds of exceeding capacities such that the additional trips would result in a significant impact. The highest ICU levels are Sand Canyon/Oak at 0.84, Irvine Boulevard/O Street at 0.85, and Irvine Boulevard/LQ Street at 0.82. Nominal levels of park traffic would impact these

4. Discussion of Checklist and Mitigation Measures

three locations. All other intersections are at Level of Service C (ICU 0.79) or better. The additional 350 PM peak hour trips added to the SEIR analyses would not change the conclusions.

In conclusion, it has been technically demonstrated through traffic studies for the WSPDP project as well as the GPN SEIR that the WSPDP project will not cause any significant environmental traffic impacts.

Major FEIR Revisions Not Required. Based on the foregoing analysis and information, there is no evidence that the changes to the project require a major change to the certified OCGP FEIR. The proposed Master Plan Minor Modification and the Park Design Review, which does not include any major change to park development areas identified in the approved OCGP Master Plan, will not result in any new significant environmental impact nor is there a substantial increase in the severity of impacts from that described in the certified OCGP FEIR.

No Substantial Change in Circumstances Requiring Major FEIR Revisions. There is no information in the Master Plan Minor Modification and the Park Design Review or otherwise available indicating substantial changes in circumstances that would require major changes to the certified OCGP FEIR.

No New Information of Substantial Importance Showing Greater Significant Effects Than Previous FEIR. This Environmental Evaluation has analyzed all available relevant information and has determined that there is no new information of substantial importance, which was unknown and could not have been known with the exercise of reasonable diligence at the time the OCGP FEIR was approved, augmented, and/or updated, indicating that the Project would have one or more significant effects not discussed in the previous FEIR or result in a substantial increase in the severity of previously identified effects.

No New Information of Substantial Importance Showing Ability to Reduce Significant Effects in Previous FEIR. This Environmental Evaluation has analyzed all available relevant information and has determined that there is no new information of substantial importance, which was unknown and could not have been known with the exercise of reasonable diligence at the time the OCGP FEIR was approved, augmented, and/or updated, indicating that: (1) mitigation measures or alternatives previously found not to be feasible would in fact be feasible, and would substantially reduce one or more significant effects of the Project, but the Project proponent declines to adopt the mitigation measures or alternatives; or (2) mitigation measures or alternatives that are considerably different from those analyzed in the previous FEIR would substantially reduce one or more significant effects on the environment, but the Project proponent declines to adopt the mitigation measures or alternatives. There are no alternatives to the Project or additional mitigation measures that would substantially reduce one or more of the significant transportation/circulation-related effects identified in and considered by the certified OCGP FEIR.

4.15.5 Mitigation from the OCGP FEIR and Applicability to the Master Plan Minor Modification and the Park Design Review

The OCGP FEIR identified mitigation measures TRAN1 through TRAN8 which, if fulfilled prior to specified development approvals, would eliminate or substantially reduce the traffic and circulation effects of development under the adopted Master Plan. The SEIR proposed that several mitigation measures from the certified OCGP FEIR be deleted (because they have been completed or they are no longer necessary in light of the NITM Program and new mitigation measures being proposed for Modified Project-specific impacts identified in the Traffic Study for the Modified Project). Mitigation Measure TRAN 1 would be carried forward for this project.

4. Discussion of Checklist and Mitigation Measures

TRAN1 Prior to the approval of any final map (other than a financing and conveyance map) allocating building intensity within Planning Areas 30 and 51, and prior to issuances of any building permits for permanent improvements within Planning Areas 30 and 51, the landowner or subsequent project applicant shall either (i) apply for annexation of any areas within the final map to the Irvine Spectrum Transportation Management Association (TMA) ("Spectrumotion") in accordance with Article X of the recorded Declaration of Covenants, Conditions and Restrictions (CC&Rs) for the Irvine Spectrum TMA, including any supplementary or amended CC&Rs, to reduce traffic, air quality and noise impacts or (ii) develop and implement a similar transportation management plan containing the elements and meeting the criteria described below as approved by the Director of Public Works:

Transportation Management Plan (TMP)

The development and implementation of a Transportation Management Plan is an identified mitigation measure to manage transportation access for Planning Areas 30 and 51. This document summarizes the key elements of the TMP.

A. Introduction

The purpose of this document is to provide an outline for a comprehensive TMP for the Planning Areas 30 and 51 ("Great Park TMP"). This report is not intended to provide the specific details of the plan, but rather to highlight the key components and provide direction for subsequent detailed planning and implementation activities. When preparation of the TMP is undertaken, all of the agency and stakeholders will be invited to provide input.

The applicant may elect to annex Planning Area 51 and a portion of Planning Area 30 into the Irvine Spectrum Transportation Management Association (Spectrumotion). Spectrumotion is a private, non-profit Transportation Management Association (TMA) formed to reduce traffic congestion in Irvine Spectrum. Spectrumotion promotes, markets, and subsidizes alternatives to solo-commuting and assists the business community in complying with trip reduction related requirements. Membership is mandatory to property owners with deed restrictions requiring participation in the TMA. Membership dues provide the funding for the Association and its programs, which offer a variety of employer and commuter services focused on reducing vehicular trip generation.

In the event that the applicant elects not to annex into Spectrumotion, a TMP similar to that provided by Spectrumotion will be developed and implemented. This document sets forth the components of the TMP should it be necessary.

B. Transportation Management Plan Framework

The key elements of the Great Park TMP are set forth below:

New Hire Orientation: Inform newly hired employees of commuting services available to them.

4. Discussion of Checklist and Mitigation Measures

Public Transportation Pass Sales: Provide a central location for purchase of passes to available transit services (i.e., OCTA buses, Metrolink, Amtrak, etc.).

Vanpool and Carpool Formation Assistance: Perform all of the administrative work necessary to establish van pools and car pools.

On-site Promotions: Hold rideshare promotions at work sites and assist in employer assistance promotions.

Telecommuting/Alternative Work Schedule Consulting: Assist employers in developing and implementing a telecommuting or alternative work schedule program.

Personalized Commute Consulting: Provide a personalized commute profile to any commuter, which includes carpool match list containing the names of other commuters in the North Irvine Sphere that live and work near each other.

Website: Maintain a website with all of their program information available.

Rideshare Promotions: Conduct high visibility rideshare promotions as a means to advertise its services.

Subsidies: To the extent financially feasible, offer subsidies to assist in the formation of vanpools, the formation of carpools, and to encourage the trying of transit services.

Public Agency Coordination: Work closely with various public and quasi-public agencies to improve bus and commuter rail service to the Spectrum and North Irvine Sphere areas.

C. Transportation Management Plan Implementation

As part of the TMP, a process will be established to monitor its effectiveness in reducing peak hour trip generation in the Planning Areas 30 and 51. Provision shall be made for the Plan to be modified as appropriate to enhance its effectiveness.

4.16 UTILITIES AND SERVICE SYSTEMS

4.16.1 Environmental Setting

Potable Water

The OCGP FEIR described the potable water system for the project. The IRWD is the jurisdictional agency responsible for plan approval and water service to the project area. Planning Area 51 is within Zone 3 North and Zone 4 of the IRWD water system. The existing on-site distribution system includes a network of distribution system pipelines, six reservoirs, and two pump stations.

4. Discussion of Checklist and Mitigation Measures

Recycled Water

As stated in the OCGP FEIR, IRWD is the jurisdictional agency responsible for plan approval and water service for the project area. Recycled water is currently supplied to Planning Area 51 via a 12-inch IRWD Zone B pipeline and connecting to an 8-inch former military base pipeline in the southwest corner of the property.

Sewer

As stated in the OCGP FEIR, IRWD is the jurisdictional agency responsible for plan approval and sewer service for the project area. Planning Area 51 is served by a two-branched system with flow, mainly by gravity, from the northeast to the southwest. The system includes a series of pipes ranging from 6 to 15 inches in diameter.

Solid Waste

The OCGP FEIR discussed in detail the environmental setting for solid waste for the project. Solid waste at the project site is collected by Waste Management, Inc., and is disposed of at the Frank R. Bowerman Landfill owned by the County of Orange Integrated Waste Management Department (IWMD).

The IWMD's Countywide Integrated Waste Management Plan (CIWMP) was approved in 1996 pursuant to California Integrated Waste Management Board requirement. The CIWMP shows that there is sufficient solid waste disposal capacity in the County for the next 27 years.

Energy and Communications

Southern California Edison (SCE) serves the project via two primary substations and the Southern California Gas Company serves Planning Area 51. AT&T is the communications provider. Detailed information regarding the environmental setting of dry utilities was included in the OCGP FEIR.

4.16.2 Impacts Identified in the OCGP FEIR and Addenda

Potable Water

The OCGP FEIR projected the potable water demand to be less than 1.75 million gallons per day (MGD) calculated for the land uses proposed within the project. Since the OCGP Master Plan Minor Modification and the Park Design Review does not include any additional intensity or change in the mix of land uses, the demand projection is consistent with the OCGP FEIR and addenda. As stated in the OCGP FEIR, selected portions of the existing potable water facilities are assumed to remain in place and operational through project buildout. The OCGP FEIR stated that the existing system will be expanded and integrated into the IRWD system and thus provide a backbone service to all users on the project site. The OCGP FEIR assumed a potable water system that would follow the routing of existing and proposed roadways. The approved Master Subdivision Map includes the alignment for water lines throughout Great Park Neighborhoods, which was an additional project design detail and not a change in the project description.

4. Discussion of Checklist and Mitigation Measures

Recycled Water

The OCGP FEIR stated that on January 27, 2003, the IRWD Board of Directors approved the assessment of water supply for the project. According to the findings of the assessment, the IRWD has determined that a sufficient non-potable water supply is available to serve the project. Since the OCGP Master Plan Minor Modification and the Park Design Review does not increase the intensity or change the mix of land uses, the total non-potable water supplies will meet the project demand.

The OCGP FEIR stated that the implementation of the project would require the expansion of the recycled water transmission lines to serve the project. It was assumed that selected on-site facilities would remain in place and operational through buildout. The OCGP FEIR stated that the existing system will be expanded and integrated into the IRWD system and provide a backbone service to all users in the project site. The OCGP FEIR assumed a non-potable system that would follow the routing of existing and proposed roadways within the project. The approved Master Subdivision Map included the alignment for the recycled water lines throughout Great Park Neighborhoods, which was an additional project design detail and is not a change in the project description.

Sewer

The OCGP FEIR stated that the IRWD will continue to provide sewer service to the project. The IRWD has indicated that it would have sufficient capacity to meet the future demand; however, additional wastewater treatment capacity may need to be purchased by project proponents as specific development projects come forward. The OCGP FEIR indicated that projected buildout demand for sewer services based on the land uses in the project were 0.89 MGD and that the project would require an increase of sewer transmission capacity to serve the project. The proposed sewer system would preserve selected, existing on-site facilities in place, remain operational through buildout and expand the system through extension of existing sewer lines. The OCGP FEIR stated that additional IRWD maintenance and equipment could be required to operate and maintain the proposed system.

The adopted Master Subdivision Map ensured that any projected use of the existing sewer system would be in conformance with all applicable regional and state requirements and the mitigation requirements of the OCGP FEIR and addenda. It included the alignment for the sewer lines throughout the project, which was an additional project design detail and did not change the project description.

Solid Waste

As stated in OCGP FEIR, demolition of existing runways, buildings, and structures within Planning Area 51 will generate debris materials that would have to be disposed of at local landfills. Green waste would also be generated as a result of ongoing park and landscaping maintenance. In addition to the City requirement for recycling of construction and demolition material to reduce waste, solid waste reduction would also be achieved through compliance with AB 939, which requires that a minimum of 50 percent of the solid waste generated in cities in California be diverted from landfills. Further, SB 1374 requires that all cities implement measures that would divert 75 percent of all construction and demolition waste from landfills. While the OCGP FEIR identified a potential impact related to solid waste, it concluded that, with the recommended, City-adopted mitigation measures, the impact would be less than significant.

4. Discussion of Checklist and Mitigation Measures

Energy and Communications

The Overlay Plan has proposed to install the new systems generally along a route that coincides with the existing and proposed roadway within the project. A portion of the routing, (specifically the portion along the "loop road") is not included in the project and would require an adjustment to the routing system for the expansion of the dry utilities system. However, the expansion of the system would generally coincide with the existing and proposed roadways consistent with the OCGP FEIR. The OCGP FEIR further stated that the specific impacts of constructing new energy and communication transmission facilities could not be determined at the program level analysis, as site-specific plans for the installation of the energy and communication transmission backbone system have not been prepared. The general significant impacts associated with the construction and operation of public facilities, including the project's construction and operation of the transmission system, were addressed in the OCGP FEIR.

4.16.3 Impacts Associated with the Master Plan Minor Modification and the Park Design Review

Potable Water

The OCGP Master Plan Minor Modification and the Park Design Review does not propose additional development intensity. Therefore, the demand projection for potable water is consistent with the OCGP FEIR and Addenda. No additional mitigation measures or change in any mitigation measure is required. The OCGP FEIR further stated that specific environmental impacts of the proposed Project on the existing and planned MWD facilities, as well as specific impacts of constructing new potable water facilities could not be determined at the program level analysis and project-level environmental review at the time that specific development plans have been prepared would be required. The general significant impacts associated with the project's construction and operation of public facilities has been addressed in the OCGP FEIR.

Recycled Water

The OCGP FEIR stated that on January 27, 2003, the IRWD Board of Directors approved the assessment of water supply for the project. The OCGP Master Plan Minor Modification and the Park Design Review does not propose any additional development intensity, and the total non-potable water supplies would meet the project demand, as analyzed in the OCGP FEIR and Addenda. The OCGP FEIR further stated that the specific environmental impacts of constructing the new recycled water facilities could not be determined at the General Plan level analysis as specific site plans and locations have not been prepared. However, the general significant impacts associated with the project's construction and operation of public facilities has been addressed in the OCGP FEIR.

Sewer

The OCGP Master Plan Minor Modification and the Park Design Review does not propose any additional development intensity. Therefore, demand projections and proposed system expansion would remain the same. The OCGP FEIR further stated that the specific environmental impact of constructing new sewer facilities to serve the project cannot be determined at the program level analysis, as site-specific plans for the installation of the sewer backbone system had not been prepared. However, the general significant

4. Discussion of Checklist and Mitigation Measures

impacts associated with the construction and operation of public facilities, including the project's construction and operation of the sewer system, has been addressed in the OCGP FEIR.

Solid Waste

As stated in OCGP FEIR, demolition of existing runways, buildings, and structures within Planning Area 51 would generate debris materials that would have to be disposed of at local landfills. Green waste would also be generated as a result of ongoing park and landscape maintenance. The Project would not change the land uses or intensity of the uses; therefore, no change in impact to solid waste is anticipated. No additional mitigation measures or changes in any mitigation measure are required.

Energy and Communications

The analysis and conclusions in the OCGP FEIR do not change since the intensity and types of land uses in the modified plan have not changed from those previously analyzed in the OCGP FEIR. The OCGP FEIR stated that the specific impacts of constructing new energy and communication transmission facilities could not be determined at the program level analysis, as site-specific plans for the installation of the energy and communication transmission backbone system have not been prepared. The general significant impacts associated with the construction and operation of public facilities, including the project's construction and operation of the transmission system, were addressed in the OCGP FEIR.

Major FEIR Revisions Not Required. Based on the foregoing analysis and information, there is no evidence that the changes to the project require a major change to the certified OCGP FEIR. The proposed Master Plan Minor Modification and the Park Design Review, which does not include any major change to the park development areas identified in the approved OCGP Master Plan, will not result in any new significant environmental impact nor is there a substantial increase in the severity of impacts from that described in the certified OCGP FEIR.

No Substantial Change in Circumstances Requiring Major FEIR Revisions. There is no information in the Master Plan Minor Modification and the Park Design Review or otherwise available indicating substantial changes in circumstances that would require major changes to the certified OCGP FEIR.

No New Information of Substantial Importance Showing Greater Significant Effects Than Previous FEIR. This Environmental Evaluation has analyzed all available relevant information and has determined that there is no new information of substantial importance, which was unknown and could not have been known with the exercise of reasonable diligence at the time the OCGP EIR was approved, augmented, and/or updated, indicating that the project will have one or more significant effects not discussed in the previous EIR or result in a substantial increase in the severity of previously identified effects.

No New Information of Substantial Importance Showing Ability to Reduce Significant Effects in Previous FEIR. This Environmental Evaluation has analyzed all available relevant information and has determined that there is no new information of substantial importance, which was unknown and could not have been known with the exercise of reasonable diligence at the time the OCGP FEIR was approved, augmented, and/or updated, indicating that; (1) mitigation measures or alternatives previously found not to be feasible would in fact be feasible, and would substantially reduce one or more significant effects of the project, but the project proponent declines to adopt the mitigation measures or alternatives; or (2)

4. Discussion of Checklist and Mitigation Measures

mitigation measures or alternatives that are considerably different from those analyzed in the previous EIR would substantially reduce one or more significant effects on the environment, but the project proponent declines to adopt the mitigation measures or alternatives. There are no alternatives to the project or additional mitigation measures that would substantially reduce one or more of the significant effects identified in and considered by the certified OCGP FEIR.

4.16.4 Mitigation from the OCGP FEIR and Applicability to the Master Plan Minor Modification and the Park Design Review

The OCGP FEIR determined the mitigation measures identified in other sections of the OCGP FEIR (5.1-5.13) address the impacts associated with the construction and operation of public facilities. These measures would be applicable to any new construction and operation of facilities for the following types of utilities to serve the project area:

- potable water
- recycled water
- wastewater
- energy and communication transmission facilities

Mitigation Measures SW1 through SW5 apply to future demolition and new construction, and would be carried forward through permit approvals for subsequent development projects. The proposed Project would neither change these mitigation measures nor their application to future development projects.

SW1 It is anticipated that much of the solid waste resulting from the demolition, dismantling, or other deconstruction of the aged structures and property, including but not limited to buildings and runways, at MCAS El Toro is contaminated with lead-based paints, asbestos, or other materials that may render it unsuitable for recycling or reuse. At the sole cost and expense of the project applicant, in order to evaluate this condition and determine the feasibility of recycling of solid waste material from the MCAS El Toro site by ordinary means, a technical evaluation by a qualified environmental consultant must be conducted. The technical evaluation shall include sufficient sample testing of all types of solid waste materials to be generated by the project to analyze its composition. A copy of the full technical evaluation and its findings must be submitted to the City of Irvine Community Development Department. The City of Irvine must confirm the adequacy of the technical evaluation prior to authorizing the demolition, dismantling, or deconstruction project to proceed.

If it is determined by the technical evaluation that material is contaminated and prohibited from being recycled by ordinary means, a further evaluation must be conducted to identify and evaluate other feasible methods approved by state law to divert the material from landfills. This may include the delivery of the waste material to other appropriate non-disposal or transformation facilities, such as "waste-to-energy" (WTE) plants.

SW2 For that solid waste which is determined to be inappropriate for recycling (as that term is defined by California Public Resources Code Section 40180), the project applicant must submit a written plan to the City and implement such plan to ensure that 75% of the material, or the maximum amount feasible as determined by the technical evaluation, is diverted from the landfill through other methods that comply with state statutes and regulations.

4. Discussion of Checklist and Mitigation Measures

SW3 For that solid waste which the technical study deems to be suitable for recycling, the project applicant must submit a written plan to the City and implement such plan to ensure that solid waste material generated by the demolition, dismantling, or deconstruction project, land use operations and maintenance is collected by a City authorized solid waste hauler or recycling agent, and that a minimum of 75% of the solid waste from the project is diverted from landfills by recycling, as that term is defined by California Public Resources Code Section 40180 ("Recycling" does not include transformation, as defined in Public Resources Code Section 40201).

SW4 To ensure ongoing compliance with these mitigation measures, the project applicant will be required to submit solid waste tonnage reports to the City of Irvine on City approved forms, accompanied by "weight ticket" receipts from state-certified disposal, nondisposal, or transformation facilities, on a quarterly basis to demonstrate that solid waste diversion has occurred in accordance with these required mitigation measures and in a manner that is consistent with, and not detrimental to, the efforts of the City of Irvine to comply with AB939.

To assure compliance with applicable statutes related to the disposal of solid waste, it is necessary for the City to require appropriate and effective mitigation measures to limit the disposal and ensure significant recycling of solid waste on-site.

SW5 For green waste, the project applicant must submit a written plan to the City and implement such plan to ensure that the green waste material generated by landscape maintenance operations is collected by a City authorized waste hauler or recycling agent, that the maximum feasible amount of that collected green waste is recycled, and that a minimum of 50% of the green waste from the project is diverted from landfills by recycling, as that term is defined by California Public Resources Code Section 40180.

4.17 DETERMINATION

Based on the information and analysis in this Initial Study/Addendum, and pursuant to Section 15162 of the State CEQA Guidelines, the City has determined that:

1. There are no substantial changes to the project that will require major revisions to the OCGP FEIR due to new, significant environmental effects or a substantial increase in the severity of impacts identified in the OCGP FEIR;
2. Substantial changes have not occurred in the circumstances under which the project is being undertaken that will require major revisions of the OCGP FEIR to disclose new, significant environmental effects or a substantial increase in the severity of the impacts identified in the OCGP FEIR; and
3. There is no new information of substantial importance not known at the time the OCGP FEIR was approved, augmented, and/or updated that shows any of the following:
 - a) The project will have any new significant effects not discussed in the OCGP FEIR;

4. Discussion of Checklist and Mitigation Measures

- b) There are impacts that were determined to be significant in the OCGP FEIR that will be substantially increased;
- c) There are additional mitigation measures or alternatives to the project that would substantially reduce one or more of the significant effects identified in the OCGP FEIR; or
- d) There are additional mitigation measures or alternatives that were rejected by the project proponent that are considerably different from those analyzed in the OCGP FEIR that would substantially reduce any significant impact identified in that EIR.

1. EIR Addendum Summary

1.1 PURPOSE AND SCOPE

This Initial Study/Addendum provides the basis for augmenting the 2007 Great Park Master Plan (subject of the Addendum No. 4 and, as the Great Park Master Plan was modified in 2011, subject to Addendum No. 8) and the modifications to the 688 acre portion of the Orange County Great Park known as the OCGP Improvement Area, and serves as the California Environmental Quality Act (CEQA) documentation for the:

- Approval of Modification to the Great Park Master Plan
- City Council determination of consistency between modified Great Park Master Plan and the Park Design (Design Package) approved as part of the Second Agreement with City of Irvine as Adjacent Landowner (subject of Addendum No. 9)

The requested modifications do not propose any changes to approved and environmentally-reviewed development intensities within the OCGP Master Plan area. This Addendum has been prepared pursuant to the provisions of CEQA (Public Resources Code Sections 21000 et seq.), the State CEQA Guidelines (14 Cal. Code Regs. 15000 et seq.) and the City of Irvine Local Guidelines for Implementing CEQA (Local CEQA Guidelines).

The term “proposed Project” refers to the proposed Modifications to the OCGP Improvement Area of approximately 688 acres, while the term “project” refers to the total MCAS El Toro reuse plan analyzed in the OCGP FEIR (and its subsequent addenda) consisting of approximately 4,700 acres. The term “2012 Modified Project” refers to the Heritage Fields Project 2012 General Plan Amendment and Zone Change, which was the subject of the Heritage Fields Project 2012 General Plan Amendment and Zone Change Second Supplemental Environmental Impact Report (SSEIR). The term “OCGP FEIR” refers to the 2003 Orange County Great Park Final EIR (FEIR) as updated by its prior Addenda (Addendum No. 1 through Addendum No. 8) and Supplemental Environmental Impact Reports (SEIRs).

1.2 ENVIRONMENTAL PROCEDURES

Pursuant to CEQA, the State CEQA Guidelines, and the Local CEQA Guidelines, this Initial Study/Addendum focuses on the proposed Modifications to the OCGP Improvement Area to determine if the proposed Project would cause a change in the environmental impact conclusions of the OCGP FEIR, and if any change in circumstances or new information exists that would substantially change the conclusions of the OCGP FEIR.

Pursuant to Section 21166 of CEQA and Section 15162 of the State CEQA Guidelines, when an EIR has been certified or a negative declaration adopted for a project, no subsequent EIR shall be prepared for the project unless the lead agency determines, on the basis of substantial evidence, that one or more of the following conditions are met:

1. EIR Addendum Summary

- (1) Substantial changes are proposed in the project that will require major revisions of the previous EIR due to the involvement of new significant environmental effects or a substantial increase in the severity of previously identified significant effects;*
- (2) Substantial changes occur with respect to the circumstances under which the project is undertaken that will require major revisions of the previous EIR due to the involvement of new significant environmental effects or a substantial increase in the severity of previously identified significant effects; or*
- (3) New information of substantial importance, which was not known and could not have been known with the exercise of reasonable diligence at the time the previous EIR was certified as complete, suggests any of the following:*
 - a) The project would have one or more significant effects not discussed in the previous EIR or negative declaration.*
 - b) Significant effects previously examined would be substantially more severe than identified in the previous EIR.*
 - c) Mitigation measures or alternatives previously found not to be feasible would in fact be feasible, and would substantially reduce one or more significant effects of the project, but the project proponent declines to adopt the mitigation measures or alternatives.*
 - d) Mitigation measures or alternatives that are considerably different from those analyzed in the previous EIR would substantially reduce one or more significant effects on the environment, but the project proponent declines to adopt the mitigation measures or alternatives.*

Section 15164 of the State CEQA Guidelines states that an Addendum to an EIR shall be prepared “if some changes or additions are necessary, but none of the conditions described in Section 15162 calling for preparation of a subsequent EIR have occurred.” This Initial Study/Addendum reviews the changes proposed by the proposed Project and any changes to the existing conditions that have occurred since the OCGP FEIR was last augmented by the Heritage Fields Project 2012 GPA & ZC Second Supplement EIR (approved in November 2013). It also reviews any new information of substantial importance that was not known and could not have been known with exercise of reasonable diligence at the time that the OCGP FEIR was certified. It further examines whether, as a result of any changes or any new information, a subsequent or supplemental EIR may be required. This examination includes an analysis of the provisions of Section 21166 of CEQA and Section 15162 of the State CEQA Guidelines and their applicability to the proposed Project. This Initial Study/Addendum relies on the attached Environmental Analysis, which addresses environmental checklist issues on a section-by-section basis.

The City of Irvine Environmental Checklist Form has been completed by the City and included in Section 3, *Environmental Checklist*. The Environmental Checklist Form is marked with the findings of the Community Development Director as to the environmental effects of the proposed Project in comparison with the findings of the OCGP FEIR. The checklist has been prepared pursuant to Section 15168(c)(4) of

1. EIR Addendum Summary

CEQA, which states that “where the subsequent activities involve site specific operations, the agency should use a written checklist or similar device to document the evaluation of the site and the activity to determine whether the environmental effects of the operation were covered in the program EIR.”

Using that approach, the City of Irvine, the Lead Agency, determined that an Addendum to the previously approved OCGP FEIR is the appropriate environmental clearance for the proposed Project.

1.3 PREVIOUS ENVIRONMENTAL DOCUMENTATION

The OCGP FEIR was originally certified by the City of Irvine in May 2003. The project analyzed in the OCGP FEIR consisted of the following actions: 1) Annexation, General Plan Amendment, Pre-Zoning (prior to annexation), and Zoning of the unincorporated portion of Planning Area (PA) 51; 2) Annexation of the unincorporated portion of PA 35 (Irvine Ranch Water District Parcel); 3) General Plan Amendment and Zone Change for PA 30 (the overall site originally included PAs 30 and 51, which were later merged into a single PA 51; for purposes of this document, both PA 30 and PA 51 will be referred to as the PA 51); and 4) Approval of the form of a Development Agreement vesting approval of overlay uses and intensities in consideration for dedication of land for public purposes and for developing and funding certain infrastructure improvements and maintenance of the public uses by the purchaser/developer and subsequent landowners and funding for specific park, roadways, and other circulation facilities and infrastructure. Together, these actions establish the policy and legislative structure to guide the development of the former MCAS El Toro property.

The OCGP FEIR mitigation measures are provided in the adopted Mitigation Monitoring and Reporting Program included in Appendix A. The table includes:

- Mitigation Measure number and a description of the action;
- Timing for implementation;
- Approving authority and reviewing agency(s), if any; and
- Method of compliance

Subsequent to certification of the OCGP FEIR, eight Addenda (Addendum No. 1 through Addendum No. 8) and two supplemental Environmental Impact Reports (SEIR and SSEIR) were approved and certified to address the potential environmental impacts associated with modifications to OCGP FEIR. An in-depth description of the previous environmental documents is provided in Section 2.2.1 of this document.

The 2003 OCGP FEIR, as augmented by Addenda 1 through 8 (collectively, Addenda), SEIR, SSEIR, and all of the associated technical documents, reports and analyses are on file and can be reviewed at the City of Irvine, Community Development Department, at One Civic Center Plaza, Irvine, California 92623.

1.4 ENVIRONMENTAL SETTING

The Orange County Great Park is located in the central portion of Orange County, approximately 45 miles southeast of Los Angeles. The Project area is generally bounded by the Woodbury residential development to the west, Portola Springs residential development to the north (under construction), Irvine

1. EIR Addendum Summary

Spectrum to the south, and the City of Lake Forest to the east. Other nearby local jurisdictions includes the cities of Laguna Hills, Laguna Niguel, Laguna Woods, Mission Viejo, Aliso Viejo, and Tustin.

Irvine Station is adjacent to the Southern California Regional Rail Authority (SCRRA) Metrolink tracks and is located to the south of the Project site. Commercial uses, including Irvine Spectrum, are located further to the south of the Project site. Surrounding the site are residential and nonresidential uses under construction to the north and west, open space to the east, and nonresidential and mixed land uses to the east and southeast within the cities of Lake Forest and Irvine.

The existing facilities and uses within the proposed Project site include existing portions of the Western Sector Park Development Plan Phase I such as the Balloon Park, Hangar 244, artist lofts, Central and West Timeline, North and South Lawns, Farm & Food Lab, Palm Court, and support parking. Consistent with the City's Zoning Ordinance, there are interim uses of the land or existing buildings which include Tierra Verde Industries, a composting and electronic waste recycling facility, agriculture, special event parking lot, and recreational vehicle parking.

1.5 CONCLUSIONS OF ADDENDUM

This Addendum No. 9 document analyzes the potential impacts of the proposed Modifications to the OCGP Improvement Area. The modifications consist of reducing the number of sports courts; expanding passive recreational area; relocating some of the Improvement Area components to optimize visibility, access and efficiency; and assessing adequacy of the parking plan. Section 4.0 of this document discusses the findings of the analysis in comparison to the OCGP FEIR.

The environmental analysis contained in this document focuses on the following environmental topics: Aesthetics, Agriculture and Forestry Resources, Air Quality, Biological Resources, Cultural Resources, Geology and Soils, Greenhouse Gas Emission, Hazards and Hazardous Materials, Hydrology and Water Quality, Land Use and Planning, Noise, Population and Housing, Public Services, Transportation/Traffic, and Utilities and Service Systems. The analysis concluded that the proposed modifications reflect a development program that is consistent with the existing land use designations and does not deviate from the development program for the area. No new uses or significant changes are proposed as part of the proposed Project, beyond those previously studied and disclosed, that would create new adverse impacts related to any of the above environmental topics or a substantial increase in the severity of previously identified significant effects.

Also, there are no mitigation measures or alternatives previously found not to be feasible that would in fact be feasible, and would substantially reduce one or more significant effects of the project, and there are no mitigation measures or alternatives that are considerably different from those analyzed in the previous EIR that would substantially reduce one or more significant effects on the environment. Therefore, no new mitigation measures are proposed, even though all original applicable mitigation measures from the OCGP FEIR and new mitigation measures; existing plans, programs, or policies (PPPs); and project design features (PDFs) from the supplemental EIRs (SEIR and SSEIR) have been carried forward into this document to further help reduce or avoid potential significant impacts.

2. Project Description

2.1 PROJECT LOCATION

The Orange County Great Park (OCGP) is located northeast of the freeway junction at Interstate 5 (I-5) and Interstate 405 (I-405), within Planning Area (PA) 51 in the City of Irvine. The proposed Project consists of modifications to the 688-acre portion of the OCGP Master Plan, which is known as the “OCGP Improvement Area”. The proposed modifications are within the Bosque and Sports Park Districts of the Improvement Area, which are bordered on the north by Irvine Boulevard; on the south by future Marine Way; on the west by future “LY” Street; and on the east by the future daylighted Agua Chinon wash. The 688-acre OCGP Improvement Area also includes the Wildlife Corridor bordering Irvine Boulevard to the north; I-5 to the south; and the project boundary to the east. Figure 2-1 depicts the Project location in a regional context and Figure 2-2 shows its local context.

The main vehicular entrance into the OCGP is from the west at Marine Way with a planned ceremonial entrance at Trabuco Road. An aerial photograph of the proposed Project site and surrounding area is shown on Figure 2-3. Irvine Station is adjacent to the Southern California Regional Rail Authority (SCRRA) Metrolink tracks and is located to the south of the Project site. Commercial uses, such as Irvine Spectrum, are located further to the south of the Project site. Surrounding the site are residential and nonresidential uses under construction to the north and west, open space to the northeast, and nonresidential and mixed land uses to the east and southeast within the cities of Lake Forest and Irvine.

2.2 PROJECT CHARACTERISTICS

2.2.1 Project Background

On May 27, 2003, the Irvine City Council certified a Final Environmental Impact Report (OCGP FEIR) and adopted a general plan amendment (GPA) and zone change (ZC) to implement the development of the OCGP. To develop at the maximum intensities allowed in the Overlay Plan shown in the General Plan and Zoning Ordinance, the land use entitlements required that the property owner enter into a development agreement with the City, which required, among other things, the dedication of land and the development or funding of certain infrastructure improvements.

On May 18, 2006, the City approved Addendum No. 1 to the OCGP FEIR to address the potential environmental impacts associated with the implementation of the OCGP Redevelopment Project Area Plan.

2. Project Description

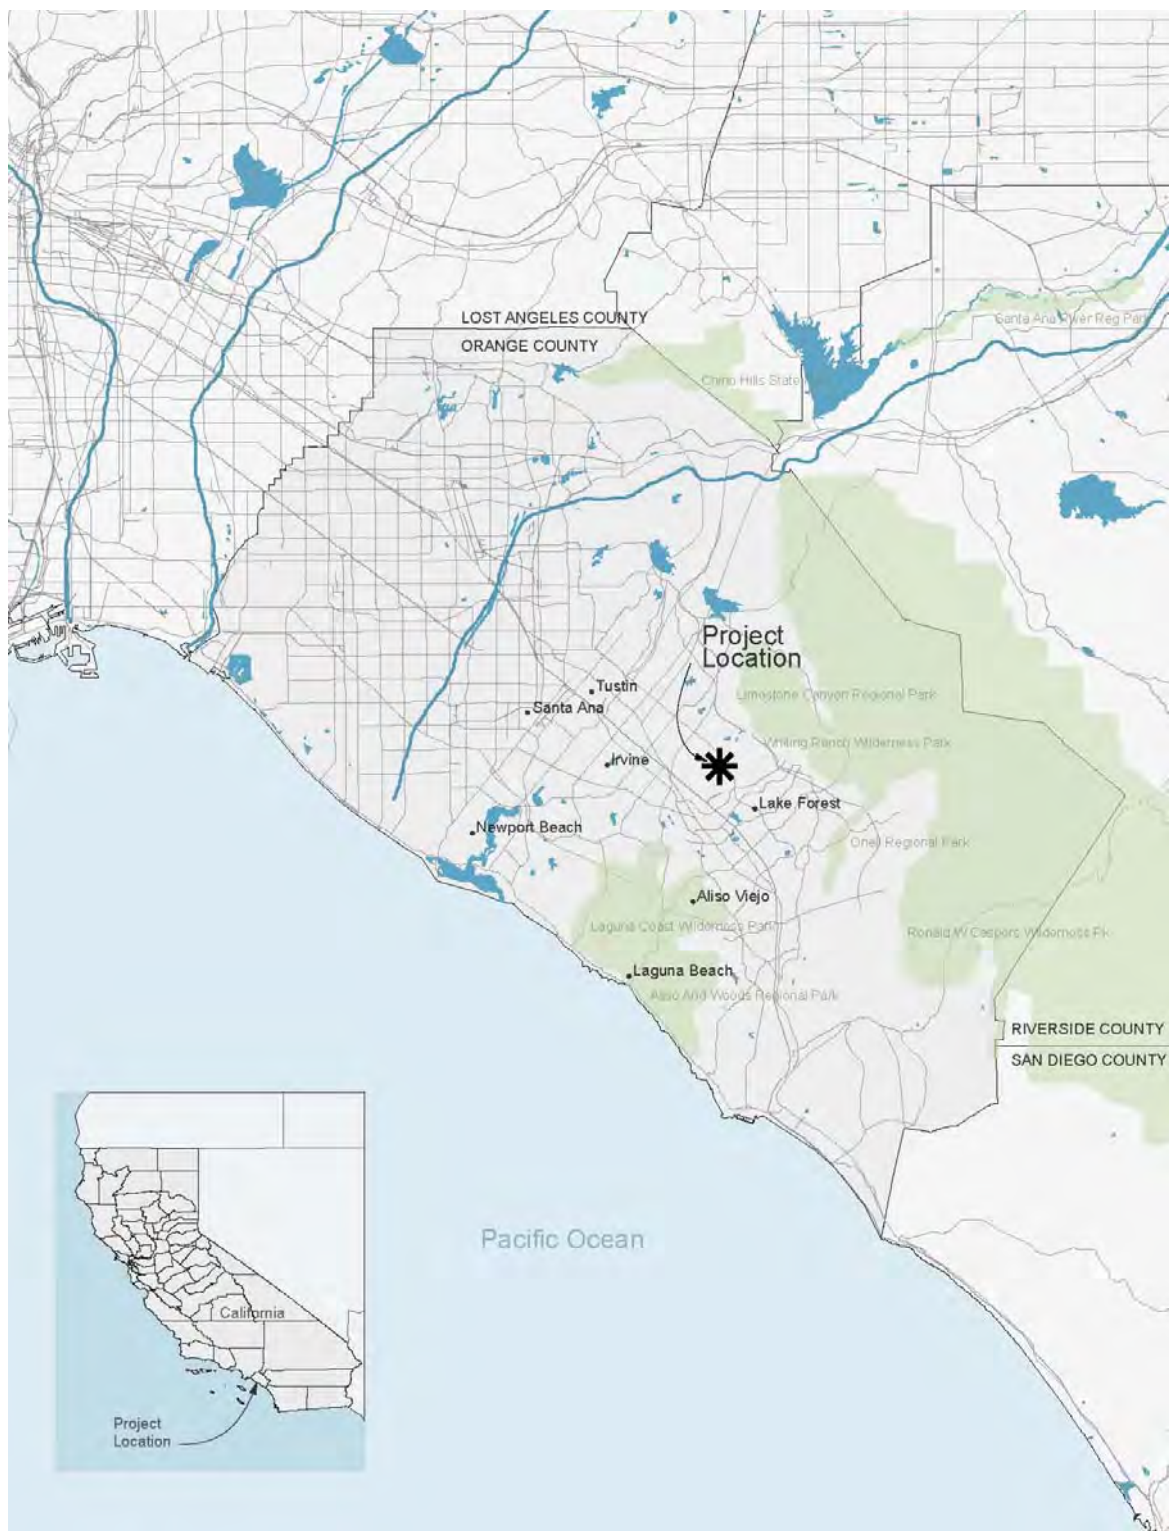

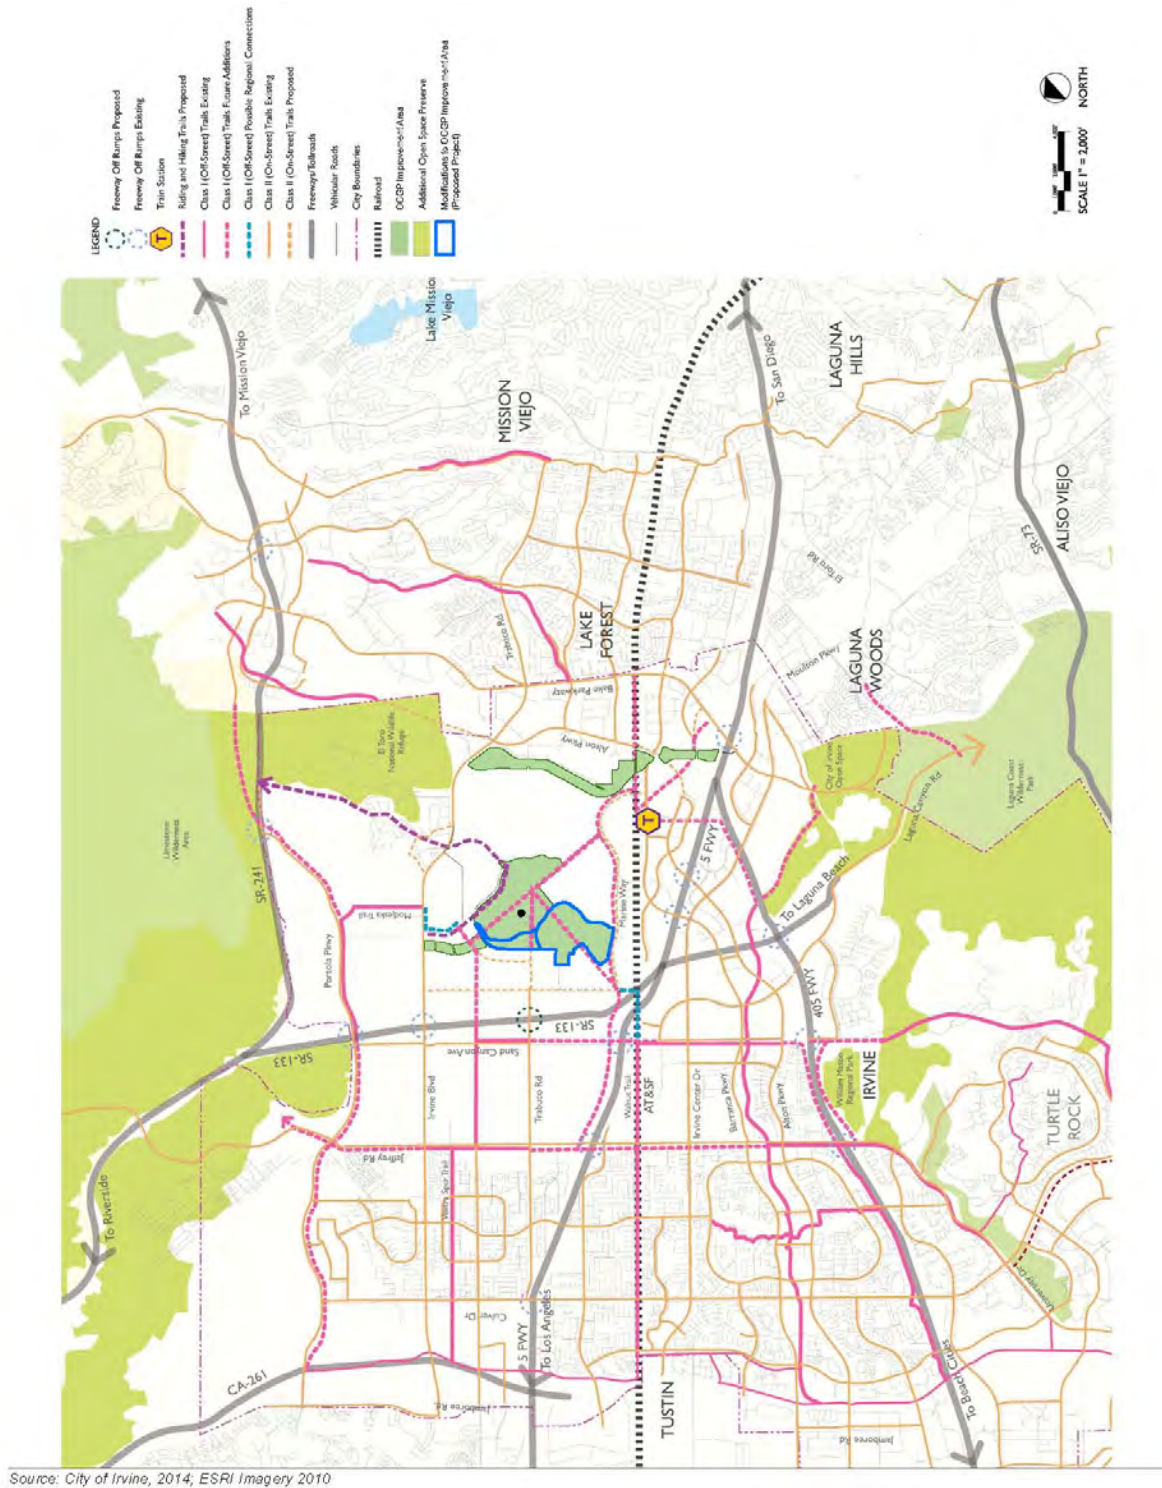

Figure 2-1
Project Location

Addendum No. 9 - Modifications to the OCGP Improvement Area

2. Project Description

Figure 2-3
Aerial Photograph

In July 2005, Heritage Fields LLC, the predecessor of Heritage Fields El Toro, LLC (Heritage Fields), purchased the property that today is comprised of all of PA 51 (except such land as the federal government has determined to permanently retain), which includes the OCGP land. Heritage Fields thereafter made the aforementioned dedications, entered into the aforementioned development agreement, and received the aforementioned land use entitlements. The Orange County Great Park Corporation (GPC) and Heritage Fields then initiated their respective master design and development processes. To facilitate additional design options, both the GPC and Heritage Fields requested and the City initiated an amendment to the General Plan and the Zoning Ordinance to reconfigure the property boundaries between the two entities. Heritage Fields requested the creation of the 8.1/8.1A Lifelong Learning District zoning designations, which allowed mixed-use development, and also proposed various revisions to the zoning text within former PA 30 and PA 51. These revisions were analyzed in Addendum No. 2 dated September 2006, and were approved as the “Revised Overlay Plan” (Overlay Plan) by the City Council on October 10, 2006.

On June 28, 2006, Heritage Fields filed an application for approval of Vesting Tentative Tract Map No. 17008 (Master Subdivision Map). The Master Subdivision Map was approved by the Planning Commission on May 17, 2007. CEQA compliance for the Master Subdivision Map was accomplished via Addendum No. 3 approved on May 17, 2007.

In 2007, the GPC sought approval of a master plan for the development of the Orange County Great Park (OCGP Master Plan). The OCGP Master Plan was approved by the Planning Commission on August 2, 2007. The CEQA compliance for the OCGP Master Plan was established via Addendum No. 4 dated July 2007 and approved by the Planning Commission on August 2, 2007.

During preliminary consideration of the conceptual design of Marine Way, the California Department of Transportation (Caltrans) expressed concerns regarding the location of Marine Way and its relationship to the Bake Parkway freeway on-ramp. It was recognized that the revised alignment required an amendment to the General Plan, the Zoning Ordinance, and the Orange County Transportation Authority’s Master Plan of Arterial Highways. Addendum No. 5 provided that CEQA review and compliance for those entitlement actions. Addendum No. 5 also examined the amendments to the City-Heritage Fields Amended and Restated Development Agreement and related changes to the City’s General Plan and Zoning Ordinance. Addendum No. 5 was approved by the City Council on July 22, 2008.

In 2008, Addendum No. 6 was prepared analyzing the potential environmental issues associated with the following requested entitlements: amended Vesting Tentative Tract Map (AVTTM) No. 17008; VTTM No. 17283; Modification to the OCGP Streetscape Design Guidelines; Master Landscape and Trails Plan (MLTP); and Master Plan for Non-Residential Development within the Lifelong Learning District. Addendum No. 6 was approved by the Planning Commission on October 16, 2008.

In 2010, Addendum No. 7 was prepared in connection with revisions to the North Irvine Transportation Mitigation (NITM) Program, which removed planned traffic improvements at seven intersections from the list of traffic mitigation measures in the OCGP FEIR. Addendum No. 7 also removed the finding of a significant impact (and associated mitigation obligations) at one ramp (SR-241 at Lake Forest Drive). Addendum No. 7 was approved by the City Council on June 29, 2010.

2. Project Description

In 2011, Heritage Fields sought from the City a series of entitlements including: a general plan amendment, a zone change, seven subdivision maps, six master plans and five park plan approvals associated with the private development of a portion of the Heritage Fields-owned property within PA 51 and former PA 30 ("Modified Project"). A Supplement to the OCGP FEIR (SEIR) was prepared in connection with those entitlement applications. The SEIR was approved and certified by the City Council on August 30, 2011.

Addendum No. 8 was prepared analyzing the potential environmental issues associated with a minor modification to the Great Park Master Plan and Park Design Review, which was associated with implementation of the "Western Sector Park Development Plan Phase I". The minor modification proposed transferring non-residential square footage from the central area (i.e., Cultural Terrace) to the southwestern area of the OCGP (i.e., Sports Park); removing the Air Museum and Concessions/Retail, and replacing them with the Artist in Residency Facility, the proposed Community Ice Facility, and the proposed Nature Education Garden; and replacing the existing Air Museum Hangar with Hangar 244. Addendum No. 8 was approved by the City on October 20, 2011.

In 2012, a Second Supplemental EIR (supplement to the OCGP FEIR (SSEIR)) was prepared to analyze the 2012 Modified Project as compared to the 2011 Approved Project. The SSEIR addressed the environmental impacts associated with the implementation of the Heritage Fields 2012 General Plan Amendment and Zone Change Project, including the 688-acre OCGP Improvement Area. The 2012 Modified Project consisted of the reduction of 410,400_{sf} of non-residential intensity and a corresponding addition of 3,412 dwelling units, as well as 1,194 density bonus units for a total of 4,606 new dwelling units (9,500 total dwelling units). The Modified Project proposed relocation of certain portions of the Approved Wildlife Corridor Feature (Segments 2 and 3). The SSEIR also analyzed the potential impacts associated with two options for the "Main Street" development along Trabuco Road east of "O" Street. Additionally, the 2012 Modified Project included implementation of recreational facilities in the previously approved Sports Park District of the OCGP. PAs 30 and 51 were also combined into a single PA, Combined PA 51, to create a cohesive development governed by a unified set of land use and development regulations. On November 26, 2013, the City Council certified the SSEIR.

Concurrent with the certification of the SSEIR, on November 26, 2013, the City Council also approved a contractual agreement (ALA II) with Heritage Fields El Toro, LLC (Heritage Fields) that obligated Heritage Fields to construct 688 acres of the Great Park (the Design Package). The ALA II included provisions that allowed the City to unilaterally require program changes within the 688-acre OCGP Improvement Area, with respect to the following elements of the Design Package: a) sand volleyball, parking and sports courts within the Sports Park sub-area; b) the dog park and mini-amphitheater within the Bosque sub-area. On March 18, 2014, the City Council approved the Unilateral Changes to the Design Package of the contractual agreement (ALA II). This action will be reflected in the discretionary action that the Planning Commission will be asked to make with regards to the Master Plan modification. Since CEQA clearance for the "Design Package" was established through the SSEIR, this Addendum document analyzes the Unilateral and Program Changes as approved by the City Council. The SSEIR served as the environmental clearance for the ALA II and its implementation.

2.2.2 Project Components

This Addendum (Addendum No. 9) addresses the potential for environmental impacts associated with the modifications to the 688-acre OCGP Improvement Area, which include both the Unilateral Program changes allowed in the ALA II and other staff recommended changes to the OCGP Improvement Area¹. The proposed modifications are within the Bosque and Sports Park Districts of the 688-acre OCGP Improvement Area. Additionally, there are two design features of the Project that would be incorporated upon project implementation and they include dual 250-foot long eastbound left-turn pockets at Marine Way and Great Park Boulevard West (562) and a 250-foot long westbound right turn lane at the Marine Way right in/right out driveway (669), located west of Great Park Boulevard (West).

The OCGP Improvement Area includes the Sports Park complex with multi-use fields, baseball, softball, tennis, sand volleyball and sports courts, an area of Bosque and Upper Bee Canyon improvements, agricultural areas, a golf course and public clubhouse, trails, and wildlife corridor. A “Design Package,” which depicts the concept plans and programming of the OCGP Improvement Area, was prepared by the City and Heritage Fields and included in the ALA II. The OCGP Improvement Area as depicted in the Design Package includes the following Districts:

- Upper Bee Canyon
- Bosque
- Agriculture
- Golf Course
- Sports Park
- Wildlife Corridor

As authorized by the ALA II, the Unilateral and Program Changes are listed below:

1. Sand Volleyball Courts (within Sports Park)

In the area north of the Palm Court, bordering Heritage Fields property, the Project proposes to eliminate the planned 4,200-square-foot Volleyball Support Building and six of the eleven planned courts. The remaining five planned courts will be re-positioned further east to allow for the development of a large children’s playground in the reclaimed area. The new playground will blend naturally with the future neighborhood park (Sports Village Green) proposed on Heritage Fields El Toro, LLC’s (HEFT) adjacent property. Additionally, in the area south of the Kids Rock play feature, the Project proposes to eliminate the four planned volleyball courts in the crescent-shaped area to allow for the development of passive picnic grounds adjacent to the large Great Lawn area.

2. Sports Courts (within Sports Park)

In the area north of the Palm Court (current location of the Farm and Food Lab), the Project proposes to eliminate all eight of the planned basketball courts and reconfigure parking into this area to preserve more land for the children’s playground to the north and the entrance to the Championship

¹ To accomplish the environmental review for this Addendum, however, it was necessary to prepare analyses that verify that the overall environmental impacts of the OCGP Improvement Area are within the assumptions set forth in prior environmental analyses.

2. *Project Description*

Soccer Field Building. This modification will not change the total number of parking stalls. Additionally, in the area south of the Kids Rock play feature, the Project proposes to relocate the four full-courts further south to a crescent-shaped area adjacent to the softball facility. This would preserve more picnic and play area around Kids Rock (currently lawn), and allow for the future development of a Splash Park. This modification could include an adjustment to the Limits of Work between Orange County Great Park/Heritage Fields El Toro improvement areas to reserve this approximately 1.7-acre area.

3. Other Program Changes (within Bosque)

Other Program Changes (recommended by the City Staff) to the 688-acre OCGP Improvement Area include the following modifications:

- Relocation and design of the Great Park Farm and Food Lab from its existing location to a new approximately 3.7-acre location near the Trabuco Entry.
- Further site development of the dog park to optimize visibility, potential pet enclosure, and defining accessible routes to this amenity from the parking lot.
- Improvement in the quality of planned public restrooms.
- Construction of utilities infrastructure in certain parking facilities by providing conduit to be “solar ready”.
- A parking plan as modified by the approved Program Changes and design enhancements.

Modifications to the OCGP Improvement Area

The Modification to the OCGP Master Plan applies to the 688-acre OCGP Improvement Area and subsequent modifications to that Improvement Area, which include the Unilateral and other Program Changes. The ALA II includes a “Design Package” that sets forth the concept plans and programming for the 688-acre OCGP Improvement Area. The SSEIR served as the environmental clearance document for the ALA II and the Design Package. The proposed Modifications to the OCGP Improvement Area, which include the Unilateral Program changes and other Program changes, outlined above, constitute the “Project” in this Addendum No. 9 document (see Table 2-1 and Figure 2-4). The following Table 2-1 highlights the Modifications to the OCGP Improvement Area.

Table 2-1. Modifications to the OCGP Improvement Area

OCGP Improvement Area Districts	Program Changes to OCGP Improvement Area
Upper Bee Canyon (33.9 acres) <ul style="list-style-type: none">- Pedestrian Trails- Class I Bike Trail- Boulder Fields- Pedestrian Undercrossing- Landform- Potential Transit Stop (Not part of budget)	No changes proposed

2. Project Description

OCGP Improvement Area Districts	Program Changes to OCGP Improvement Area
Bosque (40.0 acres) <ul style="list-style-type: none"> Open Bee Canyon (Overlook Bridge) Pedestrian and Bicycle Trails Family Picnic Areas Bicycle Station Landforms Small Amphitheater/Stage Dog Park Children's Adventure Area Great Park Garden Proposed Food Lab Relocation Site Restroom 	<ul style="list-style-type: none"> Small Amphitheater/Stage (Integrate into the bermed entry feature) Dog Park (Relocate to a 2-ac location closer to the mini-amphitheater) Proposed Farm + Food Lab Relocation Site (Relocate to a 3.7-ac location near the Trabuco Entry)
Agriculture/Golf Course (258.8 acres) <ul style="list-style-type: none"> Golf Course Clubhouse Clubhouse Parking Driving Range Golf Maintenance Facility Single Track Trail Sidewalk Agriculture Area 	<ul style="list-style-type: none"> No changes proposed
Sports Park (175.0 acres) <ul style="list-style-type: none"> 17 Soccer Pitches (includes 5 Flex Fields) 1 Championship Soccer Pitch Admin/Soccer Press Box Building 2 Soccer Support Buildings Maintenance Building Visitor Center Building 6 Baseball Fields 1 Championship Baseball Stadium Championship Baseball Building Baseball Support Building 4 Softball Fields 1 Championship Softball Stadium Softball Support Building 10 Volleyball + 1 Championship Sand Volleyball Volleyball Support Building 24 Tennis Courts 1 Championship Tennis Court Tennis Support Building 12 Basketball Courts Timeline Avenue of Champions All-Star Plaza Parking Passive Garden Trails/Walking Paths 	All of features listed with the following revisions: <ul style="list-style-type: none"> 5 Sand Volleyball Courts (reduced from 10 Volleyball + 1 Championship San Volleyball) 0 Basketball Courts (reduced from 12) 12 Basketball Courts Children's Play Area Expanded Play Area 4 Sports Courts (4 full-sized Basketball Courts) Expanded Picnic Area Removal of 4,200-square-foot Volleyball Support Building

2. *Project Description*

OCGP Improvement Area Districts	Program Changes to OCGP Improvement Area
- Restrooms	
Wildlife Corridor (177.6 acres)	No changes proposed
HEFT Property (3.2 acres)	No changes proposed
	<ul style="list-style-type: none">- Improvement in the quality of planned public restrooms.- Construction of utilities infrastructure in certain parking facilities by providing conduit to be "solar ready".- A parking plan as modified by the approved Program Changes and design enhancements.
	<ul style="list-style-type: none">- Adjustment to the Limits of Work between Orange County Great Park/Heritage Fields El Toro improvement areas (approximately 1.7 acres).

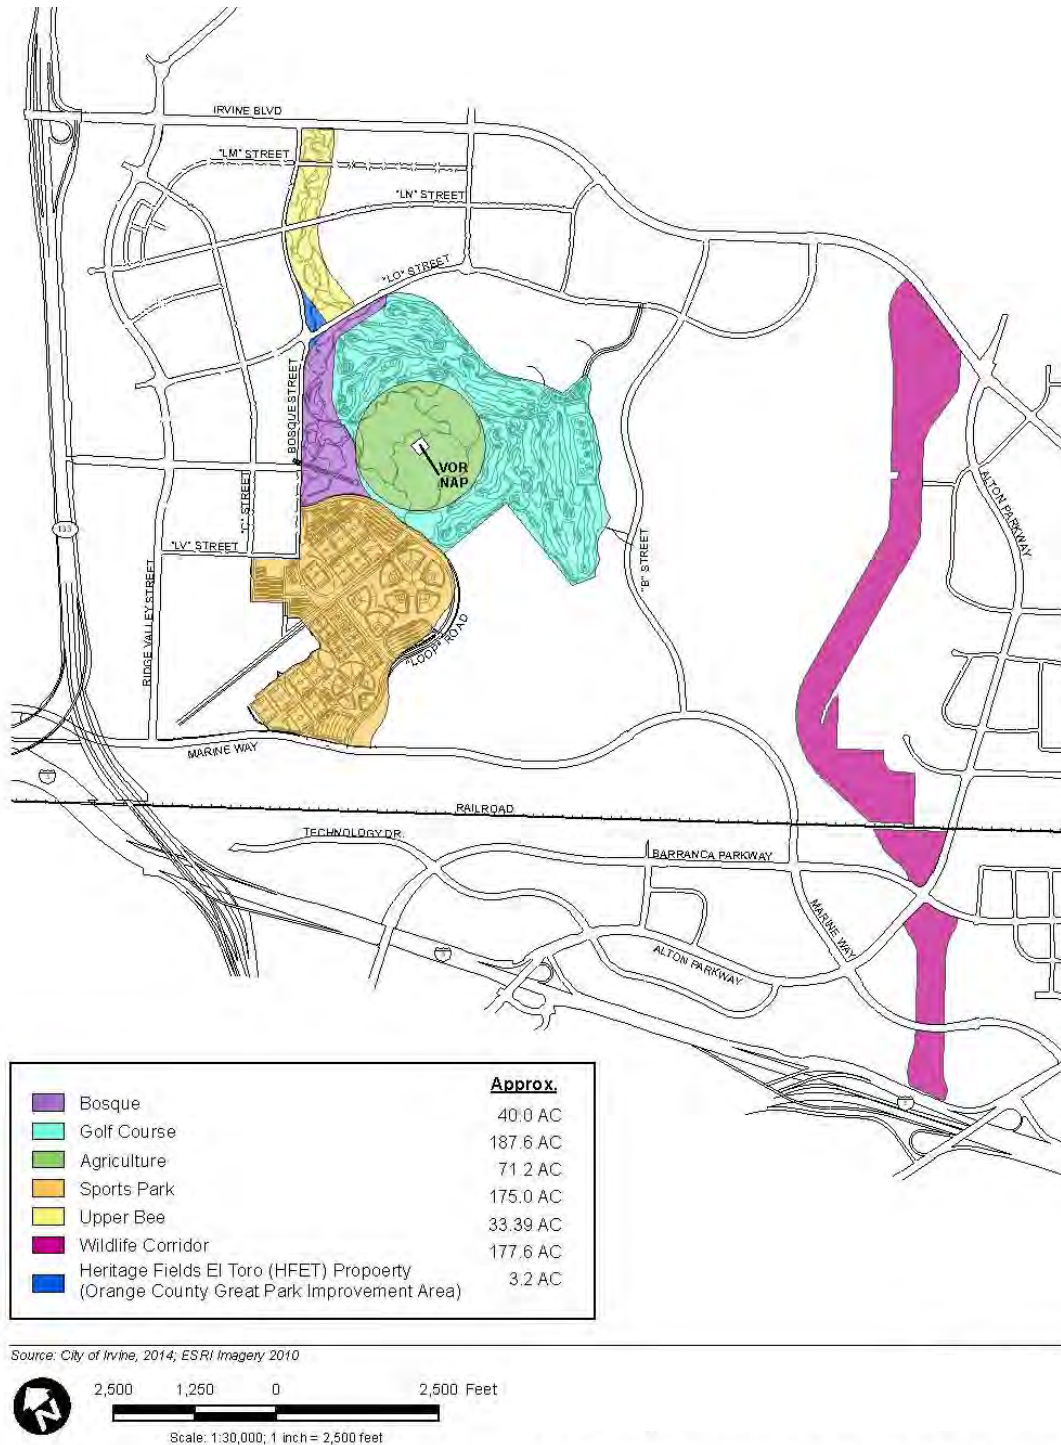

Figure 2-4
Great Park Improvement Area

2. Project Description

2.3 DISCRETIONARY APPROVALS

Implementation of the Project includes the following discretionary actions to be undertaken by the City:

- Approval of Modification to the Great Park Master Plan
- City Council determination of consistency between modified Great Park Master Plan and the Park Design (Design Package), approved as part of the Second Agreement with City of Irvine as Adjacent Landowner (subject of Addendum No. 9)

The OCGP FEIR lists additional discretionary actions to be taken by the City and other public agencies at or as part of the completion of the Project (OCGP FEIR pages 3-29 and 3-30). The actions and responsible public agencies include, but are not necessarily limited to, these approvals:

- Master plans and subdivisions for development (City)
- Community facilities districts or other assessment districts (City)
- Actions to improve interim use activities (City and DoN)
- Transfer of parcels within PA 51 (DoN)
- Clean Water Act section 404 permits (U.S. Army Corps of Engineers)
- Endangered Species Act compliance (U.S. Fish and Wildlife Service)
- Clean Water Act Section 401 and National Pollutant Discharge Elimination System (NPDES) permits (Regional Water Quality Control Board)
- California Fish and Game Code 1602 permits (California Department of Fish and Game)
- Revisions to the Orange County Master Plan of Arterial Highways (Orange County Transportation Authority)

The City of Irvine Environmental Information Form and Environmental Checklist Form have been completed by the City and are included on the following pages. The Environmental Checklist Form is marked with the findings of the Community Development Department as to the environmental effects of the changes included in the proposed Project that is the subject of this Addendum.

As explained above, this comparative analysis has been undertaken, pursuant to the provisions of the California Environmental Quality Act (CEQA), to provide the City with the factual basis for determining whether any changes in the OCGP FEIR project, any changes in the circumstances, or any new information requires additional environmental review and documentation. The basis for each of the findings listed in the attached Environmental Checklist Form in Section 3 is explained in Section 4 of the Addendum.

3. Environmental Checklist

3.1 CITY OF IRVINE INITIAL STUDY AND ENVIRONMENTAL EVALUATION

The City of Irvine Environmental Information Form and Environmental Checklist Form have been completed by the City and are included on the following pages. The Environmental Checklist Form is marked with the findings of the Community Development Department as to the environmental effects of the proposed Modifications to the OCGP Improvement Area in comparison with the findings of the OCGP FEIR.

As explained above, this comparative analysis has been undertaken, pursuant to the provisions of CEQA, to provide the City with the factual basis for determining whether any changes in the project, any changes in the circumstances under which the project is undertaken, or any new information requires additional environmental review or preparation of a subsequent or supplemental EIR. The basis for each of the findings listed in the attached Environmental Checklist Form is explained in Section 4 of this Addendum No. 9 document.

1. Project Title:

Addendum No. 9 – Modifications to the OCGP Improvement Area

2. Lead Agency Name and Address:

City of Irvine Community Development Department
One Civic Center Plaza Irvine, California 92623

3. Contact Person and Phone Number:

Barry Curtis, AICP, Manager of Planning Services (949) 724-7453

4. Project Location:

The Orange County Great Park (OCGP) is bordered on the north by Irvine Boulevard; on the south by future Marine Way; on the west by future Ridge Valley; and on the east by the future daylighted Agua Chinon wash. On the easterly border of Planning Area 51 is the future Wildlife Corridor.

5. Project Sponsor's Name and Address:

City of Irvine Community Development Department,
One Civic Center Plaza Irvine, California 92623

6. General Plan Designation:

Orange County Great Park (OCGP)

7. Zoning:

1.9 Orange County Great Park
1.4 Preservation

3. Environmental Checklist

8. Description of Project

See Section 2.2.2, *Project Components*

9. Surrounding Land Uses and Setting (Briefly describe the project's surroundings):

The proposed Project area is located in the central portion of Orange County, approximately 45 miles southeast of Los Angeles. Irvine Station is located to the south of the Project site. Commercial uses, such as Irvine Spectrum, are located further to the south of the Project site. Surrounding the site are residential and nonresidential uses under construction to the north and west, open space to the northeast, and nonresidential and mixed land uses to the east and southeast within the cities of Lake Forest and Irvine.

10. Other Public Agencies Whose Approval Is Required (e.g., permits, financing approval, or participation agreement):

N/A

3.2 ENVIRONMENTAL FACTORS POTENTIALLY AFFECTED

The environmental factors checked below would be potentially affected by this project, involving at least one impact that is a "Potentially Significant Impact" as indicated by the checklist on the following pages.

- | | | |
|---|--|---|
| <input type="checkbox"/> Aesthetics | <input type="checkbox"/> Agricultural Resources | <input type="checkbox"/> Air Quality |
| <input type="checkbox"/> Biological Resources | <input type="checkbox"/> Cultural Resources | <input type="checkbox"/> Geology/Soils |
| <input type="checkbox"/> Greenhouse Gas Emissions | <input type="checkbox"/> Hazards and Hazardous Materials | <input type="checkbox"/> Hydrology/Water Quality |
| <input type="checkbox"/> Land Use/Planning | <input type="checkbox"/> Mineral Resources | <input type="checkbox"/> Noise |
| <input type="checkbox"/> Population/Housing | <input type="checkbox"/> Public Services | <input type="checkbox"/> Recreation |
| <input type="checkbox"/> Transportation/Traffic | <input type="checkbox"/> Utilities/Service Systems | <input type="checkbox"/> Mandatory Findings of Significance |

3.3 DETERMINATION

On the basis of this initial evaluation:

- ☐ I find that the proposed project COULD NOT have a significant effect on the environment, and a NEGATIVE DECLARATION will be prepared.
- ☐ I find that although the proposed project could have a significant effect on the environment, there will not be a significant effect in this case because revisions in the project have been made by or agreed to by the project proponent. A MITIGATED NEGATIVE DECLARATION will be prepared.
- ☐ I find that the proposed project MAY have a significant effect on the environment, and an ENVIRONMENTAL IMPACT REPORT is required.
- ☐ I find that the proposed project MAY have a "potentially significant impact" or "potentially significant unless mitigated" impact on the environment, but at least one effect (1) has been adequately analyzed in an earlier document pursuant to applicable legal standards, and (2) has been addressed by mitigation measures based on the earlier analysis as described on attached sheets. An ENVIRONMENTAL IMPACT REPORT is required, but it must analyze only the effects that remain to be addressed.
- ☒ I find that although the proposed project could have a significant effect on the environment, because all potentially significant effects (a) have been analyzed adequately in an earlier EIR or NEGATIVE DECLARATION pursuant to applicable standards, and (b) have been avoided or mitigated pursuant to that earlier EIR or NEGATIVE DECLARATION, including revisions or mitigation measures that are imposed upon the proposed project, nothing further beyond an Addendum to the earlier EIR is required.

Barry Curtis, AICP, Manager of Planning Services

Date

3. Environmental Checklist

3.4 EVALUATION OF ENVIRONMENTAL IMPACTS

- 1) A brief explanation is required for all answers except “No Impact” answers that are adequately supported by the information sources a lead agency cites in the parentheses following each question. A “No Impact” answer is adequately supported if the referenced information sources show that the impact simply does not apply to projects like the one involved (e.g., the project falls outside a fault rupture zone). A “No Impact” answer should be explained where it is based on project-specific factors as well as general standards (e.g., the project will not expose sensitive receptors to pollutants, based on a project-specific screening analysis).
- 2) All answers must take account of the whole action involved, including off-site as well as on-site, cumulative as well as project-level, indirect as well as direct, and construction as well as operational impacts.
- 3) Once the lead agency has determined that a particular physical impact may occur, the checklist answers must indicate whether the impact is potentially significant, less than significant with mitigation, or less than significant. “Potentially Significant Impact” is appropriate if there is substantial evidence that an effect may be significant. If there are one or more “Potentially Significant Impact” entries when the determination is made, an EIR is required.
- 4) “Negative Declaration: Less Than Significant With Mitigation Incorporated” applies where the incorporation of mitigation measures has reduced an effect from “Potentially Significant Impact” to a “Less Than Significant Impact.” The lead agency must describe the mitigation measures, and briefly explain how they reduce the effect to a less than significant level.
- 5) Earlier analyses may be used where, pursuant to the tiering, program EIR, or other CEQA process, an effect has been adequately analyzed in an earlier EIR or negative declaration. Section 1 5063(c) (3) (D). In this case, a brief discussion should identify the following:
 - a) **Earlier Analysis Used.** Identify and state where they are available for review.
 - b) **Impacts Adequately Addressed.** Identify which effects from the above checklist were within the scope of and adequately analyzed in an earlier document pursuant to applicable legal standards, and state whether such effects were addressed by mitigation measures based on the earlier analysis.
 - c) **Mitigation Measures.** For effects that are “Less Than Significant With Mitigation Incorporated,” describe the mitigation measures that were incorporated or refined from the earlier document and the extent to which they address site-specific conditions for the project.
- 6) Lead agencies are encouraged to incorporate into the checklist references to information sources for potential impacts (e.g., general plans, zoning ordinances). Reference to a previously prepared or outside document should, where appropriate, include a reference to the page or pages where the statement is substantiated.

3. Environmental Checklist

- 7) Supporting Information Sources: A source list should be attached, and other sources used or individuals contacted should be cited in the discussion.
- 8) This is only a suggested form, and lead agencies are free to use different formats; however, lead agencies should normally address the questions from this checklist that are relevant to a project's environmental effects in whatever format is selected.
- 9) The explanation of each issue should identify:
 - a) the significance criteria or threshold, if any, used to evaluate each question; and
 - b) the mitigation measure identified, if any, to reduce the impact to less than significant.

ENVIRONMENTAL ISSUES	Subsequent or Supplemental EIR				Addendum to EIR	
	Substantial Change in Project Requiring Major EIR Revisions	Substantial Change in Circumstances Requiring Major EIR Revisions	New Information Showing Greater Significant Effects than Previous EIR	New Information Showing Ability to Reduce Significant Effects in Previous EIR	Less Than Significant Impacts/No Changes or New Information Requiring Preparation of an EIR	No Impact
I. AESTHETICS: Would the project:						
a) Have a substantial adverse effect on a scenic vista?					X	
b) Substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a State scenic highway or local scenic expressway, scenic highway, or eligible scenic highway?					X	
c) Substantially degrade the existing visual character or quality of the site and its surroundings?					X	
d) Create a new source of substantial light or glare which would adversely affect day or nighttime views in the area?					X	
II. AGRICULTURE AND FORESTRY RESOURCES: In determining whether impacts to agricultural resources are significant environmental effects, lead agencies may refer to the California Agricultural Land Evaluation and Site Assessment Mode (1997) prepared by the California Department of Conservation as an optional model to use in assessing impacts on agriculture and farmland. Would the project:						
a) Convert Prime Farmland, Unique Farmland, or Farmland of Statewide Importance (Farmland), as shown on the maps prepared pursuant to the						X

3. *Environmental Checklist*

major periods of California history or prehistory?						
b. Does the project have impacts that are individually limited, but cumulatively considerable? ("Cumulatively considerable" means that the incremental effects of a project are considerable when viewed in connection with the effects of past projects, the effects of other current projects, and the effects of probable future projects.)					X	
c. Does the project have environmental effects which will cause substantial adverse effects on human beings, either directly or indirectly?					X	

* The Environmental Checklist questions above related to greenhouse gas emissions are not answered because GHG emissions was not an issue identified and analyzed in the May 2003 certified OCGP Final Environmental Impact Report (FEIR) for a general plan amendment (GPA) and zone change (ZC) to implement the development of the Orange County Great Park. At the time of the FEIR certification, GHG emissions had been recognized as an environmental issue since the 1970s when the United States Congress enacted the National Climate Program Act (92 Stat.601, 1978) which required the President to establish a program to assist in understanding and responding to natural and human-induced climate processes, and since the 1980s when the Intergovernmental Panel on Climate Change (IPCC) was formed to assess scientific information related to climate change. Thus, issues related to climate change were known, or could have been known, at the time of the certification of the OCGP FEIR.

When an EIR has been certified for a project, no subsequent environmental document needs to be prepared by the lead agency (City of Irvine) unless there is substantial evidence that one or more of the following has occurred:

1. Substantial changes are proposed in the project involving new significant environmental effects or a substantial increase in the severity of previously significant effects;
2. Substantial changes occur with response to the project due to involvement of new significant environmental effects or a substantial increase in the severity of previously identified significant effects; or

3. New information of substantial importance, which was unknown or could not have been known with the exercise of reasonable diligence at the time the previous EIR was adopted shows any of the following:
 - a. The project will have one or more significant effects not discussed in the previous EIR;
 - b. Significant effects previously examined will be substantially more severe than shown in the previous EIR.
 - c. Mitigation measures or alternatives previously found to be infeasible would be feasible, and would substantially reduce one or more significance effects of the project, but the project proponents declined to adopt the mitigation measure or alternative; or
 - d. Mitigation measures or alternatives which are considerably different from those analyzed in the previous EIR would substantially reduce one or more significant effects on the environment, but the project proponents declined to adopt the mitigation measure or alternative.

In this case, the proposed Project does not meet the Section 15162 criteria for preparing a subsequent environmental document and no analysis of GHG emissions is required based on the following supporting information:

1. As documented throughout this Initial Study, the proposed Project does not include substantial changes proposed that involve new significant environmental impacts or a substantial increase in the severity of previously identified significant effects. As for GHG emissions, the issue was not considered potentially significant in 2003 and the GHG emissions associated with the Modifications to the OCGP Improvement Area have not increased beyond those expected with the 2003 approved project, because the proposed changes allowed by the Modifications to the OCGP Improvement Area has not increased over that allowed by the 2003 approved project.
2. GHG emissions has been recognized as an environmental issue for at least three decades and the approved project contribution to GHG emissions is not new information that was unknown or could not have been known with the exercise of reasonable diligence at the time the EIR was certified in 2003.
3. A GHG analysis that analyzed the projected emissions for both the public and private development in Planning Area 51 (which includes former Planning Area 30) was prepared in connection with the Supplement to the OCGP FEIR (SEIR) that was circulated for public review on June 2, 2011. That analysis concluded that the emissions per service population falls below the 4.8 MTons per service population threshold proposed by South Coast Air Quality Management District (SCAQMD) and utilized as a threshold of significance by the City in the SEIR.
4. In 2012 a GHG analysis was conducted that compared the 2012 Modified Project's GHG emissions to the impacts of the 2011 Approve Project's GHG emissions. The significance of the 2012 Modified Project's emissions was assessed using the SCAQMD's threshold of 4.8 MTons of CO₂e per service population per year. Similar to the 2011 Approved Project, the analysis concluded that the 2012 Modified Project's construction and operational emissions, with and without the optional conversion, were below the SCAQMD's efficiency metric of 4.8 MTons per service population per year. Therefore, under both scenarios, the 2012 Modified Project would have a less than significant impact on GHG emissions.

3. Environmental Checklist

This page intentionally left blank.

4. Discussion of Checklist and Mitigation Measures

This section provides evidence to substantiate the conclusions set forth in the Environmental Checklist. It briefly summarizes the conclusions of the 2003 Orange County Great Park FEIR, as updated by its prior Addenda and Supplemental EIRs (SEIR and SSEIR). Collectively all of these CEQA documents are known as, "OCGP FEIR". Finally this section discusses whether the proposed Modifications to the OCGP Improvement Area are consistent with the findings contained in the OCGP FEIR.

4.1 AESTHETICS

4.1.1 Environmental Setting

The OCGP FEIR addressed the potential aesthetic and visual impacts associated with the development of the former MCAS El Toro. The OCGP FEIR discussed the project's visual setting associated with its location adjacent to various arterial and state and federal highways. None of these roadways is designated as a County or State scenic highway; however, Sand Canyon Avenue is designated as a highway with rural/natural character. The City's General Plan also designates Interstate 5 (I-5) as an urban character Scenic Highway.

Generally, views of the former military base are from the surrounding highways. From these highways, a variety of land uses, structures, and facilities of differing ages, sizes, and architectural styles can be viewed. Although agricultural areas are adjacent to and within the base, the predominant views are associated with the military use of the base, including runways, aprons, hangars, warehouses, barracks housing, recreational facilities, single-family housing, offices, and commercial structures. However, since certification of the 2003 OCGP FEIR, many of the base facilities have been demolished along with portions of the runway. Additionally, the Great Park Western Sector Park Development Plan (Phase 1) has been established on the western edge of the former military base.

The city of Lake Forest and the James A. Musick Branch Jail are located to the southeast of the proposed Project site; the Irvine Spectrum is to the east and south; and existing and developing residential areas are to the north and west of the site. Further to the south are the residential developments of the cities of Laguna Woods and Laguna Hills. Portions of these residential developments are at higher elevations and have panoramic views of the Project site.

There are minimal light sources on the Project site. Existing lighting is mostly associated with outdoor nighttime parking areas, field lighting and security lighting.

4.1.2 Impacts Identified in the OCGP FEIR

The OCGP FEIR discussed the potential aesthetic effects associated with development of the site under the adopted Overlay Plan and found that future development of Planning Areas 51 would introduce new sources of light within the project area. These sources include street lighting along planned roadways and various forms of exterior lighting, including security lighting, parking lots, educational facilities, institutional and commercial developments, and lighting associated with athletic fields. The OCGP FEIR concluded that significant light impacts would occur if proposed light sources were directed into or located near existing or planned residential uses, which are sensitive to light intrusion during nighttime hours. However, it further noted that with the mitigation ultimately adopted by the City, these potential impacts would be less than significant.

4. Discussion of Checklist and Mitigation Measures

The OCGP Master Plan (the subject of Addendum No. 4) identified one potential source of nighttime illumination not previously identified in the OCGP FEIR described as illuminated iconic park elements, such as the helium tethered balloon. However, it was noted that such lighting is focused on the iconic element and not away from it. Lighting of this type would exhibit a degree of luminosity substantially lower than some of the other types already considered in the OCGP FEIR, such as lighting associated with athletic fields. As a consequence, the extent of any impact associated with the illumination of iconic park elements has already been adequately addressed in the OCGP FEIR.

No other significant or potentially significant aesthetic impacts were identified in the previous CEQA documents.

4.1.3 Impacts Associated with the Modifications to the OCGP Improvement Area

The OCGP Improvement Area is represented by a detailed Design Package, which demonstrates the design work and improvements for the 688-acre portion of the OCGP site. All land uses proposed within the Improvement Area are similar to the original OCGP Master Plan; however, the proposed Project introduces modifications to the 688-acre OCGP Improvement Area, within the Bosque and Sports Park, which include the Unilateral Program changes allowed in the ALA II and other Program changes that were recommended by the City staff.

The SSEIR, which analyzed the 688-acre OCGP Improvement Area, did not identify any significant aesthetics and light and glare impacts. While the visual character of the site would change compared to land uses to be developed under previous project, the changes would not degrade the visual quality of the site. In fact the conversion to residential from non-residential uses on the properties in the vicinity of the OCGP Improvement Area would provide more opportunity for landscaping and improvement to the visual quality of the area. The SSEIR also concluded, under the Main Street development options, that the range of permitted land uses and the permitted density would not exceed the approved permitted land uses and density. It was further indicated that development of additional acreage (11-acre Transportation Corridor Agency and 13 acres in from 1.1 Agriculture to 1.4 Preservation in Development District 6) would not result in reduced visual quality and the impacts would be similar to the previously approved project.

As described in detail in Section 2.0, Project Description, the proposed Modifications to the OCGP Improvement Area further enhance the use and efficiency of the existing and planned features. For instance, the improved parking layout would accommodate increased family amenities, and further site development within the dog park would optimize visibility within the dog park and enhance connectivity to parking and restroom facilities. The proposed Modifications to the OCGP Improvement Area reduces the number of sports courts, expands passive recreational area, relocates some of the Improvement Area components to optimize visibility, access and efficiency, and assessing adequacy of parking plan, reflect a development program that is consistent with the General Plan Land Use and Zoning Ordinance designations for the property and does not deviate from development program for the area. No new uses and facilities are included in the proposed Project that would have a substantial adverse effect on a scenic vista; substantially damage scenic resources; degrade the existing visual character or quality of the site and its surroundings; or introduce new sources of light and glare or highly reflective building materials beyond those already considered in the OCGP FEIR. Therefore, in the absence of any significant changes, besides minor adjustment to design, location, and efficiency, no revisions to the FEIR and its findings would be required.

4. Discussion of Checklist and Mitigation Measures

Major FEIR Revisions Not Required. Based on the foregoing analysis and information, there is no evidence that the changes to the project require a major change to the OCGP FEIR. The proposed Modifications to the OCGP Improvement Area, which do not include any major changes to park development areas identified in the approved OCGP Master Plan, will not result in any new significant environmental impact nor is there a substantial increase in the severity of impacts from that described in the OCGP FEIR.

No Substantial Change in Circumstances Requiring Major FEIR Revisions. There is no information in the Modifications to the OCGP Improvement Area or otherwise available indicating substantial changes in circumstances that would require major changes to the OCGP FEIR.

No New Information of Substantial Importance Showing Greater Significant Effects Than Previous FEIR. All available relevant information has been analyzed, and there is no new information of substantial importance, which was unknown and could not have been known with the exercise of reasonable diligence at the time the OCGP FEIR was approved, augmented, and/or updated, indicating that the proposed Project will have one or more significant effects not discussed in the OCGP FEIR or result in a substantial increase in the severity of previously identified effects.

No New Information of Substantial Importance Showing Ability to Reduce Significant Effects in Previous FEIR. All available relevant information has been analyzed, and there is no new information of substantial importance, which was unknown and could not have been known with the exercise of reasonable diligence at the time the OCGP FEIR was approved, augmented, and/or updated, indicating that: (1) mitigation measures or alternatives previously found not to be feasible would in fact be feasible, and would substantially reduce one or more significant effects of the proposed Project, but the project proponent declines to adopt the mitigation measures or alternatives; or (2) mitigation measures or alternatives that are considerably different from those analyzed in the previous FEIR would substantially reduce one or more significant effects on the environment, but the project proponent declines to adopt the mitigation measures or alternatives. There are no alternatives to the proposed Project or additional mitigation measures that would substantially reduce one or more of the significant aesthetic effects identified in and considered by the OCGP FEIR.

4.1.4 Mitigation from the OCGP FEIR and Applicability to the Modifications to the OCGP Improvement Area

The OCGP FEIR identified Mitigation Measures A1 and A2, which, if implemented, would reduce the effects of development under the adopted Overlay Plan to a less than significant level. Those mitigation measures were modified in the SEIR, to make them consistent with the City of Irvine adopted conditions of approval.

Of the Mitigation Measures listed below, applicable measures will be incorporated into the proposed Project upon project implementation.

- A1** Prior to issuance of building permits, lighting plans and signage plans for residential or non-residential new development shall be reviewed by the Community Development Department to ensure that minimal light intrusion and spillover into adjacent residential areas occurs.

4. Discussion of Checklist and Mitigation Measures

- A2** Prior to the issuance of building permits for residential and non-residential development, and during the master plan review process for future development in the project area, the Director of Community Development shall ensure that mirrored and highly reflective surfaces are discouraged or, where proposed, shall be accompanied by a design-level glare impact analysis that demonstrates no adverse visual impairment to motorists or other visual nuisance occurs.

Additionally, the SSEIR identified the following measure as existing plans, programs, or policies (“PPP”) that apply to the proposed Project and will help reduce or avoid potential aesthetics and light and glare impacts. The following PPP, as applicable, will be incorporated into the proposed Project upon project implementation.

PPP 1-1 Prior to issuance of building permits, the applicant shall demonstrate it has met the Irvine Uniform Security Code requirements for lighting by providing the below listed items for a complete review by the Police Department. Failure to provide a complete lighting package will result in the delay of satisfaction of this condition (City Standard Condition 3.6).

- a. Electrical plan showing light fixture locations, type of light fixture, height of light fixture, and point-by-point photometric lighting analysis overlaid on the landscape plan with a tree legend. The photometric plan should only show those fixtures used to meet the Irvine Uniform Security Code requirements.
- b. Corresponding fixture cut-sheets (specifications) of those lights used to meet the Irvine Uniform Security Code.
- c. Site plan demonstrating that landscaping shall not be planted so as to obscure required light levels.
- d. Site plans that are full-scale and legible.

4.2 AGRICULTURE AND FORESTRY RESOURCES

4.2.1 Environmental Setting

The OCGP FEIR identified approximately 659 acres of designated Prime Farmland, 70 acres of designated Unique Farmland, and 99 acres of designated Farmland of Statewide Importance (as defined below). No agricultural land within the project area is currently covered by Williamson Act contracts.

The OCGP FEIR described the Farmland Mapping and Monitoring Program (FMMP Program) of the California Department of Conservation Division of Land Resources Protection classifications of agricultural lands present within the project area as follows (California Department of Conservation, 2014):

- **Prime Farmland:** Land which has the best combination of physical and chemical features able to sustain long-term production of agricultural crops. This land has the soil quality, growing season, and moisture supply needed to produce sustained high yields. Land must have been used for irrigated agricultural production at some time during the four years prior to the mapping date.

4. Discussion of Checklist and Mitigation Measures

- **Farmland of Statewide Importance:** Similar to Prime Farmland, except this land has minor shortcomings such as greater slopes or less ability to store soil moisture than Prime Farmland. Land must have been used for production of irrigated crops at some time during the four years prior to the mapping date.
- **Unique Farmland:** Lesser quality soils used for the production of the state's leading agricultural crops. This land is usually irrigated, but may include non-irrigated orchards or vineyards as found in some climate zones in California. This land is used for the production of specific high economic value crops such as oranges, olives, avocados, rice, grapes, or cut flowers. Land must have been cropped at some time during the four years prior to the mapping date.
- **Farmland of Local Importance:** Land of importance to the local agricultural economy as determined by each county's board of supervisors and a local advisory committee.
- **Grazing Land:** Land on which the existing vegetation is suited to the grazing of livestock. This category was developed in cooperation with the California Cattlemen's Association, University of California Cooperative Extension, and other groups interested in the extent of grazing activities.
- **Urban and Built-Up Land:** Land occupied by structures with a building density of at least 1 unit to 1.5 acres, or approximately 6 structures to a 10-acre parcel. Common examples include residential, industrial, commercial, institutional facilities, cemeteries, airports, golf courses, sanitary landfills, and sewage treatment and water control structures.
- **Other Land:** Land not included in any other mapping category. Common examples include low density rural developments; brush, timber, wetland, and riparian areas not suitable for livestock grazing; confined livestock, poultry or aquaculture facilities; strip mines or borrow pits; and water bodies smaller than 40 acres. Vacant and nonagricultural land greater than 40 acres and surrounded on all sides by urban development is mapped as Other Land.
- **Land Committed to Nonagricultural Use:** This optional designation is an overlay to the standard farmland categories described above and represents existing farmland and grazing land, and vacant areas that have a permanent commitment for development. Examples of Land Committed to Nonagricultural Use would include an area undergoing permanent infrastructure installation or for which bonds or assessments have been issued for public utilities. Such lands represent planning areas where there are commitments for future nonagricultural development that are not reversible by a simple majority vote by a city council or board or supervisors.

Although the OCGP FEIR identified approximately 659 acres of designated Prime Farmland, 70 acres of designated Unique Farmland, and 99 acres of designated Farmland of Statewide Importance within OCGP overall, based on information provided through the California Department of Conservation's FMMP, land within the proposed Modifications to the OCGP Improvement Area project site falls into two of these agricultural land use designations: Urban and Built-Up Land and Other Land. The location of these land classifications are identified in Figure 4.2-1, Farmland Map.

4. Discussion of Checklist and Mitigation Measures

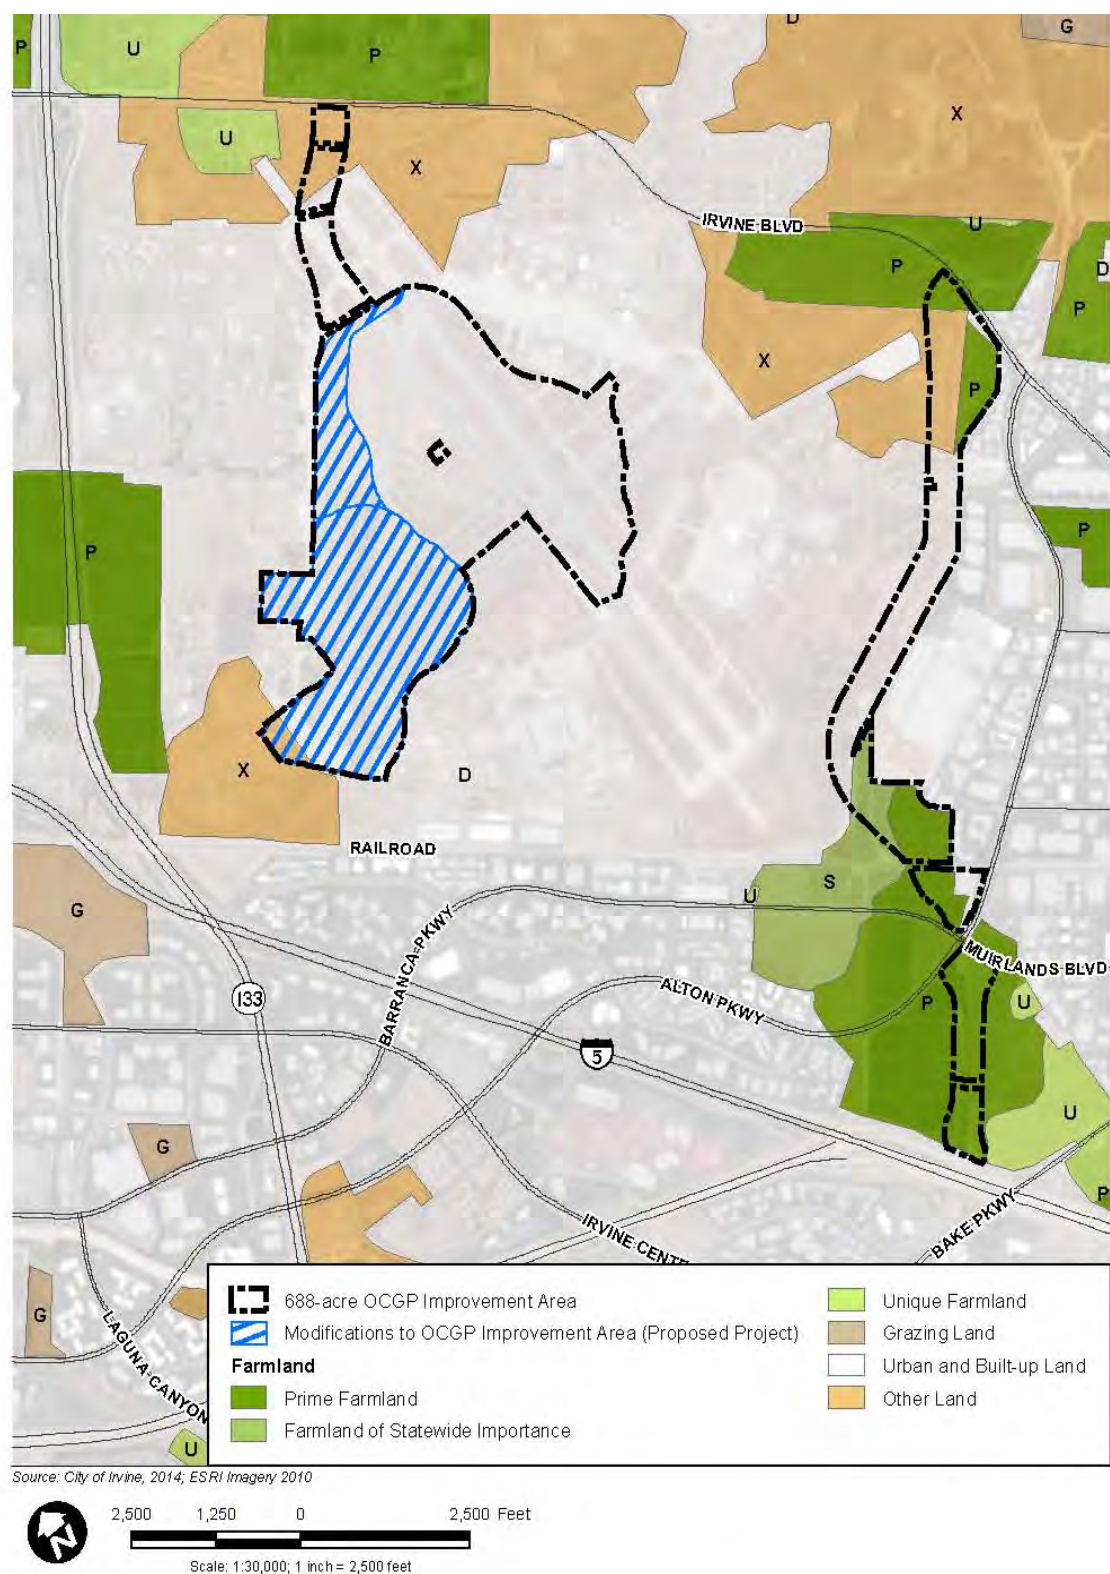

Figure 4.2-1
OCGP Improvement Area Farmland Map

4. Discussion of Checklist and Mitigation Measures

City of Irvine Policies and Programs

The project site is designated for a variety of urban uses in the City of Irvine General Plan. The OCGP Master Plan encourages agriculture as an interim land use prior to development of the land. The City of Irvine General Plan Objective L-10, as amended in 2002 and presented in the OCGP FEIR, includes the following policies to "encourage the maintenance of agriculture in undeveloped areas of the City until the time of development, and in areas not available for development".

Policy (a): Provide for farming opportunities in the community, where feasible and appropriate, through an Agricultural Legacy Program facilitating limited scale agricultural operations and programs on public lands. The program may include components such as edible landscape, metro-farming, heritage farming, model farming, education and community service farming and other farm or farm market programs. Locations for implementation of the Agricultural Legacy Program to be considered should, at a minimum, include:

- Designated open space spine network
- Designated open space areas not subject to the Natural Community Conservation Plan (NCCP)
- Other appropriate publicly owned lands

Policy (b): Consider creating a "working model" farm to act as a center for education and enjoyment of all age groups pursuant to the Agricultural Legacy Program in conjunction with the City's planning efforts concerning the reuse of MCAS El Toro, or with the South Coast Research Extension owned by UC Regents.

Policy (c): Permit agricultural use of land that is unsuitable for building because it is within flood plains, or is subject to hazards to public health, safety, and welfare or similar constraints precluding development. Conversion from agricultural use may be allowed where the identified hazard conditions have been eliminated.

Policy (d): Permit agriculture uses, on an interim basis, on land designated for development, and consider agricultural uses as part of the City's planning efforts for the re-use of MCAS El Toro.

Policy (e): Encourage and support federal and state legislation proposed for the purpose of preservation of agricultural lands that are compatible with the City's goals and objectives.

Policy (f): Allow for conversion of interim and permanent agricultural uses to development to provide land for the construction of housing units consistent with the Land Use and Housing Elements, and the development of commercial and industrial buildings consistent with the provision of job opportunities as described in the Land Use Element, where such conversion does not conflict with other L-10 policies.

Policy (g): Pursue the open space policies contained in the Conservation and Open Space Element and address any open space or aesthetic impacts from the conversion of interim and permanent agricultural uses to development as part of the City's existing policies for the preservation of open space and existing

4. Discussion of Checklist and Mitigation Measures

policies for mitigation of views and aesthetic impacts under the policies in the Conservation and Open Space Element.

4.2.2 Impacts Identified in the OCGP FEIR

The OCGP FEIR determined the Overlay Plan would preserve in perpetuity 303 acres¹ of land for agricultural use, of which 251 acres are classified as Prime Farmland, Unique Farmland, and Farmland of Statewide Importance. The locations of the 303 acres of permanent agricultural land are listed below and can be found in the OCGP FEIR as Figure 5.8-1.

- **Former PA 30:** 13 acres within Planning Area Zone (PAZ) 26; and
- **PA 51:** 90 acres within PAZ 4; 200 acres within PAZ 1.

The Overlay Plan also resulted in the permanent loss of 802 acres of designated farmland comprised of 651 acres of Prime Farmland, 63 acres of Unique Farmland, and 88 acres of Farmland of Statewide Importance. This impact was considered significant and unavoidable in the OCGP FEIR.

It was determined the Overlay Plan resulted in a significant impact associated with the conversion of agricultural land to nonagricultural use. The OCGP FEIR noted the context of agricultural production in Orange County, including development pressures that have contributed to the decrease in agricultural production in the County over time, which suggested that conversion of agricultural land to urban uses would occur with or without the development of the OCGP.

Addendum No. 5 determined that the removal of 173 acres of designated Prime Farmland in PAZ 1 would not result in new significant impacts to agricultural resources (Section 4.2.3 of Addendum No. 5). Despite the Prime Farmland designation, none of the soils in PAZ 1 were used for agricultural production. In addition, existing regulatory programs, namely the City of Irvine General Plan Objective L-10 and establishment of the Irvine Agricultural Legacy Program, addressed and mitigated the loss of agricultural land. Since certification of the OCGP FEIR, an additional 508 acres within Planning Area 1 (Orchard Hills) has been designated “Exclusive Agriculture” and added to the Agricultural Legacy Program. As a result, overall acreage enrolled within the Agricultural Legacy Program was greater than that assumed in the certified OCGP FEIR.

4.2.3 Impacts Associated with the Modifications to the OCGP Improvement Area

The 2012 Modified Project in the SSEIR proposed rezoning a 13-acre area in Development District 6 that was zoned 1.1 Exclusive Agriculture to 1.4, Preservation. The rezoning allows for the Relocated Wildlife Corridor Feature. The proposed use of the 13 acres under the 2012 Modified Project would not conflict with the zoning designation for the area, and no adverse impacts would occur. The 2011 Approved Project included 117 acres of agriculture in PA 51 in addition to the 13 acres in former PA 30, for a total of 130 acres of agriculture. All other farmland within PA 51 has already been approved for conversion to non-agricultural uses by the 2011 Approved Project.

¹ There is a typographical error within the OCGP FEIR: Table 1-2 on page 1-8 and Table 3-4 on pages 3-12 and 3-13 identify the total agricultural land as 303 acres (correct acreage); however on page 5.8-10 the agricultural use acreage is noted as 307.

4. Discussion of Checklist and Mitigation Measures

The proposed Project consists of modifications to the 688-acre OCGP Improvement Area within Bosque and Sports Park Districts. All land uses proposed within the Improvement Area are similar to the original OCGP Master Plan, and the proposed modifications do not introduce new uses or designations that would conflict with zoning (1.9 Orange County Great Park and 1.4 Preservation) or result in conversion of agriculture land or forest land to non-agriculture and non-forest land. The General Plan land use designation of the proposed Project site is "Orange County Great Park" and the proposed Project is consistent with the land uses approved in concert with the certification and updates to the OCGP FEIR.

The proposed Modifications to the OCGP Improvement Area involves reducing the number of sports courts, expanding passive recreational area, relocating some of the OCGP Improvement Area components to further enhance visibility, access and efficiency of the existing features. These modifications would reflect a development program that is consistent with the General Plan Land Use and Zoning designations for PA 51 and would occur within areas that are not designated for agriculture use. No new uses and facilities are proposed that would affect the agriculture and forestry resources, as none exists within the Project area. Consequently, the proposed Project would not result in any additional impact, beyond that previously studied and disclosed, on agricultural resources. The proposed Project would not result in conflicts with agricultural zoning, convert farmland to non-farmland uses, result in a loss of forest land, or create any new impacts to agriculture and forest resources beyond those evaluated in the OCGP FEIR.

Major FEIR Revisions Not Required. Based on the foregoing analysis and information, there is no evidence that the changes to the project require a major change to the OCGP FEIR. The proposed Modifications to the OCGP Improvement Area, which does not include any major change to park development areas identified in the approved OCGP Master Plan, will not result in any new significant environmental impact nor is there a substantial increase in the severity of impacts from that described in the OCGP FEIR.

No Substantial Change in Circumstances Requiring Major FEIR Revisions. There is no information in the OCGP Modifications to Improvement Area or otherwise available indicating substantial changes in circumstances that would require major changes to the OCGP FEIR.

No New Information of Substantial Importance Showing Greater Significant Effects Than Previous FEIR. All available relevant information has been analyzed, and there is no new information of substantial importance that was unknown and could not have been known with the exercise of reasonable diligence at the time the OCGP FEIR was approved, augmented, and/or updated, indicating that the proposed Project will have one or more significant effects not discussed in the OCGP FEIR or result in a substantial increase in the severity of previously identified effects.

No New Information of Substantial Importance Showing Ability to Reduce Significant Effects in Previous FEIR. All available relevant information has been analyzed, and there is no new information of substantial importance that was unknown and could not have been known with the exercise of reasonable diligence at the time the OCGP FEIR was approved, augmented, and/or updated, indicating that: (1) mitigation measures or alternatives previously found not to be feasible would in fact be feasible, and would substantially reduce one or more significant effects of the proposed Project, but the project proponent declines to adopt the mitigation measures or alternatives; or (2) mitigation measures or alternatives that are considerably different from those analyzed in the previous EIR would substantially

4. Discussion of Checklist and Mitigation Measures

reduce one or more significant effects on the environment, but the project proponent declines to adopt the mitigation measures or alternatives. There are no alternatives to the proposed Project or additional mitigation measures that would substantially reduce one or more of the significant effects on agriculture and forest resources identified in and considered by the OCGP FEIR.

4.2.4 Mitigation from the OCGP FEIR and Applicability to the Modifications to the OCGP Improvement Area

The OCGP FEIR identified Mitigation Measures AG1 through AG3 for implementation in conjunction with master plan review and subsequent development permits. Mitigation Measure AG1 was modified in the SSEIR to eliminate obsolete references to prior Standard Conditions. The proposed changes to Mitigation Measure AG1 would not change its substantive operation.

Of the Mitigation Measures listed below, applicable measures will be incorporated into the proposed Project upon project implementation.

AG1 In order to encourage agriculture as an interim land use pending development on the project site by warning future residents that they are buying or renting a house adjacent to existing agricultural operators, disclosure statements shall include the following for subdivisions proposed adjacent to existing agricultural operations:

Prior to issuance of building permits, the applicant shall submit, and the Director of Community Development shall have approved, a completed occupancy disclosure form for the project. The approved disclosure form, along with its attachments, shall be included as part of the rental/lease agreement and as part of the sales literature for the project. The disclosure statement shall include the following information:

- Continuation of agricultural operations adjacent to the site and their potential effects (spraying of pesticides, noise, dust, odor, etc.) on future residents or tenants.

AG2 Heritage and community service/educational farming operations shall be encouraged within utility easements and other lands. Heritage farming is defined as small-scale specialty farming operations that can be accommodated in an urban environment. An example would be the Edible Landscape project located adjacent to Harvard Avenue within the Edison right-of-way.

AG3 Future landowners and the City shall work cooperatively with farmers to minimize conflicts between agricultural operation and adjacent urban uses.

Additionally, the SSEIR identified the following measure as existing PPP that apply to the proposed Project and will help reduce or avoid potential agriculture and forestry resources impacts. The following PPP, as applicable, will be incorporated into the proposed Project upon project implementation.

PPP2-1 The City shall continue to implement the Agricultural Legacy Program outlined in City of Irvine General Plan Open Space and Conservation Element. Objective L-10 is intended to mitigate the conversion of agricultural land to nonagricultural uses citywide by facilitating limited-scale agricultural operations and programs on public lands within Irvine. As part of the Agricultural

4. Discussion of Checklist and Mitigation Measures

Legacy Program, specific sites in Irvine will be identified and made available for metro-farming within five years. Metro-farming generally includes small-scale agricultural operations and activities that can be accommodated in an urban environment. Such activities could include, but not limited to, small-scale specialty farming, model farming, heritage farming, and community service/educational farming.

4.3 AIR QUALITY

4.3.1 Environmental Setting

The OCGP FEIR described the air quality conditions regarding the following regulated pollutants: ozone (O₃), carbon monoxide (CO), nitrogen dioxides (NO₂), sulfur dioxide (SO₂), lead and particulate matter (PM), which is subdivided into two classes based on particle size: PM equal to or less than 10 micrometers in diameter (PM₁₀) and PM equal to or less than 2.5 micrometers in diameter (PM_{2.5}).

The proposed Project site is located in the Orange County portion of the South Coast Air Basin. Table 4.3-1 shows the pollutants and associated attainment status for the South Coast Air Basin. Orange County is designated as a federal non-attainment area for O₃, and PM_{2.5}, maintenance for CO and PM₁₀, and an attainment area for SO₂, NO₂, and lead. Orange County is designated as a state non-attainment area for O₃, PM₁₀, and PM_{2.5}, and an attainment area for CO, SO₂, NO₂, and lead.

Table 4.3-1. Attainment Status for the Orange County Portion of the South Coast Air Basin

Pollutant	Attainment Status	
	Federal	State
O ₃ – 1-Hour	--	Non-attainment
O ₃ – 8-hour	Nonattainment (Extreme)	Non-attainment
PM ₁₀	Attainment/Maintenance	Non-attainment
PM _{2.5}	Nonattainment	Non-attainment
CO	Attainment/Maintenance	Attainment
NO ₂	Attainment	Attainment
SO ₂	Attainment	Attainment
Lead	Attainment	Attainment

Sources: EPA 2014; ARB 2014.

4.3.2 Impacts Identified in the OCGP FEIR

The OCGP FEIR identified significant air quality impacts associated with construction and operation of the Overlay Plan. The OCGP FEIR described the construction air impacts after mitigation as significant and unavoidable. Addenda No. 3 and 4 included an analysis to determine the projected emissions associated with more recent, precise and refined information regarding the Revised Overlay Plan and OCGP Conceptual Master Plan. The Addenda determined that earthmoving activities would be consistent with the emissions inventory assumed in the certified OCGP FEIR and within the scope of the original air quality analysis.

4. Discussion of Checklist and Mitigation Measures

The analysis was conducted using URBEMIS 2007 Version 9.2, which was in accordance with SCAQMD's recommendations for preparation of air quality analyses at the time the document was developed. The emission estimates from Addendum No. 4 are provided in Table 4.3-2.

Table 4.3-2. Comparison of Daily Construction Emissions for OCGP Construction Activities

Emissions Inventory	Emission Totals, lbs./day [tons per day]				
	CO	NOx	PM ₁₀	VOC	SOx
OCGP FEIR	280	840	1,440	4,660	40
OCGP Site Grading	174	343	663	37	<1
SCAQMD Significance Threshold	550	100	150	75	150
Over (Under)	(376)	243	513	(38)	(149)
Significant for OCGP FEIR?	No	Yes	Yes	Yes	No
Significant for OCGP Equipment Mix?	No	Yes	Yes	No	No

Source: PCR Services Corporation 2007.

As shown in Table 4.3-2 above and as Addendum No. 4 concluded, no new significant impacts and no substantial increase in the severity of previously identified impacts would occur as a result of implementation of the OCGP.

The site grading and demolition would most likely occur in a phased approach, over the course of several years. A technical consultant (PCR) also conducted an analysis for Addendum No. 4 to determine whether the construction emissions inventory for a maximum worst case day (consisting of concurrent grading of the OCGP Master Plan along with site grading activities for Heritage Fields, the Agua Chinon, and the wildlife corridor and runway demolition activities) is consistent with the emissions inventory presented in the OCGP FEIR and is within the scope of the original air quality impact assessment.

The emissions from the concurrent construction activities are presented in Table 4.3-3. Concurrent grading and demolition activities estimated for Addendum No. 4 resulted in a slight decrease in equipment exhaust emissions and fugitive dust PM₁₀ emissions, as compared to those levels estimated for the OCGP FEIR.

4. Discussion of Checklist and Mitigation Measures

Table 4.3-3. Comparison of Daily Construction Emissions for
Concurrent OCGP Construction Activities

Emissions Inventory	Emission Totals, lbs./day [tons per day]				
	CO	NOx	PM10	VOC	SOx
Certified EIR	280	840	1,440	4,660	40
OCGP Site Grading	174	343	663	37	<1
Heritage Fields Site Grading	171	332	663	37	<1
Runway Demolition	66	165	76	17	<1
Total	411	839	1,402	91	<1
SCAQMD Significance Threshold	550	100	150	75	150
Over (Under)	(139)	739	1,252	16	(149)
Significant for OCGP	No	Yes	Yes	Yes	No
Significant for concurrent activities?	No	Yes	Yes	Yes	No

Source: PCR Services Corporation 2007.

Among the various sources of a project's operational emissions, those attributable to mobile sources (i.e. vehicular traffic) comprise the largest proportion of emissions. Mobile source emissions are a function of both the number and trip length characteristics of vehicle trips directly and indirectly associated with the project under consideration. Operational emissions for project area and mobile sources were estimated at above the significance thresholds for volatile organic compounds (VOC), nitrogen oxides (NOX), CO, and PM10, and are described in the OCGP FEIR and Addenda as significant and unavoidable after mitigation. In addition, the OCGP FEIR included the results of the CO "hotspots" analysis, in which no intersections in the traffic study area were expected to result in one-hour or eight-hour CO concentrations above the state standard of 20 parts per million (ppm) for one-hour concentrations and 9 ppm for eight-hour concentrations. No other construction- and operations-related significant air quality impacts were identified in the OCGP FEIR.

The SSEIR stated that the 2012 Modified Project would also result in significant and unavoidable short-term construction air quality impacts due to emissions of VOC, NO_x, CO, PM₁₀ and PM_{2.5} at levels above the applicable thresholds. PPPs 3-1 through 3-4 and Mitigation Measures AQ-1 and AQ-2 would reduce construction emissions to the extent feasible. However, the impact would remain significant and unavoidable even after mitigation.

In addition, long-term operation of the 2012 Modified Project (with and without optional conversion) would result in significant and unavoidable impacts due to emissions of VOC, NO_x, CO, and PM_{2.5}. PPP 3-5, PDFs 4-7, and 4-8, and Mitigation Measures AQ-3 through AQ-5 would reduce operational phase air quality impacts to the extent feasible. However, the impact would remain significant and unavoidable even after mitigation.

4. Discussion of Checklist and Mitigation Measures

4.3.3 Impacts Associated with the Modifications to OCGP Improvement Area

Regional Construction Impacts

The proposed Project consists of modifications to the 688-acre OCGP Improvement Area, reducing the number of sports courts, expanding passive recreational area, relocating some of the Improvement Area components to optimize visibility, access and efficiency, and assessing adequacy of parking plan.

Construction activities associated with the proposed Project would have a short-term impact on air quality. The analytical assumptions concerning construction, development phasing, and operations of the adopted OCGP Master Plan remain consistent with all prior assumptions, since there is no substantial change in overall square footage or development within the project area.

Consequently, the proposed Project would not increase the maximum daily air pollutant emissions generated during construction and demolition activities. The OCGP FEIR concluded that air pollutant emissions associated with construction and demolition activities of the Overlay Plan were considered a significant and unavoidable impact. The construction air emissions associated with the proposed Project are anticipated to be similar to those addressed in the OCGP FEIR, and therefore would not result in any new significant impacts.

Regional Operational Impacts

Operation of the proposed Project would result in long-term regional emissions associated with area and mobile sources. Area-source emissions would be associated with equipment used for landscaping and maintenance of park. Mobile-source emissions would include project-generated vehicle trips associated with workers, recreational users, and visitors to the project site. Mobile source emissions from vehicle trips to the project site would be the primary source of criteria pollutant emissions.

The emission estimates in the OCGP FEIR documents were all developed using different models recommended by SCAQMD at the time of the analysis. Therefore, the comparison of emissions from those documents will be affected by changes to the project description, as well as any changes to assumptions in the model. Therefore, the most appropriate approach to determining air quality impacts would be based on changes to the assumptions in the project description using the same model for the analysis.

Operational emissions associated with the proposed Project were quantified using the California Emissions Estimator Model (CalEEMod), Version 2013.2.2. The operational emissions associated with the activities for the proposed Project were quantified using CalEEMod to determine the net change in operational emissions associated with the proposed Project. The emission estimates presented in this Addendum are based on changes to the daily trip estimates, since mobile sources are the primary source of emissions.

Regional area- and mobile-source emissions were modeled based on proposed land use types and sizes as indicated in the Project Description (Section 2.0 of this Addendum) and the change in trip generation from the Traffic Study (LSA, 2014). According to the traffic data used to prepare this Addendum, the total daily trip generation for the Western Sector Park Development Plan and the 688 Acre Park Development

4. Discussion of Checklist and Mitigation Measures

Plan is 10,030. The total daily trip generation from the Western Sector Park Development Plan was 4,586. The 688 Acre Park Development Plan will generate an additional 5,444 daily trips for the total of 10,030. This is less than the 19,083 daily trips approved in the OCGP FEIR.

Table 4.3-4. Summary of Modeled Long-Term Operational Emissions

Source	Emissions (lb/day)				
	CO	NOx	PM ₁₀	VOC	SOx
Approved Master Plan	66.31	125.37	606.87	117.81	32.59
Proposed Project	39.86	65.89	319.00	61.91	17.13
Net Change	(24.45)	(59.48)	(287.87)	(55.90)	(15.46)

Source: AECOM 2014

As shown in Table 4.3-4, the proposed Project would decrease the maximum daily air pollutant emissions generated during operational activities compared to the approved Master Plan. The OCGP FEIR concluded that air pollutant emissions associated with operational activities of the Overlay Plan were considered a significant and unavoidable impact. The changes to the land uses as part of the proposed Project would result in the elimination of sports facilities or reconfiguration of other planned land uses. Those proposed changes would be expected to require fewer or similar activity levels for area sources (e.g., maintenance equipment), energy use, and vehicle trips. Therefore, the operational air emissions associated with the proposed Project are anticipated to be less than those addressed in the OCGP FEIR, and therefore would not adversely contribute to the impacts otherwise caused by the project analyzed in the OCGP FEIR.

Consistency Determination with the Air Quality Management Plan

The OCGP FEIR included a consistency evaluation with the SCAQMD's Air Quality Management Plan (AQMP). The consistency evaluation concluded development of the adopted Overlay Plan would have a negligible impact on the overall air quality within the South Coast Air Basin. Since the approval of the OCGP, the SCAQMD has adopted a revised AQMP. The applicable AQMP for the proposed Project was adopted by the SCAQMD in December 2012. The 2012 AQMP is the legally enforceable blueprint for how the region will meet and maintain federal ozone and PM_{2.5} air quality standards in the South Coast Air Basin.

Projects that are consistent with the land use development assumptions used in the AQMP are considered to not conflict with or obstruct the attainment of the air quality levels identified in the plan. The proposed Project would not result in an increase in VMT or new land uses that would change the consistency evaluation in the OCGP FEIR.

Localized Construction Impacts

As stated previously, the proposed Project would not increase the maximum daily air pollutant emissions generated during construction activities. However, the OCGP FEIR identified significant localized air quality impacts based on the extent and schedule of construction activities, primarily from particulate matter (PM₁₀ and PM_{2.5}) emissions associated with fugitive dust. The OCGP FEIR concluded that air pollutant emissions were considered a significant unavoidable adverse impact. The construction air

4. Discussion of Checklist and Mitigation Measures

emissions associated with the proposed Project are anticipated to be less than those addressed in the OCGP FEIR, and therefore would not adversely contribute to the impacts otherwise caused by the project analyzed in the OCGP FEIR.

Localized Operational Impacts

The OCGP FEIR did not identify significant localized air quality impacts for operational activities. Because the proposed Project would not result in an increase of the intensity of land uses and would not include any stationary sources, the proposed Project would not increase the concentrations of air pollutant emissions generated during operational activities.

Odors

The OCGP FEIR identified that development of PAs 30 and 51 would not handle large amounts of solid waste, chemicals associated with heavy industry, or other uses that would generate objectionable odors and that no significant odor impacts would occur. The proposed Project would not result in new activities or new land uses that would change the odor evaluation in the OCGP FEIR and Addenda.

Major EIR Revisions Not Required. Based on the foregoing analysis and information, there is no evidence that the changes to the project require a major change to the OCGP FEIR. The proposed Modifications to OCGP Improvement Area, which do not include any major change to park development areas identified in the approved OCGP Master Plan, will not result in any new significant environmental impact nor is there a substantial increase in the severity of impacts from that described in the OCGP FEIR.

No Substantial Change in Circumstances Requiring Major EIR Revisions. There is no information in the Modifications to OCGP Improvement Area or otherwise available indicating substantial changes in circumstances that would require major changes to the OCGP FEIR.

No New Information of Substantial Importance Showing Greater Significant Effects Than Previous EIR. All available relevant information has been analyzed, and there is no new information of substantial importance, that was unknown and could not have been known with the exercise of reasonable diligence at the time the OCGP EIR was approved, augmented, and/or updated, indicating that the proposed Project would have one or more significant effects not discussed in the OCGP FEIR or result in a substantial increase in the severity of previously identified effects.

No New Information of Substantial Importance Showing Ability to Reduce Significant Effects in Previous EIR. All available relevant information has been analyzed, and there is no new information of substantial importance, that was unknown and could not have been known with the exercise or reasonable diligence at the time the OCGP FEIR was approved, augmented, and/or updated, indicating that; 1) mitigation measures or alternatives previously found not to be feasible would in fact be feasible, and would substantially reduce one or more significant effects of the project, but the project proponent declines to adopt the mitigation measures or alternatives; or 2) mitigation measures or alternatives that are considerably different from those analyzed in the previous EIR would substantially reduce one or more significant effects on the environment, but the project proponent declines to adopt the mitigation measures or alternatives. There are no alternatives to the proposed Project or additional mitigation

4. Discussion of Checklist and Mitigation Measures

measures that would substantially reduce one or more of the significant air quality effects identified in and considered by the OCGP FEIR.

4.3.4 Mitigation from the OCGP FEIR and Applicability to the Modifications to OCGP Improvement Area

The OCGP FEIR identified Mitigation Measures AQ1 through AQ5, which reduce the air quality effects of construction and operations of development under the adopted Plan. However, as noted above, the OCGP FEIR found that short-term and long-term air quality impacts would remain significant and unavoidable. The measures are applicable to future development under the proposed Project. However, the mitigation measures were modified in the SEIR to account for the latest improvements in emission control technologies and updated SCAQMD recommendations for reducing air pollutant emissions.

Of the Mitigation Measures listed below, applicable measures will be incorporated into the proposed Project upon project implementation.

Construction Phase

AQ1 Prior to the start of demolition and construction within the project area, adjacent sensitive receptors shall be informed of the planned demolition and construction activities. Measures to avoid significantly impacting these receptors shall be developed and implemented by the project proponent in coordination with these uses. Other applicable mitigation measures such as erection of fences around construction areas; staggered use of equipment near sensitive receptors; diversion of truck trips away from receptors; etc.; shall be employed as necessary. Compliance with this measure shall be verified by the Director of Community Development.

AQ2 Prior to the commencement of construction activities required to demolish and/or remove existing DON structure, including, runways, the Director of Community Development shall receive and approve a construction emissions mitigation plan from the chosen demolition contractor. Prior to the issuance of grading permits, the applicant of any future development project shall submit, and the Director of Community Development shall approve a construction emissions mitigation plan. The plans shall identify implementation procedures for each of the following emissions reduction measures and all feasible mitigation measures shall be implemented. If certain measures are determined infeasible, an explanation thereof shall be provided.

- Utilize off-road construction equipment that conforms to Tier 3 of the United States Environmental Protection Agency, or higher emissions standards for construction equipment over 50 horsepower that are commercially available. The construction contractor shall be made aware of this requirement prior to the start of construction activities. Use of commercially available Tier 3 or higher off-road equipment, which is:
 - Year 2006 or newer construction equipment for engines rated equal to 175 horsepower (hp) and greater;
 - Year 2007 and newer construction equipment for engines rated equal to 100 hp but less than 175 hp; and

4. Discussion of Checklist and Mitigation Measures

- Year 2008 and newer construction equipment for engines rated equal to or greater than 50 hp but less than 100 hp.

The use of such equipment shall be stated on all grading plans. The construction contractor shall maintain a list of all operating equipment in use on the project site. The construction equipment list shall state the makes, models, and numbers of construction equipment on-site.

- Water exposed soils at least three times daily and maintain equipment and vehicle engines in good condition and in proper tune.
- Wash off trucks leaving the site.
- Replace ground cover on construction sites when it is determined that the site will be undisturbed for lengthy periods.
- Reduce speeds on unpaved roads to less than 15 miles per hour.
- Halt all grading and excavation operations when wind speeds exceed 25 miles per hour.
- Suspend all emission generating activities during smog alerts.
- Use propane- or butane-powered on-site mobile equipment instead of diesel/gasoline, whenever feasible.
- Properly maintain diesel-powered on-site mobile equipment.
- Prohibit nonessential idling of construction equipment to five minutes or less in compliance with California Air Resources Board's Rule 2449.
- Sweep streets with SCAQMD Rule 1186 compliant PM₁₀-efficient vacuum units at the end of the day if substantial visible soil material is carried over to the adjacent streets.
- Use electricity from power poles rather than temporary on-site diesel- or gasoline-powered generators, whenever feasible.
- Use of low-VOC asphalt.
- Maintain a minimum 24-inch freeboard on trucks hauling dirt, sand, soil, or other loose materials and tarp materials with a fabric cover or other suitable means. Provide temporary traffic controls (e.g., flag persons) during all phases of construction to ensure minimum disruption of traffic.
- Schedule construction activities that affect traffic flow on adjoining streets to off-peak hours to the extent possible.
- Reroute construction trucks away from congested streets, whenever feasible.

4. Discussion of Checklist and Mitigation Measures

- Provide dedicated turn lanes for movement of construction trucks and equipment on- and off-site, whenever feasible.
- Use coatings and solvents with a volatile organic compound (VOC) content lower than required under SCAQMD Rule 1113 (i.e., Super Compliant Paints). All architectural coatings shall be applied either by (1) using a high-volume, low-pressure spray method operated at an air pressure between 0.1 and 10 pounds per square inch gauge to achieve a 65 percent application efficiency; or (2) manual application using a paintbrush, hand-roller, trowel, spatula, dauber, rag, or sponge, to achieve a 100 percent applicant efficiency. The construction contractor shall also use precoated/natural colored building, where feasible. Use of low-VOC paints and spray method shall be included as a note on architectural building plans.

Operational Phase

AQ3 Prior to the issuance of building permits for any future development, the applicant shall submit, and the Director of Community Development shall have approved, an operation-emissions mitigation plan. The plan shall identify implementation procedures for each of the following emissions reduction measures and all feasible mitigation measures shall be implemented. If certain measures are determined infeasible, an explanation thereof shall be provided.

- Utilize built-in energy-efficient appliances to reduce energy consumption and emissions.
- Utilize energy-efficient and automated controls for air conditioners and lighting to reduce electricity consumption and associated emissions.
- Install special sunlight-filtering window coatings or double-paned windows to reduce thermal loss, whenever feasible.
- Utilize light-colored roofing materials as opposed to dark roofing materials to conserve electrical energy for air-conditioning.
- Provide shade trees in residential subdivisions as well as public areas, including parks, to reduce building heating and cooling needs, whenever feasible.
- Ensure that whenever feasible, commercial truck traffic is diverted from local roadways to off-peak periods.
- Centralize space heating and cooling for multiple-family dwelling units and commercial space.
- Orient buildings north/south for reducing energy-related combustion emissions.
- Use solar energy, when feasible.
- Use high rating insulation in walls and ceilings.

4. Discussion of Checklist and Mitigation Measures

- AQ4** Prior to the issuance of building permits, future sales information on available housing and employment opportunities within the project area shall be provided to employees and residents of the project area, so as to encourage employees to live within the residential developments planned on-site and future residents to find employment nearby.
- AQ5** Prior to the issuance of building permits, the applicant shall demonstrate to the satisfaction of the Director of Community Development that future employment generating non-residential development shall include measures to reduce vehicle trips including: the promotion of carpool incentives and alternative work schedules, easy access to public transit systems, trail linkages between uses, low-emissions vehicle fleets, and the provision of on-site facilities such as banking and food courts, and bicycle parking facilities, and other transportation demand management measures, as deemed appropriate.

Additionally, the SSEIR identified the following measures as existing PPPs that apply to the proposed Project and will help reduce or avoid potential air quality impacts. Of the PPPs listed below, applicable measures will be incorporated into the proposed Project upon project implementation.

- PPP 3-1 SCAQMD Rule 201 – Permit to Construct:** The SCAQMD requires developers who build, install, or replace any equipment or agricultural permit unit, which may cause new emissions of or reduce, eliminate, or control emissions of air contaminants to obtain a permit to construct from the Executive Officer.
- PPP 3-2 SCAQMD Rule 402 – Nuisance Odors:** The SCAQMD prohibits the discharge of any quantities of air contaminants or other material that cause injury, detriment, nuisance, or annoyance to any considerable number of persons or to the public, or that endanger the comfort, repose, health or safety of any such persons or the public, or that cause, or have a natural tendency to cause, injury or damage to business or property to be emitted within the SoCAB.
- PPP 3-3 SCAQMD Rule 403 – Fugitive Dust (PM₁₀ and PM_{2.5}):** The SCAQMD prohibits any person to cause or allow the emissions of fugitive dust from any active operation, open storage pile, or disturb surface area such that: (a) the dust remains visible in the atmosphere beyond the property line of the emission source; or (b) the dust emission exceeds 20 percent opacity (as determined by the appropriate test method included in the Rule 403 Implementation Handbook) if the dust emission is the result of movement of a motorized vehicle.
- PPP 3-4 SCAQMD Rule 1403 – Asbestos Emissions from Demolition/Renovation Activities:** This rule specifies work practice requirements to limit asbestos emissions from building demolition and renovation activities, including the removal and associated disturbance of asbestos-containing materials (ACM). All operators are required to maintain records, including waste shipment records, and are required to use appropriate warning labels, signs, and markings.
- PPP 3-5 SCAQMD Rule 445 – Wood-Burning Devices:** SCAQMD prohibits installation of wood-burning devices such as fire places and wood-burning stoves in new development unless the development is located at an elevation above 3,000 feet or if existing infrastructure for natural

4. Discussion of Checklist and Mitigation Measures

gas service is not available within 150-feet of the development. All fireplaces installed within the Proposed Project Site will be natural gas fueled fireplaces.

The SSEIR also identified the following measures as PDFs that apply to the proposed Project and will help reduce or avoid potential air quality impacts. Of the PDFs listed below, applicable measures will be incorporated into the proposed Project upon project implementation.

PDF 4-1 Compact/Mixed-Use Development: The California Energy Commission (CEC) considers compact development forms beneficial for minimizing energy consumption that leads to greenhouse gas emissions. In fact, the CEC's report on the connections between land use and climate change identifies density as the project feature most predictive of the number of vehicle trips and vehicle miles traveled ("VMT") by project occupants. Like the 2011 Approved Project, the 2012 Modified Project increases the density of development on the Proposed Project Site. Doing so will tend to reduce VMT on a local and regional basis. For the purpose of this analysis, it was assumed that there would be only a 25 percent reduction in VMT, which is within the range observed in Southern California.

PDF 4-2 High Rate of Internal Trip Capture: With the inclusion of a mix of land uses including office, commercial, industrial, and residential in the Proposed Project Site, the 2012 Modified Project significantly reduces trips outside the Proposed Project Site. This reduces trip length and congestion on the local circulation system outside the Proposed Project Site.

PDF 4-7 Energy Star Appliances: EnergyStar appliances (excluding refrigerators), such as dishwashers, clothes washers, clothes dryers, air conditions, furnaces, and water heaters, shall be offered or installed in all residential dwelling units.

PDF 4-8 Building Energy Efficiency: Residential dwellings and non-residential buildings will be constructed so that they achieve 15 percent higher energy efficiency than the applicable standards set forth in the 2008 California Building and Energy Efficiency Standards (Title 24, Part 6 of the California Building Code) or meet the standards in effect at the time of issuance of building permit. The Energy Commission's 2013 Building Energy Efficiency Standards are 25 percent more efficient than the 2008 standards for residential construction and 30 percent more efficient for nonresidential construction. The 2013 Energy Efficiency Standards, which take effect on January 1, 2014, offer builders more efficient windows, insulation, lighting, ventilation systems and other options that would reduce energy consumption in homes and businesses.

4.4 BIOLOGICAL RESOURCES

4.4.1 Environmental Setting

The OCGP FEIR described the biological resources within Planning Area 51 (including former PA 30), including a 995-acre parcel of land in the easternmost portion of Planning Area 51 retained in federal ownership and designated as both "habitat reserve" and a part of the Orange County Central-Coastal Sub-region Natural Community Conservation Plan/Habitat Conservation Plan (NCCP/HCP). The areas

4. Discussion of Checklist and Mitigation Measures

outside the habitat reserve were described as: 1) providing minimal native or undisturbed habitat, and, 2) consisting of agricultural, ornamental, and domestic landscapes.

The OCGP FEIR identified nine vegetative communities within the project site, including Venturan-Diegan sage scrub, southern cactus scrub, chaparral, woodland, riparian scrub, grassland, open water, agriculture, and predominately disturbed or developed areas. Several sensitive plant species and a large number of mature trees also were identified as potentially occurring within the project site. The sensitive plant species potentially occurring in Planning Area 51 included the southern tarplant, Palmer's grappling hook, many-stemmed dudleya, Coulter's Matilija poppy, Catalina mariposa lily, and intermediate mariposa lily. The OCGP FEIR also noted the Coulter's saltbush, Laguna Beach dudleya, San Fernando Valley spineflower, and the Lewis's evening-primrose as having a moderate potential for occurrence. Species with a low potential for occurrence included the Los Angeles sunflower, south coast saltscale, Santa Monica Mountains dudleya, heart-leafed pitcher sage, coast wooly-heads, slender-horned spineflower, Santa Barbara morning glory, tecate cypress, and salt spring checkerbloom.

The OCGP FEIR documented an observation of one sensitive wildlife species, a burrowing owl. This individual, observed during the protocol focus studies for a nearby development proposal, was outside the habitat reserve at the southwest end of Planning Area 51 along Serrano Creek. Forty other sensitive wildlife species or species of local concern were identified as having a potential to occur on the site.

The OCGP FEIR also described the Wildlife Corridor Concept Plan that would be incorporated into the eastern portion of the project site (Refer to pp. 5.9-9 through 5.9-14 of the OCGP FEIR) and explained the guidelines pursuant to which the ultimate corridor will be designed and constructed. The subject guidelines were primarily concerned with the creation and re-vegetation of wildlife habitats that would flourish in the proposed areas and serve as protective cover for target wildlife species that will presumably utilize the proposed corridor. A preliminary design concept for the creation and/or re-vegetation of the proposed route was also prepared consistent with the guidelines described below (Draft Irvine Wildlife Corridor Master Plan, November 2002). The draft recommended a series of actions to improve the environmental quality for wildlife:

- Creation (establishes historical ecosystems on lands that did not previously support that ecosystem or on severely altered sites)
- Revegetation
- Reduce the amount of noise pollution and urban influence.
- Remove and restore the unnecessary developed (paved) areas within the corridor right-of-way.
- Create a protective habitat along the entire length of the corridor.
- Apply minimum height/width requirements based on the specific wildlife species.

OCGP FEIR Mitigation Measure BIO3, which continues to apply to this Addendum, ensures that the City of Irvine will continue to work with State and federal agencies to implement the revegetation/restoration plan necessary to create a viable wildlife corridor within the Project area. The City has already engaged in

4. Discussion of Checklist and Mitigation Measures

this process as has been demonstrated through the preparation of the Irvine Wildlife Corridor Master Plan, which is independent of this project.

4.4.2 Impacts Identified in the OCGP FEIR

The OCGP FEIR concluded that implementation of the overall project could result in the occurrence of the following potentially significant effects:

- The southern tarplant, a federal species of concern, might be adversely affected by the overall OCGP Master Plan project development.
- Although very limited in aerial extent and highly disturbed, isolated riparian habitat remnants that could be adversely impacted by the OCGP Master Plan project implementation.

The Project site contains a large number of trees, many of them mature, representing a wide range of species. The OCGP project implementation may result in damage and destruction to the trees. A significant impact related to conflicts with the City of Irvine's Urban Forestry Ordinance could occur.

Addendum No. 4 (OCGP Master Plan) stated that the OCGP Master Plan portion of the overall OCGP project included essentially the same land uses and encompassed the same land area as depicted in the OCGP FEIR. Therefore, it concluded that, the OCGP FEIR adequately described the nature and severity of the environmental effects of OCGP Master Plan implementation on biological resources.

OCGP FEIR Mitigation Measure BIO1 stated that prior to approval of a subdivision map for each project area, a focused survey for the southern tarplant, mountain plover, and burrowing owl shall be conducted. MM BIO1 also stated that prior to approval of a subdivision map for development within, or in proximity to Serrano Creek, a focused survey shall be conducted for the least Bell's vireo and southwestern willow flycatcher. Should the focused survey identify a significant population of southern tarplant or mountain plover, or the presence of burrowing owl, least Bell's vireo, or southwestern willow flycatcher in an area proposed for development, impacts shall be avoided through incorporation of the species into an open space easement or, if impacts cannot be avoided, then mitigation shall be negotiated through consultation with the United States Fish and Wildlife Service (USFWS) and the California Department of Fish and Game (CDFG). Mitigation Measure BIO1 would continue to apply to this proposed Project (see Mitigation Measure BIO1, below).

The OCGP FEIR also stated that prior to approval of a subdivision map for each project area, a jurisdictional wetland delineation shall be performed for all areas within the Master Plan sub-area that contain the potential for wetland habitat and/or jurisdictional waters. The loss of impacted wetlands shall be mitigated through the implementation of a Wetland Mitigation Plan prepared and accepted by the appropriate agency (i.e., U.S. Army Corps of Engineers, U.S. Fish and Wildlife Service, California Department of Fish and Game). For wetlands impacted on-site replacement, recreation (i.e., within the proposed wildlife corridor), and/or re-vegetation is deemed acceptable by the appropriate jurisdictional agencies. Accordingly, Mitigation Measure BIO2 below would also continue to apply to the proposed Project.

4. Discussion of Checklist and Mitigation Measures

The OCGP FEIR required that several focus surveys be conducted on 51 (including former PA 30) for sensitive plant and wildlife species prior to development. PCR Services prepared a *Biological Resources Assessment for Lennar Heritage Fields, Orange County, California* in November of 2005 and an updated assessment was prepared in June of 2006.² This biological resources assessment complies with mitigation measures BIO1, requiring a focus survey for the southern tarplant, mountain plover, and burrowing owl, and BIO2 requiring a wetlands delineation to be prepared for all areas within the Master Plan sub-area that contain the potential for wetland habitat and/or jurisdictional waters. The subject study and each of its constituent focused technical studies cover a land area of approximately 3,700 acres and includes the OCGP Master Plan.

Jurisdictional Wetlands and “Waters of the U.S.”

A Jurisdictional Delineation for the site has been performed (*Investigation of Jurisdictional Wetlands and Waters of the U.S. Lennar Heritage Fields*, June 2006 PCR). The property supports six intermittent drainage systems and a variety of associated ephemeral tributaries. Five of the drainages have their headwaters in undeveloped areas of the Lomas de Santiago Foothills to the north. San Diego Creek originates in an eastern portion of the watershed that is occupied by substantial residential and commercial development. Disturbances such as channelization of large stretches of the drainages and dumping of debris and trash into portions of drainages have significantly altered several waterways and obscured many drainage features. Other disturbances on site include vegetation clearing to create roads and structures, agricultural runoff, and invasion by exotic species. Current and historic land uses associated with the establishment of MCAS El Toro (military structures, roads, agriculture, and residential development) have significantly changed the overall drainage patterns within the San Diego Creek watershed. The cumulative impact to each wash or creek has resulted in habitat and water quality impairment within the San Diego Creek watershed.

These impacts include increased sediment and debris transport due to concrete-lined stream channels, increased flow velocities and scouring, increased bank erosion, increases in the presence of non-native plant species, and an overall reduction in the amount and the quality of the riparian habitat within the watershed. Alternatively, the disturbances have increased the amount of jurisdictional areas due to the creation of freshwater marsh habitat resulting from impoundment of storm water runoff within and adjacent to drainages. In total, the site contains 31,102.11 linear feet of jurisdictional streambed that includes 22.02 acres of U.S. Army Corps of Engineers (USACE) jurisdictional “Waters of the U.S.,” and, of which, 1.66-acres meet the three parameter definition of a jurisdictional wetland. CDFG jurisdictional streambed and associated riparian habitat total 38.61 acres.

Sensitive Biological Resources

There are numerous plant and wildlife species present, or potentially present within the project area that have received special recognition by federal, State, or local resource conservation agencies and organizations. Their status is principally due to the species decline or limited population size, usually resulting from habitat loss. Protected sensitive species are those species identified by either State or federal resource management agencies, or both, as threatened or endangered under provisions of the California and Federal Endangered Species Acts, respectively.

² This report is available for review at the City of Irvine.

4. Discussion of Checklist and Mitigation Measures

Sensitive species that occur or could potentially occur within the project area are based on one or more of the following:

- The direct observation of the species within the project area during one of the biological surveys.
- A record reported in the California Natural Diversity Database (CNDDDB).
- The project area is within a known distribution of a species and contains appropriate habitat.

Sensitive Plant Communities

The project area is dominated by highly disturbed habitat types and only small areas of native vegetation exist. A total of 9.7 acres of southern willow scrub occurs in scattered patches throughout the project area. Southern willow scrub is a high priority inventory community in the CNDDDB. This community is considered sensitive because it has experienced a sharp decline in California and because it has the ability to support a number of sensitive bird species such as least Bell's vireo and southwestern willow flycatcher.

Sensitive Plant Species

Sensitive plants include those that are either candidates or are currently listed by the CDFG and USFWS and those that are considered sensitive by the California Native Plant Society (CNPS). Several sensitive plant species were reported in the CNDDDB from the surrounding region. In accordance with the mitigation measures of the OCGP FEIR, focused surveys for southern tarplant were conducted on June 3 and June 8, 2005. No species were found. The highly disturbed character of the site and reduced presence of habitat capable of supporting sensitive plant species make it highly unlikely that any listed plant species will occur on the site.

Sensitive Wildlife Species

Forty-nine sensitive wildlife species were reported in the CNDDDB as occurring with the USGS 7.5-minute El Toro quadrangle map and the eight surrounding maps. Habitat suitability assessments for these species were conducted concurrently with the site investigation throughout the 2005 fieldwork. The intent of the habitat assessment was to evaluate habitat for its ability to support sensitive species and ascertain which sensitive species are likely to be present within the project area based on expected habitat use, geographic range, and information collected in the vicinity of the project area.

The OCGP Master Plan is not within a proposed or listed critical habitat area. Six sensitive wildlife species were observed within the project area during initial field investigations: northern harrier (*Circus cyaneus*), merlin (*Falco columbarius*), Cooper's hawk (*Accipiter cooperii*), California horned lark (*Eremophila alpestris actia*), cactus wren (*Campylorhynchus brunneicapillus*), and loggerhead shrike (*Lanius ludovicianus*). Three of these species (northern harrier, merlin, and Cooper's hawk) were also observed during wintering bird surveys. In addition, the golden eagle (*Aquila chrysaetos*), burrowing owl (*Athene cunicularia*), and ferruginous hawk (*Buteo regalis*) were observed utilizing the site during these subsequent wintering bird surveys. Surveys for mountain plover (*Charadrius montanus*), in accordance

4. Discussion of Checklist and Mitigation Measures

with the OCGP FEIR mitigation measures, were conducted during the wintering bird surveys as part of Addendum No. 3; no individuals of this species, were observed on site during those field investigations. In a follow-up report ³on wintering birds dated October 30, 2006 with surveys conducted between October 2005 and March 2006, PCR Services searched the site for activity. No burrowing owls were observed until February 2006. Although the project site is open, its vegetation becomes dense and over two feet tall in most areas. A single owl occupied a burrow during the late winter but abandoned the area as the vegetation surrounding the burrow became three feet high and very dense. There was no indication that breeding activity had been initiated. Because the habitat became unsuitable as a natural result of not being mowed, PCR Services determined that no mitigation would be required.

Summary of the Biological Status of the Site

The OCGP FEIR required that focus surveys be conducted on the project site for several sensitive plant and wildlife species prior to development. The required surveys were carried out during 2005 and 2006. No species of endangered plants or wildlife were recorded on site during these investigations, conducted by PCR Services. The sensitive plant community of willow scrub extant on site is heavily disturbed and fragmented. As such, PCR Services did not recommend attempting to preserve any of the remnant stands or streambeds as they currently exist. It was also determined that the presence of several sensitive species would be addressed through mitigation designed to avoid disturbance of nesting avian species. PCR Services' findings did not indicate a need to consult formally with the USFWS.

4.4.3 Impacts Associated with the Modifications to the OCGP Improvement Area

The SSEIR for the 2012 Modified Project did not analyze biological resources, as it was screened out during the initial environmental assessment and initial study process. However, a separate, stand-alone study was prepared to analyze the potential biological resources impacts of the Wildlife Corridor relocation.

The Project proposes modifications within the Bosque and Sports Park Districts of the 688-acre OCGP Improvement Area, an area which has been part of the original OCGP Master Plan. Therefore, the OCGP FEIR adequately described the nature and severity of the environmental effects of OCGP Master Plan and its current modifications to the 688-acre OCGP Improvement Area, the subject of this Addendum, on biological resources. The proposed Modifications to the OCGP Improvement Area reducing the number of sports courts, expanding passive recreational area, relocating some of the Improvement Area components to optimize visibility, access and efficiency, and assessing adequacy of parking plan reflect a development program that is consistent with the General Plan Land Use and Zoning Ordinance designations for Planning Area 51 and Bosque and Sports Park in particular. The proposed Project would not have a substantial adverse impact on any sensitive species, riparian habitat or other sensitive natural community, and federally protected wetlands, as none exists within the Project area. Additionally, the proposed Project would not interfere with the movement of any native resident or migratory fish or wildlife species; conflict with any local policies or ordinances protecting biological resources and adopted Habitat Conservation Plan. The proposed Modifications to the OCGP Improvement Area would not result in any changes within the Wildlife Corridor. Consequently, no changes to the OCGP FEIR would be required as a result of the proposed modifications.

³ This report is available for review at the City of Irvine.

4. Discussion of Checklist and Mitigation Measures

Major FEIR Revisions Not Required. Based on the foregoing analysis and information, there is no evidence that the changes to the project require a major change to the OCGP FEIR. The proposed Modifications to the OCGP Improvement Area, which does not include any major change to park development areas identified in the approved OCGP Master Plan, will not result in any new significant environmental impact nor will there be a substantial increase in the severity of impacts from that described in the OCGP FEIR.

No Substantial Change in Circumstances Requiring Major FEIR Revisions. There is no information in the Modifications to the OCGP Improvement Area or otherwise available indicating substantial changes in circumstances that would require major changes to the OCGP FEIR.

No New Information of Substantial Importance Showing Greater Significant Effects Than Previous FEIR. All available relevant information has been analyzed, and there is no new information of substantial importance, which was unknown and could not have been known with the exercise of reasonable diligence at the time the OCGP FEIR was approved, augmented, and/or updated, indicating that the proposed Project will have one or more significant effects not discussed in the OCGP FEIR or result in a substantial increase in the severity of previously identified effects.

No New Information of Substantial Importance Showing Ability to Reduce Significant Effects in Previous FEIR. All available relevant information has been analyzed, and there is no new information of substantial importance, which was unknown and could not have been known with the exercise or reasonable diligence at the time the OCGP FEIR was approved, augmented, and/or updated, indicating that: (1) mitigation measures or alternatives previously found not to be feasible would in fact be feasible, and would substantially reduce one or more significant effects of the proposed Project, but the project proponent declines to adopt the mitigation measures or alternatives; or (2) mitigation measures or alternatives that are considerably different from those analyzed in the previous FEIR would substantially reduce one or more significant effects on the environment, but the project proponent declines to adopt the mitigation measures or alternatives. There are no alternatives to the proposed Project or additional mitigation measures that would substantially reduce one or more of the significant biological effects identified in and considered by the OCGP FEIR.

4.4.4 Mitigation from the OCGP FEIR and Applicability to the Modifications to OCGP Improvement Area

Of the Mitigation Measures listed below, applicable measures will be incorporated into the proposed Project upon project implementation.

BIO1 Prior to approval of a subdivision map for each project area, a focused survey for the southern tarplant, mountain plover, and burrowing owl shall be conducted. Prior to approval of a subdivision map for development within or in proximity to Serrano Creek, a focused survey shall be conducted for the least Bell's vireo and southwestern willow flycatcher. Should the focused survey identify a significant population of southern tarplant or mountain plover, or the presence of burrowing owl, least Bell's vireo, or southwestern willow flycatcher in an area proposed for development, impacts shall be avoided through incorporation of the species into an open space easement, or if impacts cannot be avoided, then mitigation shall be negotiated through

4. Discussion of Checklist and Mitigation Measures

consultation with the United States Fish and Wildlife Service (USFWS) and the California Department of Fish and Game (CDFG).

- BIO2** Prior to approval of a subdivision map for each project area, a wetland delineation shall be performed for all areas within the master plan sub-area that contain the potential for wetland habitat and/or jurisdictional waters. The loss of impacted wetlands shall be mitigated through the implementation of a wetland mitigation plan prepared and accepted by the appropriate agency (i.e., U.S. Army Corps of Engineers, U.S. Fish and Wildlife Service, California Department of Fish and Game). Wetlands impacted on-site shall be mitigated through on-site or off-site replacement, recreation (i.e., within the proposed wildlife corridor), and/or re-vegetation as deemed acceptable by the appropriate jurisdictional agencies.
- BIO3** The City shall continue to work with State and federal agencies during the implementation of the proposed project to implement the revegetation/restoration plan for the wildlife corridor. Measures such as sight and sound barriers, including artificial sound walls and natural diversions (e.g., hedges and tree lines) shall be incorporated into corridor design to ensure the viability of the corridor. The City shall implement the corridor consistent with the design criteria and viability analysis established in the Final FEIR.
- BIO4** Prior to issuance of a grading permit for each project area, a complete inventory of all trees of trunk diameter at breast height (DBH) greater than six inches and any significant plants (as determined by a certified arborist selected by the City) on the project site, excluding those within the habitat preserve shall be prepared. This inventory shall be prepared by an arborist certified by the International Society of Arboriculture and shall include (but not be limited to) data for each tree such as species, variety, DBH, condition (excellent, good, fair, poor, dead), and any recommendations. All trees in this inventory shall be considered "Significant Trees" under the City of Irvine's Urban Forestry Ordinance (UFO) (Sections 5-7-401 et al.) and the UFO shall apply to all trees included in this inventory.

4.5 CULTURAL RESOURCES

4.5.1 Environmental Setting

Archaeological and Historical Resources

This discussion of cultural resources includes archaeological and historical resources. The OCGP FEIR presented information pertaining to the regional setting of former MCAS El Toro from both a prehistoric and historic perspective. The OCGP FEIR reported the presence of ten prehistoric archaeological sites and eight isolated prehistoric artifacts that have been recorded in the northeastern habitat preserve portions of PA 51. These sites are generally on the ridges between Borrego Canyon Wash and the Agua Chinon Wash.

The former MCAS El Toro was surveyed to determine whether any of the structures would be eligible for the National Register. Generally, a structure that has achieved significance in the past 50 years is not considered eligible for the National Register unless it is of exceptional importance. The evaluation was expanded to include eligibility under the Legacy Cold War Project (Public Law No. 101-511, Section

4. Discussion of Checklist and Mitigation Measures

8120). Portions of PA 51, including former PA 30, (the former MCAS El Toro) were established during WWII, and no structure earlier than this period is at the former MCAS El Toro. Therefore, the historical significance of any structures at the former military base would be as part of the Cold War Legacy. Surveys conducted by the US Army Corps of Engineers and the Department of the Navy in conjunction with the base's closure concluded there were no structures eligible for designation as Cold War Legacy or for inclusion in the National Register of Historic Places.

Paleontological Resources

The OCGP FEIR reported that a majority of PA 51, including former PA 31, is on the Tustin Plain, a coastal alluvial plain. Alluvium from the Late Pleistocene to Holocene Epochs immediately underlies the majority of the project area, including the part occupying the coastal plain and washes in the eastern portion of PA 51. The Pleistocene Alluvium formation is widespread and believed to extend to depths of 1,000 feet in former PA 30. A significant deposit of Pleistocene terrestrial vertebrates was recovered during excavation of a flood control basin four miles from former PA 30; thus, it is possible that similar beds underlie the former PA 30 (OCGP FEIR 5.10-2).

The eastern portion of PA 51 is in the western foothills of the northern Santa Ana Mountains. The hills and ridges in the eastern part of PA 51 are composed of older, underlying marine and non-marine rock units of early Oligocene to late Pleistocene (23 million to 2 million years ago). In order of decreasing geologic age, these latter rock units include the undifferentiated Sespe and Vaqueros Formations, Topanga and Monterey Formations, Oso Member of the Capistrano Formation, Niguel Formation, and Non marine Terrace Deposits. Non marine Terrace Deposits also underlie the terraces at the south corner of PA 51.

The northwestern corner of PA 51 contains a small portion of the Santa Ana Mountains foothills, which were separated from the main formation by erosion. This small portion is composed of undifferentiated late Cretaceous (135 million years ago) Marine Williams Formation. The rock units underlying portions of PA 51 have previously yielded important fossil remains at recorded fossil sites on and near the site. There are three recorded fossil sites in PA 51. These sites occur in undifferentiated Sespe and Vaqueros Formations and in the Topanga Formation. Fossil types include marine invertebrates and vertebrates, continental vertebrates, land plants, and land mammals. The three recorded fossil sites lie within the proposed habitat preserve portion of PA 51.

4.5.2 Impacts Identified in the OCGP FEIR

Archaeological and Historical Resources

The OCGP FEIR determined that development according to the adopted Overlay Plan would not cause a substantial adverse change in the significance of any historical structure. The consequence of grading activities associated with future development; however, could potentially result in a substantial adverse change in the significance of an archaeological resource. The OCGP FEIR also stated that grading activities could uncover previously unknown human remains, including those interred outside formal cemeteries.

4. Discussion of Checklist and Mitigation Measures

Although the entire project area was the subject of previous cultural resources investigations as part of the Base Realignment and Closure process, it was later determined that an updated survey and report was necessary to supplement the previous work. PCR Services performed an additional Phase I and II cultural resources investigation, the results of which can be found in the *Cultural Resources Update and Review, Heritage Fields/The Great Park, City of Irvine, Orange County, California* report dated September 2006.

Later, the OCGP Master Plan reflected a development program that was consistent with the General Plan Land Use and Zoning designations for PA 51. Earth moving activities were also projected to be the same as that analyzed in the OCGP FEIR.

Paleontological Resources

The OCGP FEIR stated that earthmoving operations associated with grading and trenching have the greatest potential to impact buried paleontological resources in the moderately to highly sensitive areas in the coastal plain and washes, northeastern, northwestern, and southern portions of Planning Area 51. The OCGP FEIR considered the potential impact associated with earthmoving operations as a significant impact for which mitigation was necessary.

The OCGP Master Plan findings were also consistent with the OCGP FEIR, and the mitigation measures proposed in the OCGP FEIR were applicable and necessary in addressing potential impacts of future development.

The SSEIR document did not analyze cultural resources, as it was screened out during the initial environmental assessment and initial study process.

4.5.3 Impacts Associated with the Proposed Modifications to the OCGP Improvement Area

The SSEIR for the 2012 Modified Project did not analyze cultural resources, as it was screened out during the initial environmental assessment and initial study process.

The Project proposes modifications within the Bosque and Sports Park Districts of the 688-acre OCGP Improvement Area, an area which has been part of the original Master Plan. The OCGP FEIR adequately describes the nature and severity of the environmental effects of OCGP Master Plan and its Modifications to the OCGP Improvement Area, the subject of this Addendum, on cultural resources. The modifications are minor adjustments to the design, location and efficiency of development program components. No new uses and facilities are proposed that would cause a substantial adverse change in the significance of archaeological, paleontological, and historic resources impacts within the Project site. In addition, the proposed Project would not directly or indirectly destroy a unique cultural resource or site or unique geological feature; or disturb any human remains, including those interred outside of formal cemeteries.

Archaeological and Historical Resources

The Project as currently proposed would not cause a substantial adverse change in the significance of any historical structure, but grading associated with future development could still potentially result in a

4. Discussion of Checklist and Mitigation Measures

substantial adverse change in the significance of an archaeological resource, or uncover previously unknown human remains. As such, the cultural resources mitigation measures developed for the OCGP FEIR remain applicable to, and sufficient to mitigate impacts of, future development.

The proposed Modifications to the OCGP Improvement Area reducing the number of sports courts, expanding passive recreational area, relocating some of the Improvement Area components to optimize visibility, access and efficiency, and assessing adequacy of parking plan reflect a development program that is consistent with the General Plan Land Use and Zoning designations for Planning Area 51. Therefore, the discussion of impacts on archaeological and historical resources disclosed in the OCGP FEIR remains valid and the proposed modifications to the 688-acre OCGP Improvement Area would not result in any significant impacts or require changes to the OCGP FEIR.

Paleontological Resources

The proposed Modifications to the OCGP Improvement Area described above reflect a development program that is consistent with the General Plan Land Use and Zoning designations for Planning Area 51. Therefore, the discussion of potential impacts on paleontological resources disclosed in the OCGP FEIR remains valid and the proposed Modifications to the OCGP Improvement Area would not result in any significant impacts. As such, the paleontological Mitigation Measure P1 developed for the OCGP FEIR remains applicable to, and sufficient to mitigate impacts of, future development pursuant to the OCGP Master Plan.

Major FEIR Revisions Not Required. Based on the foregoing analysis and information, there is no evidence that the changes to the project require a major change to the OCGP FEIR. The proposed Modifications to the OCGP Improvement Area, which does not include any major change to park development areas identified in the approved OCGP Master Plan, will not result in any new significant environmental impact nor is there a substantial increase in the severity of impacts from that described in the OCGP FEIR.

No Substantial Change in Circumstances Requiring Major FEIR Revisions. There is no information in the Modifications to the OCGP Improvement Area or otherwise available indicating substantial changes in circumstances that would require major changes to the OCGP FEIR.

No New Information of Substantial Importance Showing Greater Significant Effects Than Previous FEIR. All available relevant information has been analyzed, and there is no new information of substantial importance, which was unknown and could not have been known with the exercise of reasonable diligence at the time the OCGP FEIR was approved, augmented, and/or updated, indicating that the proposed Project will have one or more significant effects not discussed in the OCGP FEIR or result in a substantial increase in the severity of previously identified effects.

No New Information of Substantial Importance Showing Ability to Reduce Significant Effects in Previous FEIR. All available relevant information has been analyzed, and there is no new information of substantial importance, which was unknown and could not have been known with the exercise or reasonable diligence at the time the OCGP FEIR was approved, augmented, and/or updated, indicating that: (1) mitigation measures or alternatives previously found not to be feasible would in fact be feasible, and would substantially reduce one or more significant effects of the proposed Project, but the project

4. Discussion of Checklist and Mitigation Measures

proponent declines to adopt the mitigation measures or alternatives; or (2) mitigation measures or alternatives that are considerably different from those analyzed in the previous FEIR would substantially reduce one or more significant effects on the environment, but the project proponent declines to adopt the mitigation measures or alternatives. There are no alternatives to the proposed Project or additional mitigation measures that would substantially reduce one or more of the significant biological effects identified in and considered by the OCGP FEIR.

4.5.4 Mitigation from the OCGP FEIR and Applicability to the Proposed Modification to the OCGP Improvement Area

Cultural Resources

The OCGP FEIR identified mitigation measures CULT1 through CULT4 which, if fulfilled, would reduce the effects of development to a level less than significant.

Of the Mitigation Measures listed below, applicable measures will be incorporated into the proposed Project upon project implementation.

CULT1 Prior to subdivision for development, a detailed archaeological report(s) shall be prepared within PAs 51 and 30. This report(s) shall specifically address the potential for encountering archaeological resources at the time specific development is proposed. The report(s) shall provide recommendations to prevent degradation of archaeological resources such as site avoidance and data recovery. Recommendations contained in the report shall be implemented. Compliance with this measure shall be verified by the Community Development Department.

CULT2 Monitoring of excavation and grading activities associated with future development in PAs 51 and 30 shall be conducted by a certified archaeologist in accordance with the report required in Mitigation Measure CULT1. If resources are encountered in the course of ground disturbance, the archaeological monitor shall be empowered to halt grading and to initiate an archaeological testing program. The testing shall include recordation of artifacts, controlled removal of the materials, and an assessment of their importance under CEQA and the City's local guidelines. Compliance with this measure shall be verified by the Community Development Department.

CULT3 Prior to the issuance of grading permits and/or building permits for any future development in PAs 51 and 30, a detailed mitigation program shall be submitted by the applicant to the City of Irvine to address archaeological resources discovered during grading. Provisions of the program shall include an immediate evaluation of the find by a qualified archaeologist. If the find is determined to be a unique archaeological resource, contingency funding and a time allotment sufficient to allow for implementation of avoidance measures or appropriate mitigation shall be available. Work may continue on other parts of the construction site while archaeological resource mitigation takes place. The City of Irvine has standard conditions applied prior to the issuance of grading permits when a project includes potentially significant archaeological sites. These include retaining a qualified archaeologist, establishing procedures for cultural and scientific resource surveillance, and protection of any resources discovered during the grading process. Compliance with this measure shall be verified by the Community Development Department.

4. Discussion of Checklist and Mitigation Measures

CULT4 Prior to the issuance of any grading and/or building permits, a mitigation program shall be submitted by the developer to the City of Irvine to address the accidental discovery of recognition of any human remains. The program shall include the following:

There shall be no further excavation or disturbance of the site or any nearby area reasonably suspected to overlie adjacent human remains until:

- The county coroner must be contacted to determine that no investigation of the cause of death is required, and

If the coroner determines the remains to be Native American:

- The coroner shall contact the Native American Heritage Commission within 24 hours.
- The Native American Heritage Commission shall identify the person or persons it believes to be the most likely descended from the deceased Native American.
- The most likely descendent may make recommendations to the landowner or the person responsible for the excavation work, for the means of treating or disposing of, with appropriated dignity, the human remains and any associated grave goods as provided in Public Resources Code Section 5097.98, or
- Where the following conditions occur, the landowner or his authorized representative shall rebury the Native American human remains and associated grave goods with appropriate dignity on the property in a location not subject to further subsurface disturbance.
 - The Native American heritage Commission is unable to identify a most likely descendent or the most likely descendent failed to make a recommendation within 24 hours after being notified by the commission.
 - The descendant identified fails to make a recommendation; or
 - The landowner or his authorized representative rejects the recommendation of the descendant, and the mediation by the Native American Heritage commission fails to provide measures acceptable to the landowner.

Compliance with this measure shall be verified by the Community Development Department.

Paleontological Resources

The OCGP FEIR identified Mitigation Measure P1, which, if fulfilled, would reduce the effects of development under the adopted Overlay Plan to a level less than significant.

P1 Prior to issuance of a grading permit for any portion of the project area, a qualified paleontologist shall be retained by the City or designee to carry out an appropriate paleontology investigation of

4. Discussion of Checklist and Mitigation Measures

the area proposed for grading. (A qualified paleontologist is defined as an individual with an M.S. or Ph.D. in paleontology or geology who is familiar with paleontological procedures and techniques.) The City of Irvine has standard conditions applied prior to the issuance of grading permits when a project site includes potentially significant paleontological sites, and paleontological monitoring conditions have not been attached to the previous map approval. These standard conditions include retaining a qualified paleontologist, establishing procedures for cultural and scientific resource surveillance, and protection of any resources discovered during the grading process.

When fossils are discovered, the paleontologist (or paleontological monitor) shall recover them. In most cases, this fossil salvage can be completed in a short period of time. However, some fossil specimens (such as a complete large mammal skeleton) may require an extended salvage period. In these instances the paleontologist (or paleontological monitor) shall be allowed to temporarily direct, divert or halt grading to allow recovery of fossil remains in a timely manner. Because of the potential for the recovery of small fossil remains, such as isolated mammal teeth, it may be necessary in certain instances to set up a screening-washing operation on-site.

Fossil remains collected during the monitoring and salvage portion of the mitigation program shall be cleaned, repaired, sorted, and cataloged. Compliance with this measure shall be verified by the Community Development Department.

4.6 GEOLOGY AND SOILS

4.6.1 Environmental Setting

The OCGP FEIR describes the topography of the OCGP as nearly flat and gently sloping down to the west to southwest with elevations ranging from 450 feet above mean sea level (msl) to 200 feet above msl. The proposed Project is located in Planning Area 51 (PA 51), which includes some slopes of the Santa Ana foothills which reach elevations of 750 feet above msl. Alluvial soils of six major soil associations consisting predominantly of varying sands, silts, and clayey silty sands are present within PA 51. The foothill portions of the project area are underlain by sedimentary bedrock units, mantled by only a thin soil cover.

The OCGP FEIR identified the primary potential seismic hazard in the area as ground motion. Seismic Response Area (SRA) designations are used by the City to assess the geologic and seismic risk associated with potential development. A majority of PA 51 is within SRA-2 (denser soils/deeper groundwater) and is considered suitable for development.

No known active faults crossing or projecting into the project area were identified; however, the proposed Project site is within the seismically active southern California region and two active faults, Whittier-Elsinore Fault and Newport-Inglewood Fault, are located within 14 miles of the site.

4.6.2 Impacts Identified in the OCGP FEIR

The OCGP FEIR disclosed the potential for future development of the OCGP area to result in the exposure of people or structures to strong ground shaking in the event of a major earthquake along anyone of the active faults in the region. The OCGP FEIR noted that new construction would be required

4. Discussion of Checklist and Mitigation Measures

to adhere to current seismic safety building codes which address seismic concerns. Existing buildings within current PA 51 do not meet current seismic codes; therefore, the temporary or permanent reuse of the existing buildings and the associated exposure of people or structures to potential substantial adverse effects due to strong seismic-related ground shaking were considered significant impacts.

Because of the documented landslides in the northeastern Santa Ana foothills area of the Site, the OCGP FEIR analysis concluded that the OCGP project would result in a significant impact associated with landslides in the affected area of PA 51 east of Irvine Boulevard, where future development of habitable structures could occur under the adopted Overlay Plan. The OCGP FEIR also concluded future development has the potential to result in soil erosion or the loss of topsoils and risk to life and property with the presence of expansive soils, and that these impacts are considered significant.

The conclusions drawn in the OCGP Master Plan were consistent to those in the OCGP FEIR. No new impacts were identified, and the OCGP FEIR had adequately described the environmental impacts of the project relative to soils, geologic hazards, and seismic safety, as well as the severity of the impacts.

4.6.3 Impacts Associated with the Modifications to the OCGP Improvement Area

The SSEIR document did not analyze geology and soils, as it was screened out during the initial environmental assessment and initial study process.

The Project site is located within the OCGP 688-acre Improvement Area and includes the same land uses as the OCGP Improvement Area. The proposed Project, consisting of modifications to the OCGP Improvement Area reducing the number of sports courts, expanding passive recreational area, relocating some of the Improvement Area components to optimize visibility, access and efficiency, and assessing adequacy of parking plan, and does not propose new uses or additional development intensity. Impacts related to seismic hazards, landslides, expansive soils, and loss of topsoil or soil erosion, are not intensified by the proposed Project. The modifications, while reducing the number of sports facilities, further enhance the use and efficiency of the existing features. No new uses and facilities and intensification of existing uses are proposed that would affect the geologic resources within the proposed Project site. Therefore the conclusions drawn in the OCGP FEIR adequately describe the environmental effects of the proposed Project relative to soils, geologic hazards, and seismic safety, as well as the severity of the impacts, and no changes to the OCGP FEIR would be required.

Major FEIR Revisions Not Required. Based on the foregoing analysis and information, there is no evidence that the changes to the project require a major change to the OCGP FEIR. The proposed Modifications to the OCGP Improvement Area, which does not include any major change to park development areas identified in the approved OCGP Master Plan, will not result in any new significant environmental impact nor is there a substantial increase in the severity of impacts from that described in the OCGP FEIR.

No Substantial Change in Circumstances Requiring Major FEIR Revisions. There is no information in the OCGP Improvement Area or otherwise available indicating substantial changes in circumstances that would require major changes to the OCGP FEIR.

No New Information of Substantial Importance Showing Greater Significant Effects Than Previous FEIR. All available relevant information has been analyzed, and there is no new information of

4. Discussion of Checklist and Mitigation Measures

substantial importance that was unknown and could not have been known with the exercise of reasonable diligence at the time the OCGP FEIR was approved, augmented, and/or updated, indicating that the proposed Project will have one or more significant effects not discussed in the OCGP FEIR or result in a substantial increase in the severity of previously identified effects.

No New Information of Substantial Importance Showing Ability to Reduce Significant Effects in Previous FEIR. All available relevant information has been analyzed, and there is no new information of substantial importance that was unknown and could not have been known with the exercise of reasonable diligence at the time the OCGP FEIR was approved, augmented, and/or updated, indicating that: (1) mitigation measures or alternatives previously found not to be feasible would in fact be feasible, and would substantially reduce one or more significant effects of the proposed Project, but the project proponent declines to adopt the mitigation measures or alternatives; or (2) mitigation measures or alternatives that are considerably different from those analyzed in the previous EIR would substantially reduce one or more significant effects on the environment, but the project proponent declines to adopt the mitigation measures or alternatives. There are no alternatives to the proposed Project or additional mitigation measures that would substantially reduce one or more of the significant geological effects identified in and considered by the OCGP FEIR.

4.6.4 Mitigation from the OCGP FEIR and Applicability to the Modifications to OCGP Improvement Area

The OCGP FEIR identified Mitigation Measures GS1 through GS4, which, if fulfilled, would reduce the effects of development under the adopted Overlay Plan to a level of less than significant.

Of the Mitigation Measures listed below, applicable measures will be incorporated into the proposed Project upon project implementation.

GS1 Prior to issuance of a building permit, the City of Irvine shall require that all development be designed in accordance with the seismic design provisions outlined in future proposed development geotechnical reports and specified in the latest Building Codes adopted by the City of Irvine. Compliance with this measure shall be verified by the Community Development Department.

GS2 Prior to issuance of a building permit, as per existing City policies, geotechnical studies shall be prepared at the time specific development projects are proposed to address site specific geotechnical considerations. The scope of each geotechnical study is based on the underlying geotechnical conditions of the individual site. These reports will provide measures to prevent settlement.

1. Prior to design and construction of any future developments within the project area, a comprehensive geotechnical evaluation, including development-specific subsurface exploration and laboratory testing, shall be conducted. The purpose of the subsurface evaluation is to:
 - a. Further evaluate the subsurface conditions in the area of the proposed structures.

4. Discussion of Checklist and Mitigation Measures

- b. Provide specific data on potential geologic and geotechnical hazards.
- c. Provide information pertaining to the engineering characteristics of earth materials in the project area.

From this data, recommendations for grading/earthwork, surface, and subsurface drainage, temporary and/or subsurface drainage, temporary and/or permanent dewatering, foundations, pavement structural section, and other pertinent geotechnical design considerations may be formulated and shall be included in the grading and building plans for individual developments. General recommendations are as follows:

- Seismic Ground Shaking - Measures to prevent risk of loss, injury or death involving seismic ground shaking include constructing new development to the latest adopted building codes. In addition, new development should not be located near active earthquake faults.
- Erosion or Loss of Topsoil - Erosion and sediment control measures shall be implemented as required by the City's Grading and Water Quality ordinances.
- Where Expansive Soils Exist - Measures for the design of foundation, slabs, flatwork and other improvements subject to drainage from expansive soils.

Compliance with this measure shall be verified by the Community Development Department.

GS3 Prior to issuance of building permits for the occupancy of any existing structure at the former MCAS El Toro, or occupancy of any existing structure if a building permit is not issued, a seismic evaluation of the structure including recommendations for seismic improvements required for compliance with current Building Codes for use of existing structures adopted by the City of Irvine and plans for any required seismic improvements shall be submitted to the Chief Building Official for review and approval.

GS4 Prior to issuance of a grading permit, detailed geotechnical and hydrology reports shall be prepared prior to any development approval or grading activities. These reports shall specifically address erosion control and surface runoff for both construction and long-term operations on the site. Recommendations contained in these reports to prevent soil erosion, siltation, and debris influx into the drainage system shall be implemented. Compliance with this measure shall be verified by the Community Development Department.

4.7 GREENHOUSE GAS EMISSIONS

As discussed in more detail in Section 3.4, the proposed Project does not meet the Section 15162 criteria for preparing a subsequent environmental document and no analysis of GHG emissions is required. However, the SSEIR included an analysis of GHG emissions and a discussion of measures that are applicable to the proposed Project. The SSEIR identified the following measures as existing PPP that apply to the proposed Project and will help reduce or avoid potential GHG impacts:

4. Discussion of Checklist and Mitigation Measures

Of the PPPs listed below, applicable measures will be incorporated into the proposed Project upon project implementation.

PPP 4-1 City of Irvine Construction and Demolition ("C&D") Debris Recycling and Reuse

Ordinance: The C&D ordinance requires that 1) all residential projects of more than one unit, 2) nonresidential developments on 5,000 square feet or larger, and 3) nonresidential demolition/renovations with more than 10,000 square feet of building, recycle or reuse a minimum of 75 percent of concrete and asphalt and 50 percent of nonhazardous debris generated.

PPP 4-2 SCAQMD Rule 445 – Wood-Burning Devices:

SCAQMD prohibits installation of wood-burning devices such as fireplaces and wood-burning stoves in new development unless the development is located at an elevation above 3,000 feet or if existing infrastructure for natural gas service is not available within 150-feet of the development. All fireplaces installed within the proposed Project site will be natural gas fueled fireplaces.

PPP 4-3 Building and Energy Efficiency Standards (CCR Title 24):

Prior to the issuance of a building permit for residential, commercial, or office structures in the Proposed Project Site, development plans for these structures shall be required to demonstrate that the project meets the 2008 Building and Energy Efficiency Standards. Commonly known as Title 24, these standards are updated periodically to allow consideration and possible incorporation of new energy efficiency technologies and methods. The 2008 standards are approximately 15 percent more energy efficient than the 2005 Building and Energy Efficiency Standards. Plans submitted for building permits shall include written notes demonstrating compliance with the 2008 energy standards and shall be reviewed and approved by the Public Utilities Department prior to issuance of building permits. Design strategies to meet this standard may include maximizing solar orientation for daylighting and passive heating/cooling, installing appropriate shading devices and landscaping, utilizing natural ventilation, and installing cool roofs. Other techniques include installing insulation (high R value) and radiant heat barriers, low-e window glazing, or double-paned windows.

PPP 4-4 Title 24 Code Cycles: Net-Zero Buildings (Residential & Non-Residential):

The California Public Utilities Commission adopted its Long-Term Energy Efficiency Strategic Plan on September 18, 2008, presenting a roadmap for all new residential and commercial construction to achieve a zero-net energy standard. This Plan outlines the goal of reaching zero net energy in residential construction by 2020 and in commercial construction by 2030. Achieving this goal will require increased stringency in each code cycle of California's Energy Code (Title 24).

PPP 4-5 California Renewable Portfolio Standard:

CARB's Renewable Portfolio Standard (RPS) is a foundational element of the State's emissions reduction plan. In 2002, Senate Bill 1078 established the California RPS program, requiring 20 percent renewable energy by 2017. In 2006, Senate Bill 107 advanced the 20 percent deadline to 2010, a goal which was expanded to 33 percent by 2020 in the 2005 Energy Action Plan II. On September 15, 2009, Governor Arnold Schwarzenegger signed Executive Order S-21-09 directing CARB to adopt regulations increasing RPS to 33 percent by 2020. These mandates apply directly to investor-owned utilities, which in the case of the 2012 Modified Project is Southern California Edison ("SCE").

4. Discussion of Checklist and Mitigation Measures

PPP 4-6 California Low Carbon Fuel Standard: On January 18, 2007, Governor Arnold Schwarzenegger issued Executive Order S-1-07 requiring the establishment of a Low Carbon Fuel Standard ("LCFS") for transportation fuels. This statewide goal requires that California's transportation fuels reduce their carbon intensity by at least 10 percent by 2020. Regulatory proceedings and implementation of the LCFS have been directed to CARB. The LCFS has been identified by CARB as a discrete early action item in the Scoping Plan. CARB expects the LCFS to achieve the minimum 10 percent reduction goal; however, many of the early action items outlined in the Scoping Plan work in tandem with one another. To avoid the potential for double-counting emission reductions associated with AB 1493 (Pavley), the Scoping Plan has modified the aggregate reduction expected from the LCFS to 9.1 percent.

PPP 4-7 Federal Corporate Average Fuel Economy ("CAFE") Standards: The 2007 Energy Bill creates new federal requirements for increases in fleetwide fuel economy for passenger vehicles and light trucks. The federal legislation requires a fleetwide average of 35 miles per gallon (mpg) to be achieved by 2020. The National Highway Traffic Safety Administration is directed to phase in requirements to achieve this goal. Analysis by CARB suggests that this will require an annual improvement of approximately 3.4 percent between 2008 and 2020.

PPP 4-8 California Assembly Bill 1493 – Pavley Standards: On July 22, 2002, Governor Gray Davis signed Assembly Bill 1493 requiring CARB to develop and adopt regulations designed to reduce greenhouse gases emitted by passenger vehicles and light-duty trucks beginning with the 2009 model year. The standards set within the Pavley regulations are expected to reduce GHG emissions from California passenger vehicles by about 22 percent in 2012 and about 30 percent in 2016. California had petitioned the USEPA in December 2005 to allow these more stringent standards and California executive agencies have repeated their commitment to higher mileage standards. On July 1, 2009, the USEPA granted California a waiver that will enable the state to enforce stricter tailpipe emissions on new motor vehicles.

PPP 4-9 SB 375: SB 375 requires the reduction of GHG emissions from light trucks and automobiles through land use and transportation efforts that will reduce vehicle miles traveled ("VMT"). In essence, SB 375's goal is to control GHGs by curbing urban sprawl and through better land use planning. SB 375 essentially becomes the land use contribution to the GHG reduction requirements of AB 32, California's global warming bill enacted in 2006. The Modified Project is consistent with SB 375 strategies to reduce VMT and associated GHG emissions in that it represents a compact, mixed-use development, improves the jobs/housing balance in the city of Irvine and the Orange County Council of Governments Subregion, and provides access to mass transit. According to SCAG's 2008 Regional Comprehensive Plan, SCAG's Land Use and Housing Action Plan can be expected to result in a 10 percent reduction in VMT in 2035 when compared to current trends.

PPP 4-11 Comprehensive Signal Retiming and Coordination Program: Emissions are highest at the lowest travel speeds. The City is currently retiming and coordinating signals throughout Irvine under its ITEMS (Irvine Traffic Engineering System) program. A program to retime and coordinate traffic signals would produce more even traffic flows, so that vehicles are not starting and stopping constantly. These types of programs can improve vehicular level of service ("LOS"), thereby decreasing emissions for the same volume of vehicles.

4. Discussion of Checklist and Mitigation Measures

PPP 4-12 Waste Reduction: The City adopted a Zero Waste program in 2007 to approach waste management. The City recovers approximately 66 percent of its waste for recycling and composting, which exceeds the state's AB 939 waste diversion goals. Furthermore, waste haulers establish rate schedules according to bin size and frequency of collection. Commercial customers that subscribe to smaller bins (e.g., 2 cubic-yard bins) are routinely charged less by haulers. This pricing structure encourages waste reduction and recycling, and tends to minimize hauler pickups.

The SSEIR also identified the following measures as PDFs that apply to the proposed Project and will help reduce or avoid potential GHG impacts:

Of the PDFs listed below, applicable measures will be incorporated into the proposed Project upon project implementation.

PDF 4-1 Compact/Mixed-Use Development: The California Energy Commission ("CEC") considers compact development forms beneficial for minimizing energy consumption that leads to greenhouse gas emissions. In fact, the CEC's report on the connections between land use and climate change identifies density as the project feature most predictive of the number of vehicle trips and vehicle miles traveled ("VMT") by project occupants. The 2012 Modified Project intensified the residential development on the Proposed Project Site as compared to the 2011 Approved Project, and locates additional housing opportunities near major employment and transportation centers. Doing so will tend to reduce VMT on a local and regional basis.

PDF 4-2 High Rate of Internal Trip Capture: With the inclusion of a mix of land uses including office, commercial, industrial, and residential in the Proposed Project Site, the 2012 Modified Project significantly reduces trips outside the Proposed Project Site. This reduces trip length and congestion on the local circulation system outside the Proposed Project Site.

PDF 4-3 Low-Flow Fixtures: The 2012 Modified Project incorporates low-flow water fixtures that will meet the requirements of the California Green Building Standards Code standards. Prior to issuance of building permit, the Applicant or its successor shall submit evidence to the satisfaction of the Director of Community Development that toilets, urinals, sinks, showers, and other water fixtures installed on-site are low-flow water fixtures that meet the California Green Building Standards Code standards.

PDF 4-4 Landscaping and Irrigation Systems: The 2012 Modified Project incorporates automated, high-efficiency landscaping irrigation systems on all master landscaped areas that reduce water use, such as evapotranspiration "smart" weather-based irrigation controllers, and bubbler irrigation; low-angle, low-flow spray heads; moisture sensors; and use of a California-friendly landscape palette. Prior to approval of landscape plans, the Applicant or its successor shall submit evidence to the satisfaction of the City's Director of Community Development that such landscaping irrigation systems will be installed so as to make the 2012 Modified Project consistent with the intent of the California Water Conservation in Landscaping Act of 2006 ("AB 1881"), including provisions to reduce the wasteful, uneconomic, inefficient, and unnecessary consumption of water.

4. Discussion of Checklist and Mitigation Measures

- PDF 4-5 Use of Reclaimed Water on All Master Landscaped Areas:** Prior to approval of landscape plans, the Applicant or its successor shall submit evidence to the satisfaction of the City's Director of Community Development and the Irvine Ranch Water District ("IRWD") that the landscape plans incorporate the use of reclaimed water in all master landscaped areas, including master landscaped commercial, multifamily, common, roadways, and park areas. Master landscapes shall also incorporate weather-based controllers and efficient irrigation system designs to reduce overwatering, combined with the application of a California-friendly landscape palette.
- PDF 4-6 Material Recovery:** The 2012 Modified Project incorporates measures to reduce waste generated by Proposed Project Site residents, occupants and visitors, and to encourage recycling of solid wastes, utilizing the Orange County Integrated Waste Management Department's material recovery facilities to recycle glass, plastic, cans, junk mail, paper, cardboard, greenwaste (e.g., grass, weeds, leaves, branches, yard trimmings, and scrap wood), and scrap metal. Future employees, residents, and customers would participate in these programs. These measures include the requirement to include on-site recycling facilities at all commercial, retail, industrial, and multi-family residential developments. In addition, educational materials identifying available recycling programs shall be distributed to all land uses, including single-family residential.
- PDF 4-7 Energy Star Appliances:** EnergyStar appliances (excluding refrigerators), such as dishwashers, clothes washers, clothes dryers, air conditions, furnaces, and water heaters, shall be offered or installed in all residential dwelling units.
- PDF 4-8 Building Energy Efficiency:** Residential dwellings and non-residential buildings will be constructed so that they achieve 15 percent higher energy efficiency than the applicable standards set forth in the 2008 California Building and Energy Efficiency Standards (Title 24, Part 6 of the California Building Code) or meet the standards in effect at the time of issuance of building permit. The Energy Commission's 2013 Building Energy Efficiency Standards are 25 percent more efficient than the 2008 standards for residential construction and 30 percent more efficient for nonresidential construction. The 2013 Energy Efficiency Standards, which take effect on January 1, 2014, offer builders more efficient windows, insulation, lighting, ventilation systems and other options that would reduce energy consumption in homes and businesses.
- PDF 4-9 Carbon Sequestration:** The 2012 Modified Project incorporates landscaping and a plant palate that will foster carbon sequestration within the Proposed Project Site that is comparable to the landscaping and plant palate that was already incorporated into the 2011 Approved Project.
- PDF 4-10 Softscape Landscaped Areas:** Consistent with the sustainable practices and modern landscaping standards, and consistent with the landscaping used in the 2011 Approved Project, the 2012 Modified Project reduces softscape (e.g., plants/horticultural elements of landscape design) landscaped areas by 28 percent as compared to the default assumption in CalEEMod.

4. Discussion of Checklist and Mitigation Measures

4.8 HAZARDS AND HAZARDOUS MATERIALS

4.8.1 Environmental Setting

Hazardous Materials and Hazardous Wastes

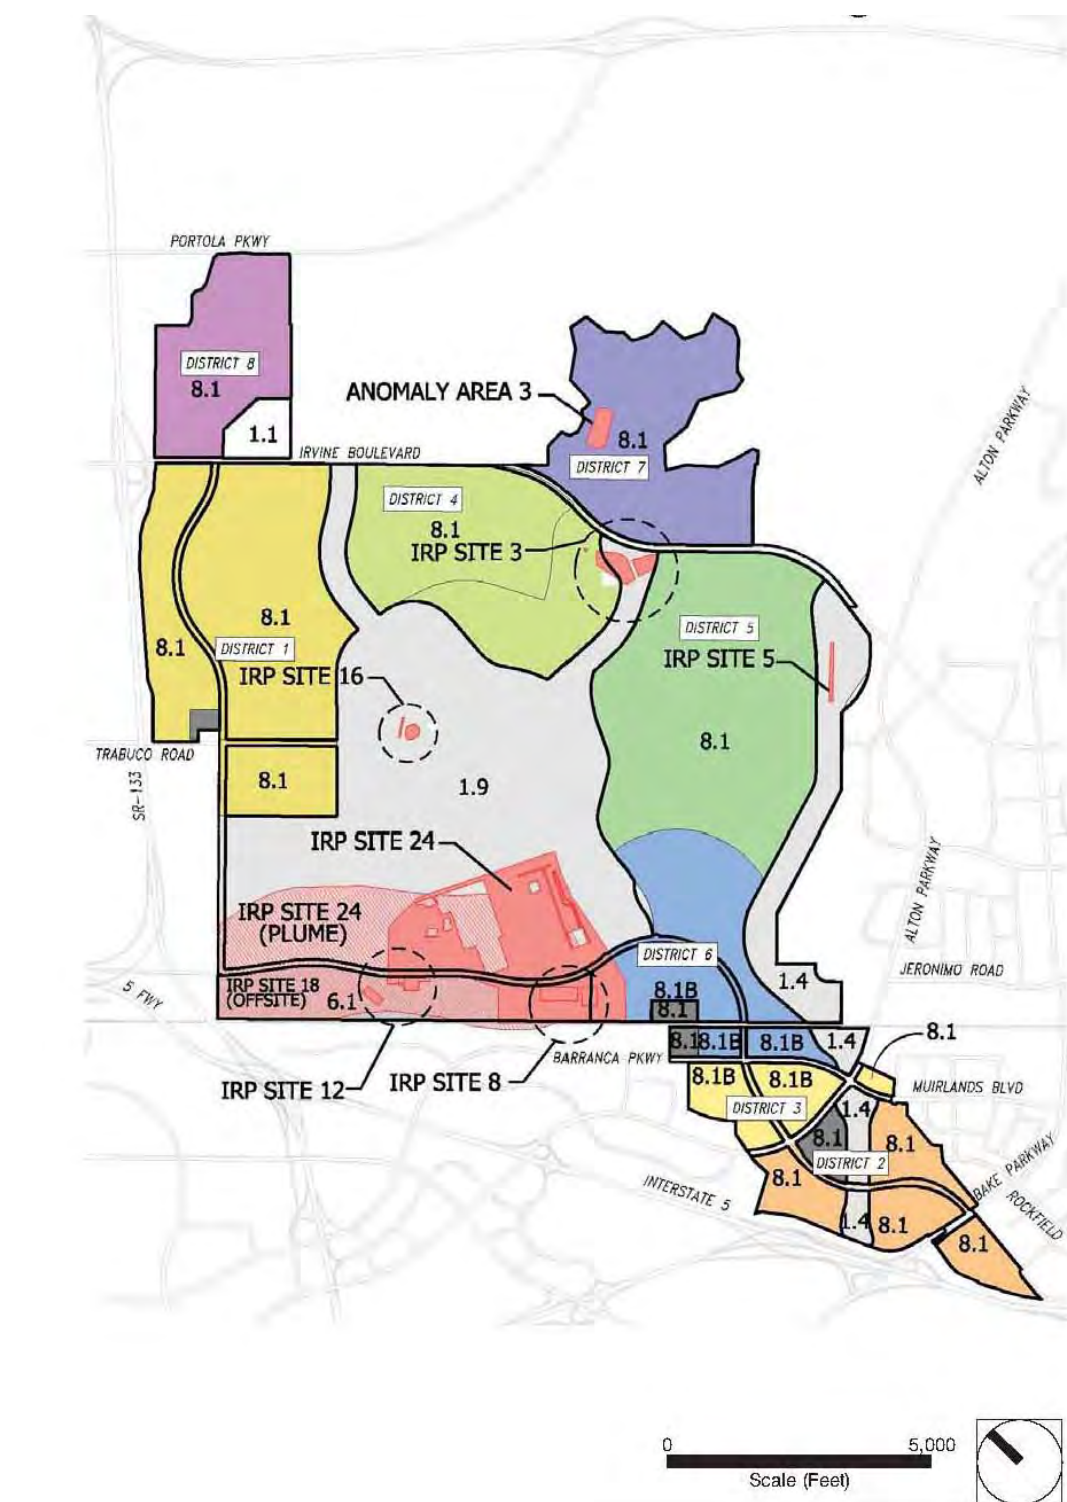

The OCGP FEIR discussed an environmental baseline survey (EBS) that was conducted for the project area. Information was used from the Base Realignment and Closure Business Plan for Marine Corps Air Station (MCAS) El Toro dated May 2002; the EBS dated 1995; and an update to the EBS-April 2003 Draft Final EBS. The 2003 EBS identified "76 potential release locations, all of which require further evaluation for potential releases to the environment and subsequent remediation, if required" (Refer to OCGP FEIR p.5.5-5).

The Installation Restoration Program (IRP) for the former MCAS El Toro was authorized in 1984. The IRP outlined hazardous remediation needs and identified 24 sites (Sites 1-22, 24, and 25) for investigation at the former MCAS El Toro. The IRP sites were originally divided into two categories: No Further Action sites (Table 4.8-1) and Action Required sites (Table 4.8-2). The IRP Sites identified as Action Required sites are depicted on Figure 4.8-1, *Installation Restoration Program Sites*. The Action Required IRP sites that are located within the 688-acre OCGP Improvement Area include sites 5 and 16.

IRP Site 5 (Perimeter Landfill), which covers approximately 1.8 acres, operated between 1955 and the late-1960s as a cut-and-fill disposal facility. Typical of municipal landfills, Site 5 contains a variety of materials. Reportedly, almost any waste generated at former MCAS El Toro may have been disposed at IRP Site 5, including burnable trash; municipal solid waste; cleaning fluids; scrap metals; paint residues; and unspecified fuels, oils, and solvents. Wastes were typically burned in place to reduce volume prior to burial. A Remedial Action Completion Report (RACR) dated August 2012 has been prepared and documents that the landfill has been remediated and is protective of human health and the environment. An Operations and Maintenance/Long-Term Monitoring (LTM) Plan dated November 2010 has been prepared and approved by the Department of Toxic Substances Control. The post-construction LTM activities at IRP Site 5 monitor the effectiveness of the landfill cap, surface-water drainage structures, landfill gas monitoring system, groundwater monitoring network, and site security features.

At IRP Site 16 (Crash Crew Pit No. 2), aviation fuels (JP-5, AVGAS), chlorinated solvents, hydraulic fluid, crankcase oil, white phosphorus, magnesium phosphate, and napalm were burned in unlined pits for fire training from 1972 to 1985. The Draft Remedial Action Completion Report (RACR) prepared for Site 16 documents that the deep vadose zone (from 10 feet below ground surface [bgs] to groundwater, which is present at approximately 170 feet bgs) response action (i.e., monitoring) is complete and No Further Action is required for the deep vadose zone at Site 16. The Draft RACR Report meets the requirements of a Closure Report as specified in the Final Record of Decision (ROD). The Final ROD documented No Further Action for surface and shallow soil (0-10 feet bgs) at IRP Site 16. Based on the results of soil gas monitoring, petroleum corrective actions including soil vapor extraction and MPE remediation, and modeling results, it is unlikely for VOCs to further impact groundwater (due to infiltration) at concentrations exceeding drinking water standards. As a result, it has been recommended that the requirements for positive drainage within the Main Pit on Site 16 be eliminated.

Addendum No. 9 - Modifications to the OCGP Improvement Area

4. Discussion of Checklist and Mitigation Measures

Of the 404 underground storage tanks (USTs) identified at the Base, 357 had been remediated and received findings of "no further action" at the time the OCGP FEIR was prepared. Of the 39 aboveground storage tanks (ASTs) on the property, 36 had been remediated and received findings of "no further action".

Evaluation and remediation of previously identified IRP sites within the project site continues with the resulting changes in the condition of the property largely anticipated in the OCGP FEIR. Subsequent to certification of the OCGP FEIR, the DON completed environmental related findings that support the suitability to transfer (FOST) real property made available through the Base Realignment and Closure process and to support the lease of areas not yet suitable for transfer.⁴ Please see Figure 4.8-1 for Installation Restoration Program (IRP) Locations.

The areas suitable for lease encompassed locations of concern identified in the 1995 and 2003 EBS, and in the OCGP FEIR, where future evaluation and/or actions are ongoing or required. These areas were identified as "carve-outs" in the DON documentation.⁵

Subsequent to certification of the OCGP FEIR, a total of seven FOSTs have documented that all necessary remediation has been completed to protect human health and the environment on approximately 3,478 acres of the former MCAS El Toro. Information concerning remediation is subject to periodic change as additional information is generated from cleanup programs and activities that are being planned for, or are in progress.

Emergency Plans

The OCGP FEIR described the former MCAS El Toro site (PA 51, including former PA 30) as a potential emergency response staging area because of its capacity for processing and storing large quantities of cargo. The Orange County Emergency Plan, which incorporates the statewide standardized emergency management system (SEMS), guides multijurisdictional response to emergency conditions. No substantial change to the description of the setting regarding emergency plans has occurred that would alter the analysis and conclusions of the OCGP FEIR on emergency plans and response.

Wildland Fires

The OCGP FEIR identified high fire hazard areas within open space, undeveloped land northeast of and adjacent to Planning Area 51. The City has no construction records of existing buildings and structures on the property. No substantial change to the description of the setting relative to wild land fires has occurred that would alter the analysis and conclusions of the OCGP FEIR regarding wild land fires.

⁴ U.S. Department of the Navy, 2004. *Final Finding of Suitability to Transfer, Parcel IV and Portions of Parcels I, II, and III, Former Marine Corps Air Station, El Taro, California, July 2004; Final Finding of Suitability to Lease for Carve-outs Within Parcels I, II, and III, Former Marine Corps Air Station, El Taro, California, July 2004.*

⁵ U.S. Department of the Navy, 2004a. *Final Finding of Suitability to Lease for Carve-outs within Parcels I, II, and III, Former Marine Corps Air Station, El Taro, California, July 2004.*

4. Discussion of Checklist and Mitigation Measures

4.8.2 Impacts Identified in the OCGP FEIR

Hazardous Materials and Wastes

The OCGP FEIR identified no significant impacts associated with the No Further Action IRP sites, which are listed in Table 4.8-1. Table 4.8-2 identifies each Action Required IRP site and its location relative to the adopted Overlay Plan. The OCGP FEIR disclosed the following environmental consequences of the adopted Overlay Plan as significant impacts:

- Construction activities involving demolition and possible substantial remodeling of existing structures in the project area as the project area develops could result in the disturbance of structures and soils containing asbestos-containing building materials (ACM) and lead-based paint.
- IRP site 24 is located in the 6.1 Institutional and 1.9 Orange County Great Park zoning districts. The site may be conveyed with temporary restrictions on use that are not appropriate for transportation facility use. This is considered a significant impact.
- Future uses of IRP site 3 may be potentially constrained by the implementation of institutional controls.
- IRP site 16 (Crash Crew Pit No.2) is located in the 1.9 Orange County Great Park zoning district. The site may be conveyed with temporary restrictions on use that are not appropriate for recreational land uses.

Table 4.8-1. No Further Action IRP Sites and Zoning

IRP Site	IRP Designation	Adopted Overlay Plan Zoning District
4	Ferrocene Spill Area	8.1 Trails and Transit Oriented District
6	Drop Tank Drainage Area No. 1	8.1 Trails and Transit Oriented District
7	Drop Tank Drainage Area No. 2	1.9 Orange County Great Park
9	Crash Crew Pit No. 1	1.9 Orange County Great Park
10	Petroleum Disposal Area	1.9 Orange County Great Park
13	Oil Change Area	1.9 Orange County Great Park
14	Battery Acid Disposal Area	1.9 Orange County Great Park
15	Suspended Fuel Tanks	1.9 Orange County Great Park
19	Air Craft Expeditionary Refueling	8.1 Trails and Transit Oriented District
20	Hobby Shop	8.1 Trails and Transit Oriented District
21	Materials Management Group	6.1 Institutional
22	Tactical Air Fuel Dispensing System	1.9 Orange County Great Park

Source: OCGP FEIR, Table 5.5-4, p. 5.5-22; SEMA Associates (June 7, 2006) (rev June 2008).

Emergency Plans

The OCGP FEIR determined the Overlay Plan would not be expected to interfere with emergency response and evacuation plans on the basis that other sites within Orange County are already designated as emergency staging areas and portions of the OCGP would remain available to non-aviation emergency response equipment. Accordingly, the OCGP FEIR concluded that the adopted Overlay Plan would not result in a significant impact related to emergency response and evacuation plans.

Wildland Fires

The OCGP FEIR concluded that the Habitat Reserve, Wildlife Corridor, and Recreational areas in the northeastern portion of Planning Area 51 would be exposed to the highest level of fire risk from wildland fires under the adopted Overlay Plan, and that reuse of existing buildings require inspection for conformance to fire life safety code requirements. The OCGP FEIR identified the wild land fire impacts as potentially significant.

4.8.3 Impacts Associated with the Modifications to the OCGP Improvement Area

As previously mentioned, the Action Required IRP sites that are located within the 688-acre OCGP Improvement Area include IRP Sites 5 and 16.

Issues relating to IRP Site 5 (Perimeter Road Landfill), including settling, are not expected to constraint proposed land uses within the proposed Project site. The remediation for this site (which is within the Wildlife Corridor Feature area), consisting of the installation of a synthetic liner and implementation of institutional controls, has been completed. This site has been capped and can accommodate shallow-rooted plants. The proposed native grasses for the Wildlife Corridor Feature meet the “shallow-rooted” restriction. Based on the DON’s Operations and Monitoring/Long Term Monitoring Plan, the Wildlife

4. Discussion of Checklist and Mitigation Measures

Corridor Feature is an acceptable use of the capped landfill, and all land use restrictions associated with this area can, and will be followed in developing the Wildlife Corridor Feature. The planting restrictions apply only to the footprint of the capped landfill (less than 10 acres), and would not affect the overall flora and fauna of the Wildlife Corridor Feature. Implementation of the institutional controls (ICs) would reduce any potential exposure from the IRP Site 5, and therefore, would have a less than significant impact.

IRP Site 16 (Crash Crew Pit No. 2) consisted of three unlined fire fighter training pits. Due to the potential risks associated with the existing groundwater contamination, the DON may restrict use of the site until the groundwater is remediated to an appropriate risk level, at which time the site would be released for unrestricted use. This remediation process will likely take multiple years to complete, and during this time various ICs could be implemented to limit certain activities and unauthorized access to the site. Long-term monitoring of the ICs is conducted annually by the City of Irvine and the developer in accordance with the Property Deed and "Covenant to Restrict the Use of Property". Additionally, site inspections were conducted by the Navy's consultant in June and December 2012 in accordance with the Final Remedial Design. Based on the results from the site inspections and maintenance activities, the goals of maintaining positive site drainage, preventing exposure to contaminants at the site, and maintaining the integrity of monitoring equipment continue to be met (Trevet, October 2013). Implementation of the ICs and maintenance activities would reduce any potential exposure from IRP Site 16 such that the proposed Project would have a less than significant impact.

The proposed Project includes modifications to the 688-acre OCGP Improvement Area within the same land area as depicted in the OCGP FEIR, consisting of reducing the number of sports courts; expanding passive recreational area; relocating some of the Improvement Area components to further enhance the visibility, access and efficiency of the existing features, and assessing adequacy of the parking plan. Therefore, the OCGP FEIR adequately described the nature and severity of the environmental effects of the proposed Modifications to the OCGP Improvement Area, the subject of this Addendum, on hazardous materials and wastes. No new land uses are proposed that would create a significant hazard to the public or the environment; involve routine transport or use of hazardous materials; emit hazardous emissions; expose people to risks involving wildland fires, and interfere with an adopted emergency response plan. The modifications, while significantly reducing the number of sports facilities, further enhance the use and efficiency of the existing features. Therefore, the proposed Project would not result in impacts related to hazards and hazardous materials within the Project site and would not require any changes to the OCGP FEIR.

Hazardous Materials and Wastes

As previously mentioned, a total of seven FOSTs documented that all necessary remediation has been completed to protect human health and the environment on approximately 3,478 acres of the former MCAS El Toro. Overall, the proposed Modification to the OCGP Improvement Area would not change the OCGP FEIR conclusions, and with Mitigation Measures HH1, HH2, HH5, and HH6, the Project would result in less than significant impacts related to hazardous materials and wastes.

Emergency Plans

Like the Overlay Plan, the implementation of the proposed Modification to the OCGP Improvement Area would not be expected to interfere with emergency response and evacuation plans on the base since

4. Discussion of Checklist and Mitigation Measures

other sites within Orange County are already designated emergency staging areas and portions of the OCGP would remain available to emergency response equipment. Accordingly, the proposed Modifications to the OCGP Improvement Area would not change the OCGP FEIR conclusions; the proposed Project would not result in a significant impact related to emergency response and evacuation plans.

Wildland Fires

The Wildlife Corridor Feature within the 688-acre OCGP Improvement Area would be exposed to the highest level of fire risk from wildland fires because this area is adjacent to the NCCP Reserve which is currently defined as having high risk for wildland fires under the updated Fire Hazard Map. Although not considered a high wildland fire hazard area, the Wildlife Corridor Feature would be subject to fuel modification requirements within its boundary.

As the potential significant wildland fire impacts of the Modifications to the OCGP Improvement Area are similar to those disclosed in the OCGP FEIR, the Modifications to the OCGP Improvement Area would not substantially change the findings and conclusions of the OCGP FEIR regarding wildland fires.

Major FEIR Revisions Not Required. Based on the foregoing analysis and information, there is no evidence that the changes to the project require a major change to the OCGP FEIR. The proposed Modifications to the OCGP Improvement Area, which does not include any major change to park development areas identified in the approved OCGP Master Plan, will not result in any new significant environmental impact nor is there a substantial increase in the severity of impacts from that described in the OCGP FEIR.

No Substantial Change in Circumstances Requiring Major FEIR Revisions. There is no information in the Modifications to the OCGP Improvement Area or otherwise available indicating substantial changes in circumstances that would require major changes to the OCGP FEIR.

No New Information of Substantial Importance Showing Greater Significant Effects Than Previous FEIR. All available relevant information has been analyzed, and there is no new information of substantial importance, which was unknown and could not have been known with the exercise of reasonable diligence at the time the OCGP FEIR was approved, augmented, and/or updated, indicating that the proposed Project will have one or more significant effects not discussed in the OCGP FEIR or result in a substantial increase in the severity of previously identified effects.

No New Information of Substantial Importance Showing Ability to Reduce Significant Effects in Previous FEIR. All available relevant information has been analyzed, and there is no new information of substantial importance, which was unknown and could not have been known with the exercise of reasonable diligence at the time the OCGP FEIR was approved, augmented, and/or updated, indicating that: (1) mitigation measures or alternatives previously found not to be feasible would in fact be feasible, and would substantially reduce one or more significant effects of the proposed Project, but the project proponent declines to adopt the mitigation measures or alternatives; or (2) mitigation measures or alternatives that are considerably different from those analyzed in the previous FEIR would substantially reduce one or more significant effects on the environment, but the project proponent declines to adopt the mitigation measures or alternatives. There are no alternatives to the proposed Project or additional

4. Discussion of Checklist and Mitigation Measures

mitigation measures that would substantially reduce one or more of the significant biological effects identified in and considered by the OCGP FEIR.

4.8.4 Mitigation from the OCGP FEIR and Applicability to the Modifications to the OCGP Improvement Area

The OCGP FEIR identified six mitigation measures to reduce the effects of the adopted Overlay Plan on public health and safety, specifically environmental effects associated with hazardous materials and waste, emergency response, and wildland fires, to a level less than significant. However, the mitigation measures were modified and new measures were adopted in the SEIR. An explanation for the new mitigation measures is set forth below. In addition, SSEIR proposed to make two minor modifications to Mitigation Measures HH2 and HH3 adopted by the City for the 2011 Approved Project. The modification to HH2 was made to update the reference to the SSEIR. The modification to HH3 was made to note that the high fire hazard maps are occasionally updated and does not affect the substance of the mitigation measure.

The certified OCGP FEIR's Mitigation Measure HH1 was updated because much of the abatement it required has been completed. In addition, many of its requirements are triggered upon the transfer of the property from the Navy to the City of Irvine, and that transfer has already occurred for a substantial portion of the property associated with the Modified Project. The new Mitigation Measure HH1 is provided below:

Of the Mitigation Measures listed below, applicable measures will be incorporated into the proposed Project upon project implementation.

HH1 For any remaining structures known to contain asbestos-containing materials ("ACMs") that will be renovated and/or demolished, Heritage Fields shall ensure that all asbestos is removed and disposed of in accordance with applicable federal, state and local regulatory requirements.

Prior to occupancy, renovation or demolition of any remaining structures constructed before October 1988, and in which the presence of ACMs is unknown, an asbestos survey shall be conducted by Heritage Fields. This requirement can be waived if an architect or project engineer responsible for the construction of the structure or an accredited asbestos inspector signs a statement that no ACM was specified as a building materials, and to the best of their knowledge, no ACMs were used as a building materials, if the asbestos survey identifies ACMs, the applicant shall ensure that all asbestos is removed and disposed of in accordance with applicable federal, state and local regulatory requirements.

Any existing structures in which ACMs have been identified and which will remain in use shall be addressed in an Operation and Maintenance Plan and must be managed in accordance with applicable laws.

Any renovation and/or lead-based paint ("LBP") abatement activities on residential units at former MCAS El Toro shall be conducted in accordance with all applicable federal, state and local regulatory requirements.

4. Discussion of Checklist and Mitigation Measures

The certified OCGP FEIR's Mitigation Measure HH2 required updating because its requirements were triggered upon the transfer of the property from the Navy to the City of Irvine, and that transfer has already occurred for a substantial portion of the property associated with the Modified Project. In addition, since the certified OCGP FEIR was prepared, FOSTs 4, 5, 6, and 7 have been issued and each of them specifies in detail the nature of the restrictions and institutional controls that must be implemented. The new Mitigation Measure HH2 is provided below:

- HH2** The portions of the Proposed Project Site located on the active Installation Restoration Program ("IRP") Sites listed in Table 5.5-2, *Action Required IRP Sites and Zoning – 2012 Modified Project*, of the DSSEIR for the 2012 Modified Project shall be used only in accordance with the requirements of the applicable Final Finding of Suitability for Transfer or Finding of Suitability to Lease, including in strict compliance with all lease restrictions (such as restrictions against soil or groundwater disturbance without approval from the Department of the Navy and regulators) and all institutional controls (such as restrictions against disturbing the integrity of physical remedial components like caps or groundwater treatment systems and other restrictions imposed by the Department of the Navy).
- HH3** The Community Development Department, in coordination with the Orange County Fire Authority (OCFA), will be responsible for review of all development plans, which would include evaluation of very high fire severity zones, special fire protection plans, and any requirements for fuel modification zones. Projects potentially impacted by wild land fire hazards will be subject to OCFA Guidelines for "Development Within and Exclusion from Very High Fire Severity Zones" and "Fuel Modification Plans and Maintenance." Additionally, all demolition, renovation, and construction activities in the project area will be subject to review by OCFA to ensure adequate fire protection, water flow, emergency access, design features, etc., according to the standards of the Uniform Fire Code and the California Fire Code. Due to the implementation of these standard fire protection procedures and based on the revised Fire Hazard Maps, the 2012 Modified Project is not anticipated to result in significant short- or long-term adverse impacts related to fire hazards.
- HH4** Prior to issuance of occupancy permits of any existing structure at the former MCAS El Toro, a fire life-safety evaluation of the structure including recommendations for improvements required for compliance with current Building Codes for use of existing structures adopted by the City of Irvine and plans for any required improvements shall be submitted to the Chief Building Official for review and approval.
- HH5** Prior to the issuance of a grading permit, the applicant shall prepare and the Director of Community Development shall approve a protocol plan (including but not limited to worker training, health and safety precautions, additional testing requirements, and emergency notification procedures) in the event that unknown hazardous materials are discovered during grading, construction, and/or related development activities. Additionally, said protocol plan will be revised should the discovery of previously unknown hazardous materials be made during any of the above mentioned development activities. The applicant and/or property owner that discovers contamination due to past military operations not previously identified by the Department of Navy ("DON") shall be responsible for notifying the DON, appropriate regulatory agencies, and the Director of Community Development of the City of Irvine in a timely manner.

4. Discussion of Checklist and Mitigation Measures

Additionally, said Protocol Plan shall be revised should the discovery of previously unknown hazardous materials be made during any of the above mentioned development activities.

- HH6** The City of Irvine shall develop and maintain the location and status, as well as other pertinent information, of all monitoring wells on the former MCAS El Toro in a geographic information systems database ("GIS"). The City will review all permit applications on the former air station for monitoring well locations that may be affected by a permit, and require applicants to maintain appropriate access. Access to monitoring wells will be limited to authorized personnel.

Additionally, the SSEIR identified the following measures as existing PPP that apply to the proposed Project and will help reduce or avoid potential hazards and hazardous materials impacts:

Of the PPPs listed below, applicable measures will be incorporated into the proposed Project upon project implementation.

- PPP 5-1** If any underground storage tanks ("USTs") are encountered during site grading and excavation activities, they shall be removed in accordance with the existing standards and regulations of, and oversight by, the Orange County Health Care Agency ("OCHCA"), based on compliance authority granted through the California Code of Regulations, Title 23, Division 3, Chapter 16, Underground Tank Regulations. The process for UST removal is detailed in the OCHCA's "Underground Storage Tanks: The Basics." Soil samples from areas where storage tanks have been removed or where soil contamination is suspected shall be analyzed for hydrocarbons including gasoline and diesel in accordance with procedures set forth by OCHCA. If hydrocarbons are identified in the soil, the appropriate response/remedial measures will be implemented as directed by OCHCA with support review from the Regional Water Quality Control Board until all specified requirements are satisfied and a Tank Closure Letter is issued. Any aboveground storage tank ("AST") in existence at the commencement of site development shall be removed in accordance with all applicable regulations under the oversight of Orange County Fire Authority. Compliance requirements relative to the removal/closure of storage tanks are set forth through the California Health and Safety Code, Sections 25280 through 25299.
- PPP 5-2** During demolition, grading, and excavation, workers shall comply with the requirements of Title 8 of the California Code of Regulations, Section 1532.1, which provides for exposure limits, exposure monitoring, respiratory protection, and good working practice by workers exposed to lead. Lead-contaminated debris and other wastes shall be managed and disposed of in accordance with the applicable provision(s) of the California Health and Safety Code.
- PPP 5-3** Prior to approval of a conditional use permit, project applicants shall prepare a Fire Master Plan for submittal to the Orange County Fire Authority ("OCFA") consistent with OCFA Guideline B-09 (Fire Master Plans for Commercial and Residential Development).
- PPP 5-4** Federal law requires compliance with Rule 29 of the Code of Federal Regulations ("CFR") Part 1926. Prior to site demolition activities, building materials shall be carefully assessed for the presence of lead-based paint, and its removal, where necessary, must comply with state and federal regulations, including Occupational Safety and Health Administration ("OSHA") 29 CFR Part 1926. The OSHA rule establishes standards for occupational health and environmental

4. Discussion of Checklist and Mitigation Measures

controls for lead exposure. The standard also includes requirements addressing exposure assessment, methods of compliance, respiratory protection, protective clothing and equipment, hygiene facilities and practices, medical surveillance, medical removal protection, employee information and training, signs, recordkeeping, and observation of monitoring. Furthermore, the requirements of California Code of Regulations, Title 17, Division 1, Chapter 8, identify procedures that must be followed for accreditation, certification, and work practices for lead-based paint and lead hazards. Section 36100 thereof specifically sets forth requirements for lead-based paint abatement in public and residential buildings.

- PPP 5-5** Prior to site demolition activities, building materials must be carefully assessed for the presence of asbestos-containing materials ("ACM"), and removal of this material, where necessary, must comply with state and federal regulations, including SCAQMD Rule 1403, which specifies work practices with the goal of minimizing asbestos emissions during building demolition and renovation activities, including the removal and associated disturbance of ACMs. The requirements for demolition and renovation activities include asbestos surveying; notification; ACM removal procedures and time schedules; ACM handling and cleanup procedures; and storage, disposal, and landfill disposal requirements for asbestos-containing waste materials.
- PPP 5-6** During site decommissioning and demolition activities, hazardous wastes must be managed in accordance with the requirements of Title 22, Division 4.5 of the California Code of Regulations. Title 22 sets forth the requirements with which hazardous-waste generators, transporters, and owners or operators of treatment, storage, or disposal facilities must comply. These regulations include the requirements for packaging, storage, labeling, reporting, and general management of hazardous waste prior to shipment. In addition, the regulations identify standards applicable to transporters of hazardous waste such as the requirements for transporting shipments of hazardous waste, manifesting, vehicle registration, and emergency accidental discharges during transportation.
- PPP 5-7** During demolition, grading, and excavation, workers shall comply with the requirements of Title 8 of the California Code of Regulations, Section 1529, which provides for exposure limits, exposure monitoring, respiratory protection, and good working practices by workers exposed to asbestos. Asbestos-contaminated debris and other wastes shall be managed and disposed of in accordance with the applicable provision(s) of the California Health and Safety Code.
- PPP 5-8** Evidence of soil and/or groundwater contamination (e.g., chemical odors, staining) unrelated to above/underground storage tank releases may be encountered during site development. The appropriate agency (e.g., OCHCA, DTSC, or the RWQCB) shall be notified if these conditions are encountered during construction or grading activities. With their oversight, an environmental site assessment shall be completed and a determination shall be made as to whether cleanup is required. Cleanup activities are required to be consistent with all applicable federal, State and local rules, regulations, and laws. A cleanup would not be considered complete until confirmatory samples of soil and/or groundwater reveal levels of contamination below the standards established by the oversight agency. Alternatively, a risk assessment may be prepared for the site to determine that there are no human or environmental risks associated with leaving contamination below specific levels in place. Construction in the impacted area

4. Discussion of Checklist and Mitigation Measures

shall not proceed until a “no further action” clearance letter or similar determination is issued by the oversight agency, or until a land use covenant is implemented.

4.9 HYDROLOGY AND WATER QUALITY

4.9.1 Environmental Setting

The OCGP FEIR describes the project site as within the San Diego Creek watershed, which includes the San Diego Creek, Peters Canyon Channel, and the tributaries to these water courses. The major drainage channels that traverse the site (PA 51) are the Marshburn Channel, Bee Canyon Channel, Agua Chinon Channel, and Borrego Canyon Channel.

San Diego Creek and Upper Newport Bay are listed as impaired water bodies under Section 303(d) of the Clean Water Act. Accordingly, Total Maximum Daily Load (TMDL) for pollutants that have impaired these water bodies has been established and was included in the OCGP FEIR (OCGP FEIR Table 5.7-2). The OCGP FEIR also noted that the County of Orange and the City of Irvine hold a Nationwide Pollution Discharge Elimination System (NPDES) permit for the storm drain systems, and that the State has issued a NPDES general permit relating to construction activities on sites over five acres in the area. Lastly, the flood control improvements associated with the SR-133 toll road were noted in the OCGP FEIR as having reduced the 100-year flood zone north and west of the property.

4.9.2 Impacts Identified in the OCGP FEIR

The OCGP FEIR identified several significant impacts on hydrology and water quality associated with future development under the adopted Overlay Plan before mitigation. First, grading and excavation activities required for future development could result in the exposure of bare soils to both wind- and water-related erosion and associated significant water quality impacts (specifically, a violation of water quality standards or waste discharge requirements). Compliance with City grading and water quality regulations, including the NPDES discharge permitting requirements and preparation of a Storm Water Pollution Prevention Plan (SWPPP) and a Water Quality Management Plan (WQMP), are the primary means of controlling the potential impacts of grading and excavation activities. These City requirements, which are described in mitigation measures H/WQ1 and H/WQ2, will reduce the impact to a less-than significant level.

According to the OCGP FEIR, the existing drainage patterns and stream courses would not be substantially altered by future development under the adopted Overlay Plan. In addition, the potential for inundation is reduced by improvements to upstream flood-control facilities. Without project-related flood-control facilities, the rate or amount of surface runoff due to new development would result in flooding on- and off-site, depending on the nature of the specific development. Although this impact was identified as significant, the effect of increased runoff would be reduced to a less-than-significant level through preparation and implementation of hydraulic studies, recommendations for each specific development and the construction of flood-control improvements commensurate with each specific development (Mitigation Measure H/WQ3).

The impact analysis for the Overlay Plan assumed development of the land use patterns created by the zoning designations for the Overlay Plan area and a backbone storm drain system. The storm drain

4. Discussion of Checklist and Mitigation Measures

system took into consideration and included improvements identified in the San Diego Creek Flood Control Master Plan. The drainage plan for the Overlay Plan area included improvements to the major drainages, including Marshburn Channel, Bee Canyon Channel, Agua Chinon Channel, and the Borrego Channel, the Wildlife Corridor and Serrano Creek, and San Diego Creek, as described in the OCGP FEIR and addenda.

While conceptually defined in the OCGP FEIR, the foregoing area-wide drainage and flood control facility system has since been undergoing increasingly more definitive design engineering refinement. The latest formal expression of these system enhancements is memorialized in the following documents: Master Plan of Drainage, Fuscoe Engineering February 23, 2007,⁶ Orange County Great Park - Hydrology/Hydraulic Report, Fuscoe Engineering June 12, 2007 (collectively, Fuscoe Reports); PAs 30 and 51 Bee Canyon, Agua Chinon, Borrego, Serrano and Upper San Diego Creek Update, RBF Consulting February 27, 2008, and Planning Area 51 Marshburn Watershed Update, RBF Consulting March 14, 2008 (collectively, RBF Reports). These reports refine the drainage control system components described in the OCGP FEIR. The on-site channels will continue to drain the project site under existing conditions. Additional backbone storm drain facilities will be designed to accommodate the changes in the land use surface runoff within the Great Park Neighborhoods development. The post development hydrology was analyzed per the Orange County Hydrology Manual for a 100-year peak storm design event.

OCGP FEIR Mitigation Measure H/WQ3 states that prior to approval of the first tentative tract or parcel map in the project area, detailed hydrologic and hydraulic analysis shall be conducted. Studies and analyses shall be prepared in accordance with Orange County Flood Control District (OCFCD) methodologies and standards and the Flood Control Master Plan for San Diego Creek, as well as any additional guidelines in effect at the time of project design. Recommendations contained in the hydrology studies and/or hydraulic analysis to address drainage/flooding issues related to proposed development shall be implemented. In compliance with the mitigation measure, the Fuscoe Reports, and RBF Reports were prepared.

4.9.3 Impacts Associated with Modifications to the OCGP Improvement Area

The Modifications to the OCGP Improvement Area encompass the same land area proposed for park development as depicted in the OCGP FEIR. The proposed Project, consisting of modifications to the OCGP Improvement Area reducing the number of sports courts, expanding passive recreational area, relocating some of the Improvement Area components to optimize visibility, access and efficiency, and assessing adequacy of parking plan, does not propose any new uses or facilities that would violate water quality standards or waste discharge requirements; substantially alter the existing drainage pattern of the site; deplete groundwater supplies; create or contribute runoff water; or create risks involving flooding. Therefore, the OCGP FEIR adequately describes the nature and severity of the environmental effects of OCGP Master Plan and its proposed Modifications to the OCGP Improvement Area, the subject of this Addendum, on hydrology and water quality.

Just as the area-wide and off-site drainage and flood control system facility components have undergone continued design engineering refinement, so has the concurrent refinement of on-site drainage and flood

⁶ This report was submitted to the City of Irvine as a part of the Master Subdivision Map application.

4. Discussion of Checklist and Mitigation Measures

control systems. However, those refinements do not alter the environmental conclusions in the OCGP FEIR and this Addendum.

Major FEIR Revisions Not Required. Based on the foregoing analysis and information, there is no evidence that the changes to the project require a major change to the OCGP FEIR. The proposed Modifications to the OCGP Improvement Area, which does not include any major change to park development areas identified in the approved OCGP Master Plan, will not result in any new significant environmental impact nor is there a substantial increase in the severity of impacts from that described in the OCGP FEIR.

No Substantial Change in Circumstances Requiring Major FEIR Revisions. There is no information in the OCGP Modifications to Improvement Area or otherwise available indicating substantial changes in circumstances that would require major changes to the OCGP FEIR.

No New Information of Substantial Importance Showing Greater Significant Effects Than Previous FEIR. All available relevant information has been analyzed, and there is no new information of substantial importance, which was unknown and could not have been known with the exercise of reasonable diligence at the time the OCGP FEIR was approved, augmented, and/or updated, indicating that the proposed Project will have one or more significant effects not discussed in the OCGP FEIR or result in a substantial increase in the severity of previously identified effects.

No New Information of Substantial Importance Showing Ability to Reduce Significant Effects in Previous FEIR. All available relevant information has been analyzed, and there is no new information of substantial importance, which was unknown and could not have been known with the exercise of reasonable diligence at the time the OCGP FEIR was approved, augmented, and/or updated, indicating that: (1) mitigation measures or alternatives previously found not to be feasible would in fact be feasible, and would substantially reduce one or more significant effects of the proposed Project, but the project proponent declines to adopt the mitigation measures or alternatives; or (2) mitigation measures or alternatives that are considerably different from those analyzed in the previous FEIR would substantially reduce one or more significant effects on the environment, but the project proponent declines to adopt the mitigation measures or alternatives. There are no alternatives to the proposed Project or additional mitigation measures that would substantially reduce one or more of the significant effects on hydrology and/or water quality identified in and considered by the OCGP FEIR.

4.9.4 Mitigation from the OCGP FEIR and Applicability to the Modifications to the OCGP Improvement Area

The OCGP FEIR identified four mitigation measures to reduce the effects of the project on hydrology and water quality. All of the mitigation measures are applicable to the proposed Project and would be carried forward to future development of the project site. Implementation of Mitigation Measures H/WQ 1 through H/WQ 4 would reduce project impacts to a less than significant level. The mitigation measures were modified in the SEIR.

Of the Mitigation Measures listed below, applicable measures will be incorporated into the proposed Project upon project implementation.

4. Discussion of Checklist and Mitigation Measures

H/WQ1 Prior to issuance of a grading permit, the applicant shall provide evidence that the development of the project area shall comply with City of Irvine adopted Grading and Water Quality Ordinances to ensure that the potential for soil erosion is minimized on a project-by-project basis. Specifically, the NPDES discharge permitting requirements to which the City is obligated will ensure that construction activities reduce, to the maximum extent feasible, the water quality impacts of construction activities. The NPDES permit guidance states that "industrial/commercial construction operations that result in a disturbance of one acre or more of total land area ... and residential construction sites that result in the disturbance of five acres or more ... shall be required to develop and implement BMPs ... to control erosion and siltation and contaminated runoff from the construction sites." Note: In March 2003 this provision will apply to residential construction sites that result in the disturbance of one acre or more.

The City's standard conditions of approval indicate that a Storm Water Pollution Prevention Plan (SWPPP) shall be prepared prior to the approval of grading permits for any project site in order to reduce sedimentation and erosion. The SWPPP shall include the adoption of erosion and sediment control practices such as desilting basins and construction site chemical control management measures.

Additionally, prior to the issuance of a grading permit, project applicants must submit, and the Director of Community Development or designee must have approved, a Water Quality Management Plan (WQMP). The WQMP must identify the Best Management Practices (BMPs) that will be used on the site to control predictable pollutant runoff after the site is occupied. Ongoing operations after construction would be subject to the Countywide Municipal NPDES Stormwater Permit, for which the City is a Co-Permittee. This WQMP shall identify, at a minimum, the routine, structural, and non-structural measures specified in the Countywide NPDES DAMP Appendix which are applicable to a project, the assignment of long-term maintenance responsibilities (specifying the developer, parcel owner, maintenance association, lessee, etc.), and shall reference the location(s) of structural BMPs.

Also in accordance with standard City project permitting and approval procedures, Notices of Intent (NOI) for coverage of projects under the General Construction Activity Storm Water Runoff Permit will be submitted to the State Water Resources Control Board prior to issuance of grading permits in the project area. This requirement will be met to the satisfaction of the Director of Community Development of any disturbance of one acre or more of soil in the project area. Also in force during the period of construction would be the General Dewatering NPDES permit of the Santa Ana RWQCB, as well as the provisions of the Countywide Permit.

The Mitigation Measures will be implemented in accordance with local and State regulatory requirements. As future projects are planned and designed in the project area, specific BMPs and other water quality control methods will be utilized to reduce water quality degradation in the Newport Bay watershed. Future projects in the proposed project area will acknowledge and implement those additional requirements that may be imposed by RWQCB in the future. Compliance with these measures shall be verified by the Community Development Department.

4. Discussion of Checklist and Mitigation Measures

H/WQ2 Prior to issuance of a grading permit, evidence (e.g., in the form of a construction management plan) shall be provided that demonstrates that all stormwater runoff and dewatering discharges from the project area shall be managed to the maximum extent practicable or treated as appropriate to comply with water quality requirements identified in the Santa Ana Regional Water Quality Control Board Basin Plan, including Total Maximum Daily Load (TMDL) Implementation Plan adopted for this watershed.

H/WQ3 Prior to approval of the first tentative tract or parcel map in the project area, detailed hydrologic and hydraulic analysis shall be conducted. Studies and analysis shall be prepared in accordance with OCFCD methodologies and standards and the Flood Control Master Plan for San Diego Creek, as well as any additional guidelines in effect at the time of project design. Recommendations contained in the hydrology studies and/or hydraulic analysis to address drainage/flooding issues related to proposed development shall be implemented. Compliance with this measure shall be verified by the Community Development Department.

H/WQ4 Prior to issuance of a building permit for any unit within the 100-year floodplain, developers with property located in the newly delineated 100-year floodplain shall be required to construct such improvements as necessary to remove the property from the 100-year floodplain. Additionally, the developer shall prepare a Letter of Map Revision (LOMR) request to have the FIRMS revised to remove the development areas from the 100-year floodplain upon completion of the approved flood control facilities. The LOMR request shall be filed upon completion of design of the flood control improvements to contain or redirect the 100-year flood flows away from the property.

After the improvements are constructed, Record Drawings and a maintenance agreement with, or letter from, a public agency shall be submitted to FEMA to complete the LOMR process.

Additionally, the SSEIR identified the following measures as existing PPP that apply to the proposed Project and will help reduce or avoid potential hydrology and water quality impacts:

Of the PPPs listed below, applicable measures will be incorporated into the proposed Project upon project implementation.

PPP 6-1 Prior to the issuance of a precise grading permit, the applicant shall submit a hydrology and hydraulic analysis of the site. The analysis shall be prepared by a professional civil engineer versed in flood control analysis and shall include the following information and analysis (Standard Condition A.6):

- a. Hydrology/hydraulic analysis of 100-year surface water elevation at the project site to determine building elevation or flood proofing elevation.
- b. Analysis of existing and post-development peak 100-year storm flow rates, including mitigation measures to reduce peak flows to existing conditions.
- c. An analysis demonstrating that the volume of water ponded on the site and stored underground in the drainage system outside of the building envelope in the proposed

4. Discussion of Checklist and Mitigation Measures

condition is greater than or equal to the corresponding volume in the existing condition. The water surface used to determine the ponded volume shall be based on the water surface in the major flood control facility that the site is tributary to.

PPP 6-2 Prior to the issuance of a precise grading permit, the applicant shall submit a groundwater survey of the site. The analysis shall be prepared by a geotechnical engineer versed in groundwater analysis and shall include the following information and analysis (Standard Condition A.7):

- a. Potential for perched groundwater intrusion into the shallow groundwater zone upon buildout.
- b. Analysis for relief of groundwater buildup and properties of soil materials on-site.
- c. Impact of groundwater potential on building and structural foundations.
- d. Proposed mitigation to avoid potential for groundwater intrusion within five feet of the bottom of the footings.

PPP 6-3 This project will result in soil disturbance of one or more acres of land that has not been addressed by an underlying subdivision map. Prior to the issuance of preliminary or precise grading permits, the applicant shall provide the City Engineer with evidence that a Notice of Intent (NOI) and relevant Permit Registration Documents have been filed with the State Water Resources Control Board and that a Waste Discharge Identification ("WDID") Number is issued. Such evidence shall consist of a copy of the NOI Receipt letter with WDID retrieved from the State Water Resources Control Board Stormwater Multi-Application and Report Tracking System (SMARTS) website or the Regional Water Quality Control Board, or a letter from either agency stating that the NOI has been filed (Standard Condition A.10).

PPP 6-4 Prior to the issuance of precise grading permits, the applicant shall submit, and the Director of Community Development shall have approved, a project water quality management plan (WQMP). The WQMP shall identify the best management practices that will be used on the site to control predictable pollutant runoff (Standard Condition A.13).

4.10 LAND USE AND PLANNING

4.10.1 Environmental Setting

The OCGP FEIR described the existing and former land uses in PA 51, including former PA 31, and other areas adjoining and surrounding these planning areas. Subsequent to the City's approval of the General Plan Amendment and Zone Change for the Overlay Plan, DON initiated an auction process for the sale of the former MCAS El Toro property. To facilitate the transfer, the property was divided and presented to prospective buyers as four distinct parcels. Interested parties were invited to bid on one or more of the parcels. In 2005, Heritage Fields, El Toro, LLC successfully purchased all four parcels from the DON (3,671 acres), and entered into a Development Agreement with the City of Irvine on July 12, 2005. The Development Agreement sets forth the terms and conditions of subsequent development and

4. Discussion of Checklist and Mitigation Measures

implementation of the Great Park, including dedication in fee of 1,096 acres of the property for development of the Great Park Master Plan.

The existing uses within the site include portions of the Western Sector Park Development Plan Phase I, which includes OCGP Balloon, Hangar 244, the artist lofts, Central and West Timeline, Palm Court, North Lawn, Farm and Food Lab and support parking. Consistent with a provision in the Zoning Ordinance, there are interim uses such as Tierra Verde Industries, a composting and electronic waste recycling operation, special event parking lot, and recreational vehicle storage that operating on an interim basis.

4.10.2 Impacts Identified in the OCGP FEIR

The OCGP FEIR identified no significant impact to established communities. There were no residents living within the PA 51 at the time the OCGP FEIR was prepared and there has been no change in this regard; there are no residents living within the OCGP project site. The OCGP FEIR analyzed certain amendments to the City's General Plan that were adopted on May 27, 2003, as part of the City's adoption of the Overlay Plan. The adopted Overlay Plan was determined to be consistent with each element of the General Plan.

Additionally, the detailed General Plan and Zoning Ordinance consistency analysis conducted in the SSEIR also concluded that the 2012 Modified Project was consistent with the applicable goals and policies of the General Plan. The 2012 Modified Project proposed to include various changes to the City's Zoning Ordinance, not consistent with the zoning at that time, which could potentially create a significant land use impact. However, it was concluded that implementation of the zone changes that were proposed would bring the zoning into compliance and no impact would result.

4.10.3 Impacts Associated with the Modifications to the OCGP Improvement Area

The proposed Project is consistent with the land uses approved in concert with the certification and updates to the OCGP FEIR. The proposed Project would implement approved development, and therefore would not affect the goals, objectives or policies, or the facilities and services described in any of the General Plan Elements. No changes or new impacts would occur. In addition, the proposed Project does not contain elements that would alter the findings, conclusions and mitigation measures since all proposed Project development remains within the previously established project boundaries. Although the proposed Project involves reducing the number of sports facilities, it would further enhance the use and efficiency of the existing and planned features. No new uses and facilities are proposed that would physically divide an established community; conflict with any applicable land use plan, policy or regulations; or conflict with any applicable habitat conservation plan or natural community conservation plan. The modifications further enhance the use and efficiency of the existing features. The following analysis discusses the proposed Project, consisting of modifications to the OCGP Improvement Area reducing the number of sports courts, expanding passive recreational area, relocating some of the Improvement Area components to optimize visibility, access and efficiency, and assessing adequacy of parking plan, in consideration of each General Plan Element:

Circulation Element: The goal of the Circulation Element is “to provide a balanced transportation system.” The proposed Project would not alter the planned network of arterials and connections to roadways in the surrounding area; nor would they materially change the riding and hiking trails and trail

4. Discussion of Checklist and Mitigation Measures

linkages; pedestrian and bicycle circulation; and transit, air transportation, and telecommunication opportunities.

Housing Element: The goal of the Housing Element is to “provide for safe and decent housing for all economic segments of the community.” The proposed Project would not increase or decrease the number of residential units approved for the project analyzed in the OCGP FEIR since only parkland is affected by the proposed modifications.

Cultural Resources: The proposed Project would not affect the adopted goals, objectives, and policies of this element. Development would be required to comply with this element’s requirements and to implement mitigation measures found in the OCGP FEIR. With implementation of OCGP FEIR measures P1 and CULT1 through CULT4, the impacts of new development on paleontological and cultural resources would be less than significant. Furthermore, the proper disposition of such resources, if any are encountered prior to or during construction would be ensured; and through the information recovered, the community’s understanding and appreciation for its historic and prehistoric heritage would have been enhanced.

Noise Element: The proposed Project would not affect the goal of this element – “to contribute to a healthy and safe environment by minimizing noise impacts” – or the mobile noise, stationary noise, and noise abatement objectives and implementing policies of the element. The proposed Project modifies the existing set of planned park uses, but not in a way that would increase or decrease noise to a significant extent.

Public Facilities and Services Element: The Project would not affect facilities or services described in the Urban Service Plan for the adopted Overlay Plan. As no substantive change in the Urban Service Plan is necessary, and that plan was a principle means of demonstrating consistency with the Public Facilities and Services Element, the proposed Project also is consistent with this element of the General Plan. In fact, development of the proposed Project facilitates accomplishment of the Public Facilities and Services Element by assisting in achieving the objectives and policies that ensure a full range of necessary public facilities and services that are convenient to the users.

Integrated Waste Management Element: This element seeks to “encourage solid waste reduction and provide for the efficient recycling and disposal of refuse and solid waste material without deteriorating the environment.” The proposed Project would not affect the adopted objectives and implementing policies regarding solid waste, waste, wastewater, and solid waste facility siting requirements.

Growth Management Element: The goal of the Growth Management Element is to “ensure that growth and development are integrally planned with, and phased concurrently with, the City of Irvine’s ability to provide an adequate circulation system and public facilities.” When the OCGP FEIR was certified, it disclosed that although it included changes to the Master Plan of Arterial Highways. The OCGP project would not change any of the objectives or implementing policies of the Growth Management Element. The proposed Project likewise would not alter any of the objectives or implementing policies because it would remain consistent with the development phasing already a part of the overall development plan.

Parks and Recreation Element: The goal of the Parks and Recreation Element is to “provide park and recreation opportunities at a level that maximizes available funds and enables residents of all ages to

4. Discussion of Checklist and Mitigation Measures

utilize their leisure time in a rewarding, relaxing, and creative manner.” The proposed Project facilitates achievement of this objective by adopting changes to the OCGP Master Plan that are necessary to proceed forward with development of 688 additional acres of the Orange County Great Park.

Conservation and Open Space Element: The goal of this element is to “maintain and preserve the environmental systems as a major feature in the City.” This goal would continue to be achieved through the implementation of objectives L-1 through L-12 and corresponding policies. Objective L-10 encourages “the maintenance of agriculture in undeveloped areas of the City until the time of development, and in areas not available for development.” The proposed Project would not alter any of the objectives or implementing policies.

Seismic Element: The goal of the Seismic Element is to “minimize the loss of life, disruption of goods and services, and the destruction of property associated with an earthquake.” Five Seismic Response Area (SRA) designations are used to describe the magnitude and types of potential seismic hazards present within the City, and provide policy guidance. The OCGP FEIR reported that the majority of the El Toro property was in category SRA-2. The OCGP FEIR reported that no objectives or implementing policies would be changed as a result of the OCGP project. Likewise, the proposed Project would not alter that finding/conclusion because all proposed Project development remains within the previously established boundaries.

Safety Element: The goal of the Safety Element is to “minimize the danger to life and property from manmade and natural hazards, including fire hazards, flood hazards, non-seismic geologic hazards, and air hazards.” The OCGP FEIR disclosed the need for fuel modification to mitigate potential wildland fire hazards and drainage improvements to lessen flood hazards associated with implementation of the project, and concluded no objectives or implementing policies would be changed as a result of the adopted Overlay Plan. Likewise, the proposed Project would not alter any of the objectives or implementing policies.

Major FEIR Revisions Not Required. Based on the foregoing analysis and information, there is no evidence that the changes to the project require a major change to the OCGP FEIR. The proposed Modifications to the OCGP Improvement Area, which does not include any major change to park development areas identified in the approved OCGP Master Plan, will not result in any new significant environmental impact nor is there a substantial increase in the severity of impacts from that described in the OCGP FEIR.

No Substantial Change in Circumstances Requiring Major FEIR Revisions. There is no information in the Modifications to the OCGP Improvement Area or otherwise available indicating substantial changes in circumstances that would require major changes to the OCGP FEIR.

No New Information of Substantial Importance Showing Greater Significant Effects Than Previous FEIR. All available relevant information has been analyzed, and there is no new information of substantial importance that was unknown and could not have been known with the exercise of reasonable diligence at the time the OCGP FEIR was approved, augmented, and/or updated, indicating that the proposed Project will have one or more significant effects not discussed in the OCGP FEIR or result in a substantial increase in the severity of previously identified effects.

4. Discussion of Checklist and Mitigation Measures

No New Information of Substantial Importance Showing Ability to Reduce Significant Effects in Previous FEIR. All available relevant information has been analyzed, and there is no new information of substantial importance that was unknown and could not have been known with the exercise of reasonable diligence at the time the OCGP FEIR was approved, augmented, and/or updated, indicating that: (1) mitigation measures or alternatives previously found not to be feasible would in fact be feasible, and would substantially reduce one or more significant effects of the proposed Project, but the project proponent declines to adopt the mitigation measures or alternatives; or (2) mitigation measures or alternatives that are considerably different from those analyzed in the previous EIR would substantially reduce one or more significant effects on the environment, but the project proponent declines to adopt the mitigation measures or alternatives. There are no alternatives to the proposed Project or additional mitigation measures that would substantially reduce one or more of the significant effects on hydrology and/or water quality identified in and considered by the OCGP FEIR.

4.10.4 Mitigation from the OCGP FEIR and Applicability to the Modifications to the OCGP Improvement Area

The OCGP FEIR identified no significant land use impacts; therefore, no mitigation measures were proposed. However, the following existing PPPs and PDFs would help reduce and avoid potential impacts related to land use and planning.

Of the PPPs and PDFs listed below, applicable measures will be incorporated into the proposed Project upon project implementation.

- Aesthetics PPP 1-1
- Air Quality PPP 3-1 through 3-5
- Greenhouse Gas Emissions PPP 4-1 through 4-12
- Hazards and Hazardous Materials PPP 5-1 through 5-8
- Hydrology and Water Quality PPP 6-1
- Noise PPP 8-1 through 8-3
- Public Services PPP 10-1 through 10-10
- Utilities and Service Systems PPP 13-1 through 13-8
- Greenhouse Gas Emissions PDFs 4-5, 4-7 and 4-8

4.11 NOISE

4.11.1 Environmental Setting

The OCGP FEIR described mobile noise sources from nearby freeways, roadways, rail facilities, and vehicle use at adjacent commercial businesses, light industrial facilities, and agricultural lands as the

4. Discussion of Checklist and Mitigation Measures

dominant noise source in the project area. Stationary sources of noise included temporary and intermittent noise from construction activities and agricultural operations, noise associated with the industrial/business parks to the east and the business park and entertainment uses to the south.

The OCGP FEIR presented the results of a noise survey, in which noise measurements were conducted at nine locations. Ambient noise levels at the four surveyed representative residential locations ranged from 58 dBA to 65 dBA CNEL (Refer to OCGP FEIR p. 5.4-18, Figure 5.4-6, and Table 5.4-7). The audible noise sources included local traffic, distant traffic, birds, aircraft, and human voices, all of which were characterized as typical of suburban areas.

4.11.2 Impacts Identified in the OCGP FEIR

The OCGP FEIR concluded that development of the Overlay Plan would not result in any significant noise effects. The noise assessment considered a worst-case condition of simultaneous demolition and construction activities with the combined sound level of 20 pieces of large mobile equipment operating at a distance of 5,000 feet; 5 concrete breakers operating at a distance of 6,000 feet; and 2 crusher plants operating at a distance of 10,000 feet from the nearest off-project area residential location. The distances represented the closest possible location of the construction equipment to the nearest off-project area residences during a heavy construction period. The nearest off-site residential uses (sensitive noise source) were located approximately 4,000 feet from the property boundary. Under this scenario, the analysis estimated sound levels of approximately 56 dBA at the nearest off-site residential location. (Refer to OCGP FEIR, p. 5.4-24 and Table 5.4-8)

As buildout of the project site was assumed to occur over time (years 2007–2025), construction-related noise impacts on residential areas within the proposed Project site were also estimated. Using the same construction equipment assumptions and a distance of 600 feet from the nearest residential area, the combined effect of the equipment was estimated at a sound level of 70 dBA at the nearest on-site residential locations during a heavy construction period. While the City of Irvine Noise Ordinance does not specify a limit on construction noise levels, it stipulates the days and hours during which construction activities may occur and when construction would not be allowed unless a temporary waiver is requested and granted; specifically, construction is allowed Monday through Friday between 7:00 a.m. and 7:00 p.m., and on Saturdays between 9:00 a.m. and 6:00 p.m.; no construction is allowed outside those hours, on Sundays, or on federal holidays unless a temporary waiver is granted by the Chief Building Official or authorized representative (Refer to OCGP FEIR, p. 5.4-31.)

The SSEIR concluded that operational noise levels of the Modified Project would not create a substantial permanent increase in ambient noise levels or expose persons to noise levels in excess of the exterior or interior noise level standards established in the City's Noise Ordinance and the Noise Element of the City's General Plan. In terms of ambient noise levels at sensitive receptors, the SSEIR concluded that with preparation of a noise study (interior and exterior noise) prior to obtaining building permits (Mitigation Measure N-1), the Modified Project's impacts would be less than significant. The SSEIR also indicated that with implementation of plans, programs and policies and project design features, the Modified Project's construction noise impacts to off-site noise-sensitive receptors would be less than significant. It was also concluded that the Modified Project would not result in cumulative noise impacts.

4. Discussion of Checklist and Mitigation Measures

4.11.3 Impacts Associated with the Modifications to the OCGP Improvement Area

The OCGP FEIR noise assessment considered a worst-case condition of simultaneous demolition and construction activities. The worst-case assumptions described for the adopted Overlay Plan remain reasonable assumptions for the proposed Project, consisting of modifications to the OCGP Improvement Area reducing the number of sports courts, expanding passive recreational area, relocating some of the Improvement Area components to optimize visibility, access and efficiency, and assessing adequacy of the parking plan; no new information about future demolition and construction has become available that would increase the number of pieces of equipment to be operated simultaneously.

Construction Noise

Construction activities associated with the proposed Project would result in a short-term increase in ambient noise levels in proximity to construction activities on the proposed Project site. The Modifications to the OCGP Improvement Area will not allow any additional development intensity (i.e., building square footage) beyond what is allowed by the adopted Overlay Plan, and therefore, the proposed Project, consisting of modifications to the OCGP Improvement Area reducing the number of sports courts, expanding passive recreational area, relocating some of the Improvement Area components to optimize visibility, access and efficiency, and assessing adequacy of the parking plan, would not result in an increase in construction noise levels above those forecasted in the OCGP FEIR. Consequently, the proposed Project would not increase the forecasted noise levels generated during construction activities. Therefore, the construction noise levels associated with the proposed Project are anticipated to be similar to those addressed in the OCGP FEIR, and would not result in any significant impacts.

Construction Vibration

The OCGP FEIR identified that nuisance vibration (i.e., human annoyance) from construction activities associated with the adopted Overlay Plan would result in noticeable vibration levels in proximity to the construction activities. However, vibration annoyance from construction activities would be temporary, and occur during the daytime in proximity to construction activities; therefore, nuisance vibration would be less than significant. Existing structures are located sufficient distance away from construction activities such that structural damage from vibration would not occur (i.e., the nearest residence is 600 feet from the construction activities). The proposed Project, consisting of modifications to the OCGP Improvement Area reducing the number of sports courts, expanding passive recreational area, relocating some of the Improvement Area components to optimize visibility, access and efficiency, and assessing the adequacy of parking plan, would not generate significantly higher levels of vibration. Therefore, the construction vibration levels associated with the proposed Project are anticipated to be similar to those addressed in the OCGP FEIR, and would not result in any significant impacts.

Operation Noise

Current information regarding the noise impacts within the proposed Project site were previously evaluated in the OCGP FEIR. The OCGP FEIR concluded that noise associated with land uses would not be significant with use of acoustical design features (e.g., sound insulating construction, perimeter barrier walls, acoustical equipment enclosures, and operational restrictions) incorporated to comply with the local regulations. The proposed Modifications to the OCGP Improvement Area, consisting of Modifications to

4. Discussion of Checklist and Mitigation Measures

the OCGP Improvement Area reducing the number of sports courts, expanding passive recreational area, relocating some of the Improvement Area components to optimize visibility, access and efficiency, and assessing adequacy of the parking plan, would not result in land use changes that would increase project-related stationary or mobile source noise generated by the proposed Project. Therefore, noise levels associated with the proposed Project are anticipated to be similar to those addressed in the OCGP FEIR and would not result in any significant impacts.

Traffic Noise

The Environmental Noise Assessment prepared for the OCGP FEIR identified a traffic noise screening analysis threshold of 1.5 dBA for all project-related traffic noise level increases where the resulting noise levels would be in excess of 65 dBA, and required further analysis where that screening threshold was met within residential and other sensitive areas. Although changes in noise levels of 3 dBA are considered "barely perceptible," and changes of 5 dBA are considered "clearly noticeable," the OCGP FEIR used this 1.5 dBA noise level screening threshold to be conservative. The OCGP FEIR concluded that the development within PA 51 would cause no significant impact on account of traffic noise.

Traffic volumes have been predicted for affected roadways of the 688-acre OCGP Improvement Area based on the Modifications to the OCGP Improvement Area, consisting of reducing the number of sports courts, expanding passive recreational area, relocating some of the Improvement Area components to optimize visibility, access and efficiency, and assessing adequacy of the parking plan. According to "The 688 Acre Park Development Plan Traffic Study," prepared by LSA in July 2014, the Modifications to the OCGP Improvement Area would result in average daily traffic volumes which are consistent with the assumptions in the OCGP FEIR (LSA 2014).

The proposed Modifications to the OCGP Improvement Area would not result in traffic noise level changes that would increase project-related traffic noise generated by the proposed Project or result in traffic noise levels that exceed 65 dBA at noise sensitive receptors. Therefore, noise levels associated with the proposed Project are anticipated to be similar to those addressed in the OCGP FEIR and would not result in any significant impacts.

Airport Noise

The former MCAS El Toro operations have ceased and no public airport, public use airport, or airport land use plan exists in the proposed Project vicinity. Therefore, noise levels associated with the proposed Project are anticipated to be similar to those addressed in the OCGP FEIR and would not result in any significant impacts.

Land Use Compatibility

The proposed Modifications to the OCGP Improvement Area would include removal of the 4,200-square-foot volleyball support building and replacement with the children's play area. The overall square footage of the ancillary buildings within the OCGP Improvement Area would be reduced by 4,200 square feet with the removal of the volleyball support building. .

4. Discussion of Checklist and Mitigation Measures

The overall land use types and activities of the proposed Project would remain substantially similar to the adopted Overlay Plan. Because the OCGP FEIR did not identify any significant impacts related to land use compatibility, the proposed Project, consisting of modifications to the 688-acre OCGP Improvement Area reducing the number of sports courts, expanding passive recreational area, relocating some of the Improvement Area components to optimize visibility, access and efficiency, and assessing adequacy of the parking plan, is also compatible with the Irvine General Plan and Zoning Ordinance for noise and vibration compatibility.

Major FEIR Revisions Not Required. Based on the foregoing analysis and information, there is no evidence that the changes to the Project require a major change to the OCGP FEIR. The proposed Modifications to the OCGP Improvement Area, which does not include an major change to park development areas identified in the approved OCGP Master Plan, will not result in any new significant environmental impact nor is there a substantial increase in the severity of impacts from that described in the OCGP FEIR.

No Substantial Change in Circumstances Requiring Major FEIR Revisions. There is no information in the Modifications to the OCGP Improvement Area or otherwise available indicating substantial changes in circumstances that would require major changes to the OCGP FEIR.

No New Information of Substantial Importance Showing Greater Significant Effects Than Previous FEIR. All available relevant information has been analyzed, and there is no new information of substantial importance, which was unknown and could not have been known with the exercise of reasonable diligence at the time the OCGP FEIR was approved, augmented, and/or updated, indicating that the proposed Project will have one or more significant effects not discussed in the OCGP FEIR or result in a substantial increase in the severity of previously identified effects.

No New Information of Substantial Importance Showing Ability to Reduce Significant Effects in Previous FEIR. All available relevant information has been analyzed, and there is no new information of substantial importance, which was unknown and could not have been known with the exercise or reasonable diligence at the time the OCGP FEIR was approved, augmented, and/or updated, indicating that; (1) mitigation measures or alternatives previously found not to be feasible would in fact be feasible, and would substantially reduce one or more significant effects of the proposed Project, but the project proponent declines to adopt the mitigation measures or alternatives; or (2) mitigation measures or alternatives that are considerably different from those analyzed in the previous EIR would substantially reduce one or more significant effects on the environment, but the project proponent declines to adopt the mitigation measures or alternatives. There are no alternatives to the proposed Project or additional mitigation measures that would substantially reduce one or more of the significant noise effects identified in and considered by the OCGP FEIR.

4.11.4 Mitigation from the OCGP FEIR and Applicability to the OCGP Improvement Area

The OCGP FEIR identified no significant noise impacts; therefore no mitigation measures were proposed. However, the SEIR identified the following measures that apply to the proposed Project and will help reduce or avoid potential noise impacts:

4. Discussion of Checklist and Mitigation Measures

Of the Mitigation Measures listed below, applicable measures will be incorporated into the proposed Project upon project implementation.

N-1 Prior to the issuance of building permits for lots facing or located near major highways such as Irvine Boulevard, the project applicant or its successor shall provide a final noise study to the Director of Community Development that demonstrates how the exterior and interior noise requirements (65 dBA CNEL and 45 dBA CNEL, respectively) of the City of Irvine General Plan Noise Element will be met. To attain the exterior and interior noise requirements, the final noise study shall include, but not be limited to the following measures, in addition to such measures as the final noise study determines are required and shall be shown on the final map:

Exterior

- Provide a minimum six-foot high noise barrier for single-family detached residences shown in Figures 5.7-3 through 5.7-7 of this DSEIR.

Interior

- Provide a “windows closed” condition, requiring a means of mechanical ventilation (e.g., air conditioning) for all units.
- Provide standard and upgraded dual-glazed windows with a minimum Sound Transmission Coefficient rating of 26. Specific window recommendations shall be made once final architectural plans are available and detailed interior noise reduction calculations can be calculated based on actual building assembly details.

N-2 Prior to authorization to use, occupy and/or operate any multi-family residential unit, the project applicant or its successor shall submit evidence to the satisfaction of the Director of Community Development that occupancy disclosure notices for residential units with balconies that do not meet the City’s exterior noise standard of 65 dBA CNEL will be provided to all future tenants pursuant to the City’s Noise Ordinance.

The SSEIR identified the following measures as existing PPPs that apply to the proposed Project and will help reduce or avoid potential noise impacts:

Of the PPPs listed below, applicable measures will be incorporated into the proposed Project upon project implementation.

PPP 8-1 Title 6 (Public Works), Division 8 (Pollution), Chapter 2 (Noise) of the Irvine Municipal Code, also known as the City’s Noise Ordinance, outlines the regulations necessary to control unnecessary, excessive and annoying noise in the City. The provisions of this chapter are applicable to nontransportation-related stationary noise sources. It outlines the noise level measurement criteria; establishes the noise zones and the maximum permitted exterior and interior noise standards in each zone; and discloses special noise provisions for construction, truck delivery and maintenance activities. For example, as outlined in Section 6-8-205 of the Noise Ordinance, no construction shall be permitted outside of the hours of 7:00 AM to 7:00 PM

4. Discussion of Checklist and Mitigation Measures

Monday through Friday and 9:00 AM to 6:00 PM Saturdays, unless a temporary waiver is granted by the Chief Building Official or authorized representative. Trucks, vehicles, and equipment that are making, or are involved with, material deliveries, loading, or transfer of materials, equipment service, maintenance of any devices or appurtenances for or within any construction project in the City shall not be operated or driven on City streets outside of these hours or on Sundays and federal holidays unless a temporary waiver is granted by the City. Any waiver granted shall take impact upon the community into consideration. No construction activity will be permitted outside of these hours except in emergencies including maintenance work on the City rights-of-way that might be required.

PPP 8-2 Prior to the issuance of building permits for each structure or tenant improvement, other than a parking structure, the applicant shall submit a final acoustical report prepared to the satisfaction of the Director of Community Development. The report shall demonstrate that the development will be sound attenuated against present and projected noise levels including stationary, roadway, aircraft, helicopter, and railroad noise to meet City interior and exterior noise standards. The final acoustical report shall include all information required by the City's Acoustical Report Information Sheet (Form 42-48). The report shall be accompanied by a list identifying the sheet(s) of the building plans that include required sound attenuation measures (Standard Condition 3.5).

PPP 8-3 Title 5 (Planning), Division 10 (Grading Code and Encroachment Regulations), Chapter 1 (Grading Code), Section 5-10-127.G (Import and Export of Earth Materials) of the Irvine Municipal Code, states that if a grading project includes the movement of earth material to or from the site in an amount considered substantial by the Chief Building Official, the permittee is required to submit the proposed haul route for review and approval by the Chief Building Official. Special conditions of the grading permit may be imposed that require alternate routes or other measures in consideration of the possible impact on the adjacent community environment or effect on the public right-of-way itself.

The SSEIR also identified the following measure as PDF that apply to the proposed Project and will help reduce or avoid potential noise impacts. The following PDF, as applicable, will be incorporated into the proposed Project upon project implementation.

PDF 8-1 Construction Noise: Prior to issuance of grading permits, the project applicant or its successor shall incorporate the following measures as a note on the grading plan cover sheet to ensure that the greatest distance between noise sources and sensitive receptors during construction activities has been achieved, and that construction noise has been reduced.

- During construction activities, all construction equipment, fixed or mobile, shall be equipped with properly operating and maintained mufflers, consistent with manufacturers' standards. All stationary construction equipment shall be placed so that emitted noise is directed away from the noise-sensitive receptors nearest the Proposed Project Site boundaries.

4. Discussion of Checklist and Mitigation Measures

- Equipment shall be staged in areas that will create the greatest distance between construction-related noise sources and the noise-sensitive receptors nearest the Proposed Project Site during all project construction.
- All construction-related activities shall be restricted to the construction hours outlined in the City's Noise Ordinance (Municipal Code Section 6-8-205).
- Haul truck and other construction-related trucks traveling to and from the Proposed Project Site shall be restricted to the same hours specified for the operation of construction equipment. To the extent feasible, haul routes shall not pass directly by sensitive land uses or residential dwellings.
- Where construction will occur adjacent to any developed/occupied noise-sensitive uses, a construction-related noise mitigation plan shall be submitted the Director of Community Development for review and approval prior to the issuance of grading permits. The plan must depict the location of construction equipment and how the noise from this equipment will be mitigated during construction of the 2012 Modified Project, through the use of such methods as: (1) temporary noise attenuation fences; (2) preferential location of equipment; and (3) use of current technology and noise-suppression equipment.
- Construction of planned sound walls that have been incorporated into the project design shall be installed prior to construction of the building foundation; or temporary sound blankets (fences typically composed of poly-vinyl-chloride-coated outer shells with absorbent inner insulation) shall be placed along the boundary of the Proposed Project Site facing the nearest noise-sensitive receptors during construction activities.

4.12 POPULATION AND HOUSING

4.12.1 Environmental Setting

The OCGP FEIR examined demographics in the context of the existing and projected population of the Orange County region and the City of Irvine. Population and housing information was developed based on the 2000 United States Bureau of Census population, household, and employment census information. The most recent Census was conducted in 2010 ("2010 Census") and this data is used, when available, for analysis in this section. The areas surrounding the former base and the Orange County subregion are considered jobs-rich and housing-poor. The Southern California Association of Governments (SCAG) seeks to encourage housing growth over job growth in the Orange County subregion.

The OCGP FEIR reported that the ratio of jobs to housing in the area has environmental implications related to transportation and air quality. Thus, a major focus of the regional planning efforts has been to improve the ratio of jobs to housing in all affected subregions in order to reduce the vehicular trips, costly infrastructure improvements, and resultant air emissions.

4. Discussion of Checklist and Mitigation Measures

4.12.2 Impacts Identified in the OCGP FEIR

As noted above, the area surrounding the former MCAS El Toro and the Orange County subregion are considered jobs-rich and housing-poor. SCAG seeks to improve the jobs-to-housing ratio in the Orange County subregion. The OCGP FEIR reported that regional projections are dynamic and, as a compilation of local land use projections, reflect changing community views on the location and the types of growth desired. The Orange County Council of Governments (OCCOG) adopted the Orange County Projections 2010 report (OCP-2010), which provides projections of anticipated growth for Orange County in terms of population, housing and employment based on detailed information about growth trends, development and local land use provided by Orange County jurisdictions and public agencies; infrastructure, utility and service providers; and the private sector. OCP-2010 accounts for projects in progress, including the 1,269 density bonus units. According to the OCP-2010, forecast growth rates for population, dwelling units, and employment in Irvine over the 2008-2035 period are all higher than the corresponding rates for the entire Orange County area, as shown in Table 4.12-1.

Table 4.12-1. OCP-2010 Projections for Orange County and the City of Irvine, 2008-2035

	2008	2010	2020	2035	Change, 2010-2035	
					Total	Percent
Orange County						
Population	3,123,058	3,182,061	3,430,505	3,582,266	400,205	12.6%
Dwelling Units	1,035,005	1,045,959	1,100,260	1,174,912	128,953	12.3%
Employment	1,624,061	1,510,928	1,646,437	1,799,477	288,549	19.1%
City of Irvine						
Population	210,761	223,024	271,340	309,977	86,953	39.0%
Dwelling Units	78,955	83,103	100,572	117,427	34,324	41.3%
Employment	223,480	203,831	236,641	286,492	82,661	40.6%

Source: OCGP DSEIR, Table 5.8-3, p. 5.8-3; Center for Demographic Research, Cal State Fullerton. "2010 Orange County Projections", released January 27, 2011.

According to OCP-2000, as of June 2000, Orange County had approximately 1.5 million jobs. According to OCP-2010, that number was projected to increase to approximately 1.51 million by 2010. OCP-2010 projects that jobs in Orange County will grow by 288,549 between 2010 and 2035, which amounts to an average of 11,542 jobs per year (a 19.1 percent increase in jobs over the 25-year period).

Although implementation of the Overlay Plan would not have exceeded the OCP-2010 employment projections, its impact on employment was considered significant because the Orange County subregion is anticipated to become increasingly jobs-rich over the next 20 years and the Overlay Plan-related employment would exacerbate the subregional jobs/housing imbalance. As discussed in the OCGP FEIR, the Overlay Plan is expected to result in:

- An increase of up to 9,000 residents
- A provision of 3,625 dwelling units
- An approximate increase of 16,510 jobs
- An on-site jobs-housing ratio of 4.55

4. Discussion of Checklist and Mitigation Measures

The increase in population would not substantially exceed projections contained for the site in OCP-2010. The increase in jobs, however, would contribute to worsening Orange County's jobs/housing ratio imbalance and is therefore considered a significant impact. The OCGP FEIR identified less than significant impacts for population and housing, and a significant and unavoidable impact for employment.

In 2008, the City granted 1,269 density bonus residential units to Heritage Fields pursuant to state law. Consequently, the Overlay Plan now includes a total of 4,894 residential units, and a total of 12,462 residents, based on estimates of persons per household in the City's General Plan. The Overlay Plan, including the 1,269 density bonus units, was included in the City's data for OCP-2010, which will in turn be used by SCAG to establish regional growth forecasts. Therefore, the population, housing and employment growth created by the Overlay Plan is consistent with OCP-2010 regional planning projections, and will be consistent with anticipated forecasts forthcoming from SCAG. OCP-2010 estimates a jobs-housing balance of 2.45 in Irvine in 2010 and 2.44 in 2035, as shown in Table 4.12-2. The Overlay Plan would contribute to making the community more jobs-housing balanced over time.

Table 4.12-2. OCP-2010 Jobs to Housing Ratio for Orange County and the City of Irvine, 2008-2035

	2008	2010	2020	2035
Orange County				
Dwelling Units	1,035,005	1,045,959	1,100,260	1,174,912
Employment	1,624,061	1,510,928	1,646,437	1,799,477
<i>Jobs-Housing Ratio</i>	<i>1.57</i>	<i>1.44</i>	<i>1.50</i>	<i>1.53</i>
City of Irvine				
Dwelling Units	78,955	83,103	100,572	117,427
Employment	223,480	203,831	236,641	286,492
<i>Jobs-Housing Ratio</i>	<i>2.83</i>	<i>2.45</i>	<i>2.35</i>	<i>2.44</i>

Source: OCGP DSEIR, Table 5.6-7, p. 5.6-8; Center for Demographic Research, Cal State Fullerton. "2010 Orange County Projections", released January 27, 2011.

The 16,510 new jobs contemplated in the 2003 EIR will still be generated under the Overlay Plan. Therefore, the Overlay Plan, which includes 4,894 residential units, would have an on-site jobs-housing ratio of 3.37, which is substantially improved from the 4.55 ratio associated with the 3,625 units analyzed in the Certified EIR. However, since the 3.37 jobs-housing ratio is still greater than Irvine's existing jobs-housing ratio of 2.45, the Overlay Plan's significant impact to the jobs-housing balance remains.

Although OCP-2010 was originally approved in January 2011, publication was delayed until 2012 to incorporate 2010 Census population and housing data. The OCP-2010 Modified represents the growth projected in the approved 2010 projections, with the inclusion of the 2010 Census data. According to the OCP-2010, forecast growth rates for population, dwelling units, and employment in Irvine over the 2010-2035 period are all higher than the corresponding rates for the entire Orange County area, as shown in Table 4.12-3.

4. Discussion of Checklist and Mitigation Measures

Table 4.12-3. OCP-2010 Projections for Orange County and the City of Irvine, 2010-2035

	2010	2020	2035	Change, 2010-2035	
				Total	Percent
Orange County					
Population	3,019,356	3,266,107	3,421,228	401,872	13.3%
Dwelling Units	1,050,330	1,105,238	1,180,929	130,599	12.4%
Employment	1,490,296	1,625,805	1,778,845	288,549	19.4%
City of Irvine					
Population	215,644	265,605	304,242	88,598	41.1%
Dwelling Units	84,189	103,303	120,158	35,969	42.7%
Employment	209,152	241,962	291,813	82,661	39.5%

Source: Center for Demographic Research, Cal State Fullerton. "2010 Orange County Projections Modified", released January 26, 2012.

According to OCP-2000, there were a total of 1.49 million jobs in Orange County in 2010 (as shown in Table 4.12-2). OCP-2010 projects that jobs in Orange County will grow by 288,549, between 2010 and 2035, which amounts to an average of 11,542 jobs per year (a 19.4 percent increase in jobs over the 25-year period).

OCP-2010 estimates a jobs-housing balance of 2.48 in Irvine in 2010 and 2.43 in 2035, as shown in Table 4.12-4. These are well above the industry standard for an ideal jobs-housing ratio in the range of 1.3 to 1.7. OCP-2010 projects that Irvine will outpace Orange County's housing and employment growth rates between 2010 and 2035.

Table 4.12-4. OCP-2010 Jobs to Housing Ratio for Orange County and the City of Irvine, 2010-2035

	2010	2020	2035
Orange County

Employment	1,490,296	1,625,805	1,778,845
<i>Jobs-Housing Ratio</i>	<i>1.42</i>	<i>1.47</i>	<i>1.51</i>
City of Irvine			
Dwelling Units	84,189	103,303	120,158
Employment	209,152	241,962	291,813
<i>Jobs-Housing Ratio</i>	<i>2.48</i>	<i>2.34</i>	<i>2.43</i>

Source: Center for Demographic Research, Cal State Fullerton. "2010 Orange County Projections Modified", released January 26, 2012.

Additionally, in terms of jobs-housing imbalance, the SSEIR concluded that the implementation the 2012 Modified Project would improve this condition by increasing the amount of housing opportunities. The additional housing proposed by the 2012 Modified Project would assist the City in achieving a healthier jobs-housing balance with the ratio of 1.85. Therefore, the jobs-housing impact is not considered a significant impact.

4. Discussion of Checklist and Mitigation Measures

4.12.3 Impacts Associated with the Modifications to the OCGP Improvement Area

The proposed Project would not alter the population, housing, and employment information contained in the OCGP FEIR or change the ratio of jobs to housing beyond that already analyzed in the OCGP FEIR. Additionally, the proposed Project, consisting of modifications to the 688-acre OCGP Improvement Area reducing the number of sports courts, expanding passive recreational area, relocating some of the Improvement Area components to optimize visibility, access and efficiency, and assessing adequacy of parking plan, does not propose new uses and facilities that would induce substantial population growth in the area; displace a substantial number of existing housing; or displace substantial number of people.

Major FEIR Revisions Not Required. Based on the foregoing analysis and information, there is no evidence that the changes to the project require a major change to the OCGP FEIR. The proposed Modifications to the OCGP Improvement Area, which does not include any major change to park development areas identified in the approved OCGP Master Plan, will not result in any new significant environmental impact nor is there a substantial increase in the severity of impacts from that described in the OCGP FEIR.

No Substantial Change in Circumstances Requiring Major FEIR Revisions. There is no information in the Modifications to the OCGP Improvement Area or otherwise available indicating substantial changes in circumstances that would require major changes to the OCGP FEIR.

No New Information of Substantial Importance Showing Greater Significant Effects Than Previous FEIR. All available relevant information has been analyzed, and there is no new information of substantial importance that was unknown and could not have been known with the exercise of reasonable diligence at the time the OCGP FEIR was approved, augmented, and/or updated, indicating that the proposed Project will have one or more significant effects not discussed in the OCGP FEIR or result in a substantial increase in the severity of previously identified effects.

No New Information of Substantial Importance Showing Ability to Reduce Significant Effects in Previous FEIR. All available relevant information has been analyzed, and there is no new information of substantial importance that was unknown and could not have been known with the exercise of reasonable diligence at the time the OCGP FEIR was approved, augmented, and/or updated, indicating that: (1) mitigation measures or alternatives previously found not to be feasible would in fact be feasible, and would substantially reduce one or more significant effects of the proposed Project, but the project proponent declines to adopt the mitigation measures or alternatives; or (2) mitigation measures or alternatives that are considerably different from those analyzed in the previous EIR would substantially reduce one or more significant effects on the environment, but the project proponent declines to adopt the mitigation measures or alternatives. There are no alternatives to the proposed Project or additional mitigation measures that would substantially reduce one or more of the significant effects on population and housing identified in and considered by the OCGP FEIR.

4. Discussion of Checklist and Mitigation Measures

4.12.4 Mitigation from the OCGP FEIR and Applicability to the Modifications to the OCGP Improvement Area

The OCGP FEIR identified a significant impact associated with the jobs/housing ratio. The OCGP FEIR also stated that no mitigation is available to rectify conflicts between the numerical objectives of regional planning documents including the jobs/housing ratio.

The SSEIR identified the following measure as existing PPP that applies to the proposed Project and will help reduce or avoid potential population and housing impacts. The following PPP, as applicable, will be incorporated into the proposed Project upon project implementation.

PPP 9-1 Compliance with the City's Housing Element. Compliance with the City's Housing Element policies provides a strategic blueprint to ensure the siting of new very low, low, and moderate income housing units in future development projects under the 2012 Modified Project to help the City continue to meet its State fair share housing targets. The Housing Ordinance mandates that all projects with 50 or more housing units shall set-aside 15 percent of the total units for very low, low, and moderate income households.

4.13 PUBLIC SERVICES

4.13.1 Environmental Setting

Law Enforcement

The Irvine Police Department (IPD) provides law enforcement services to the Project site. IPD is headquartered at the Irvine Civic Center Complex located at one Civic Center Plaza and has a satellite facility in the Irvine Spectrum Entertainment Complex. Primary response to the Project site would be patrol vehicles assigned geographically throughout the City. The ratio of police officers to population is 0.94 officers per 1,000 residents. At any given time, a minimum of 9 sworn officers are available to respond to calls for service anywhere in Irvine.

The James A. Musick Jail Facility is owned by the County of Orange and operated by the Orange County Sheriff's Department. The jail facility is located on a 105-acre parcel in PA 35 located northeast of the proposed Project site. The jail facility has permanently assigned staff personnel that guard the jail 24 hours a day. The staff includes deputies, special officers, and correctional service technicians. The jail facility is currently a minimum-security detention and corrections facility. Inmate housing and detention facilities are located in the northeast corner of the jail facility site. The remainder of the site is used for agriculture uses associated with inmate detention. The IPD also has a mutual aid agreement with the County Sheriff's Department and is available to assist the Sheriff with law enforcement at the Musick Jail Facility, if requested by the Sheriff.

Fire and Emergency Medical Services

The Orange County Fire Authority (OCFA) provides fire protection services to the city of Irvine, unincorporated Orange County, and 22 other jurisdictions. It maintains mutual aid agreements with all other cities in Orange County and with the State of California. Prior to annexation of the Project site,

4. Discussion of Checklist and Mitigation Measures

primary fire protection to Planning Area 51 was provided by OCFA under contract to the county of Orange on an interim basis. Subsequent to the annexation of the property into the city of Irvine, OCFA has continued and will continue to provide fire protection service to the project area. OCFA has 71 fire stations, and 11 of these stations are in Irvine. Nearby OCFA fire stations outside of the City limits (i.e., Tustin and Lake Forest) may respond to calls in the City, if necessary. OCFA also has in place Secured Fire Protection Services Agreement with the Irvine Company, as part of the Northern Sphere Area that funds fire protection facilities and apparatus and would help provide adequate service to all areas surrounding the Project site.

Parks and Recreation

The private neighborhood park serving Pavilion Park (first phased residential development for the Great Park Neighborhoods) is open and serving residents. A portion of the Western Sector Park Development Plan Phase I is currently operating with recreation facilities that are open to the public. In addition, many public facilities are located within five miles of the OCGP including neighborhood and community parks, recreational trails, and open space.

There are approximately 506 acres of neighborhood and community parks and recreational trails in the City of Irvine's public park system, including one aquatic complex containing three competition size pools. Irvine presently has 18 community parks, 37 public neighborhood parks, and 200 private neighborhood parks. William R. Mason Regional Park, a County of Orange facility, and numerous private parks and recreation facilities are also available throughout Irvine that provide additional recreational opportunities for the City's residents.

The City of Irvine, through its Conservation and Open Space Element has established an open space program comprehensively aggregating open space, adjoining other regional open space, and promoting conservation and passive recreational opportunities (e.g. Bommer Canyon, Shady Canyon and Limestone Canyon).

School Services

Planning Area 51 is within the school service boundaries of the Irvine Unified School District (IUSD) and the Saddleback Valley Unified School District (SVUSD). Prior to the closure of the base, an IUSD elementary school (El Toro Marine Elementary School at 8171 Southeast Trabuco Road) with a 650-student capacity was operating on the former base property. There are currently 48 schools in IUSD, including 22 elementary schools, five middle schools, four high schools, two alternative education schools, and 15 Title I schools. There are currently 35 schools in SVUSD, including 24 elementary schools, four intermediate schools, four high schools, one continuation high school, one independent study high school, and one special education school.

Library Services

The Orange County Public Library (OCPL) provides library services to municipalities and unincorporated parts of Orange County through 33 library branches located throughout the OCPL service area. Irvine is served by three OCPL branches, the Heritage Park Regional Library located at 14361 Yale Avenue, the

4. Discussion of Checklist and Mitigation Measures

University Park Library located at 4512 Sandburg Way, and the Katie Wheeler Library located at 13109 Old Myford Road.

In addition, there are three colleges and universities, each with academic libraries, in Irvine. Residents can use these academic libraries to supplement the public library branches, as each academic library allows nonstudents to purchase a library card that provides borrowing privileges.

4.13.2 Impacts Identified in the OCGP FEIR

Law Enforcement

The OCGP FEIR discussed the law enforcement needs of Planning Area 51 and stated that following annexation, the Irvine Police Department would provide law enforcement for the entire project area. The OCGP FEIR also analyzed the number of police officers, police supervisors and support staff, as well as the number of vehicles, equipment, and services. The OCGP FEIR stated that police protection for the park area would be funded through the use of a special park assessment. As stated in the OCGP FEIR, the general impacts associated with construction and operation of public facilities were analyzed in the OCGP FEIR as part of the planned land uses which also included the construction of a new Police substation. The OCGP FEIR concluded that the police facilities were adequate to handle the personnel and equipment that were employed and utilized by the department.

Additional police personnel and associated equipment would be provided through the continued implementation of the City's Strategic Business Plan and annual budget review process. Pursuant to the ARDA, Heritage Field El Toro, LLC has provided 5.5 acre site located in District 1 North to the City for civic uses. It is anticipated that the City will be funding and constructing a new IPD substation at this location. During the development review and permitting process, the IPD would review and approve any new development plans to ensure that adequate facilities and personnel are provided to allow the IPD to serve the needs of all of Irvine residents. All standard conditions and guidelines would be applied during the normal review process, including the PPPs outlined in Section 4.13.4. Implementation of the PPPs would reduce potential impacts associated with police protection to less than significant.

Fire and Emergency Medical Services

Subsequent to annexation of the property, Planning Area 51 would continue to be served by OCFA. The OCGP FEIR stated that it was likely that additional fire services infrastructure would be required to support the proposed project. OCFA had not provided the detailed calculations of the extent of new services. The OCGP FEIR stated that the final determination of fire station needs and locations would be made at a future date when more information is known about risk, layout, and types of occupancy. The specific environmental impact of constructing the new fire facilities to serve the project could not be determined at the General Plan level of analysis as specific site plans and locations had not been prepared. However, the general impacts associated with the construction and operation of public facilities were addressed within the OCGP FEIR. A temporary fire station is currently located a short distance from the planned ceremonial entrance to the OCGP along Trabuco Road.

4. Discussion of Checklist and Mitigation Measures

Table 5.10-1 of the SSEIR (see Table 4.13-1 below) includes the stations that would provide initial response and the next level of response to calls for emergency services from the project site and surrounding area. All portions of the project site are within four minutes (two miles) of an existing fire station.

Table 4.13-1. OCFA Responding Stations (Table 5.10-2 of the SSEIR)

Station Number	Station Location	Equipment and Personnel
Initial Responding Stations to roject Site		
Fire Station 20	7020 Trabuco Road	1 Paramedic Engine/1 Water Tender/12 Personnel
Fire Station 27	12400 Portola Springs Road	1 Paramedic Engine/9 Personnel
Fire Station 38	26 Parker	1 Engine/1 Medic Van/15 Personnel
Fire Station 51 ¹	18 Cushing Division Chief Headquarters	1 Paramedic Engine/14 Personnel (including Division II Chief and Administrative Captain)
Next Level of Responding Stations to Project Site		
Fire Station 26	4861 Walnut Avenue	1 Engine/1 Medic Van/1 Patrol/15 Personnel/Reserve Firefighters
Fire Station 55	4955 Portola Parkway	1 Paramedic Assessment Unit (PAU) Engine/9 Personnel
Fire Station 47	47 Fossil Road	1 Paramedic Assessment Unit (PAU) Engine/9 Personnel
Fire Station 22	24001 Paseo de Valencia, City of Laguna Woods	2 Paramedic Engines/1 Truck/1 Battalion/39 Personnel
Fire Station 19	23022 El Toro Road, City of Lake Forest	1 Paramedic Engine/1 Squad/12 personnel/Reserve Firefighters

Source: SSEIR 2012

¹ Fire Station 51 is the initial responding station for PA 51.

In addition to the fire stations listed above, OCFA has in place a Secured Fire Protection Services Agreement with the Irvine Company as part of the Northern Sphere Area that funds fire protection facilities and apparatus and would help provide adequate service to all areas surrounding and within the proposed Project site. Overall, compliance with the Mitigation Measures HH-3 and HH-4, PPP 10-1 through 10-10, and PDF 10-1 would ensure a less than significant impact on fire protection and emergency services.

Parks and Recreation

As discussed in detail in OCGP FEIR, the parkland acreage under the project would greatly exceed the existing City of Irvine's standards, and would provide a regional open space amenity for the benefit of Orange County. The OCGP FEIR calculated a total of 45.1 acres of parkland required for the Great Park Neighborhoods development. A portion of that acreage would be in neighborhood parks.

The community park requirement for the future Great Park Neighborhoods development has been addressed through the Development Agreement between the City and Heritage Fields (Recorded on July 12, 2005) and reflected in the Amended and Restated Development Agreement (ARDA) (December 2010). Based on the SSEIR, requirement for dedication of community parkland has been met via past dedication of 165 acres of parkland and payment of fees to the City as set forth in the ARDA. Conveyance of the OCGP to the City satisfied any requirement imposed on the developer for the dedication or development of community parks as required by the City's General Plan and Municipal Ordinance. The neighborhood park requirements for the future Great Park Neighborhoods development

4. Discussion of Checklist and Mitigation Measures

would be met within the Great Park Neighborhoods development, outside the OCGP. Details of specific park locations, ownership, sizes, and improvements would be presented to the Community Services Commission as a part of the Park Plan for the new residential developments. Since the OCGP Master Plan does not create a demand for parks and recreation but is itself a park and recreation amenity, no new impacts on parks and recreation are anticipated. This is consistent with the findings of the OCGP FEIR.

School Services

The OCGP FEIR discussed in detail the proposed project, the related student generation, and the required school facilities. Based on an initial analysis, the IUSD estimated the need for one 13-acre K-8 site as well as funding for expansion and modernization of existing middle and high school facilities by project buildout.

According to the SSEIR, per the Heritage Fields (HF) Mitigation Agreement with IUSD, two K-8 schools, each with a maximum capacity of 1,000 students, and a new high school (HS #5) with a maximum capacity of 2,600 students are planned for construction. Based on the current projections and the provisions contained within the HF Mitigation Agreement with IUSD, IUSD would be able to provide adequate school services and facilities. As for SVUSD, with payment of the SB 50 Fees, no significant impacts to the SVUSD would occur.

Library Services

Impacts to library services are determined only by the development of residential land uses. To meet the demand of library services, the City completed a Library Needs Assessment Study in October 2006 to evaluate the state of library services and identify options for enhanced library services within the City. The study determined that new facilities are needed, especially in light of anticipated population growth.

The 2007 Library Alternatives Study prepared by the City present six potential sites for new libraries, and identifies library facility options, including construction of a new branch library and/or a new main library, totaling 39,000 square feet, at the Great Park. The study further recommended inclusion of new library facilities in the Citywide Capital Improvement Program and Public Facilities Master Plan that would allow the City Council to assess development of new library facilities. However, there are no capital funds designated for expansion of the OCPL system.

Since a portion of property taxes are specifically allocated for capital improvement and operating costs for the OCPL system, new residents of the Irvine (including the project) would be required to make a financial contribution to expand and/or construct new library facilities. Development of the project would also be required to comply with PPP 10-10. In addition, residents of Irvine, including future residents of the City have access to any branch of OCPL library system, including those within neighboring cities such as Tustin and Costa Mesa, and also those within academic libraries and resources of the colleges and universities within the City. Therefore, significant impact on library services is not anticipated.

4. Discussion of Checklist and Mitigation Measures

4.13.3 Impacts Associated with the Modifications to the OCGP Improvement Area

The proposed modifications, consisting of modifications to the OCGP Improvement Area reducing the number of sports courts, expanding passive recreational area, relocating some of the Improvement Area components to optimize visibility, access and efficiency, and assessing adequacy of parking plan further enhance the use and efficiency of the existing features. The proposed Project would not result in new uses that would impact or alter provision of public services or create additional demand on existing level of service.

Law Enforcement

The proposed Project would not result in changes to the intensity or type of the land uses and therefore, the demand on law enforcement is within the envelope of analysis presented in the OCGP FEIR.

Fire and Emergency Medical Services

Since the proposed Project would not result in change the intensity or type of land uses, the demand on fire protection is consistent with the analysis presented in the OCGP FEIR.

Parks and Recreation

The proposed Project would not result in changes to the land use intensity and type. Therefore, the demand and potential impact on parks and recreation remains consistent with the analysis contained in the OCGP FEIR.

School Services

The proposed Project would not result in changes to the land use intensity and type. Therefore, the demand and potential impact on school services remains consistent with the analysis contained in the OCGP FEIR.

Library Services

The proposed Project would not result in changes to the land use intensity and type. Therefore, the demand and potential impact on library services remains consistent with the analysis contained in the OCGP FEIR.

Major FEIR Revisions Not Required. Based on the foregoing analysis and information, there is no evidence that the changes to the project require a major change to the OCGP FEIR. The proposed Modifications to the OCGP Improvement Area, which does not include any major change to park development areas identified in the approved OCGP Master Plan, will not result in any new significant environmental impact nor is there a substantial increase in the severity of impacts from that described in the OCGP FEIR.

4. Discussion of Checklist and Mitigation Measures

No Substantial Change in Circumstances Requiring Major FEIR Revisions. There is no information in the Modifications to the OCGP Improvement Area or otherwise available indicating substantial changes in circumstances that would require major changes to the OCGP FEIR.

No New Information of Substantial Importance Showing Greater Significant Effects Than Previous FEIR. All available relevant information has been analyzed, and there is no new information of substantial importance, which was unknown and could not have been known with the exercise of reasonable diligence at the time the OCGP FEIR was approved, augmented, and/or updated, indicating that the proposed Project will have one or more significant effects not discussed in the OCGP FEIR or result in a substantial increase in the severity of previously identified effects.

No New Information of Substantial Importance Showing Ability to Reduce Significant Effects in Previous FEIR. All available relevant information has been analyzed, and there is no new information of substantial importance, which was unknown and could not have been known with the exercise or reasonable diligence at the time the OCGP FEIR was approved, augmented, and/or updated and addenda were approved, indicating that: (1) mitigation measures or alternatives previously found not to be feasible would in fact be feasible, and would substantially reduce one or more significant effects of the proposed Project, but the project proponent declines to adopt the mitigation measures or alternatives; or (2) mitigation measures or alternatives that are considerably different from those analyzed in the OCGP FEIR would substantially reduce one or more significant effects on the environment, but the project proponent declines to adopt the mitigation measures or alternatives. There are no alternatives to the proposed Project or additional mitigation measures that would substantially reduce one or more of the significant public services-related effects identified in and considered by the OCGP FEIR.

4.13.4 Mitigation from the OCGP FEIR and Applicability to the Modifications to the OCGP Improvement Area

The OCGP FEIR determined the mitigation measures identified in other sections of the OCGP FEIR (Sections 5.1-5.13) address the impacts associated with the construction and operation of public facilities. These measures would be applicable to any new construction and operation of facilities for police, fire protection, park and recreation, and education services.

In addition, the SSEIR identified the following measures as existing PPPs that apply to the proposed Project and will help reduce or avoid potential public services impacts:

Of the PPPs listed below, applicable measures will be incorporated into the proposed Project upon project implementation.

PPP 10-1 Every project applicant shall comply with all applicable Orange County Fire Authority codes, ordinances, and standard conditions regarding fire prevention and suppression measures relating to water improvement plans, fire hydrants, automatic fire extinguishing systems, fire access, access gates, combustible construction, water availability, and fire sprinkler systems.

4. Discussion of Checklist and Mitigation Measures

- PPP 10-2** Prior to the approval of the first certificate of occupancy the applicant shall arrange for and have passed an inspection, to be performed by the Police Department and the Orange County Fire Authority, to ensure compliance with the Emergency Access Plan requirements. The inspector shall verify test acceptance and locations of all Knox boxes and key switches as depicted on the approved plan (Standard Condition 4.9).
- PPP 10-3** Prior to the issuance of the first building permit, the applicant shall submit and have approved by the Chief of Police an Emergency Access Plan, which identifies and locates all Knox Boxes, Knox key switches, and Click2Enter radio access control receivers. Said plan shall be incorporated into the plan set approved for building permits (Standard Condition 3.17).
- PPP 10-4** Prior to the issuance of the first building permit, the applicant shall have executed a Secured Fire Protection Agreement with the Orange County Fire Authority (Standard Condition A.15).
- PPP 10-5** The project applicant shall comply with all applicable requirements of the City of Irvine Uniform Security Code (Municipal Code Title 5, Division 9, Chapter 5).
- PPP 10-6** Prior to issuance of the first building permit, a Construction Site Security Plan, per the Irvine Uniform Security Code, Section 5-9-521, shall be approved by the Chief of Police. Said plan shall be incorporated into the plan set approved for building permits (Standard Condition 3.20).
- PPP 10-7** Prior to approval of the first certificate of occupancy, the project applicant shall demonstrate to the City's Police Department that an Opticom traffic light control system has been installed at all signalized intersections servicing or adjacent to the Proposed Project Site (Condition of Approval).
- PPP 10-8** The project applicant shall implement the concepts of Crime Prevention Through Environmental Design in the design and layout of individual development projects within the Proposed Project Site to reduce criminal opportunity and calls for police service. Implementation of these concepts shall be verified by the City's Police Department during the development review process (Condition of Approval).
- PPP 10-9** Pursuant to California Government Code Section 65995, the individual applicant shall pay developer fees to the appropriate school districts at the time building permits are issued; payment of the adopted fees would provide full and complete mitigation of school impacts. Alternatively, the applicant may enter into a school finance agreement with the school district(s) to address mitigation to school impacts in lieu of payment of developer fees. The agreement shall establish financing mechanisms for funding facilities to serve the students from the project. If the applicant and the affected school district(s) do not reach a mutually satisfying agreement, then project impact would be subject to development fees.
- PPP 10-10** In the event that a city-wide library impact fee is adopted and in force, the developer shall pay this fee prior to issuance of building permits for new development. Since a 39,000 square foot library facility is approved for development within Existing PA 51, this would satisfy payment of a library impact fee, if adopted by the City at a future date.

4. Discussion of Checklist and Mitigation Measures

The SSEIR also identified the following measure as PDF that apply to the proposed Project and will help reduce or avoid potential public services impacts. The following PDF, as applicable, will be incorporated into the proposed Project upon project implementation:

PDF 10-1 A key consideration in the final planting program for the Relocated Wildlife Corridor Feature will be to ensure that the planting plan does not create a fire hazard for adjacent development. The WLC has been designed with native grasslands and southern cactus scrub within 150 feet of future development. Maintenance of vegetation within the WLC is not anticipated, but is allowed as needed for fire control. Final approval of the planting schemes and palettes will require approval from the Orange County Fire Authority and assurance that the WLC will not create a fire hazard for the adjacent development or require mitigation by the adjacent development.

4.14 RECREATION

Issues related to Recreation are discussed above under Section 4.13, *Public Services*.

4.15 TRANSPORTATION/TRAFFIC

4.15.1 Environmental Setting

The OCGP FEIR described the traffic and circulation conditions of a study area that encompassed 145 existing intersections (2007) and an additional 11 future intersections (Post 2025) in the City of Irvine, and portions of seven adjacent jurisdictions including the cities of Lake Forest, Mission Viejo, Laguna Hills, Laguna Woods, Aliso Viejo, Laguna Beach, and unincorporated areas of Orange County.

The OCGP FEIR used the City of Irvine Traffic Performance Criteria, which establishes level of service (LOS) "A" to "D" as the peak-hour minimum acceptable service level. In its adoption of the Overlay Plan, the City General Plan Policy B-1(C), which allowed for the consideration of LOS E as acceptable for application to intersections in Planning Areas 13, 31, 32, 34, 35 and 39, was changed to include the effects of future development in PA 51, including former PA 31, on the intersections in those Planning Areas.

The City's performance criteria also includes a standard of 0.02 or greater for existing deficiencies, roadway volume to capacity (V/C) ratio or the intersection capacity utilization (ICU) or an increase from acceptable to unacceptable LOS, to identify significant project impacts and associated need for improvements at both roadways and intersections.

4.15.2 Impacts Identified in the OCGP FEIR

The OCGP FEIR assessed the traffic impacts of two development scenarios for the overall OCGP project, the Base Plan and the Overlay Plan. The OCGP FEIR concluded that the adopted Overlay Plan would cause an increase in traffic which would be substantial in relation to the existing traffic load and capacity of the street system in the year 2007, year 2025, and post-2025 scenarios.

4. Discussion of Checklist and Mitigation Measures

The OCGP FEIR concluded that the adopted Overlay Plan would exceed, either individually or cumulatively, a level of service standard established by the county congestion management agency for designated roads or highways in the 2007 and 2025 scenarios.

The OCGP FEIR utilized trip thresholds (also known as “trip caps”) for each of the planning areas within the Great Park area. The trip cap is based on socioeconomic data average daily trip generation for the approved Orange County Great Park plan (the Overlay Plan area), which includes the Heritage Fields development. The traffic impacts of the 2006 GPA/ZC project were analyzed in Addendum No. 2 by distributing project-related traffic over existing and future traffic conditions. The three future conditions (year 2010, year 2025 and post-2025) were based on the circulation system plus fully funded intersection improvements that were planned to be in place in each future time frame and the land use and development growth that is projected in each future time frame. In each case, project impacts were identified by comparing traffic conditions with and without the 2006 GPA/ZC project.

The circulation system performance criteria applied in the analysis were the criteria approved in the 2003 North Irvine Transportation Mitigation (NITM) Program Nexus Study. The performance criteria were also consistent with the criteria adopted by the jurisdictions that are within the project study area. The criteria include components for arterial roadways, intersections, freeway/tollway ramps, and freeway/tollway mainline segments.

The results of the year 2010, year 2025 and post-2025 analysis indicated that the proposed 2006 GPA/ZC project was not forecast to significantly impact any roadway segment based on the second level of analysis (the City’s peak hour link capacity analysis methodology), intersection, freeway/tollway ramp, or any freeway/tollway mainline segment.

Subsequently, as addressed in Addendum No. 3, a Traffic Study for the Master Subdivision Map was prepared by Austin-Foust Associates, Inc. to address the transportation impacts for the “project,” i.e. backbone infrastructure with no new land use development in an interim year timeframe consistent with the TTM scope of work of the North Irvine Transportation Mitigation (NITM) Program Ordinance. The Traffic Study analyzed the impacts of the Master Subdivision Map (MSM) application based on Year 2010 traffic conditions in the traffic analysis study area.

An Internal Circulation Analysis for the Master Subdivision Map in the Overlay Plan area was prepared by Austin-Foust Associates, Inc. to analyze the access and internal circulation for the Heritage Fields project. The project traffic loaded directly onto the surrounding arterial system at several locations.

The intersections were analyzed using intersection capacity utilization (ICU) values to determine level of service (LOS). The results of this analysis showed that all intersections operate at an acceptable level of service under Post-2025 buildout conditions. The intersections were then analyzed for signalization needs. Traffic signal warrants based on peak hour volumes (as adopted by the Federal Highway Administration and Caltrans) were used to determine the need for signalization. Based on the application of the warrants, it was determined that traffic signals should be installed at all of the analyzed intersections except for the intersections of “C” Street and “D” Street at Marine Way.

Recommended on-site traffic-control measures included stop signs, traffic signals, and roundabouts. Left-turn pocket lengths for project access intersections with exclusive left-turn lanes were estimated using the

4. Discussion of Checklist and Mitigation Measures

County of Orange Environmental Management Agency (EMA) Highway Design Manual. The estimated left-turn storage length requirements for the analyzed intersections were based on peak hour volumes. Right-turn lanes were proposed to be provided for select project access locations on site where additional intersection capacity is needed.

Addendum No. 4 analyzed the impacts of the proposed OCGP Master Plan. Since the proposed land uses within the OCGP Master Plan were consistent with those analyzed in the OCGP FEIR and the updated traffic study for the Revised Overlay Plan, no additional traffic analysis was found to be necessary, and no new significant impacts related to traffic were anticipated.

Addendum No. 5 analyzed the impacts associated with realignment of the Marine Way/Bake Parkway intersection and concluded that the project would not produce or substantially worsen significant impacts identified in the OCGP FEIR. Consistent with the conclusions in the OCGP FEIR, traffic and circulation impacts associated with the project would be less than significant, as the future development would implement all applicable laws and regulations to reduce impacts on traffic and circulation.

Addendum No. 7 analyzed potential impacts associated with the removal of certain NITM Improvements from the OCGP FEIR that were determined to no longer be necessary. Based on the findings of the NITM Five-Year Review Traffic Study, it was determined that previously proposed traffic mitigation strategies were not required for seven intersections and one ramp since they operate at an acceptable LOS under all interim year and build-out conditions. In addition, improvements above and beyond the baseline conditions for these locations were not warranted based on forecast future traffic activity.

The SEIR analyzed the potential impacts of the 2nd Amended VTTM 17008, Amended TTM 17283, TTM 17202, TTM 17364, TTM 17366 and TTM 17368 within the Heritage Fields site located in PA 51, including former PA 30, in the City of Irvine. The purpose of the comprehensive and tract map-level NITM traffic studies was to identify the location, timing and prioritization of applicable NITM improvements and any necessary project-related improvements that address potential impacts caused by project traffic.

The results of the analyses indicated the need for the following NITM improvements:

- Alton & Technology (2030): Westbound Technology restripe to include 2.5 left turn lanes, 1.5 through lanes, and a defacto right turn lane.
- El Toro & Jeronimo (2030): Add second southbound El Toro left turn lane.
- Alicia & Muirlands (2015): Add second southbound Alicia left turn lane.
- I-5 Southbound off-ramp to Sand Canyon (Post-2030): Add a second drop lane from the I-5 to the off-ramp.
- I-5 Southbound off-ramp to Alton (Post-2030): Add a second auxiliary lane from the I-5 to the off-ramp.
- I-5 Southbound off-ramp to El Toro (2030): Add a second drop lane from the I-5 to the off-ramp.

4. Discussion of Checklist and Mitigation Measures

Additional improvements needed to address traffic impacts caused by the project include:

- Jeffrey & Roosevelt (2030): Restripe eastbound Roosevelt approach to provide a shared through/right turn lane.
- Bake & Portola (Post-2030): Restripe the northbound Bake approach to provide a shared through/left lane (which currently exists as a through lane) and modify the traffic signal for a north/south split phase signal operation. Alternatively, restripe the northbound approach to provide dual left turn lanes in combination with a single through lane and single right turn lane, and modify signal operation to include northbound right turn overlap.
- Lake Forest & Portola (2030, fair-share): Conversion of the northbound Lake Forest approach from de-facto right-turn to dedicated right-turn, and modification of the traffic signal to include right turn overlap phase.

As part of Addendum No. 8, two traffic studies were prepared by LSA for the OCGP Western Sector Development Plan Phase 1 located in Planning Area 51 in the City of Irvine. The results of the August 2011 parking and traffic generation analysis indicated that 2,804 parking spaces would be necessary to accommodate the park visitors on a weekday, and 3,842 spaces would be required on a weekend. The conceptual Great Park design included regular day-to-day parking for 5,505 vehicles. This supply of parking would be more than sufficient to accommodate the parking demand for the entire park at any given time on a typical weekday or weekend. The analysis also concluded that the maximum daily trip generation of the park modification would be 13,537 trips on a typical weekday. This is below the 19,083 weekday trips calculated in the OCGP FEIR, and therefore no changes to the impact analysis would occur.

According to the traffic data used to prepare Addendum No. 8, full build-out of the Great Park Master Plan would result in a total of 19,030 weekday trips, which is below the FEIR maximum; however, the FEIR traffic analysis was not based on weekend conditions. The weekend trip analysis was conducted for the parking demand calculations and was not included in the original OCGP FEIR.

As presented in the August 2011 traffic study, the Western Sector Development Plan Project would generate approximately 4,635 daily trips, which was significantly below the 19,083 daily trips approved as part of the OCGP FEIR. The AM peak hour is forecast at 184 and the PM peak hour at 659.

The project would not produce new or substantially increase the severity of significant impacts previously identified in the OCGP FEIR. Consistent with the conclusions in the OCGP FEIR, traffic and circulation impacts associated with the project would be less than significant as the future development would implement all applicable laws and regulations to reduce impacts on traffic and circulation.

The 2011 SEIR concluded that with the 2011 Approved Project all intersections and roadway/freeway/tollway/ramp segments would operate at acceptable levels of service with the existing or planned improvements. However, it stated that since the primary responsibility for approving and/or completing certain improvements outside of the City of Irvine limits lie with agencies other than the City (i.e., City of Lake Forest, Laguna Woods, Mission Viejo, County of Orange, and Caltrans), there is the potential that significant impacts may not be fully mitigated if such improvements are not completed for reasons beyond

4. Discussion of Checklist and Mitigation Measures

the City's control. Should that occur, impacts relating to traffic generated by the 2011 Approved Project would remain significant.

4.15.3 Impacts Associated with the Modifications to the OCGP Improvement Area

The SSEIR document identified the traffic impacts of the 2012 Modified Project by analyzing the study area circulation system based on existing traffic conditions, 2015, 2030 and Post-2030 future traffic conditions. In some cases, new project impacts that were not mitigated by improvements identified in the North Irvine Transportation Mitigation (NITM) Program were identified for project development scenarios. Recommended mitigation measures for each impacted location were presented. The SSEIR concluded that if identified improvement for intersections were not be feasible due to cost, right-of-way issues, or community opposition, traffic impacts could remain significant and unavoidable.

A Traffic Study for the 688-acre Park Development Plan was prepared to analyze the potential traffic impacts of the Project in general accordance with the North Irvine Transportation Mitigation (NITM) Program per City Council Resolution 03-61 and applicable sections of the City's Traffic Study Guidelines (updated August 24, 2004) and the City of Irvine Transportation Guidelines (TG) dated July 31, 1993. The analysis identifies potential impacts of the proposed Project in the Project area based on Existing (2012) and Future Year (2017) traffic conditions using the Irvine Transportation Analysis Model (ITAM 12.3). The Traffic Study area extends from Jeffrey Road on the west, Bake Parkway on the east, Portola Parkway on the north, and the I-405 freeway to the south. The analysis includes all arterials and major intersections within the study boundary area.

The following summarizes the existing conditions and 2017 base, and the OCGP 688-acre Park Development Plan alternatives that have been evaluated and included in the Traffic Study:

1. Existing Conditions
2. Existing plus 688 Acre Park Development Plan
3. 2017 Baseline (No Project) (Assumes Heritage Fields Project Option 2)
4. 2017 Baseline + 688 Acre Park Development Plan
5. 2017 Baseline + 688 Acre Park Development Plan with Heritage Fields Project Option 1
6. 2017 Baseline + 688 Acre Park Development Plan with connector roadway between "LY" Street and Marine Way (Roadway Connection Alternative)

Existing Roadways and Intersections

The existing roadway network is presented in Figure 4.15-1. This figure presents the roadway classification and the existing number of travel lanes. All access to the project connects from Sand Canyon Road and Marine Way. Trabuco Road also connects to the OCGP; however, park uses are not accessible from Trabuco Road at this time. As Marine Way extends east of Sand Canyon, it terminates at the intersection of Marine Way and "C" Street. "C" Street extends north and provides all access to the OCGP 688 Acre Park Development Plan except for some uses which will be accessed via Trabuco Road.

4. Discussion of Checklist and Mitigation Measures

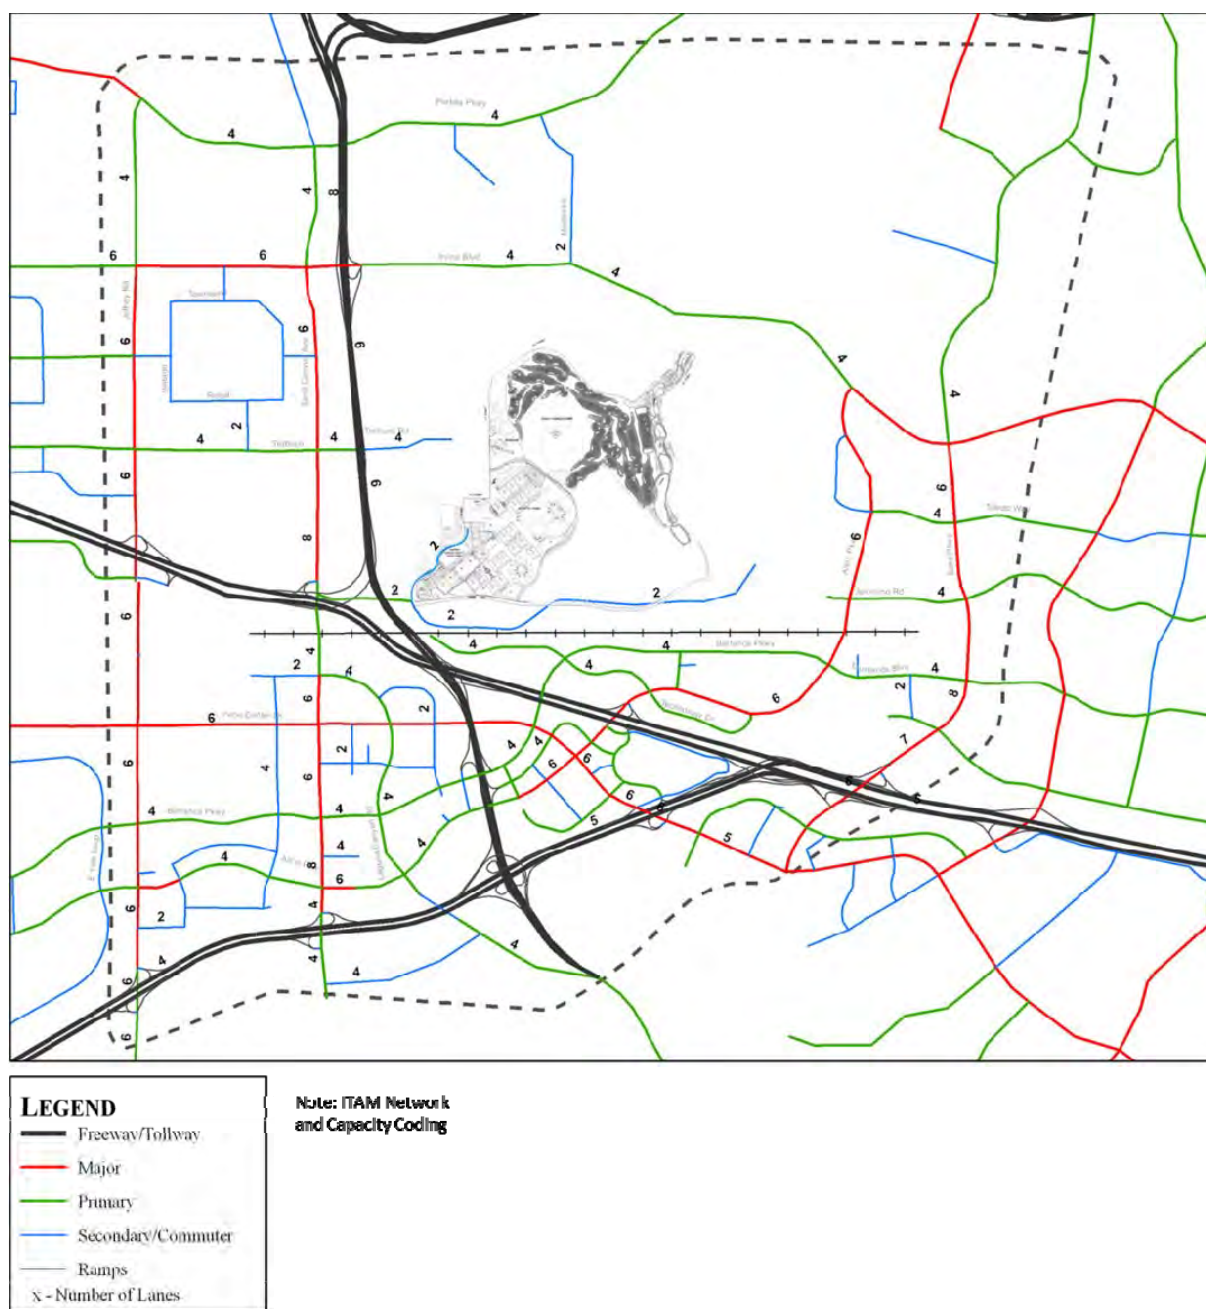

Figure 4.15-1
Existing Roadway Network

4. Discussion of Checklist and Mitigation Measures

Figure 4.15-2
Traffic Study Area Intersections

4. Discussion of Checklist and Mitigation Measures

The intersections included in the Traffic Study are also presented in Figure 4.15-2. These intersections are identified with a three digit intersection identification number. Not all intersections currently exist, but will be added as part of the 2017 analysis.

Presented in Figure III-3 of the Traffic Study are the existing intersection geometrics for each of the intersections included in the Traffic Study. These figures present the number of left, through, and right turn lanes.

Methodology and Approach

The Traffic Study is based on the latest version of the Irvine Transportation Analysis Model (ITAM 12.3). The analysis reports the Base Year (2012) Existing and the 2017 Baseline without the project. The alternatives analysis then added the project to the Existing and 2017 Baseline alternatives. The 2017 Baseline ITAM model run used for the “No Project” includes approved projects and infrastructure improvements assumed in ITAM 12.3 for interim 2017 conditions. The Traffic Study includes the entire 688-acre Improvement Area as the study area.

Alternatives

The “With Project” condition adds the OCGP 688 Acre Park Development Plan to the Existing Conditions and the 2017 Baseline plus various alternatives described below.

1. Existing Conditions
2. Existing plus 688 Acre Park Development Plan
3. 2017 Baseline, No Project (Assumes Heritage Fields Project Option 2)
4. 2017 Baseline + 688 Acre Park Development Plan
5. 2017 Baseline + 688 Acre Park Development Plan with Heritage Fields Project Option 1
6. 2017 Baseline + 688 Acre Park Development Plan with connector roadway between “LY” and Great Park Boulevard (Roadway Connection Alternative)

ITAM Traffic Analysis Zones

The daily traffic volumes and peak hour intersection turn movement forecasts were generated using the Irvine Transportation Analysis Model (ITAM 12.3). Project related adjustments include refinement to the traffic analysis zones within the OCGP to better define OCGP trip activity traveling to and from various parking destinations within the park. A map of the updated Traffic Analysis Zones is presented in Figure 4.15-3.

Trip Generation

The daily and peak hour trip generation forecasts by ITAM Traffic Analysis Zone and parking area for the Western Sector Park Development Plan and the 688 Acre Park Development Plan are presented in Table

4. Discussion of Checklist and Mitigation Measures

4.15-1. The project land uses and trip generation for the 688 Acre Park Development Plan for the 2012 (existing) + project and the 2017 + project traffic analysis is basically the same, except for one land use. The proposed Community Ice Facility is not included in the 2012 existing baseline, but is included in the 2017 as it was previously approved as part of the Western Sector Park Development Plan.

As presented in Table 4.15-1, the total OCGP daily trip generation for the Western Sector Park Development Plan and the 688 Acre Park Development Plan is 10,030. This is less than the 19,083 daily trips approved in the OCGP FEIR. The difference between 19,083 and 10,030 is 9,053, which would be available for the future phased development of the Orange County Great Park. The total daily trip generation for the Western Sector Park Development Plan and the 688 Acre Park Development Plan without the Community Ice Facility is 9,310.

ITAM Assumptions for Alternatives

The Alternative 1 (Existing Conditions Baseline) and Alternative 3 (2017 Baseline No Project) ITAM traffic forecasts were provided by the City of Irvine. The remaining four alternatives required land use and network adjustments to ITAM. They are summarized as follows:

Alternative 2 is the Existing Plus Project alternative that adds the 688 Acre Park Development to the Existing Conditions.

Alternative 4 (i.e., 2017 “With Project”) adds the 688 Acre Park Development Plan to the 2017 Baseline alternative.

Alternatives 5 and 6 are alternatives to Alternative 4, the 2017 Baseline plus 688 Acre Park Development Plan.

Alternative 5 analyzes an alternative Heritage Fields Project Option 1 land use plan. For this alternative, the ITAM land use assumptions for Heritage Fields Project Option 2 TAZ land uses and quantities were replaced with the Option 1 land use and quantities. The Option 1 TAZ land use and quantities were provided by the City of Irvine.

All alternatives include a high school in TAZ 606, which is south of Irvine Boulevard referred to as High School Site A.

Alternative 6 is identical to Alternative 4, the 2017 ITAM Baseline plus the proposed 688 Acre Park Development, except for a roadway network change that provides a loop connection between “LY” Street and Great Park Boulevard along the eastern edge of the Sports Park ball fields. All land use, trip generation and network changes for Alternatives 2, 4, 5 and 6 were reviewed and approved by the City of Irvine.

4. Discussion of Checklist and Mitigation Measures

4. Discussion of Checklist and Mitigation Measures

2017 Baseline Roadway Network Updates

The committed 2017 intersection geometry includes some additional improvements assumed in place by 2017. The resulting 2017 Intersection Geometry is presented in Figure IV-2 of the Traffic Study.

Performance Criteria

Two levels of traffic analysis were conducted, and they are: 1) daily and peak hour arterial link volume to capacity ratio level of service analysis and peak hour Intersection Capacity Utilization (ICU – for signalized intersections) or Highway Capacity Manual (HCM – for unsignalized intersections); and 2) intersection design analysis per the City's Transportation Guidelines (TG). The following section describes the performance measures.

Daily Arterial Volume to Capacity Level of Service Analysis

For each arterial link within the study area a daily link level of service is based on the average daily traffic (ADT) volume/capacity (V/C) ratios, based on the following capacities:

City of Irvine

Major Arterial	8-lane	72,000
	6-lane	54,000
Primary Arterial	4-lane	32,000
Secondary Arterial	4-lane	28,000
Commuter	2-lane	13,000

Outside City of Irvine

Major Arterial	8-lane	75,000
	6-lane	56,300
Primary Arterial	4-lane	37,500
Secondary Arterial	4-lane	25,000 (24,000 – City of Orange)
Commuter	2-lane	12,500 (12,000 – City of Orange)

The performance standards for the daily volume to capacity ratios for all links is LOS D or a V/C ratio less than or equal to 0.90 except arterials in Irvine Planning Area 33 (Spectrum I) and Planning Area 36 (Irvine Business Complex/IBC), and Congestion Management Plan arterials outside the City of Irvine where the threshold is LOS E where daily volume to capacity ratio must be less than or equal to 1.00.

Daily and Peak Hour Arterial Volume to Capacity Level of Service Analysis

As required by the City of Irvine Peak Hour Link Capacity Analysis guidelines, arterial links that exceed the daily volume to capacity ratio level of service analysis thresholds must conduct a peak hour link volume to capacity ratio analysis.

4. Discussion of Checklist and Mitigation Measures

AM and PM Peak Hour Intersection Capacity Utilization

To determine significant impacts at signalized intersections, the ICU methodology was used for intersections within the study area. The ICU methodology compares the volume-to-capacity (v/c) ratios of conflicting turn movements at an intersection, sums these critical conflicting v/c ratios for each intersection approach, and determines the overall ICU. The resulting ICU is expressed in terms of level of service (LOS), where LOS A represents free-flow activity and LOS F represents overcapacity operation. Parameters set by the City for ICU calculations, including lane capacity, right-turn treatment, and clearance interval, which are included in the analysis. According to the City Traffic Impact Analysis Guidelines (adopted by City Council on August 24, 2004), level of service at an intersection or roadway is considered to be unsatisfactory when the ICU exceeds 0.90 (LOS D). In addition, the City General Plan has identified intersection locations in which an ICU is acceptable when less than or equal to 1.0 (LOS E) in Planning Area 33, Planning Area 36, CMP intersections outside the City of Irvine, intersections of Bake Parkway/I-5 northbound and southbound ramps, Alton Parkway/Irvine Boulevard, Bake Parkway/Irvine Boulevard, Lake Forest Drive/I-5 southbound ramps-Avenida de la Carlotta and Lake Forest Drive/Irvine Center Drive.

A project impact is identified if the project results in an ICU greater than the acceptable level or service, the project contribution is required to bring the intersection back to an acceptable level of service, or when the projects results in an ICU of 0.02 or greater for an already deficient location, the project contribution is required back to no-project conditions.

The intersection turn movements and level of service is presented in Appendix C of the Traffic Study. The ICU level of service calculation sheets are presented in the Appendix D of the Traffic Study.

AM and PM Peak Hour Unsignalized Intersection Level of Service Analysis

To determine adequacy of peak-hour operations at unsignalized intersections, the HCM methodology was used. The HCM methodology evaluates conflicting flows and applies gap acceptance criteria to determine delay and level of service for stop controlled unsignalized intersection. The Unsignalized Intersection Level of Service calculation sheets are presented in Appendix E of the Traffic Study.

Alternatives Analysis

The following chapter provides an evaluation of each of the six alternatives. This analysis includes:

1. OCGP Project Trip Distribution
2. Daily Traffic Link Volume Forecasts and Volume/Capacity Level of Service Analysis
3. Peak Hour Link Analysis (for those alternatives and links which exceeded the daily thresholds)
4. Signal Warrant Analysis to determine which intersections warrant signalization and will be evaluated with Intersection Capacity Utilization level of service and which intersections will be stop controlled and evaluated per the Highway Capacity Manual unsignalized intersection level of service analysis.
5. Peak Hour Intersection Level of Service Analysis

4. Discussion of Checklist and Mitigation Measures

The Transportation Guidelines (TG) analyses are presented in Section VII of the Traffic Study.

Project Trip Distribution

The forecast OCGP 688-acre Park Development Plan trip distribution percentages provide an understanding as to where trips traveling to and from the OCGP will travel and which roadways and intersections might be affected. A select zone analysis was conducted that aggregated all of the affected TAZs associated with the proposed OCGP 688-acre Park Development Plan to determine how traffic is distributed throughout the roadway network. The OCGP 688-acre Park Development Plan trip distribution is presented in Figure 4.15-4.

Daily Traffic Forecasts and Volume/Capacity Ratio Level of Service Analysis

Based on the ITAM, daily traffic forecasts were prepared for each alternative. Utilizing these daily forecasts and daily threshold capacities from the Performance Criteria above, the daily volume to capacity ratio level of service analysis was performed.

Figures VI-2 through VI-13 of the Traffic Study present the average daily traffic and the resulting daily volume to capacity level of service for each of the six alternatives. The links, which were identified as over the daily threshold, are highlighted on the volume to capacity level of service maps.

As presented in the Figures VI-2 through VI-13 of the Traffic Study, there were six links for Alternative 1: Existing Conditions and Alternative 2: Existing plus OCGP 688 Acre Park Development Plan, which exceeded the City of Irvine's daily capacity thresholds. The addition of the OCGP traffic to the existing traffic volumes did not result in any additional links being impacted.

There were 23 links for Alternative 3: 2017 Baseline which exceeded the daily threshold. There were no project alternatives (Alternative 4 through 6), which resulted in additional links being impacted.

4. Discussion of Checklist and Mitigation Measures

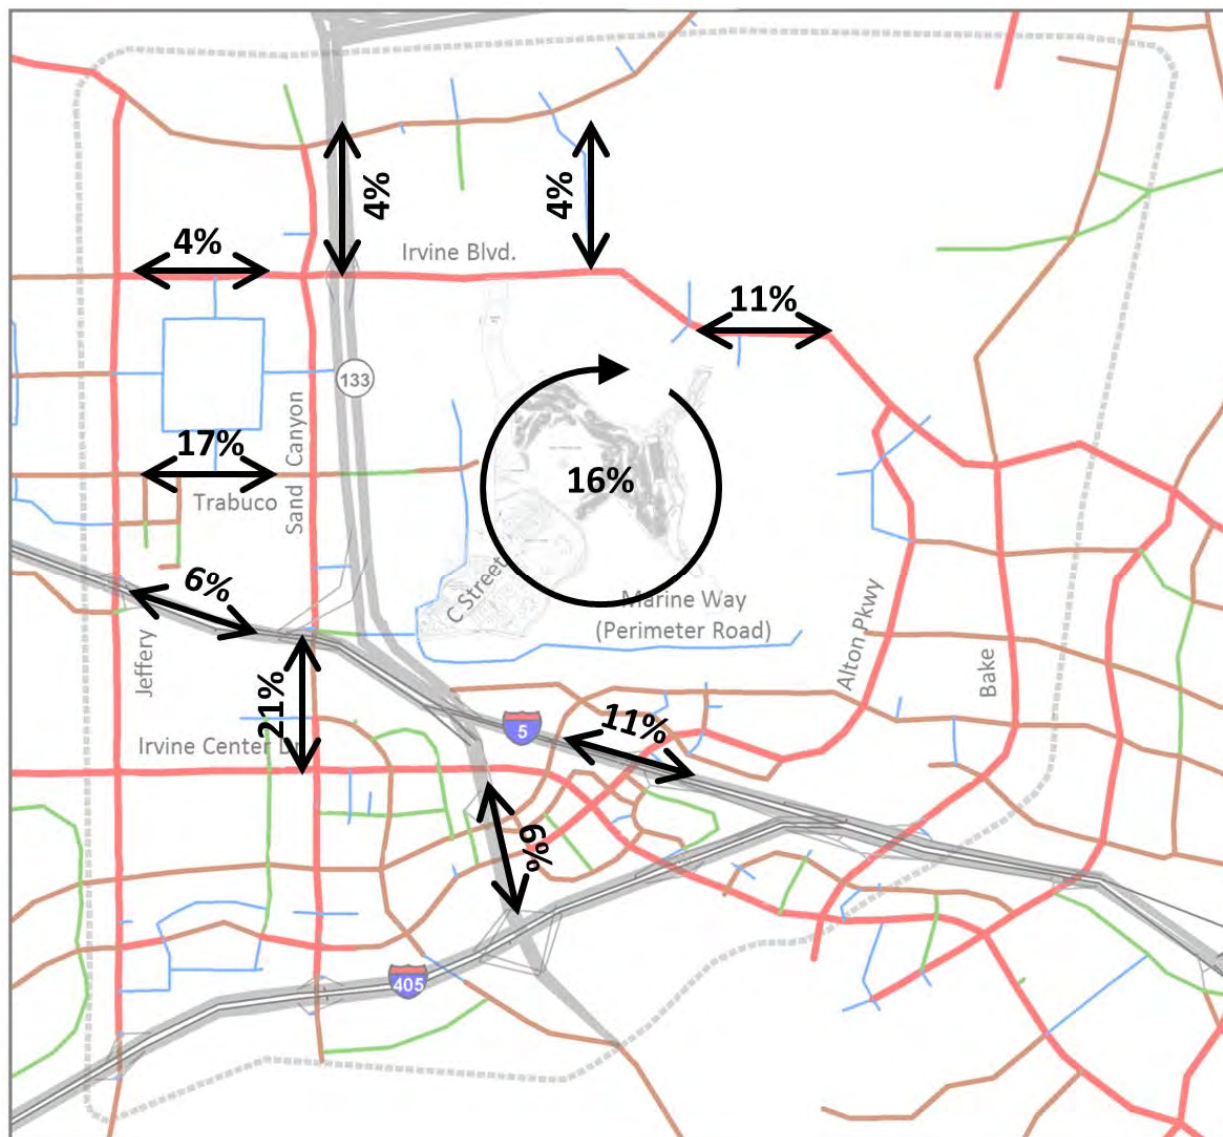

Figure 4.15-4
Great Park 688-acre Park Development Plan Trip Distribution

4. Discussion of Checklist and Mitigation Measures

AM and PM Peak Hour Link Analysis

The City of Irvine's Traffic Impact Analysis Guidelines requires an AM and PM Peak Hour level of service link analysis for links which exceed the daily threshold. Presented in Tables 4.15-2 and 4.15-3 are the AM and PM peak hour link analysis for the six roadway links for all six alternatives. Based on this analysis, all six links of the Existing and the Existing plus OCGP 688 Acre Park Development Plan resulted in acceptable AM and PM peak hour link levels of service.

In addition, all 23 links for the 2017 Baseline and all 2017 OCGP alternatives also resulted in acceptable AM and PM peak hour link levels of service.

Signal Warrant Analysis

The Traffic Study also evaluates whether each intersection will function at an acceptable levels of service. The methodology to evaluate peak hour intersection traffic for signalized intersections is Intersection Capacity Utilization. If an intersection is not signalized, then the peak hour intersection level of service analysis is based on the Highway Capacity Manual Unsignalized Intersection Level of Service analysis.

The majority of the intersections that were included in the Traffic Study are existing intersections that are already signalized. However, the project intersections included as part of the 688-Acre Park Design Plan are either currently not signalized or they have not been constructed. Therefore, to determine which, if any, of these intersections will warrant signalization, an unsignalized intersection level of service analysis was first required for all project or future intersections.

The signal warrant analysis is based on peak hour traffic volumes on the major street and the approaching minor street. Presented in Table 4.15-4 is the resulting signal warrant analysis, which shows six intersections that warrant signalization based on forecast 2017 Base No Project traffic: Intersections 558 – “O” Street at Irvine Boulevard; Intersection 559 – “O” Street at Trabuco; Intersection 560 – “O” Street at Marine Way; Intersection 561 – “LY” Street at Irvine Boulevard; Intersection 572 – Modjeska-A Street at Irvine Boulevard; and Intersection 577 - Pusan Way-Z Street at Irvine Boulevard. The signalization of these six intersections is similarly identified in the 2011 GPN VTTM traffic study as being needed for interim-year conditions. Intersection 562: Marine Way and Great Park Boulevard warrants a signal with the addition of the 688 Acre OCGP. The remaining intersections in the study area will not warrant signalization and the peak hour intersection level of service analysis is based on the Highway Capacity Manual unsignalized intersection level of service methodology. The signal warrant analysis by alternative is presented in Appendix B of the Traffic Study.

Notes: Intersections where signals are warranted are shown in **bold**.

*The 2011 GPN VTTM traffic study identified six intersections as warranting a signal in interim year conditions and is reflected in the baseline conditions.

Peak Hour Intersection Level of Service Analysis

An AM and PM peak hour intersection level of service analysis was conducted for all intersections included in the Traffic Study. The intersections that warranted signalization were evaluated based on the Intersection Capacity Utilization methodology, and intersections that did not warrant signalization were evaluated based on the High Capacity Manual unsignalized intersection level of service methodology.

The results of this analysis for all alternatives are presented in Table VI-4 of the Traffic Study. As presented, there are no existing intersections which were found to exceed the City of Irvine's acceptable level of service threshold.

In review of the 2017 alternatives, Alternative 3: 2017 No Project Baseline, there were two intersections which were found to exceed the City of Irvine's peak hour level of service threshold. These intersections are at Jeffrey Road and Alton Parkway (#291) and at Laguna Canyon Road and Lake Forest Drive (#406). The City of Irvine's criteria for determining project impacts is whether the forecast Intersection Capacity Utilization for intersections exceeding the acceptable LOS threshold is increased by 0.02 or more with the addition of project traffic or if the LOS goes from acceptable to unacceptable LOS. Based on the Intersection Capacity Utilization analysis, there were no OCGP 688 Acre Park Development Plan alternatives (Alternatives 4-6) which added to existing deficiencies at either of these two intersections. Therefore, there are no intersection level of service impacts from the project.

4. Discussion of Checklist and Mitigation Measures

Special Issues – Transportation Guidelines

Transportation Guidelines (TG)

The traffic analysis includes the evaluation of Project intersections based on the Transportation Guidelines (TGs), July 30, 1993, to determine consistency with the City's design requirements. Specific design elements to be evaluated include turn-pocket lengths (TG-1), signal spacing (TG-7), distance between driveways and intersections (TG-8), corner clearance (TG-9), left-turn in/out access (TG-10), right turn lanes at driveways (TG-11), signal warrants (TG-13), and driveway length (TG-15).

As previously presented, the signal warrant analysis (TG-13) was conducted for project intersections for each alternative and intersection to determine whether the intersection warranted being signalized and evaluated with the ICU capacity analysis methodology, or unsignalized, HCM methodology. Therefore, the following presents the analysis of the remaining Transportation Guidelines.

TG-1 Turn Lane Pocket Lengths

The lengths of left-turn pockets at signalized intersections are based on several parameters, including traffic control, turn volume, and cycle length.

The purpose of the turn pocket length is to allow the turning vehicle to exit the through movement and decelerate into the turn pocket without impacting the through movement. The minimum single-turn pocket length for Commuter and Local streets is 90 feet. For Major, Primary, and Secondary arterials, the minimum allowed left turn pocket is 150 feet. The maximum length of a single left turn pocket is 300 feet. For purposes of this analysis, a conservative 120-second cycle length, 10% truck mix, and 95% confidence level have been assumed.

For each intersection, the required left turn bay length was identified according to TG guidelines. Consistent with NITM Program traffic studies, where pocket lengths exceed the standard 150 feet for public arterials or 90 feet for commuter and local roadways, the recommended length is based on 1-foot per peak hour left-turn volume (highest of AM and PM) and rounded into increments of 10 feet. The resulting left turn pocket storage requirement for each signalized intersection and alternative is presented in Table VII-1 of the Traffic Study.

At Great Park Boulevard (West) and Marine Way (562), dual 250-foot eastbound turn lanes are a design feature of the Project.

Based on the 2017 analysis, there was one other left turn pocket length demand which exceeded the 300-foot threshold. This was the westbound left turn lane from Irvine Boulevard to "Z" Street/Pusan Way (577). This left turn lane is not recommended to be widened to two lanes because this intersection will operate at an acceptable LOS (LOS A/B) with a single westbound left-turn lane. Additionally, the OCGP Access Study indicates that the westbound left turn demand drops significantly at Post 2030 buildout with additional anticipated network improvements, and a single westbound left turn lane will operate acceptably.

5. Discussion of Checklist and Mitigation Measures

TG-7 Distance Between Signalized Intersections

Adequate separation between signalized intersections along highways is a key parameter for maintaining signal progression. Marine Way is a Primary Highway with a desirable spacing of one mile between signalized intersections and a minimum of one-half mile between signalized intersections.

The intersection of "O" Street and Trabuco Road (#559) warrants a signal in the 2017 Baseline No Project Alternative as well as in all With Project alternatives. The distance between these two future signalized intersections exceed the minimum thresholds as presented in Table 4.15-5.

Based on the findings of the Traffic Study, there are three signals proposed along Marine Way: at "O" Street, Great Park Boulevard (West), and Great Park Boulevard (East). The distances between both sets of signals exceed the minimum spacing requirements.

Table 4.15-5. Distances between Signalized Intersections

Street	From	To	Desirable	Minimum Distance	Measured Distance	Exceeds Minimum Spacing
Marine Way	"O" Street	Great Park Boulevard West	2,640	1,320	3,000	Yes
	Great Park Boulevard West	Great Park Boulevard East (build-out condition)	2,640	1,320	3,750	Yes
"O" Street	Marine Way	Trabuco Road	1,320	400	3,900	Yes

TG-8 Distance Between Driveways and Intersections

Driveway and intersection spacing requirements are provided in TG-8. The minimum separation for Primary Highways is 230 feet (Marine Way), for Secondary Highways is 185 feet ("O" Street), for Commuter Streets is 150 feet, and for Local Streets is 105 feet. As presented in Figure VII-1 of the Traffic Study, all driveways equal or exceed the minimum TG-8 requirement for distances between intersections and driveways.

TG-9 Corner Clearance

TG-9 ensures that access driveways do not interfere with nearby signalized intersections. The following items are considered for each unsignalized driveway that is adjacent to one or more signalized intersections:

1. Downstream right turn considerations (right turns at the nearest adjacent intersection must not back up as to the unsignalized driveway);
2. Downstream left turn considerations (right turning vehicles must be able to adequately maneuver into the left turn lane at the nearest adjacent intersection); and
3. Sufficient spacing for major street left turn bays.

4. Discussion of Checklist and Mitigation Measures

There is only one stop controlled driveway that could potentially impact a future signal. This is the proposed right-in and right-out access at driveway 669, which is 600 feet west of the future proposed intersection of Marine Way and Great Park Boulevard West (562). The 600 feet between this driveway and the intersection of Great Park Boulevard West allows sufficient distance to avoid right turn queue interference and adequate distance to merge to the left turn lane, if needed.

TG-10 Left Turn In / Left Turn Out Access

TG-10 provides procedures to determine whether left-in only or left-in/left-out access at unsignalized intersection locations will be considered along Major, Primary, Secondary, and Commuter streets. This procedure has been used along with Highway Capacity Manual unsignalized level of service analysis to determine the appropriate configurations.

Presented in Table 4.15-6 is the Left Turn In and Left Turn Out access analysis for project intersections for Alternatives 4 through 6, which include the 2017 plus Great Park 688 Acre Park Development Plan alternatives. As presented in Table 4.15-6, left turn in and out movements can be accommodated for all alternatives and intersections.

Table 4.15-6. Left Turn In and Out Access Analysis

Alternatives	Int. ID	Intersection Name	Conflicting Left In Volume AM (PM)	Left In Volume AM (PM)	Conflicting Left Out Volume AM (PM)	Left Out Volume AM (PM)	Left In & Out Acceptable

TG-11 Right Turn Lanes at Driveways

Right turn lanes are required at unsignalized driveways on Major, Primary, and Secondary roadways when the turn volumes and through volumes could conflict and increase the potential for accidents. TG-11 provides guidelines for when right turn lanes are required at unsignalized driveways. TG-11 does not require right turn lanes on Commuter roadways.

5. Discussion of Checklist and Mitigation Measures

Ideally, TG-11 should be based on buildout conditions and not interim year 2017 conditions as future year additional traffic might result in a threshold to be exceeded. Therefore, the ultimate improvement should be provided when the project is constructed as presented in Table 4.15-7.

Table 4.15-7. Right Turn Lanes at Driveways (Post 2035 Forecasts)

Alternatives	Int. ID	Intersection Name	Conflicting Left In Volume AM (PM)	Left In Volume AM (PM)	Threshold Exceeded
Alternative 4 Post 2035 Base + 688 Acre GP	576	O St./C St. (South)	8 / 73	200	No
	655	O St./8 th St.	10 / 38	200	No
	663	O St./Ice Rink/Picnic Area	2 / 4	200	No
	669	Marine Way & Parking Area 8 RIRO	10 / 170	100	No*

	669	Marine Way & Parking Area 8 RIRO	10 / 170	100	No*

* A project design feature of a 250-foot right turn pocket is proposed.

There are three project driveways/intersections along “O” Street. “O” Street is designed as a Secondary Highway which requires a right turn lane if either the AM or PM peak hour volumes exceeds 200. Based on the findings of the Traffic Study, right turn volumes are below the threshold and a right turn lane is not required.

At the Marine Way right in/right out driveway (669), located west of Great Park Boulevard that provides access to Parking Area 8, a 250-foot long westbound right turn lane will be provided as a design feature of the Project.

TG-15 Driveway Length

Primary driveways should be of sufficient length to allow vehicles to enter the parking area without causing subsequent vehicles to back out onto City streets. Driveways should be measured from the back of the sidewalk or the stop bar exiting the site to the near curb line of the first intersection parking stall or traffic control measure (internal drive aisle or pedestrian crosswalk) located on site. The minimum driveway length is based on one foot per entering vehicle rounded up to the next 25-foot.

Based on the findings of the Traffic Study, the resulting driveway lengths for each project access are presented in Table 4.15-8.

4. Discussion of Checklist and Mitigation Measures

Table 4.15-8. Driveway Length Requirements

673	Parking Area 9 (East)/GP Blvd. (E/W)	120 (140)	150	120 (140)	150	124 (130)	150

Special Issues – Alternative Access to Parking Areas 3 and 4

The analysis evaluated two “T” intersection access locations on “C” Street to Parking Area 4 (664 and 665) and one access to Parking Area 3 (675). None of the three intersections warranted a signal, all had acceptable levels of service, and all met each of the Transportation Guidelines (TG).

As part of the design process for the OCGP, an alternative has been proposed to create two full access intersections along “C” at 664 and 665 that would provide access to both Parking Area 3 and 4. With this alternative, the intersection at 675 would be eliminated.

To determine if the proposed access alternative would result in any impacts, a sensitivity analysis was conducted which includes the following:

1. Post 2035 Project Intersection and Driveway Geometry
2. Signal Warrant Analysis (TG-13)
3. Intersection Level of Service Analysis
4. TG-1: Turn Lane Pocket Lengths
5. TG-8: Distance Between Driveways and Intersections

5. Discussion of Checklist and Mitigation Measures

6. TG-10: Left Turn In/Out Access
7. TG-11: Right Turn Lanes at Driveways
8. TG-15: Driveway Length

Project Intersection and Driveway Geometry

The proposed project intersection and driveway geometry for the “C” Street north intersection (664) and south intersection (665) is presented in Figure VIII-1 of the Traffic Study. As presented, these intersections would include one lane for all approaches that provide for left, through and right turn movements. “C” Street would not be stop controlled, but all driveway approaches from Parking Area 3 and 4 would be stop controlled.

Signal Warrant Analysis (TG-13)

A signal warrant analysis was conducted for both intersections as presented in Appendix F of the Traffic Study and intersection lane geometrics as presented in Figure VIII-1 of the Traffic Study. The Signal Warrant worksheets for each alternative and intersection are included in Appendix F of the Traffic Study. As presented in Table 4.15-9, neither intersection warrants a signal.

Table 4.15-9. Special Issue - “C” Street and Parking Areas 3 & 4 Signal Warrant Analysis

Int. ID	Intersection Name	AM Peak Hour Volumes		PM Peak Hour Volumes		Signal Warrant
		(Dir)	(Dir)	(Dir)	(Dir)	
664	C St./Parking Area 3 & 4 North	120 (NB/SB)	7 (WB)	126 (NB/SB)	69 (WB)	No
665	C St./Parking Area 3 & 4 South	100 (NB/SB)	5 (EB)	114 (NB/SB)	46 (WB)	No

Intersection Level of Service Analysis

An unsignalized intersection level of service analysis was conducted for each of the two intersections. The Level of Service work sheets are presented in Appendix F of the Traffic Study and the resulting intersection level of service at each intersection is presented in Table 4.15-10.

Table 4.15-10. Special Issue – “C” Street and Parking Areas 3 & 4 Intersection LOS

Int. ID	Intersection Name	Control	Special Issue – Parking Areas 3 & 4 Intersection Level of Service Analysis	
			(Dir)	(Dir)
664	C St./Parking Area 3 & 4 North	TWSC	9.7 / 10.0 Seconds	A / B
665	C St./Parking Area 3 & 4 South	TWSC	9.4 / 9.3 Seconds	A / A

As presented, both intersections will operate at acceptable level of service.

4. Discussion of Checklist and Mitigation Measures

TG-1 Turn Lane Pocket Lengths

The length of left turn lanes is based on peak hour left turn volumes for intersections which warrant left turn lanes. The aligned intersections of 664 and 665 along “C” Street operate with acceptable levels of service with single lane that serves left, through and right turns. Therefore, determining the length of the turn lane is not required.

TG-8 Distance Between Driveways and Intersections

Driveway and intersection spacing requirements are provided in TG-8. The minimum separation for driveways and intersections on Commuter Streets is 150 feet and for Local Streets is 105 feet. As presented in Figure VIII-2 of the Traffic Study, the distances between the “C” Street and Parking Area 3 & 4 North and Parking Area 3 & 4 South exceeds the minimum requirements for a Commuter or Local Street. These two driveways also exceed the minimum distance requirements between “C” Street and “LV” Street and “C” Street and 8th Street.

TG-10 Left Turn In/Out Access

TG-10 determines whether left-in only or left-in/left-out access at unsignalized intersection locations will be considered along Major, Primary, Secondary, and Commuter streets.

Presented in Table 4.15-11 is the Left Turn In and Left Turn Out access analysis for the “C” Street driveways and Parking Area 3 and 4 North and Parking Area 3 and 4 South. As presented, both intersections will accommodate forecast left in and out turn movements.

Table 4.15-11. Special Issue – TG-10: Left Turn In/Out Access

Int. ID	Intersection Name	Conflicting Left In Volume AM (PM)	Left In Volume AM (PM)	Conflicting Left Out Volume AM (PM)	Left Out Volume AM (PM)	Left In & Out Acceptable
664	C St./Parking Area 3 North	67 / 34	- / -	113 / 182	1 / 1	Yes / Yes
	C St./Parking Area 4 North	18 / 25	33 / 35	114 / 120	2 / 5	Yes / Yes
665	C St./Parking Area 3 South	60 / 23	2 / 1	99 / 154	1 / 5	Yes / Yes
	C St./Parking Area 4 South	31 / 88	7 / 2	100 / 113	1 / 2	Yes / Yes

TG-11 Right Turn Lanes at Driveways

Right turn lanes are required on major, primary and secondary roadways if peak hour right turn volumes exceed the TG’s minimum volume warrant. “C” Street is a Commuter roadway and right turn lanes are not required.

TG-15 Driveway Length

Primary driveways should be of sufficient length to allow vehicles to enter the parking area without causing subsequent vehicles to back out onto City streets. The minimum driveway length is based on one

5. Discussion of Checklist and Mitigation Measures

foot per entering vehicle rounded up to the next 25-foot. The resulting driveway lengths for the Parking Area 3 and 4 North and the Parking Area 3 and 4 South on “C” Street are presented in Table 4.15-12.

Table 4.15-12. Special Issue – TG-15: Drive Length

Int. ID	Intersection Name	Entering AM (PM) Peak Hour Volumes	Minimum Driveway Length
664	C St./Parking Area 3 North	12 (18)	25
	C St./Parking Area 4 North	39 (39)	50
665	C St./Parking Area 3 South	9 (12)	25
	C St./Parking Area 4 South	23 (44)	50

Special Issues – Alternative Travel Modes

Pedestrian and Bicycle Circulation

When complete, the OCGP will include a comprehensive trail network for bicyclist and pedestrians. The proposed bicycle and pedestrian connectivity plan is illustrated in Figure VIII-1 of the Traffic Study. As presented, the Project will include an internal trail network, Class I (Off-Street) trails, as well as other off-street trails.

Pedestrian and bicycle connections are also available along the Timeline. Bicycles are considered as part of the mixed-flow on the Timeline and are not intended to be confined to a specified bicycle lane. Pedestrian connections are provided between existing uses in the Western Sector Park Development Plan and to future development areas in the OCGP.

Almost the entire pedestrian network provides the user the ability to walk without having to cross any major roadways.

General Plan Policies (A, B, and C)

At buildout, the OCGP will provide a comprehensive trail network for pedestrians and bicyclists. In the interim condition, with the development of the OCGP 688 Acre Park Development Plan, the initial elements of the plan framework will be developed.

Objective B-3, Pedestrian Circulation

- ***Policy (a):*** Link residences with schools, shopping centers, and other public facilities, both within a planning area and to adjacent planning areas, through an internal system of trails.

Bicycle connections between the OCGP and neighborhood residences, schools, shopping centers, and other public facilities are important. The project includes an extensive internal trail network and will provide connections to regional trails, as well as the surrounding Great Park Neighborhoods development.

4. Discussion of Checklist and Mitigation Measures

- **Policy (b):** *Require development to provide safe, convenient, and direct pedestrian access to surrounding land uses and transit stops. Issues such as anticipated interaction between pedestrians and vehicles, proposed infrastructure improvements and design standards shall be considered.*

Presented in the Connectivity Plan (Figure VIII-1 of the Traffic Study) are locations of pedestrian entry points and potential transit stops. These entry points and transit stops are connected to the park through the extensive hierarchy of pedestrian and bicycle trails.

- **Policy (c):** *Design and locate land uses to encourage access to them by non-automotive means.*

The project proposes an extensive internal pedestrian and bicycle system, which will provide easy pedestrian and bicycle connections from one area of the park to another. Several large parking areas are provided rather than many smaller lots, allowing visitors to park and access various uses through other non-automotive means. Non-automotive access is facilitated by regional transit opportunities via the Irvine Station and OCTA will be encouraged to provide direct drop offs to the park, additionally the City's trail system will provide multiple points of access to park uses.

Objective B-4, Bicycle Circulation

Similar the discussion above, the OCGP has an extensive system of all types of bicycle trails and paths for bicyclist. The OCGP 688 Acre Park Development Plan provides the second phase of the improvements along with the Western Sector Park Development Plan area, and will be complemented with the future Cultural Terrace.

- **Policy (a):** *Use the Trails Network diagram as a basis for detailed planning of the bicycle trail system. Detailed planning shall occur though the development process outlined in the City's Zoning and Subdivision Ordinances.*

The internal bicycle and pedestrian system provides connections to Class I (Off-Street) and Class II (On-Street) trails consist with the City of Irvine trail network.

- **Policy (b):** *Require a system of bicycle trails, both on and off street, in each planning area. Such trails shall be linked to the system shown in Figure B-4. The on street trails shall be designed for the safety of the cyclist.*

The internal trail system is consistent with trail network shown on General Plan Figure B-4 (Trails Network). The internal bicycle trails within the OCGP has minimal vehicle conflicts for increased level of safety. These paths are integrated with the existing development from the Western Sector Park Development Plan. Where bicycle trails interact with vehicles, appropriate classification design will be implemented.

- **Policy (c):** *The trail system shall be designed to accommodate cyclists of all levels of experience and shall provide for both recreation and transportation.*

5. Discussion of Checklist and Mitigation Measures

The bicycle paths and trails will provide opportunities for all levels of experience from the easy and safe cycling along a Class I Trail.

- **Policy (d):** *Require bicycle trail linkages between residential areas, employment areas, schools, parks, community facilities, commercial centers and transit facilities.*

Class I (Off-Street) Trails as well as other pedestrian trails will be provided as a part of the development of the OCGP. These trails provide linkages connecting to the City's existing trail system and expanded trail network for future development areas such as the Irvine Station, surrounding Great Park Neighborhoods development and commercial uses nearby.

- **Policy (e):** *Require pedestrian and bicycle circulation plans detailing access to the subject property and adjacent properties in conjunction with new development.*

The OCGP Pedestrian and Bicycle network will provide connections to the Great Park Neighborhoods development and to the future Marine Way improvements.

- **Policy (f):** *Require the bicycle trip destinations, including community facilities, commercial centers, and transit facilities to be equipped with appropriate bicycle facilities, including but not limited to the provision of showers and bike racks.*

The OCGP is a recreational destination with extensive bike trail connectivity to the park and trails within the park for bike use; therefore, it will include bicycle facilities, including bike racks within the park. In addition, the OCGP will participate in the future "Orange Bike Program" which emphasizes connecting the Great Park Neighborhoods to the OCGP.

- **Policy (g):** *Require traffic control devices and traffic signal phasing for bicycle crossing, turning and through movements.*

No traffic control devices, such as traffic signals, are proposed within the OCGP 688 Acre Park Development Plan.

- **Policy (h):** *Require grade separated crossing for Class I bikeways at major intersections, wherever feasible, to increase safety and efficiency.*

No grade separated crossings are proposed.

- **Policy (i):** *Provide off-street bicycle trails in areas with minimal cross traffic, such as open space spine, flood control and utility easements where possible.*

As stated previously, the entire OCGP will provide a comprehensive off-street bicycle path and trails network with very limited cross traffic.

- **Policy (j):** *Support programs to increase public awareness of bicycle safety and bicycling as an alternative mode of transportation.*

4. Discussion of Checklist and Mitigation Measures

A wide-variety of programs will be offered through the OCGP to educate the public on alternative modes of transportation. Bicycling and bicycling safety will be an important topic, which will be available at various events and kiosks located around the park as well as a bike sharing program.

- ***Policy (k):*** *Incorporate, where appropriate, school and park locations within the design of the bikeway system.*

The OCGP is a park and incorporates a comprehensive bikeway system.

Transit

Transit is an important element of the transportation mobility opportunities for the OCGP. With buildout of the OCGP, transit will provide regional and local access to and from the park. The OCTA bus transit service will be both permitted and encouraged to enter the OCGP and provide passenger drop-offs and pick-ups at the various sites. Special transit service for key events is also anticipated.

Riding and Hiking

There are no proposed riding or hiking trails within the OCGP 688 Acre Park Development Plan. However, these facilities are proposed in subsequent phases of development.

Conclusions and Recommendations of the Traffic Study

Based on the OCGP 688-acre Park Development Plan Traffic Study, the following findings are summarized.

- The OCGP 688 Acre Park Development Plan will generate approximately 5,444 daily trips. This trip generation will not result in significant impacts to the local and regional roadway network.
- Under existing conditions, there are six links where the existing traffic volume to capacity ratio exceeds the City Standards. Based on the peak hour volume to capacity ratios, all six links are within City level of service standards. The proposed OCGP 688-acre Park Development Plan does not result in any additional links to fail the City volume to capacity ratio standards.
- Based on the Existing Conditions ICU level of service analysis, there are no intersections that exceed the City of Irvine level of service standards. All intersections continue to operate at acceptable conditions with the addition of the OCGP 688-acre Park Development Plan traffic.
- Based on Alternative 3, the 2017 Baseline alternative without the OCGP 688-acre Park Development Plan (i.e., 2017 No Project), there are 23 arterial links which will have volume to capacity ratios which exceed the daily thresholds. Based on the peak hour link analysis, all 23 links will result in acceptable peak hour volume to capacity ratios.
- There are no additional links that will exceed the daily thresholds with any of the 2017 OCGP 688-acre Park Development Plan alternatives. All 23 peak hour links will result in acceptable peak hour volume to capacity ratios.

5. Discussion of Checklist and Mitigation Measures

- Based on the 2017 Conditions ICU level of service analysis, there are no intersection level of service impacts from the proposed Project.
- There are six intersections in which signalization is assumed in the 2017 Base No Project condition: Intersections 558 – Ridge Valley/"O" Street at Irvine Boulevard; Intersection 559 - "O" Street at Trabuco; Intersection 561 – "LY" Street at Irvine Boulevard; Intersection 560 – "O" Street at Marine Way; Intersection 572 – Modjeska-A Street at Irvine Boulevard; and Intersection 577 - Pusan Way-Z Street at Irvine Boulevard. The signalization of these six intersections is previously identified in the 2011 GPN VTTM Traffic Study as being needed for interim-year conditions.
- The OCGP 688 Acre Park does not warrant any additional signals with the Baseline 2017 plus 688 Acre OCGP alternatives. At "O" Street and 8th Street, while a signal is currently not warranted, the permanent location of a future Fire Station in the vicinity will likely require that this intersection be signalized. At "O" Street and "C" Street, while a signal is also currently not warranted, the left in/left out analysis for Post 2035 (see OCGP Access Study) presents left turn volumes that exceed thresholds. A traffic signal would provide the necessary gaps to address the left turn volumes and therefore should be considered. The ultimate determination of traffic signals at these locations is subject to the review and approval of the City Engineer."
- For Marine Way at Great Park Boulevard (562), dual 250-foot eastbound turn lanes are a design feature of the Project.
- The OCGP 688 Acre Park Development Plan as proposed will accommodate adequate signal spacing between signalized intersections (TG-7), adequate distance between driveways and intersections (TG-8), and adequate corner clearance (TG-9). All proposed left turn in and out intersections and driveways are acceptable.
- At the Marine Way right in/right out driveway located west of Great Park Boulevard (669), a 250-foot westbound right turn lane is a design feature of the Project.

The Traffic Study analyzed the potential impacts from the OCGP 688-acre area, which includes the Bosque and Sports Park Districts where the proposed Modifications to the OCGP Improvement Area occur; and therefore, it includes the traffic and access related impacts of the proposed Project. Additionally, the proposed Project, reducing the number of sports courts, expanding passive recreational area, relocating some of the Improvement Area components to optimize visibility, access and efficiency, and assessing adequacy of parking plan, would not introduce new uses that would impact traffic, circulation and access within the proposed Project area. Therefore, the traffic related impacts of the proposed Modifications to the OCGP Improvement Area would be less than significant.

Major FEIR Revisions Not Required. Based on the foregoing analysis and information, there is no evidence that the changes to the project require a major change to the OCGP FEIR. The proposed Modifications to the OCGP Improvement Area, which does not include any major change to park development areas identified in the approved OCGP Master Plan, will not result in any new significant environmental impact nor is there a substantial increase in the severity of impacts from that described in the OCGP FEIR.

4. Discussion of Checklist and Mitigation Measures

No Substantial Change in Circumstances Requiring Major FEIR Revisions. There is no information in the Modifications to the OCGP Improvement Area or otherwise available indicating substantial changes in circumstances that would require major changes to the OCGP FEIR.

No New Information of Substantial Importance Showing Greater Significant Effects Than Previous FEIR. All available relevant information has been analyzed, and there is no new information of substantial importance, which was unknown and could not have been known with the exercise of reasonable diligence at the time the OCGP FEIR was approved, augmented, and/or updated, indicating that the proposed Project would have one or more significant effects not discussed in the OCGP FEIR or result in a substantial increase in the severity of previously identified effects.

No New Information of Substantial Importance Showing Ability to Reduce Significant Effects in Previous FEIR. All available relevant information has been analyzed, and there is no new information of substantial importance, which was unknown and could not have been known with the exercise or reasonable diligence at the time the OCGP FEIR was approved, augmented, and/or updated, indicating that: (1) mitigation measures or alternatives previously found not to be feasible would in fact be feasible, and would substantially reduce one or more significant effects of the proposed Project, but the project proponent declines to adopt the mitigation measures or alternatives; or (2) mitigation measures or alternatives that are considerably different from those analyzed in the previous FEIR would substantially reduce one or more significant effects on the environment, but the proposed project proponent declines to adopt the mitigation measures or alternatives. There are no alternatives to the proposed Project or additional mitigation measures that would substantially reduce one or more of the significant transportation/circulation-related effects identified in and considered by the OCGP FEIR.

4.15.4 Mitigation from the OCGP FEIR and Applicability to the Modifications to the OCGP Improvement Area

The OCGP FEIR identified Mitigation Measures TRAN1 through TRAN8 which, if fulfilled prior to specified development approvals, would eliminate or substantially reduce the traffic and circulation effects of development under the adopted Master Plan. The SEIR proposed that several mitigation measures from the certified OCGP FEIR be deleted (because they have been completed or they are no longer necessary in light of the NITM Program and new mitigation measures being proposed for Modified Project-specific impacts identified in the Traffic Study for the Modified Project). Mitigation Measure TRAN 1 would be carried forward for this project; however, it was modified by the City and approved as shown with 2nd AVTTM 17008 (PC Resolution 11-3109). References to PA 30 were proposed to be removed since the 2012 Modified Project's proposed GPA/ZC consolidated PAs 30 and 51 into one PA to be designated Combined PA 51.

Of the Mitigation Measures listed below, applicable measures will be incorporated into the proposed Project upon project implementation.

TRAN1 Prior to the approval of any final map of a subsequent subdivision map (other than a financing and conveyance map) for any land use, excluding single family land uses (single family land use includes single family detached and single family attached projects), parks, schools, daycare, and religious institutions, that allocates building intensity within Combined Planning Area 51, the landowner or subsequent project applicant shall either (i) apply for annexation of

5. Discussion of Checklist and Mitigation Measures

any areas within the final map to the Irvine Spectrum Transportation Management Association (TMA) ("Spectrumotion") in accordance with Article X of the recorded Declaration of Covenants, Conditions and Restrictions (CC&Rs) for the Irvine Spectrum TMA, including any supplementary or amended CC&Rs, to reduce traffic, air quality and noise impacts or (ii) develop and implement a similar transportation management plan containing the elements and meeting the criteria described below as approved by the Director of Public Works. The transportation management plan shall be implemented via payment of assessment dues to an organization similar to Spectrumotion for all land uses, with the exceptions noted above. While affordable housing units will be included, their assessment fees will be covered by other remaining adjacent land uses. The implementation (payment of assessment dues) for either option described above shall occur prior to issuance of building permit(s):

Transportation Management Plan (TMP)

The development and implementation of a Transportation Management Plan is an identified mitigation measure to manage transportation access for Combined Planning Area 51. This document summarizes the key elements of the TMP.

A. Introduction

The purpose of this document is to provide an outline for a comprehensive TMP for the Combined Planning Area 51 ("Great Park TMP"). This report is not intended to provide the specific details of the plan, but rather to highlight the key components and provide direction for subsequent detailed planning and implementation activities. When preparation of the TMP is undertaken, all of the agency and stakeholders will be invited to provide input.

The applicant may elect to annex Combined PA 51 into the Irvine Spectrum Transportation Management Association (Spectrumotion). Spectrumotion is a private, non-profit Transportation Management Association (TMA) formed to reduce traffic congestion in Irvine Spectrum. Spectrumotion promotes, markets, and subsidizes alternatives to solo-commuting and assists the business community in complying with trip reduction related requirements. Membership is mandatory to property owners with deed restrictions requiring participation in the TMA. Membership dues provide the funding for the Association and its programs, which offer a variety of employer and commuter services focused on reducing vehicular trip generation.

In the event that applicant elects not to annex into Spectrumotion, a TMP similar to that provided by Spectrumotion will be developed and implemented. This document sets forth the components of the TMP should it be necessary.

B. Transportation Management Plan Framework

The key elements of the Great Park TMP are set forth below:

New Hire Orientation: Inform newly-hired employees of commuting services available to them.

Public Transportation Pass Sales: Provide a central location for purchase of passes to available transit services (i.e., OCTA buses, Metrolink, Amtrak, etc.).

4. Discussion of Checklist and Mitigation Measures

Vanpool and Carpool Formation Assistance: Perform all of the administrative work necessary to establish van pools and car pools.

Onsite Promotions: Hold rideshare promotions at work sites and assist in employer assistance promotions.

Telecommuting/Alternative Work Schedule Consulting: Assist employers in developing and implementing a telecommuting or alternative work schedule program.

Personalized Commute Consulting: Provide a personalized commute profile to any commuter, which includes carpool match list containing the names of other commuters in the North Irvine Sphere that live and work near each other.

Website: Maintain a website with all of their program information available.

Rideshare Promotions: Conduct high visibility rideshare promotions as a means to advertise its services.

Subsidies: To the extent financially feasible, offer subsidies to assist in the formation of vanpools, the formation of carpools, and to encourage the trying of transit services.

Public Agency Coordination: Work closely with various public and quasi-public agencies to improve bus and commuter rail service to the Spectrum and North Irvine Sphere areas.

C. Transportation Management Plan Implementation

As part of the TMP, a process will be established to monitor its effectiveness in reducing peak hour trip generation in the Combined PA 51. Provision shall be made for the Plan to be modified as appropriate to enhance its effectiveness.

TRAN2 Following adoption of a land use plan and circulation plan for the Great Park property and before the issuance of any building permits within the base property, the City of Irvine shall request a cooperative study with OCTA and other affected jurisdictions to amend the Orange County Master Plan of Arterial Highways (MPAH). Marine Way, Trabuco Road from the SR-133 toll way to "O" Street/(formerly College Road), and Ridge Valley (formerly Y Street) should be included on the MPAH.

TRAN3 Prior to issuance of the first building permit for dwelling units or non-residential square footage, a Fee Reallocation Study shall be completed to recalculate the NITM Fees, reflecting any fair share allocation modifications. The landowner or subsequent property owner shall submit the Fee Reallocation Study under a separate cover to be approved by the Director of Public Works in consultation with the NITM Advisory Committee.

TRAN4 Prior to approval of the last final map for the Modified Project (or any portion thereof in the event that the final map is approved in multiple phases), the landowner or subsequent property owner shall pay the costs of the following mitigation in an amount to be mutually agreed upon

5. Discussion of Checklist and Mitigation Measures

between the landowner or subsequent property owner and the City and reflective of the costs of the mitigation at the time of payment:

- 286 Jeffrey Road & Roosevelt: Restripe the eastbound approach to provide a shared through/right turn lane.
- 361 Bake Parkway & Portola Parkway: Restripe the northbound approach to provide a share through/left lane (which currently exists as a through lane) and modify the traffic signal for a north/south split phase signal operation. Alternatively, restripe the northbound approach to provide dual left-turn lanes in combination with a single through lane and single right-turn lane, and modify signal operation to include northbound right-turn overlap phase.
- 374 Lake Forest & Portola Parkway (Pending Projects analysis impact): Convert the existing northbound approach from de-facto right-turn to a dedicated right-turn, and modify the existing traffic signal operation to include right-turn overlap phase.

The following additional mitigation measures were proposed in the SSEIR:

TRAN5 (For specific Project-related non-NITM improvements): In conjunction with the submittal of any tentative tract maps/tentative parcel maps for the Project within Combined PA 51, the landowner or subsequent project applicant shall prepare, subject to review and approval of the City, the required tentative tract map/tentative parcel map (TTM/TPM) level traffic study per City Resolution No. 03-61. This Traffic Study will verify whether the intersection locations listed below, which have been identified as impacted in this SSEIR, are projected to be impacted by the subject project of the Interim Year Analysis. For those intersections impacted by subject project of the TTM/TPM Traffic Study, the tentative tract map/tentative parcel map will be conditioned to construct the necessary improvements that have been identified in the TTM/TPM Traffic Study. For those intersections listed below, which are not projected to be impacted by the subject project of the TTM/TPM Traffic Study, and prior to approval of the last final map for the 2012 Modified Project (or any portion thereof in the event that the final map is approved in multiple phases), the land owner or subsequent property owner shall construct, pay fair share of the costs or enter into an agreement with the City to establish the mechanism in which the funds generated by the fair share mitigations shall be provided and utilized by Caltrans, City of Lake Forest, City of Tustin and/or City of Irvine toward implementing the improvements.

- 16. Newport & Irvine – Modification of signal to provide a northbound right turn overlap phase. (2030, Option 2) Improvement no longer needed if Pending projects are approved.
- 54. Browning & Irvine – Application of ATMS, subject to approval by City of Tustin. (2030, Options 1 & 2)
- 221. Culver & Bryan – Addition of a westbound defacto right turn lane. (2030, Option 2) Improvement no longer needed if Pending projects are approved.

4. Discussion of Checklist and Mitigation Measures

- 286. Jeffrey & Roosevelt – Conversion of the eastbound shared through/right lane into a through lane and addition of a second right turn lane. (Post-2030, Options 1 & 2)
- 290. Jeffrey & Barranca – Application of PA9C-identified ATMS. (2030. Options 1 & 2)
- 291. Jeffrey & Alton – Provision of an eastbound standard right-turn lane with right-turn overlap resulting in an ultimate eastbound lane configuration of 2 left-turn lanes, 2 through lanes, and 1 right-turn lane. (Post-2030, Options 1 & 2)
- 303. Sand Canyon & I-5 NB ramp/Marine Way – Conversion of the northbound defacto right turn lane to a standard right turn lane with right turn overlap signal operation. (2030, Options 1 & 2)
- 306. Sand Canyon & Oak Canyon - Fair Share contribution towards – conversion of the westbound shared through/right lane to a single through lane and conversion of the westbound right-turn lane into a free-right turn lane, as identified in the PA40/12 GPA/ZC. (2030, Options 1 & 2) Improvement no longer needed if Pending projects are approved.
- 321. Laguna Canyon & Old Laguna Canyon – Application of ATMS, subject to approval by the Director of Public Works. Alternate improvement is the addition of a fourth northbound through lane. (Post-2030, Options 1 & 2) Improvement no longer needed if Pending projects are approved.
- 366. Bake & Rockfield – Fully funded LFTM improvement: Conversion of a westbound through lane to a third left turn lane. (2030, Options 1 & 2)

TRAN6 (For specific Project-related NITM improvements): The NITM Program provides a funding mechanism for the coordinated and phased installation of required traffic and transportation improvements established in connection with land use entitlements for City of Irvine Planning Areas 1, 5, 6, 8, 9, 40 and 51. As established by City Ordinance No. 03-20, Combined PA 51 is included in this program and, as such, is required to pay its fair share towards the List of NITM Improvements included within the established NITM Program. The following Project impacted locations are included in the NITM List of Improvements and thus, payment of NITM fees will mitigate the Combined PA 51 project's fair share responsibility towards these improvements:

- 228. Culver & Barranca – Conversion of the westbound defacto right-turn lane to a through lane. (2030, Options 1 & 2)
- 424. Los Alisos & Rockfield – Addition of a southbound right turn lane. (2030, Option 1)
- I-5 Northbound Off-ramp to Jamboree – Addition of a second drop lane from the I-5 to the Jamboree off-ramp. (2030, Option 1)

5. Discussion of Checklist and Mitigation Measures

TRAN7 (If pending projects are approved, Project-related non-NITM improvements): In the event that all of the pending (not approved) projects analyzed are approved and in conjunction with the submittal of any tentative tract maps/tentative parcel maps for the Project within Combined PA 51, the landowner or subsequent project applicant shall prepare, subject to review and approval of the City, the required tentative tract map/tentative parcel map (TTM/TPM) level Traffic Study per City Resolution No. 03-61. This Traffic Study will verify whether the intersection locations listed below, which have been identified as impacted in this SSEIR, are projected to be impacted by the subject project of the Interim Year Analysis. For those intersections impacted by subject project of the TTM/TPM Traffic Study, the tentative tract map/tentative parcel map will be conditioned to construct the necessary improvements that have been identified in the TTM/TPM Traffic Study. For those intersections listed below, which are not projected to be impacted by the subject project of the TTM/TPM Traffic Study, and prior to approval of the last final map for the 2012 Modified Project (or any portion thereof in the event that the final map is approved in multiple phases), the land owner or subsequent property owner shall construct, pay fair share of the costs or enter into an agreement with the City to establish the mechanism in which the funds generated by the fair share mitigations shall be provided and utilized by Caltrans, City of Lake Forest, City of Tustin and/or City of Irvine toward implementing the improvements.

- 54. Browning & Irvine – Application of ATMS, subject to approval by City of Tustin. (2030, Options 1 & 2)
- 286. Jeffrey & Roosevelt – Conversion of the eastbound shared through/right lane into a through lane and addition of a second right turn lane. (Post-2030, Options 1 & 2)
- 290. Jeffrey & Barranca – Application of PA9C-identified ATMS.
- 291. Jeffrey & Alton – Provision of an eastbound standard right-turn lane with right-turn overlap resulting in an ultimate eastbound lane configuration of 2 left-turn lanes, 2 through lanes, and 1 right-turn lane. (2030 & Post-2030, Options 1, Post-2030, Option 2)
- 303. Sand Canyon & I-5 NB ramp/Marine Way – Conversion of the northbound defacto right turn lane to a standard right turn lane with right turn overlap signal operation. (2030, Options 1 & 2)
- 366. Bake & Rockfield – Fully funded LFTM improvement: Conversion of a westbound through lane to a third left turn lane. (2030, Options 1 & 2)
- 417. El Toro & Portola – Fully funded LFTM improvement: Addition of a southbound right turn overlap phase. (2030, Options 1 & 2)

TRAN8 (If pending projects are approved, For specific Project-related NITM improvements): The NITM Program provides a funding mechanism for the coordinated and phased installation of required traffic and transportation improvements established in connection with land use

4. Discussion of Checklist and Mitigation Measures

entitlements for City of Irvine Planning Areas 1, 5, 6, 8, 9, 40 and 51. As established by City Ordinance No. 03-20, Combined PA 51 is included in this program and, as such, is required to pay its fair share towards the List of NITM Improvements included within the established NITM Program. In the event that all of the pending (not approved) projects analyzed are approved, the following Project impacted locations are included in the NITM List of Improvements and thus, payment of NITM fees will mitigate the Combined PA 51 project's fair share responsibility towards these improvements:

- 228. Culver & Barranca – Conversion of the westbound defacto right-turn lane to a through lane. (2030, Options 1 & 2)
- I-5 NB Off-ramp to Jamboree – Addition of a second drop lane from the I-5 to the Jamboree off-ramp. (2030 & Post-2030, Option 1 & 2)

TRAN9 (Caltrans Fair Share): Prior to approval of the last final map for the 2012 Modified Project (or any portion thereof in the event that the final map is approved in multiple phases), the land owner or subsequent property owner shall make a good-faith effort to enter into a fair share agreement with Caltrans and the City of Irvine to establish its fair share allocation towards the future implementation of the following freeway facility improvements. It may not be possible for the City of Irvine to successfully negotiate the agreement. Fair share contribution shall be calculated using the same methodology for determining fair share contributions as included in the North Irvine Transportation Mitigation Program. The Agreement shall establish the mechanism in which the funds generated by the Project's fair share mitigations shall be provided and utilized by Caltrans and/or City of Irvine toward implementing the following improvements:

- I-5 Northbound, north of Culver – Directional capacity enhancement equivalent to a single general purpose lane. (2030, Options 1 & 2)
- I-5 Northbound, north of Jeffrey – Directional capacity enhancement equivalent to a single general purpose lane. (2030, Options 1 & 2) Improvement no longer needed if Pending projects are approved.
- I-405 Northbound, north of Jeffrey – Directional capacity enhancement equivalent to a single general purpose lane. (2030 and Post-2030, Options 1 & 2) Improvement no longer needed if Pending projects are approved.

TRAN10 (If pending projects are approved, Caltrans Fair Share): In the event that all of the pending (not approved) projects analyzed are approved, and prior to approval of the last final map for the 2012 Modified Project (or any portion thereof in the event that the final map is approved in multiple phases), the land owner or subsequent property owner shall make a good-faith effort to enter into a fair share agreement with Caltrans and the City of Irvine to establish its fair share allocation towards the future implementation of the following freeway facility improvements. It may not be possible for the City of Irvine to successfully negotiate the agreement with Caltrans. Fair share contribution shall be calculated using the same methodology for determining fair share contributions as included in the North Irvine Transportation Mitigation Program. The Agreement shall establish the mechanism in which

5. Discussion of Checklist and Mitigation Measures

the funds generated by the Project's fair share mitigations shall be provided and utilized by Caltrans and/or City of Irvine toward implementing the following improvements:

- SR-133 northbound loop on-ramp at Barranca Parkway – Conversion of the HOV preferential lane to a second metered mixed-flow lane (2015, Option 2)
- I-5 Northbound, north of Culver – Directional capacity enhancement equivalent to a single general purpose lane. (2030, Options 1 & 2)

TRAN11 (Rockfield MPAH Amendment) The City of Irvine shall submit a request to OCTA and other affected jurisdictions to amend the Orange County Master Plan of Arterial Highways (MPAH) to eliminate the extension of Rockfield Boulevard from the eastern project boundary to Marine Way.

TRAN12 (If Rockfield MPAH Amendment not approved by OCTA) In the event that the Rockfield MPAH change does not occur and the Rockfield connection to Marine Way is ultimately constructed, and in addition to previously identified Post-2030 Option 1 improvements, the land owner or subsequent property owner shall enter into a fair share agreement with the City of Irvine to establish its fair share allocation towards the future implementation of the conversion of the HOV preferential lane at the SR-133 northbound loop on-ramp at Barranca Parkway to a second metered mixed-flow lane. The fair share contribution shall be calculated using the same methodology for determining fair share contributions as included in the North Irvine Transportation Mitigation Program. For Option 2, the mitigations as indicated in TRAN5 through TRAN10 remain unchanged in the event that the Rockfield MPAH change does not occur and the Rockfield connection to Marine Way is ultimately constructed.

Additionally, the SSEIR identified the following PDF to help reduce or avoid potential traffic impacts. The following PDF, as applicable, will be incorporate into the proposed Project upon project implementation:

PDF 12-1 The 2012 Modified Project's optional conversion of non-residential square footage to residential units, if implemented, will be subject to a traffic analysis to assess traffic impacts, if any, due to the specific changes in land use and will include a reduction in allowable Multi-Use intensity in terms of equivalent traffic generation (excluding DB units) based on AM peak, PM peak, and ADT. Conversions to other non-residential uses within the Multi-Use category, if implemented, will also be subject to a traffic analysis to assess traffic impacts, if any, and shall be reflected in terms of equivalent traffic generation based on AM peak, PM peak, and ADT.

4.16 UTILITIES AND SERVICE SYSTEMS

4.16.1 Environmental Setting

Potable Water

The Irvine Ranch Water District (IRWD) is the purveyor of potable and non-potable water service to the project site. IRWD is a multiservice agency that provides potable and non-potable water supply and wastewater collection, treatment, and disposal services to a population of approximately 266,000, within

4. Discussion of Checklist and Mitigation Measures

an area covering 84,610 acres (132 square miles). PA 51 is within Zone 3 North, Zone 4, and Zone 5 of the IRWD water system. The existing on-site distribution system includes a network of distribution system pipelines, six reservoirs, and two pump stations. The original water system for the former MCAS El Toro property was designed and built as a stand-alone system. Currently, IRWD supplies potable water through four metered connections that connect to the IRWD Zone 3 North and Zone 4 water system. The on-site existing distribution system consists of a network of distribution system pipelines, six reservoirs, and two pump stations.

Recycled Water

The IRWD is the jurisdictional agency responsible for water service for the project area. Recycled water is currently supplied to PA 51 via a 12-inch IRWD Zone B pipeline that connects to an eight-inch pipeline in the southwest corner of the project area. PA 51 lies within three separate IRWD recycled water system pressure zones, including Zone B East Irvine, Zone C East Irvine, and Zone D AMP East.

Sewer

The IRWD is the jurisdictional agency responsible for sewer service for the project area. Wastewater treatment is provided by IRWD's Michelson Wastewater Reclamation Plant (MWRP) that has a capacity of 28 mgd. PA 51 is served by a two-branched system with flow from the northeast to the southwest, mainly by gravity. The system includes a series of pipes ranging from 6- to 15-inches in diameter. The sewer discharge exits PA 51 at the southwest boundary of the project site, flows through the system, and discharges through the San Diego Creek Interceptor on the north side of the San Diego (I-405) Freeway.

Solid Waste

OC Waste & Recycling (OCWR) is the regulating agency that operates the local Orange County landfills, including the Frank R. Bowerman Landfill, located in the City. Waste Management of Orange County is the private contract waste hauler for all residential developments in Irvine. Solid waste at the project site is collected by Waste Management, Inc., and is disposed of at the Frank R. Bowerman Landfill. The average daily rate of disposal for the Frank R. Bowerman landfill is 5,500 tpd, with a maximum daily permitted capacity of 11,500 tpd. This landfill has capacity through year 2053.

Energy and Communications

Southern California Edison (SCE) serves the project area via two primary substations, and the Southern California Gas Company (SCGC) provides natural gas to the project area. AT&T is the telephone service provider. Cox Communications provides cable video, data, and telephone service to south Orange County, including Irvine.

4.16.2 Impacts Identified in the OCGP FEIR

Potable Water

The OCGP FEIR projected the potable water demand to be less than 1.75 million gallons per day (MGD) calculated for the land uses proposed within the project. As stated in the OCGP FEIR, selected portions

5. Discussion of Checklist and Mitigation Measures

of the existing potable water facilities are assumed to remain in place and operational through project buildout. The OCGP FEIR stated that the existing system will be expanded and integrated into the IRWD system and thus provide a backbone service to all users on the project site. The OCGP FEIR assumed a potable water system that would follow the routing of existing and proposed roadways.

The SSEIR concluded that even though the 2012 Modified Project would increase water consumption, the 2011 SAMP included a Sensitivity Analysis which considered development of up to 9,500 residential units. Subsequent demand projections for the 2012 Modified Project were not considered significant changes in comparison to the 2011 SAMP. Therefore, no significant changes to the planned on-site water infrastructure were considered necessary to serve the 2012 Modified Project, and it was further indicated that there was sufficient supply capacity to accommodate full buildout through 2032, upon completion of under development supplies.

Recycled Water

The OCGP FEIR stated that on January 27, 2003, the IRWD Board of Directors approved the assessment of water supply for the project. According to the findings of the assessment, the IRWD has determined that a sufficient non-potable water supply is available to serve the project. Since the proposed Modifications to the OCGP Improvement Area do not increase the intensity or change the mix of land uses, the total non-potable water supplies will meet the demand.

The OCGP FEIR stated that the implementation of the project would require the expansion of the recycled water transmission lines to serve the project. It was assumed that selected on-site facilities would remain in place and operational through buildout. The OCGP FEIR stated that the existing system will be expanded and integrated into the IRWD system and provide a backbone service to all users in the project site. The OCGP FEIR assumed a non-potable system that would follow the routing of existing and proposed roadways within the project.

The SSEIR concluded that the demand for recycled water decreased compared to previous projects due to the removal of the golf course. Therefore, no impact related to increased demand was anticipated, and it was further indicated that there was sufficient recycled water supply capacity to accommodate full buildout through 2032, upon completion of under development supplies.

Sewer

The OCGP FEIR stated that the IRWD will continue to provide sewer service to the project. The IRWD has indicated that it would have sufficient capacity to meet the future demand; however, additional wastewater treatment capacity may need to be purchased by project proponents as specific development projects come forward. The OCGP FEIR indicated that projected buildout demand for sewer services based on the land uses in the project were 0.89 MGD and that the project would require an increase of sewer transmission capacity to serve the project. The proposed sewer system would preserve selected, existing on-site facilities in place, remain operational through buildout and expand the system through extension of existing sewer lines. The OCGP FEIR stated that additional IRWD maintenance and equipment could be required to operate and maintain the proposed system.

4. Discussion of Checklist and Mitigation Measures

The adopted Master Subdivision Map ensured that any projected use of the existing sewer system would be in conformance with all applicable regional and state requirements and the mitigation requirements of the OCGP FEIR and addenda. It included the alignment for the sewer lines throughout the project, which was an additional project design detail and did not change the project description.

The SSEIR indicated that IRWD has adequate wastewater treatment capacity for the 2012 Modified Project's estimate wastewater generation. Therefore, development of the project would not require construction of new or expanded wastewater treatment facilities.

Although the 2012 Modified Project would increase wastewater generation, the 2011 SAMP included a Sensitivity Analysis which considered development of up to 9,500 residential units. Subsequent demand projections for the 2012 Modified Project were not considered significant changes in comparison to the 2011 SAMP. Therefore, no significant changes to the planned on-site sewer infrastructure were considered necessary to serve the 2012 Modified Project.

Solid Waste

As stated in OCGP FEIR, demolition of existing runways, buildings, and structures within Planning Area 51 will generate debris materials that would have to be disposed of at local landfills. Green waste would also be generated as a result of ongoing park and landscaping maintenance. In addition to the City requirement for recycling of construction and demolition material to reduce waste, solid waste reduction would also be achieved through compliance with AB 939, which requires that a minimum of 50 percent of the solid waste generated in cities in California be diverted from landfills. Further, SB 1374 requires that all cities implement measures that would divert 75 percent of all construction and demolition waste from landfills. While the OCGP FEIR identified a potential impact related to solid waste, it concluded that, with the recommended, City-adopted mitigation measures, the impact would be less than significant.

The SSEIR indicated that the 2012 Modified Project would increase the amount of solid waste generated and would increase the demand for solid waste services, there was adequate capacity at the Frank R. Bowerman Landfill to accommodate the 2012 Modified Project and cumulative development.

Energy and Communications

The Overlay Plan has proposed to install the new systems generally along a route that coincides with the existing and proposed roadway within the project. A portion of the routing, (specifically the portion along the "loop road") is not included in the project and would require an adjustment to the routing system for the expansion of the dry utilities system. However, the expansion of the system would generally coincide with the existing and proposed roadways consistent with the OCGP FEIR. The OCGP FEIR further stated that the specific impacts of constructing new energy and communication transmission facilities could not be determined at the program level analysis, as site-specific plans for the installation of the energy and communication transmission backbone system have not been prepared. The general significant impacts associated with the construction and operation of public facilities, including the project's construction and operation of the transmission system, were addressed in the OCGP FEIR.

5. Discussion of Checklist and Mitigation Measures

The SSEIR concluded that the no impacts related to energy and communications were anticipated and that the energy and communications providers indicated there was adequate capacity to serve the 2012 Modified Project as well as cumulative development in the area.

4.16.3 Impacts Associated with the Modifications to the OCGP Improvement Area

The proposed modifications, consisting of modifications to the OCGP Improvement Area reducing the number of sports courts, expanding passive recreational area, relocating some of the Improvement Area components to optimize visibility, access and efficiency, and assessing adequacy of parking plan further enhance the use and efficiency of the existing features. The proposed Project would not result in new uses that would impact or alter provision of utilities and service systems or create additional demand on existing level of service.

Potable Water

The modifications to the OCGP Improvement Area do not propose additional development intensity. Therefore, the demand projection for potable water is consistent with the OCGP FEIR. No additional mitigation measures or change in any mitigation measure is required. The OCGP FEIR further stated that specific environmental impacts of the proposed Project on the existing and planned MWD facilities, as well as specific impacts of constructing new potable water facilities could not be determined at the program level analysis and project-level environmental review at the time that specific development plans have been prepared would be required. The general significant impacts associated with the proposed Project's construction and operation of public facilities has been addressed in the OCGP FEIR; and therefore, the proposed Project would not demand increased supplies or require construction of new water treatment facilities that would create an impact on the environment.

Recycled Water

The modifications to the Improvement Area do not propose any additional development intensity, and the total non-potable water supplies would meet the project demand, as analyzed in the OCGP FEIR. The OCGP FEIR further stated that the specific environmental impacts of constructing the new recycled water facilities could not be determined at the General Plan level analysis as specific site plans and locations have not been prepared. However, the general significant impacts associated with the proposed Project's construction and operation of public facilities has been addressed in the OCGP FEIR; and therefore, the proposed Project would not demand increased supplies or require construction of new water treatment facilities that would create an impact on the environment.

Sewer

The modifications to the OCGP Improvement Area do not propose any additional development intensity. Therefore, demand projections and proposed system expansion would remain the same. The OCGP FEIR further stated that the specific environmental impact of constructing new sewer facilities to serve the project cannot be determined at the program level analysis, as site-specific plans for the installation of the sewer backbone system had not been prepared. However, the general significant impacts associated with the construction and operation of public facilities, including the project's construction and operation of the sewer system, has been addressed in the OCGP FEIR. Therefore, the proposed Project would not

4. Discussion of Checklist and Mitigation Measures

result in increased demand for wastewater treatment exceeding the requirements of the applicable Regional water Quality Control Board or require construction of new wastewater treatment facilities that would create an impact on the environment.

Solid Waste

As stated in OCGP FEIR, demolition of existing runways, buildings, and structures within Planning Area 51 would generate debris materials that would have to be disposed of at local landfills. Green waste would also be generated as a result of ongoing park and landscape maintenance. The proposed Project would not change the land uses or intensity of the uses; therefore, no change in impact to solid waste is anticipated as a result of the modifications to the Improvement Area. Additionally, there is adequate capacity at the Frank R. Bowerman Landfill to accommodate the solid waste disposal demand of the proposed Project.

Energy and Communications

The OCGP FEIR stated that the specific impacts of constructing new energy and communication transmission facilities could not be determined at the program level analysis, as site-specific plans for the installation of the energy and communication transmission backbone system have not been prepared. The analysis and conclusions in the OCGP FEIR do not change since the proposed Project does not introduce new land uses that would increase demand on energy and communications infrastructure. Additionally, the proposed Project, consisting of modifications to the OCGP Improvement Area reducing the number of sports courts, expanding passive recreational area, relocating some of the Improvement Area components to optimize visibility, access and efficiency, and assessing adequacy of parking plan would reduce demand on electricity within the proposed Project area. The general significant impacts, associated with the construction and operation of public facilities, were addressed in the OCGP FEIR.

Major FEIR Revisions Not Required. Based on the foregoing analysis and information, there is no evidence that the changes to the project require a major change to the OCGP FEIR. The proposed Modifications to the OCGP Improvement Area, which do not include any major change to the park development areas identified in the approved OCGP Master Plan, will not result in any new significant environmental impact nor is there a substantial increase in the severity of impacts from that described in the OCGP FEIR.

No Substantial Change in Circumstances Requiring Major FEIR Revisions. There is no information in the Modifications to the OCGP Improvement Area or otherwise available indicating substantial changes in circumstances that would require major changes to the OCGP FEIR.

No New Information of Substantial Importance Showing Greater Significant Effects Than Previous FEIR. All available relevant information has been analyzed, and there is no new information of substantial importance, which was unknown and could not have been known with the exercise of reasonable diligence at the time the OCGP EIR was approved, augmented, and/or updated, indicating that the proposed Project will have one or more significant effects not discussed in the OCGP EIR or result in a substantial increase in the severity of previously identified effects.

5. Discussion of Checklist and Mitigation Measures

No New Information of Substantial Importance Showing Ability to Reduce Significant Effects in Previous FEIR. All available relevant information has been analyzed, and there is no new information of substantial importance, which was unknown and could not have been known with the exercise or reasonable diligence at the time the OCGP FEIR was approved, augmented, and/or updated, indicating that; (1) mitigation measures or alternatives previously found not to be feasible would in fact be feasible, and would substantially reduce one or more significant effects of the proposed Project, but the project proponent declines to adopt the mitigation measures or alternatives; or (2) mitigation measures or alternatives that are considerably different from those analyzed in the previous EIR would substantially reduce one or more significant effects on the environment, but the project proponent declines to adopt the mitigation measures or alternatives. There are no alternatives to the proposed Project or additional mitigation measures that would substantially reduce one or more of the significant effects identified in and considered by the OCGP FEIR.

4.16.4 Mitigation from the OCGP FEIR and Applicability to the Modifications to the OCGP Improvement Area

The OCGP FEIR determined the mitigation measures identified in other sections of the OCGP FEIR (5.1-5.13) address the impacts associated with the construction and operation of public facilities. These measures would be applicable to any new construction and operation of facilities for the following types of utilities to serve the project area:

- potable water
- recycled water
- wastewater
- energy and communication transmission facilities

Mitigation Measures SW1 through SW5 apply to future demolition and new construction, and would be carried forward through permit approvals for subsequent development projects.

Of the Mitigation Measures listed below, applicable measures will be incorporated into the proposed Project upon project implementation.

SW1 It is anticipated that much of the solid waste resulting from the demolition, dismantling, or other deconstruction of the aged structures and property, including but not limited to buildings and runways, at MCAS El Toro is contaminated with lead-based paints, asbestos, or other materials that may render it unsuitable for recycling or reuse. At the sole cost and expense of the project applicant, in order to evaluate this condition and determine the feasibility of recycling of solid waste material from the MCAS El Toro site by ordinary means, a technical evaluation by a qualified environmental consultant must be conducted. The technical evaluation shall include sufficient sample testing of all types of solid waste materials to be generated by the project to analyze its composition. A copy of the full technical evaluation and its findings must be submitted to the City of Irvine Community Development Department. The City of Irvine must confirm the adequacy of the technical evaluation prior to authorizing the demolition, dismantling, or deconstruction project to proceed.

4. Discussion of Checklist and Mitigation Measures

If it is determined by the technical evaluation that material is contaminated and prohibited from being recycled by ordinary means, a further evaluation must be conducted to identify and evaluate other feasible methods approved by state law to divert the material from landfills. This may include the delivery of the waste material to other appropriate non-disposal or transformation facilities, such as "waste-to-energy" (WTE) plants.

SW2 For that solid waste which is determined to be inappropriate for recycling (as that term is defined by California Public Resources Code Section 40180), the project applicant must submit a written plan to the City and implement such plan to ensure that 75% of the material, or the maximum amount feasible as determined by the technical evaluation, is diverted from the landfill through other methods that comply with state statutes and regulations.

SW3 For that solid waste which the technical study deems to be suitable for recycling, the project applicant must submit a written plan to the City and implement such plan to ensure that solid waste material generated by the demolition, dismantling, or deconstruction project, land use operations and maintenance is collected by a City authorized solid waste hauler or recycling agent, and that a minimum of 75% of the solid waste from the project is diverted from landfills by recycling, as that term is defined by California Public Resources Code Section 40180 ("Recycling" does not include transformation, as defined in Public Resources Code Section 40201).

SW4 To ensure ongoing compliance with these mitigation measures, the project applicant will be required to submit solid waste tonnage reports to the City of Irvine on City approved forms, accompanied by "weight ticket" receipts from state-certified disposal, nondisposal, or transformation facilities, on a quarterly basis to demonstrate that solid waste diversion has occurred in accordance with these required mitigation measures and in a manner that is consistent with, and not detrimental to, the efforts of the City of Irvine to comply with AB939.

To assure compliance with applicable statutes related to the disposal of solid waste, it is necessary for the City to require appropriate and effective mitigation measures to limit the disposal and ensure significant recycling of solid waste on-site.

SW5 For green waste, the project applicant must submit a written plan to the City and implement such plan to ensure that the green waste material generated by landscape maintenance operations is collected by a City authorized waste hauler or recycling agent, that the maximum feasible amount of that collected green waste is recycled, and that a minimum of 50% of the green waste from the project is diverted from landfills by recycling, as that term is defined by California Public Resources Code Section 40180.

The SSEIR identified the following measures as existing PPPs that apply to the proposed Project and will help reduce or avoid potential utilities and service system impacts:

Of the PPPs listed below, applicable measures will be incorporated into the proposed Project upon project implementation.

5. Discussion of Checklist and Mitigation Measures

Water

PPP 13-1 Requirement to Use Recycled Water: Irvine Ranch Water District (IRWD) will identify areas within the Sub Area Master Plan that are capable of receiving service from the IRWD's recycled water system, and will determine the feasibility of providing recycled water service to these areas. IRWD will also review applications for new permits to determine the feasibility of providing recycled water service to these applicants. If recycled water service is determined by IRWD to be feasible, applicants for new water service shall be required to install on-site facilities to accommodate both potable water and recycled water service in accordance with IRWD's Rules and Regulations.

PPP 13-2 Connection Fees: The Project Applicant shall enter into agreement or agreements as necessary with IRWD to establish the appropriate financial fair share costs to be borne by the project proponent. Fair share costs may include, but are not limited to, those associated with the preparation of studies necessary to analyze the needs of the 2012 Modified Project and infrastructure expansion necessary to serve the 2012 Modified Project.

PPP 13-3 Fire Flow Analysis: In accordance with IRWD requirements, each tentative tract map in the 2012 Modified Project must provide a fire flow analysis. If the analysis identifies any deficiencies, the developer will be responsible for any water system improvements associated with the development project required to rectify the deficiencies and meet IRWD fire flow requirements.

Wastewater

PPP 13-2 is applicable.

Solid Waste

PPP 13-4 The City Construction and Demolition (C&D) Debris Recycling and Reuse ordinance requires that 1) all residential projects of more than one unit, 2) nonresidential developments on 5,000 square feet or larger, and 3) nonresidential demolition/renovations with more than 10,000 square feet of building recycle or reuse a minimum of 75 percent of concrete and asphalt and 50 percent of nonhazardous debris generated.

PPP 13-5 The City adopted a Zero Waste program in 2007 to approach waste management. The City recovers approximately 66 percent of its waste for recycling and composting, which exceeds the state's AB 939 waste diversion goals. Furthermore, waste haulers establish rate schedules according to bin size and frequency of collection. Commercial customers that subscribe to smaller bins (e.g., 2 cubic-yard bins) are routinely charged less by haulers. This pricing structure encourages waste reduction and recycling, and tends to minimize hauler pickups.

PPP 13-6 The Irvine Sustainable Community Initiative (Initiative Ordinance 10-11), adopted by the voters of the City as Initiative Measure S on November 2, 2010, and certified by the City Council on December 14, 2010, became effective December 24, 2010. The ordinance was adopted to ratify and implement policies in support of renewable energy and environmental

4. Discussion of Checklist and Mitigation Measures

programs for a sustainable community. It outlines the City's direction for continuing to develop and implement programs geared towards green building, renewable energy and sustainability. For example, the City would continue to develop and implement recycling, zero waste or other innovative onsite business programs to divert waste from landfills and also continue to develop and implement the use of native, California-friendly and drought-tolerant landscaping.

PPP 13-7 Prior to the issuance of grading permits for a project that involves the demolition of an asphalt or concrete parking lot on site, the applicant shall submit a waste management plan demonstrating compliance with the requirements of Title 6, Division 7 of the City of Irvine Municipal Code relating to recycling and diversion of demolition waste as applicable to said project. Over the course of demolition or construction, the applicant shall ensure compliance with all code requirements related to the use of City-authorized waste haulers (Standard Condition 2.24).

PPP 13-8 Prior to the issuance of building permits for a project that involves new construction or that involves the demolition or renovation of existing buildings on site, the applicant shall comply with requirements of Title 6, Division 7 of the City of Irvine Municipal Code relating to recycling and diversion of construction and demolition waste as applicable to said project. Over the course of demolition or construction, the applicant shall ensure compliance with all code requirements related to the use of City-authorized waste haulers (Standard Condition 3.7).

Energy and Communications

PPP 4-3 California's Building and Energy Efficiency Standards (CCR Title 24): Prior to the issuance of a building permit for residential, commercial, or office structures in the Proposed Project Site, development plans for these structures shall be required to demonstrate that the project meets the Building and Energy Efficiency Standards in place at the time of building permit issuance. Commonly known as Title 24, these standards are updated periodically to allow consideration and possible incorporation of new energy efficiency technologies and methods. The 2008 standards are approximately 15 percent more energy efficient than the 2005 Building and Energy Efficiency Standards. The 2013 Building Energy Efficiency Standards are 25 percent more efficient than previous standards for residential construction and 30 percent more efficient for nonresidential construction. The 2013 Standards, which take effect on January 1, 2014, offer builders more efficient windows, insulation, lighting, ventilation systems and other features that reduce energy consumption in homes and businesses. Plans submitted for building permits shall include written notes demonstrating compliance with the energy standards and shall be reviewed and approved by the Public Utilities Department prior to issuance of building permits. Design strategies to meet this standard may include maximizing solar orientation for daylighting and passive heating/cooling, installing appropriate shading devices and landscaping, utilizing natural ventilation, and installing cool roofs. Other techniques include installing insulation (high R value) and radiant heat barriers, low-e window glazing, or double-paned windows.

5. Discussion of Checklist and Mitigation Measures

PPP 4-4 Title 24 Code Cycles: Net-Zero Buildings (Residential & Non-Residential): The California Public Utilities Commission adopted its Long-Term Energy Efficiency Strategic Plan on September 18, 2008, presenting a roadmap for all new residential and commercial construction to achieve a zero-net energy standard. This Plan outlines the goal of reaching zero net energy in residential construction by 2020 and in commercial construction by 2030. Achieving this goal will require increased stringency in each code cycle of California's Energy Code (Title 24).

PPP 4-5 California Renewable Portfolio Standard: CARB's Renewable Portfolio Standard (RPS) is a foundational element of the State's emissions reduction plan. In 2002, Senate Bill 1078 established the California RPS program, requiring 20 percent renewable energy by 2017. In 2006, Senate Bill 107 advanced the 20 percent deadline to 2010, a goal which was expanded to 33 percent by 2020 in the 2005 Energy Action Plan II. On September 15, 2009, Governor Arnold Schwarzenegger signed Executive Order S-21-09 directing CARB to adopt regulations increasing RPS to 33 percent by 2020. These mandates apply directly to investor-owned utilities, which in the case of the 2012 Modified Project is Southern California Edison.

The SSEIR also identified the following measures as existing PDFs that apply to the proposed Project and will help reduce or avoid potential utilities and service system impacts.

Of the PDFs listed below, applicable measures will be incorporated into the proposed Project upon project implementation.

WATER

PDF 4-3 Low-Flow Fixtures: The 2012 Modified Project incorporates low-flow water fixtures that will meet the requirements of the California Green Building Standards Code standards. Prior to issuance of building permit, the Applicant or its successor shall submit evidence to the satisfaction of the Director of Community Development that toilets, urinals, sinks, showers, and other water fixtures installed on-site are low-flow water fixtures that meet the California Green Building Standards Code standard.

PDF 4-4 Landscaping and Irrigation Systems: The 2012 Modified Project incorporates automated, high-efficiency landscaping irrigation systems on all master landscaped areas that reduce water use, such as evapotranspiration "smart" weather-based irrigation controllers, and bubbler irrigation; low-angle, low-flow spray heads; moisture sensors; and use of a California-friendly landscape palette. Prior to approval of landscape plans, the Applicant or its successor shall submit evidence to the satisfaction of the Director of Community Development that such landscaping irrigation systems will be installed so as to make the 2012 Modified Project consistent with the intent of the California Water Conservation in Landscaping Act of 2006 (AB 1881), including provisions to reduce the wasteful, uneconomic, inefficient, and unnecessary consumption of water.

PDF 4-5 Use of Recycled Water on All Master Landscaped Areas: Prior to approval of landscape plans, the Applicant or its successor shall submit evidence to the satisfaction of the Director of Community Development and IRWD that the 2012 Modified Project incorporates the use of

4. Discussion of Checklist and Mitigation Measures

recycled water in all master landscaped areas, including master landscaped commercial, multifamily, common, roadways, and park areas. Master landscapes will also incorporate weather-based controllers and efficient irrigation system designs to reduce overwatering, combined with the application of a California-friendly landscape palette.

Wastewater

PDF 4-3 is applicable.

4.17 DETERMINATION

Based on the information and analysis in this Initial Study/Addendum, and pursuant to Section 15162 of the State CEQA Guidelines, the City has determined that:

1. There are no substantial changes to the project that will require major revisions to the OCGP FEIR due to new, significant environmental effects or a substantial increase in the severity of impacts identified in the OCGP FEIR;
2. Substantial changes have not occurred in the circumstances under which the project is being undertaken that will require major revisions of the OCGP FEIR to disclose new, significant environmental effects or a substantial increase in the severity of the impacts identified in the OCGP FEIR; and
3. There is no new information of substantial importance not known at the time the OCGP FEIR was approved, augmented, and/or updated that shows any of the following:
 - a. The project will have any new significant effects not discussed in the OCGP FEIR;
 - b. There are impacts that were determined to be significant in the OCGP FEIR that will be substantially increased;
 - c. There are additional mitigation measures or alternatives to the project that would substantially reduce one or more of the significant effects identified in the OCGP FEIR; or
 - d. There are additional mitigation measures or alternatives that were rejected by the project proponent that are considerably different from those analyzed in the OCGP FEIR that would substantially reduce any significant impact identified in that EIR.

ORANGE COUNTY GREAT PARK 688 ACRE PARK DEVELOPMENT PLAN TRAFFIC STUDY

TABLE OF CONTENTS

I. EXECUTIVE SUMMARY	1
Project Description	1
Analysis Scope and Methodology	3
Summary of Findings	3
II. INTRODUCTION	5
Project Site	5
Traffic Study Boundary	5
Existing, General Plan, and Proposed Site Uses	5
III. EXISTING CONDITIONS	8
Existing Site Uses	8
Existing Roadways and Intersections	8
IV. METHODOLOGY AND APPROACH	16
Alternatives	16
ITAM Traffic Analysis Zones	16
688 Acre Park Development Plan Trip Generation	18
ITAM Assumptions for Alternatives	18
2017 Baseline Roadway Network Updates	20
V. PERFORMANCE CRITERIA	28
Daily Arterial Volume To Capacity Level of Service Analysis	28
Daily and Peak Hour Arterial Volume To Capacity Level of Service Analysis	28
AM and PM Peak Hour Intersection Capacity Utilization	28
AM and PM Peak Hour Unsignalized Intersection Level of Service Analysis	29
VI. ALTERNATIVES ANALYSIS	30
Project Trip Distribution	30
Daily Traffic Forecasts and Volume/Capacity Ratio Level of Service Analysis	30
AM and PM Peak Hour Link Analysis	44
Signal Warrant Analysis	44
Peak Hour Intersection Level of Service Analysis	47
VII. SPECIAL ISSUES – TRANSPORTATION GUIDELINES	51
Transportation Guidelines (TG)	51
TG-1 Turn Lane Pocket Lengths	51
TG-7 Distance Between Signalized Intersections	53
TG-8 Distance Between Driveways and Intersections	53

ORANGE COUNTY GREAT PARK 688 ACRE PARK DEVELOPMENT PLAN PHASE 1 TRAFFIC STUDY

(CASE NO. 00598937-PMP)

I. EXECUTIVE SUMMARY

This Executive Summary presents the findings of a traffic study prepared to determine if there are any potential impacts from the proposed Orange County Great Park (OCGP) 688 Acre Development Plan located in Planning Area 51 in the City of Irvine.

The OCGP is located north of Marine Way, east of future “O” Street, south of Irvine Boulevard, and west of Alton Parkway in the City of Irvine, California. The first phase of development of the OCGP was referred to as the Western Sector Park Development Plan, a majority of which has been constructed and exists today. The proposed 688 Acre Park Development Plan, analyzed here, is the second phase of planned development, which is scheduled for operation within three years of approval and will include sports fields and supportive uses consistent with the approved OCGP Master Plan. Access to the 688 Acre Park Development Plan will be via the existing Marine Way and “C” Street and future access via “O” Street, Trabuco Road, “LV” Street, “LY” Street, and “LQ” Street.

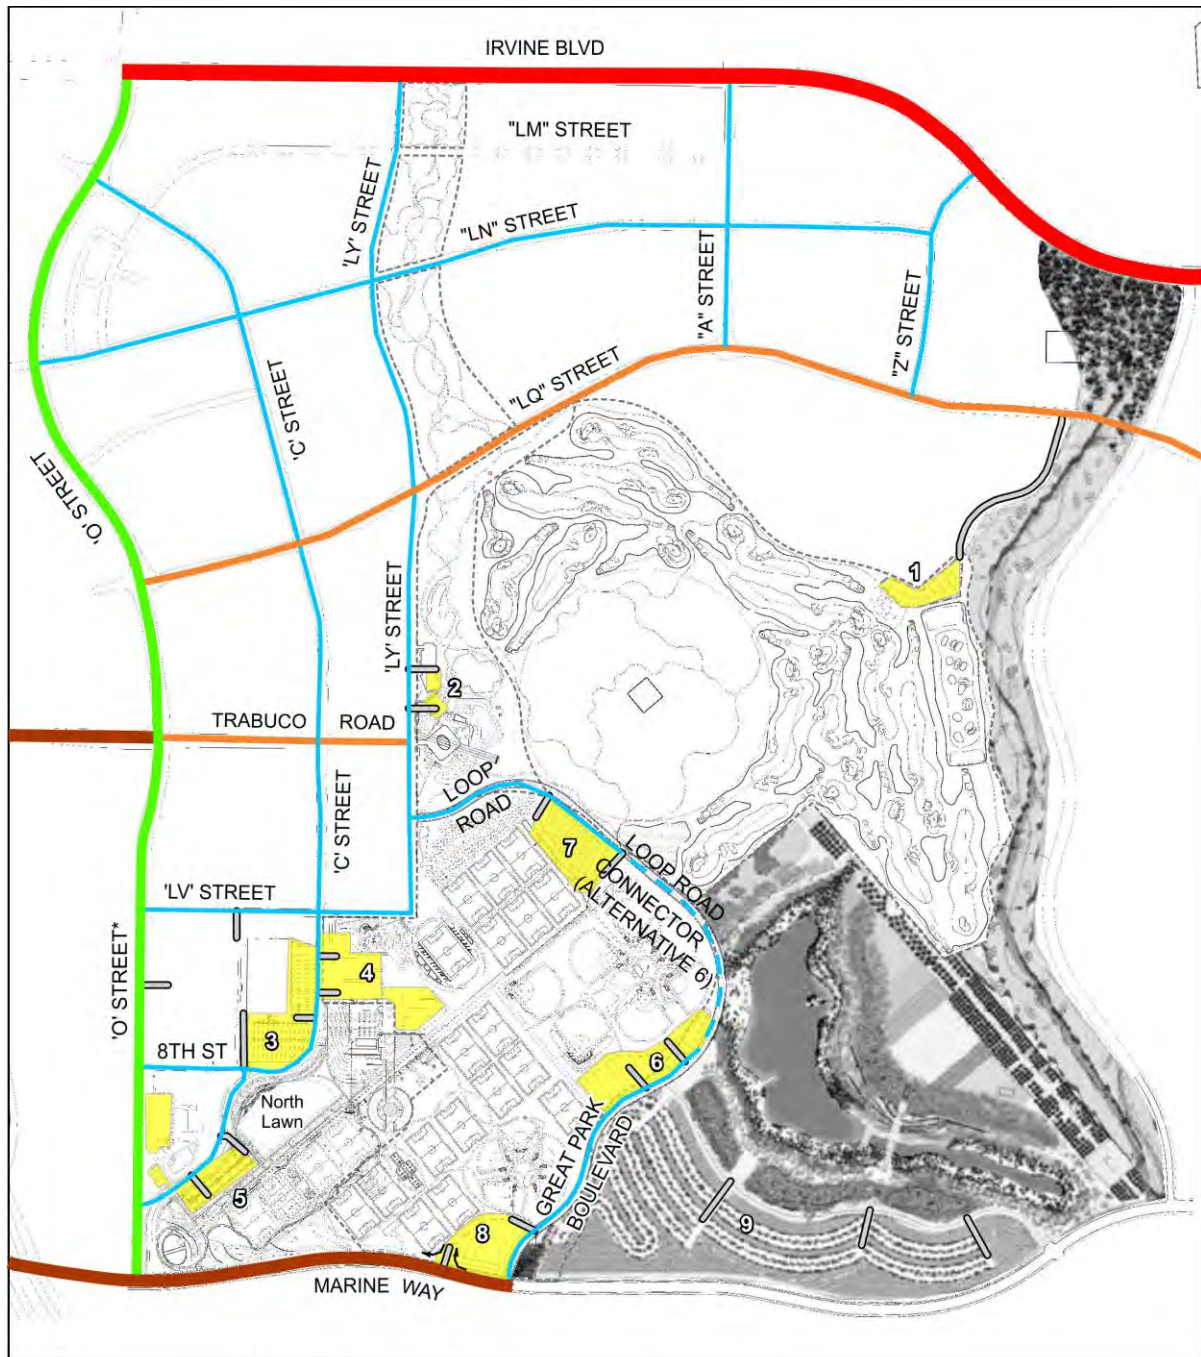

The purpose of the study is to evaluate the potential impacts of the proposed project in general accordance with the North Irvine Transportation Mitigation (NITM) Program per City Council Resolution 03-61 and applicable sections of the City’s Traffic Study Guidelines (updated August 24, 2004) and the City of Irvine Transportation Guidelines (TG) dated July 31, 1993.

This traffic study has been completed per the approved Scope of Work presented in Appendix A. Ongoing communication between the City and LSA staff has occurred throughout this process to assure methodology, ITAM travel demand modeling, and assumptions have been incorporated within this Traffic Study.

Project Description

The OCGP site is located at the former El Toro Marine Corps Air Station (MCAS). It is bordered by Irvine Boulevard on the north and future Marine Way on the south, “O” Street on the west and the Wildlife Corridor on the east. The project site is illustrated in Figure I-1. It should be noted that the map coverage area does not include the Wildlife Corridor to the east as this use does not generate trips or provide parking access. This figure also includes the roadway hierarchy, access locations, and proposed parking areas within the OCGP.

- Local
- Local (Alternative 6)

Parking Areas

1 GP Parking Number

Parking Access

*O' Street between Trabuco Road and Marine Way is currently designated Commuter, but is being designed and constructed as a Secondary Highway.

The first phase of development of the OCGP was the Western Sector Park Development Plan, a majority of which has been constructed and exists today. The proposed OCGP 688 Acre Park Development Plan is the second phase of planned development. The third phase of planned development will be the Cultural Terrace.

The proposed project, this OCGP 688 Acre Park Development Plan, will include sports fields such as soccer fields, baseball/softball fields, an 18-hole golf course and club house, dog park, sand volleyball courts, basketball/sports courts, a mini-amphitheater/stage, tennis courts, spectator seating and support buildings for soccer, baseball and softball events, open space, and other park activities.

Analysis Scope and Methodology

In accordance with the approved Scope of Work (Appendix A), the analysis in this report identifies potential impacts of the proposed project in the project study area based on Existing (2012) and Future Year (2017) traffic conditions using the Irvine Transportation Analysis Model (ITAM 12).

The following summarizes the existing conditions and 2017 base, and the OCGP 688 Acre Park Development Plan alternatives that have been evaluated and included in this traffic study:

1. Existing Conditions
2. Existing plus 688 Acre Park Development Plan
3. 2017 Baseline (No Project) (Assumes Heritage Fields Project Option 2)
4. 2017 Baseline + 688 Acre Park Development Plan
5. 2017 Baseline + 688 Acre Park Development Plan with Heritage Fields Project Option 1
6. 2017 Baseline + 688 Acre Park Development Plan with connector roadway between “LY” Street and Marine Way (Roadway Connection Alternative)

Note that the approved scope of work identified an alternative High School Site B analysis. During the preparation of this document, the Irvine Unified School District closed escrow on the Site A site and has commenced grading operation at this site. Accordingly, Site B is no longer being studied as an alternative to this project.

Summary of Findings

Based on the OCGP 688 Acre Park Development Plan Traffic Study, the following findings are summarized.

- The OCGP 688 Acre Park Development Plan will generate approximately 5,444 daily trips. This trip generation will not result in significant impacts to the local and regional roadway network.
- Under existing conditions, there are six links where the existing traffic volume to capacity ratio exceeds the City Standards. Based on the peak hour volume to capacity ratios, all six

- links are within City level of service standards. The proposed 688 Acre Park Development Plan does not result in any additional links to fail the City volume to capacity ratio standards.
- Based on the Existing Conditions ICU level of service analysis, there are no intersections that exceed the City of Irvine level of service standards. All intersections continue to operate at acceptable conditions with the addition of the OCGP 688 Acre Park Development Plan traffic.
 - Based on Alternative 3, the 2017 Baseline alternative without the OCGP 688 Acre Park Development Plan (i.e., 2017 No Project), there are 23 arterial links which will have volume to capacity ratios which exceed the daily thresholds. Based on the peak hour link analysis, all 23 links will result in acceptable peak hour volume to capacity ratios.
 - There are no additional links that will exceed the daily thresholds with any of the 2017 OCGP 688 Acre Park Development Plan alternatives. All 23 peak hour links will result in acceptable peak hour volume to capacity ratios.
 - Based on the 2017 Conditions ICU level of service analysis, there are no intersection level of service impacts from the proposed project.
 - There are six intersections in which signalization is assumed in the 2017 Base No Project condition: Intersections 558 – Ridge Valley/"O" Street at Irvine Boulevard, Intersection 559 – "O" Street at Trabuco, Intersection 561 – "LY" Street at Irvine Boulevard, Intersection 560 – "O" Street at Marine, Intersection 572 – Modjeska-A Street at Irvine Boulevard and Intersection 577 - Pusan Way-Z Street at Irvine Boulevard. The signalization of these six intersections is similarly identified in the 2011 GPN VTTM traffic study as being needed for interim-year conditions.
 - The OCGP 688 Acre Park does not warrant any additional signals with the Baseline 2017 plus 688 Acre OCGP alternatives. At "O" Street and 8th Street, while a signal is currently not warranted, the permanent location of a future Fire Station in the vicinity will likely require that this intersection be signalized. At "O" Street and "C" Street, while a signal is also currently not warranted, the left in/left out analysis for Post 2035 (see OCGP Access Study) presents left turn volumes that exceed thresholds. A traffic signal would provide the necessary gaps to address the left turn volumes and therefore should be considered. The ultimate determination of traffic signals at these locations is subject to the review and approval of the City Engineer."
 - Marine Way at Great Park Boulevard (562), dual 250-foot eastbound left turn lanes are a design feature of the project..
 - The OCGP 688 Acre Park Development Plan as proposed will accommodate adequate signal spacing between signalized intersections (TG-7), adequate distance between driveways and intersections (TG-8), and adequate corner clearance (TG-9). All proposed left turn in and out intersections and driveways are acceptable.
 - At the Marine Way right in/right out driveway located west of Great Park Boulevard (669), a 250-foot long westbound right turn lane is a design feature of the project.

II. INTRODUCTION

Project Site

The 688 Acre Park Development Plan site is centrally located in the OCGP and is bordered by future Marine Way on the south, Irvine Boulevard to the north, and future “LY” Street on the west. The Wildlife Corridor is located on the easterly edge of the Planning Area 51. The OCGP is surrounded by the Great Park Neighborhoods Development. A project vicinity map is presented in Figure II-1 and a project site plan is presented in Figure II-2.

Traffic Study Boundary

The traffic study boundary is presented in Figure II-1. In general, the traffic study area extends from Jeffrey Road on the west, Bake Parkway on the east, Portola Parkway on the north, and the I-405 freeway to the south. The analysis includes all arterials and major intersections within the study boundary area.

Existing, General Plan, and Proposed Site Uses

The OCGP is within the City of Irvine’s jurisdiction and is owned and being developed by the City of Irvine. The City of Irvine General Plan identifies the land use category for the site as “Orange County Great Park.”

The proposed land uses for the site are consistent with the Orange County Great Park Final Environmental Impact Report (OCGP FEIR) as updated by its prior Addenda and Supplemental EIRs (SEIR and SSEIR). The proposed OCGP 688 Acre Park Development Plan land uses are consistent with the City’s General Plan and Zoning Ordinance.

The first phase of development of the OCGP was the Western Sector Park Development Plan. The proposed OCGP 688 Acre Park Development Plan is the second phase of planned development. The third phase of planned development will be the Cultural Terrace.

The proposed OCGP 688 Acre Park Development Plan will include soccer fields, baseball/softball fields, an 18-hole golf course and club house, dog park, sand volleyball courts, basketball/sports courts, a mini-amphitheater/stage, tennis courts, spectator seating, as well as support buildings for soccer, baseball and softball events, open space and other park activities.

*'O' Street between Trabuco Road and Marine Way is currently designated Commuter, but is being designed and constructed as a Secondary Highway.

III. EXISTING CONDITIONS

Existing Site Uses

In 1993, the El Toro MCAS was listed by the Department of Defense in the Base Realignment and Closure Act for closure by 1999, with the site transferring to civilian control. The OCGP is within the City of Irvine’s jurisdiction and is owned and being developed by the City of Irvine. The Western Sector Park Development Plan area includes the OCGP Balloon, Hangar 244, artist lofts, Central and West Timeline, Farm and Food Lab, the Palm Court, the North Lawn, and parking. In addition, there are existing temporary uses including, Tierra Verde Industries, a composting and electronic recycling operation, special event parking lot, and recreational vehicle storage.

Existing Roadways and Intersections

The existing roadway network which serves the OCGP 688 Acre Park Development Plan is presented in Figure III-1. This figure presents the roadway classification and the existing number of travel lanes. All access to the project connects from Sand Canyon Road and Marine Way. Trabuco Road also connects to the OCGP, however, park uses are not accessible from Trabuco Road at this time. As Marine Way extends east of Sand Canyon, it terminates at the intersection of Marine Way and “C” Street. “C” Street extends north and provides all access to the OCGP 688 Acre Park Development Plan except for some uses which will be accessed via Trabuco Road.

The intersections included in the traffic study are also presented in Figure III-2. These intersections are identified with a three digit intersection identification number. It should be noted that not all intersections currently exist, but will be added as part of the 2017 analysis.

Presented in Figure III-3 are the existing intersection geometrics for each of the intersections included in the traffic study. These figures present the number of left, through, and right turn lanes.

IV. METHODOLOGY AND APPROACH

The OCGP 688 Acre Park Development Plan Traffic Study is based on the latest version of the Irvine Transportation Analysis Model (ITAM 12.3). The analysis reports the Base Year (2012) Existing and the 2017 Baseline without the project. The alternatives analysis then added the project to the Existing and 2017 Baseline alternatives. The 2017 Baseline ITAM model run used for the “No Project” includes approved projects and infrastructure improvements assumed in ITAM 12.3 for interim 2017 conditions.

Alternatives

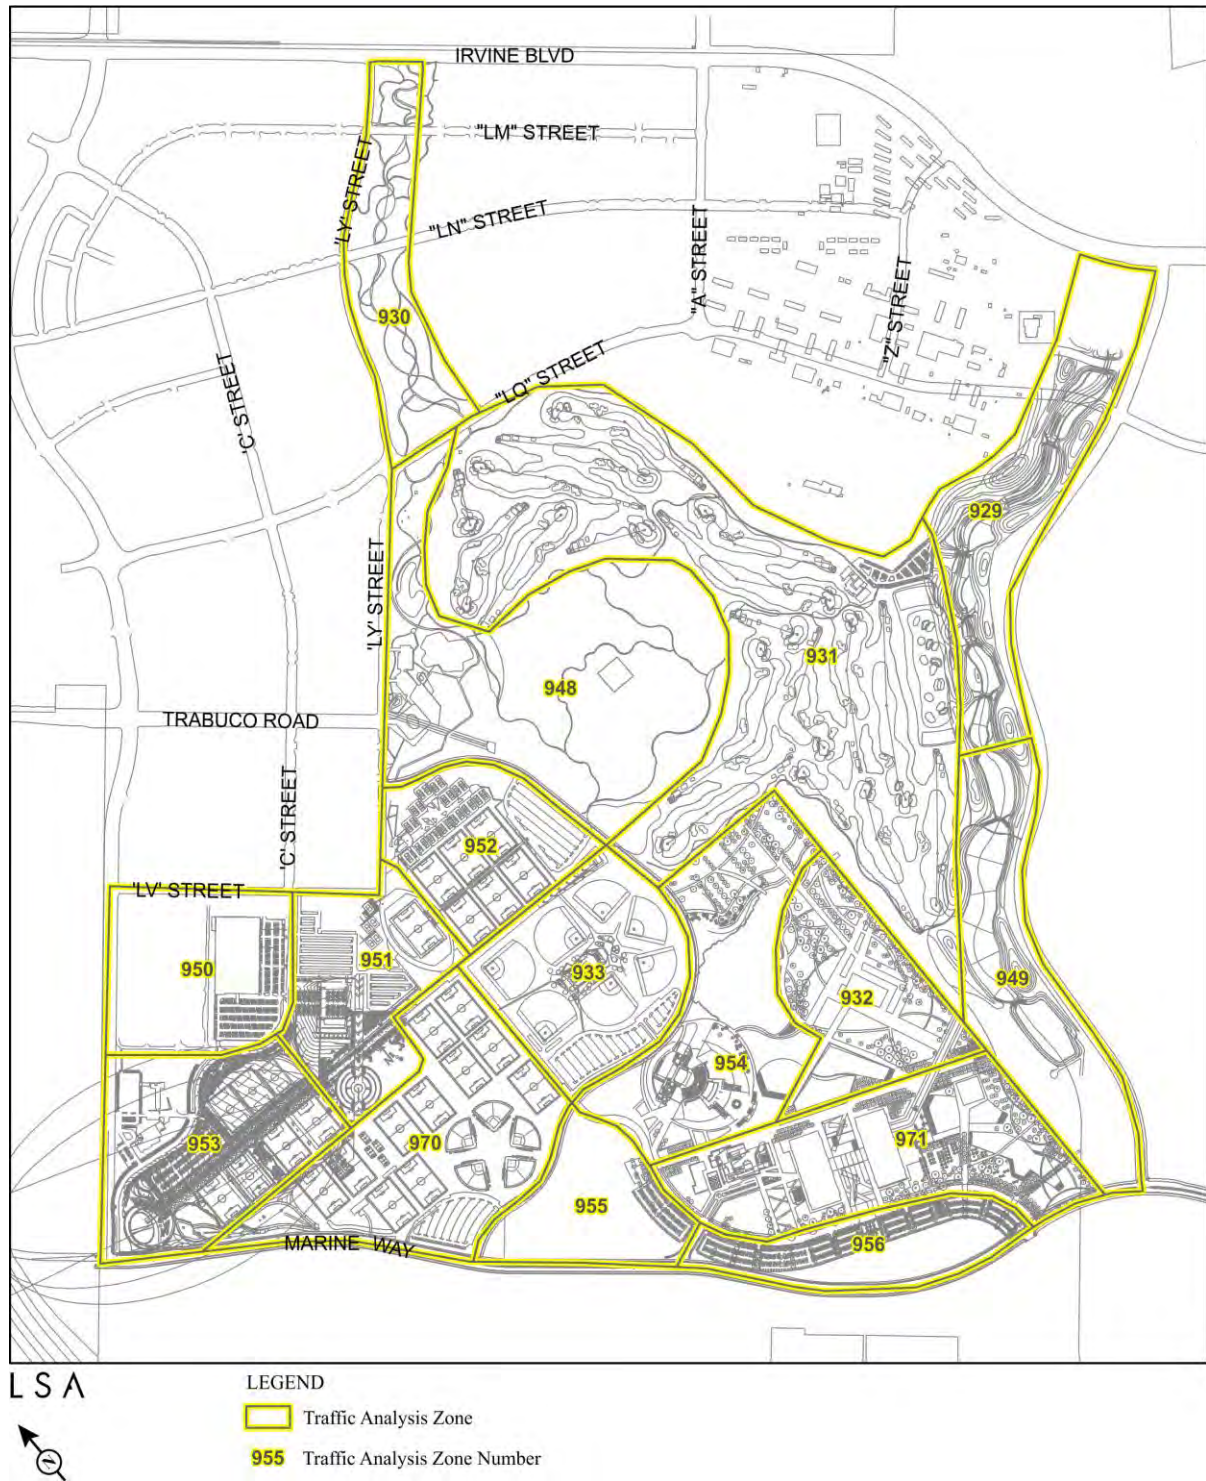

The “With Project” condition adds the OCGP 688 Acre Park Development Plan to the Existing Conditions and the 2017 Baseline plus various alternatives described below.

1. Existing Conditions
2. Existing plus 688 Acre Park Development Plan
3. 2017 Baseline, No Project (Assumes Heritage Fields Project Option 2)
4. 2017 Baseline + 688 Acre Park Development Plan
5. 2017 Baseline + 688 Acre Park Development Plan with Heritage Fields Project Option 1
6. 2017 Baseline + 688 Acre Park Development Plan with connector roadway between “LY” and Great Park Boulevard (Roadway Connection Alternative)

ITAM Traffic Analysis Zones

The daily traffic volumes and peak hour intersection turn movement forecasts were generated using the Irvine Transportation Analysis Model (ITAM 12.3). Project related adjustments include refinement to the traffic analysis zones within the OCGP to better define OCGP trip activity traveling to and from various parking destinations within the park. A map of the updated Traffic Analysis Zones is presented in Figure IV-1.

Figure IV-1: Great Park Traffic Analysis Zones

688 Acre Park Development Plan Trip Generation

The daily and peak hour trip generation forecasts by ITAM Traffic Analysis Zone and parking area for the Western Sector Park Development Plan and the 688 Acre Park Development Plan are presented in Table IV-1. The project land uses and trip generation for the 688 Acre Park Development Plan for the 2012 (existing) + project and the 2017 + project traffic analysis is basically the same, except for one land use. The proposed Community Ice Facility is not included in the 2012 existing baseline, but is included in the 2017 as it was previously approved as part of the Western Sector Park Development Plan.

As presented in Table IV-1, the total OCGP daily trip generation for the Western Sector Park Development Plan and the 688 Acre Park Development Plan is 10,030. This is less than the 19,083, daily trips approved in the OCGP FEIR. The difference between 19,083 and 10,030 is 9,053, which would be available for the future phased development of the OCGP Cultural Terrace.

The 10,030 daily trip generations includes both the Western Sector Park Development Plan and the 688 Acre Park Development Plan area. The Community Ice Facility within the Western Sector Park Development Plan area does not currently exist and was, therefore, not included in Alternative 1: Existing Conditions. The total daily trip generation for the Western Sector Park Development Plan and the 688 Acre Park Development Plan without the Community Ice Facility is 9,310.

The total daily trip generation from the Western Sector Park Development Plan was 4,586. The 688 Acre Park Development Plan will generate an additional 5,444 daily trips for the total of 10,030.

ITAM Assumptions for Alternatives

The Alternative 1 (Existing Conditions Baseline) and Alternative 3 (2017 Baseline No Project) ITAM traffic forecasts were provided by the City of Irvine. The remaining four alternatives required land use and network adjustments to ITAM. All OCGP 688 Acre Park Development Plan model assumptions and model runs for the project alternatives were reviewed and approved by the City of Irvine. They are summarized as follows:

Alternative 2 is the Existing Plus Project alternative that adds the 688 Acre Park Development to the Existing Conditions.

Alternative 4 (i.e., 2017 “With Project”) adds the 688 Acre Park Development Plan to the 2017 Baseline alternative.

Alternatives 5 and 6 are alternatives to Alternative 4, the 2017 Baseline plus 688 Acre Park Development Plan.

Alternative 5 analyzes an alternative Heritage Fields Project Option 1 land use plan. For this alternative, the ITAM land use assumptions for Heritage Fields Project Option 2 TAZ land uses and quantities were replaced with the Option 1 land use and quantities. The Option 1 TAZ land use and quantities were provided by the City of Irvine and presented in Table IV-2.

604	235	DU	Multi-Family	36
604	235	DU	Multi-Family	122
605	235	DU	Multi-Family	112

All alternatives include a high school in TAZ 606, which is south of Irvine Boulevard referred to as High School Site A.

Alternative 6 is identical to Alternative 4, the 2017 ITAM Baseline plus the proposed 688 Acre Park Development, except for a roadway network change that provides a loop connection between “LY” Street and Great Park Boulevard along the eastern edge of the Sports Park ball fields. All land use, trip generation and network changes for Alternatives 2, 4, 5 and 6 were reviewed and approved by the City of Irvine.

2017 Baseline Roadway Network Updates

Presented in Chapter III is the Existing Roadway Geometry for the intersections within the region. The committed 2017 intersection geometry includes improvements assumed in place by 2017 that will be required by others and the OCGP 688 Acre Park Development Plan. The resulting 2017 Intersection Geometry is presented in Figure IV-2.

Figure IV-2: 2017 Intersection Geometry

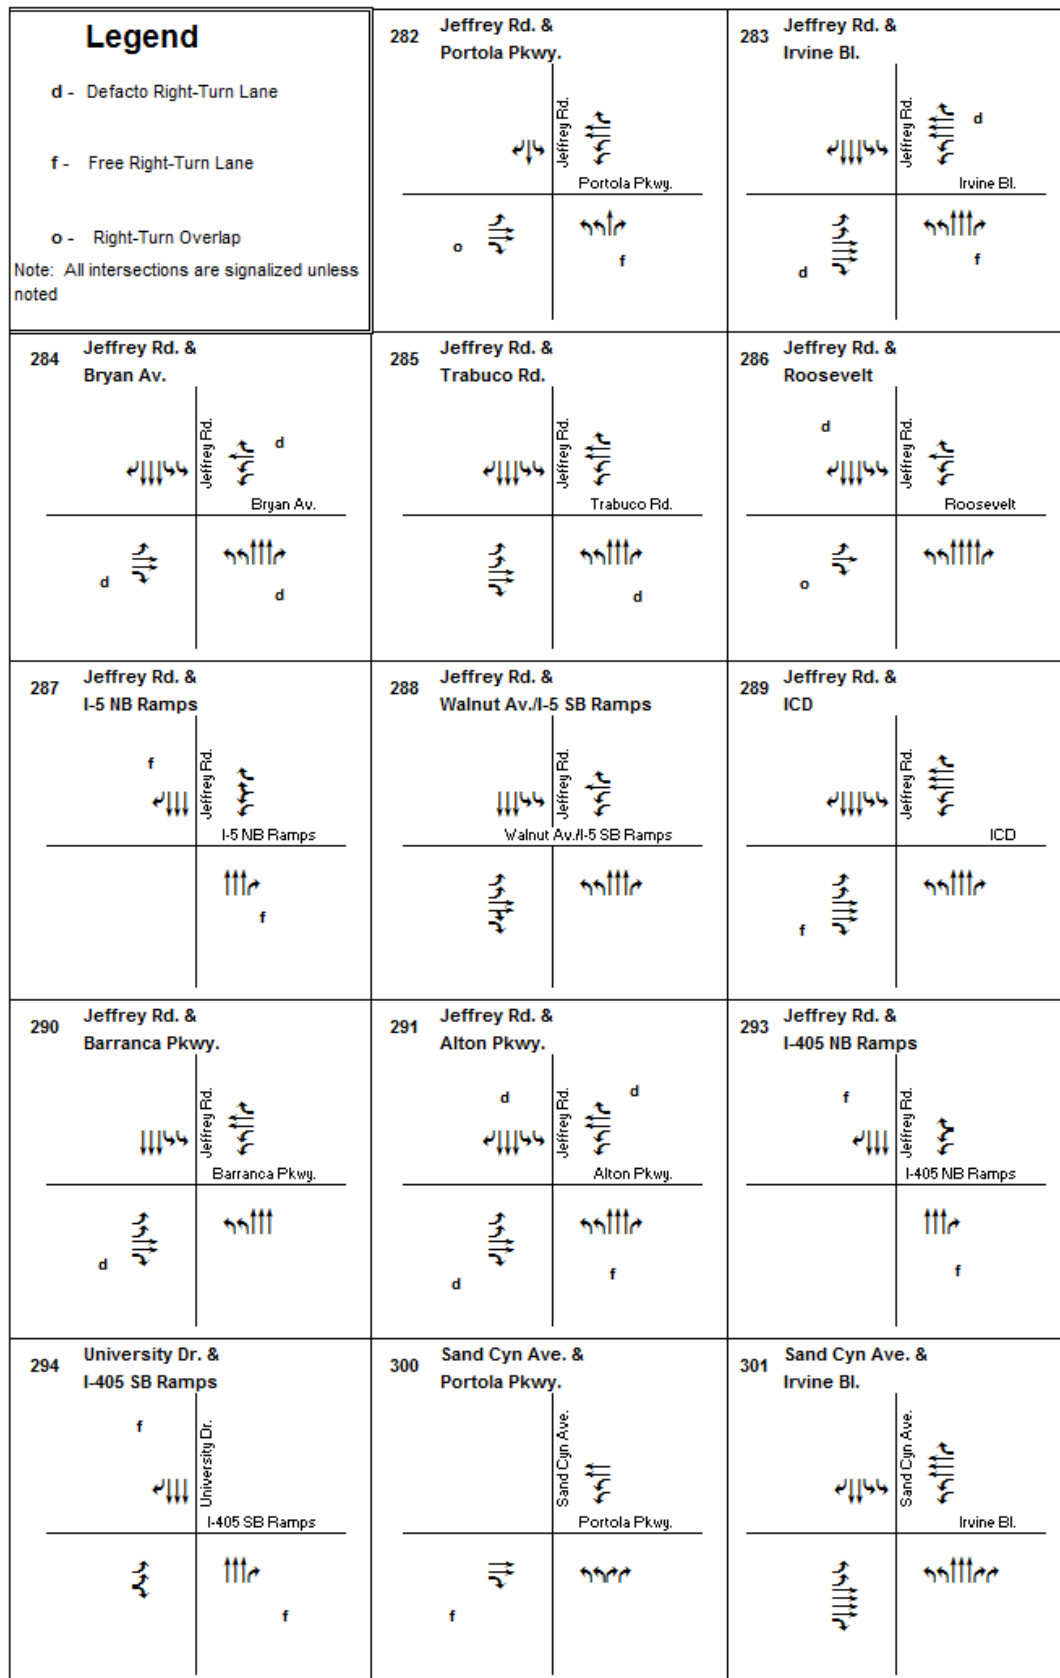

Figure IV-2: 2017 Intersection Geometry (Continued)

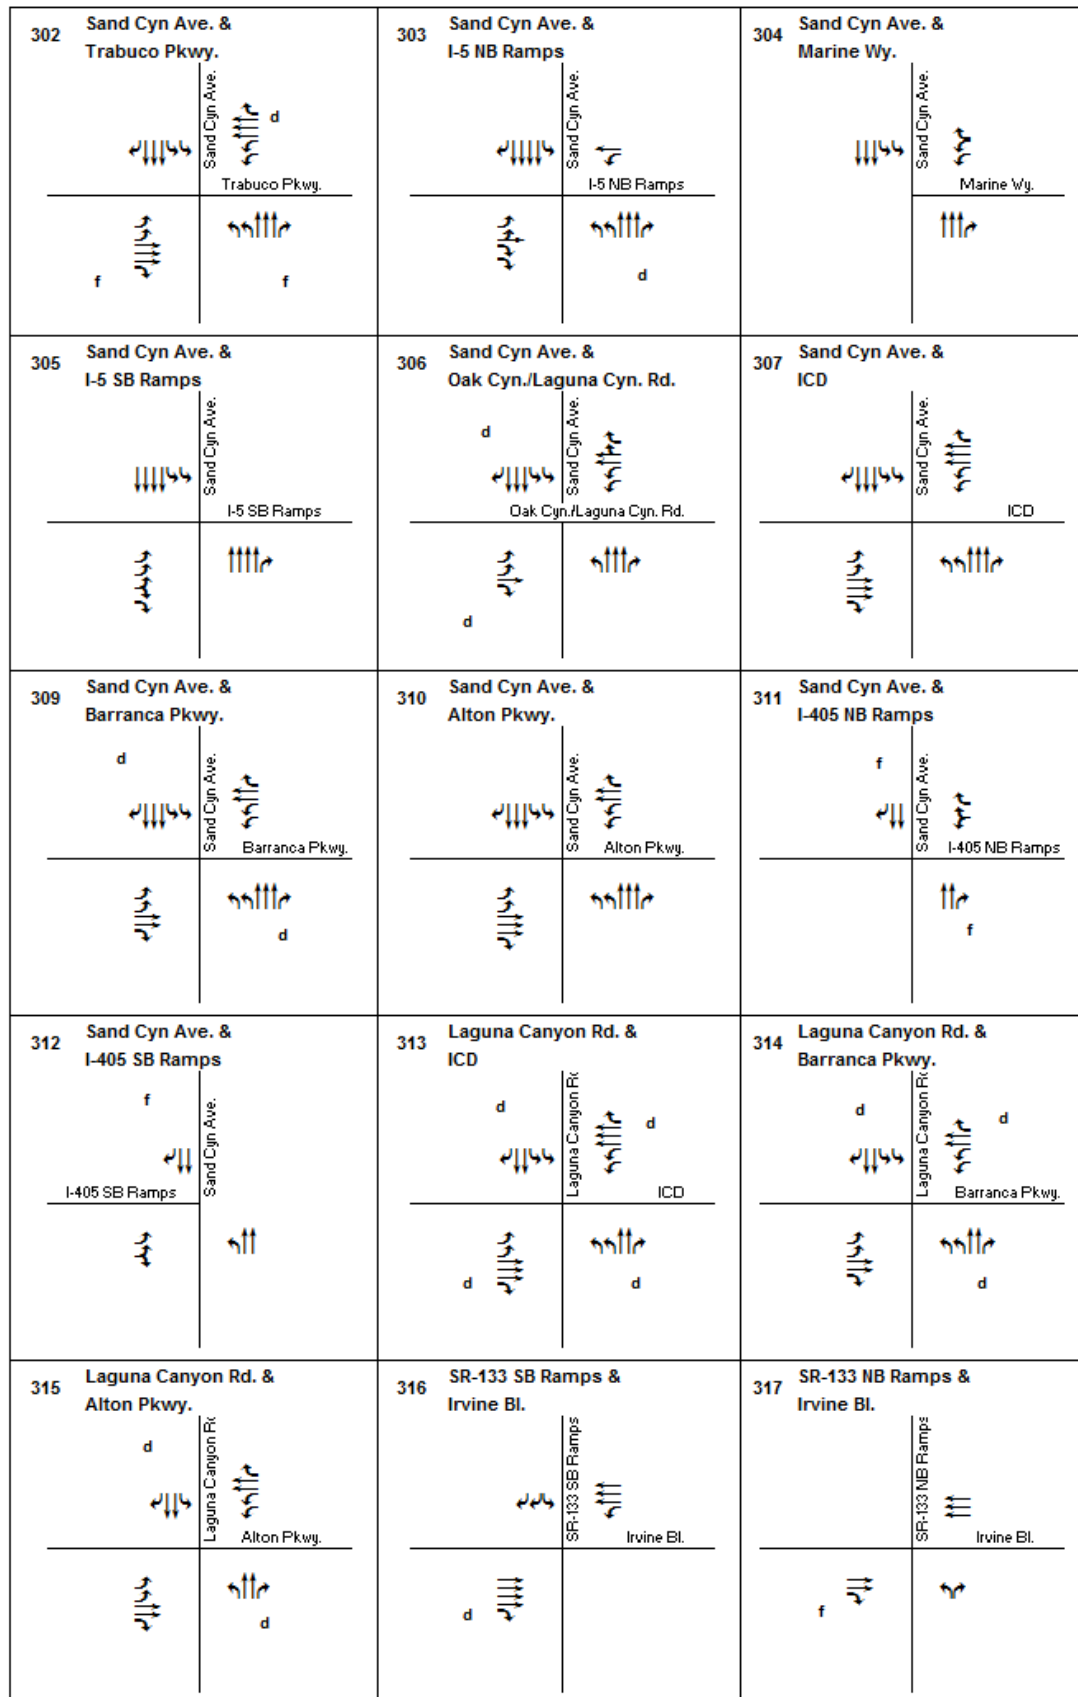

Figure IV-2: 2017 Intersection Geometry (Continued)

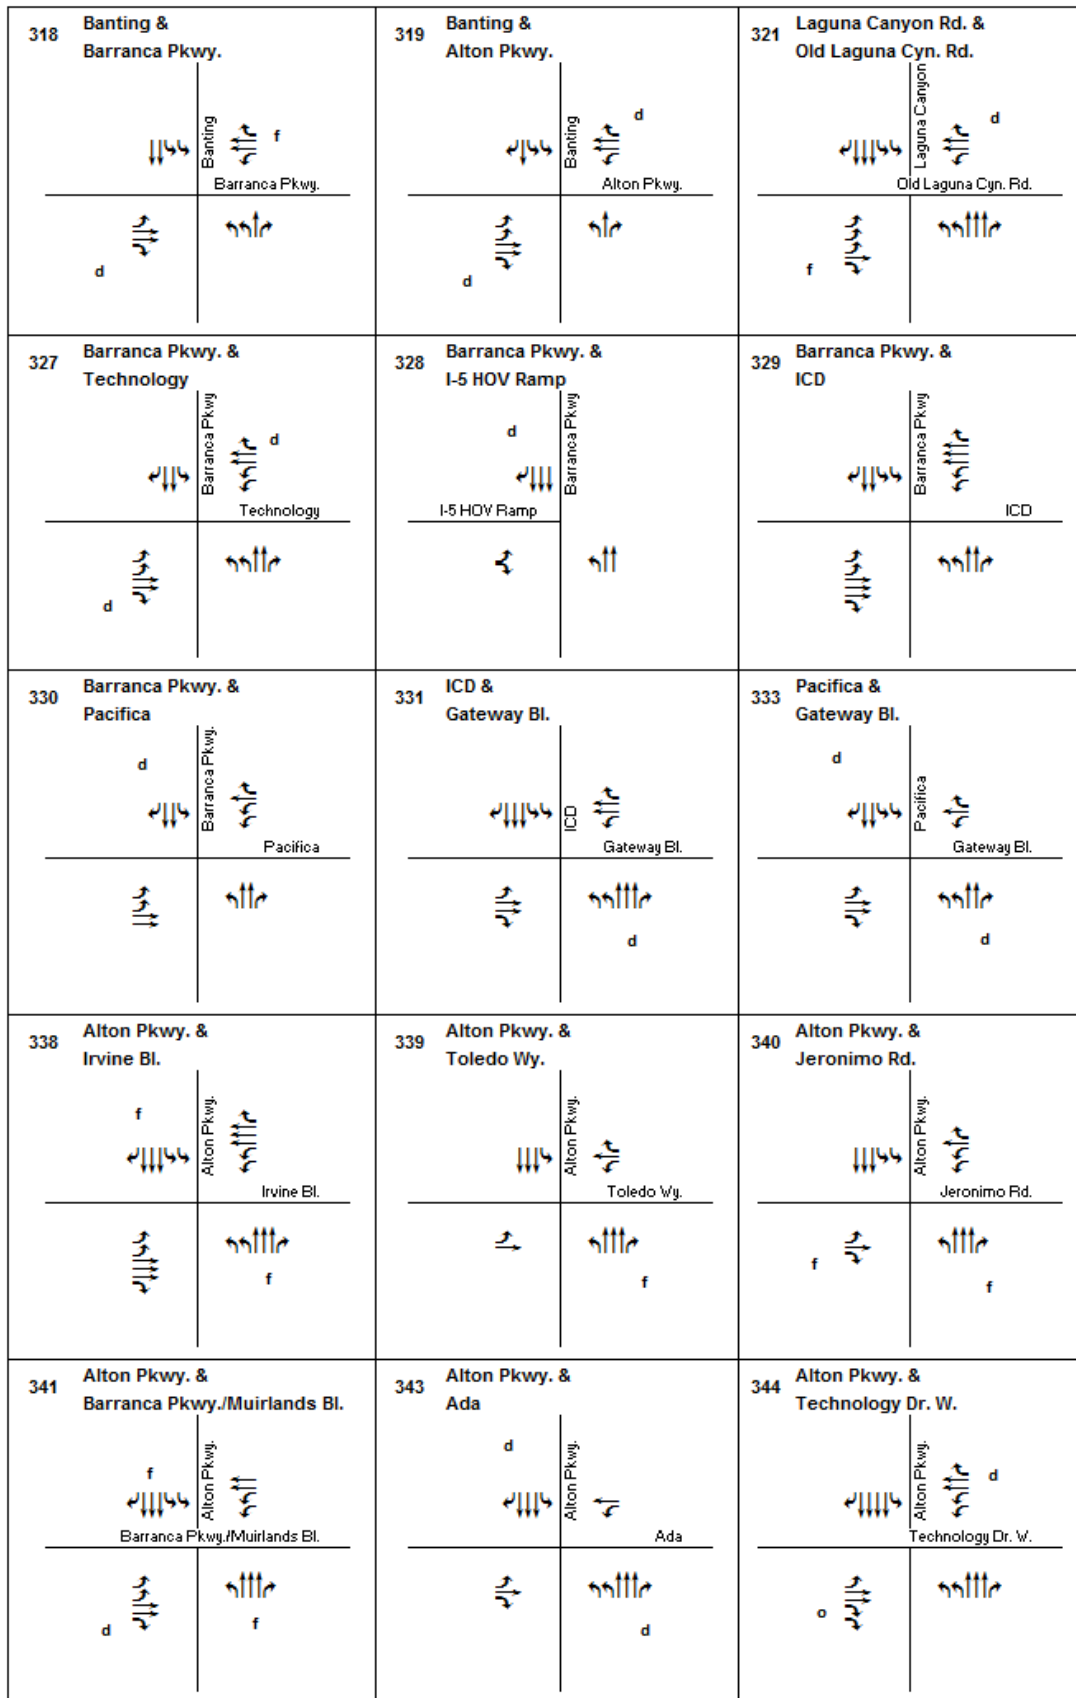

Figure IV-2: 2017 Intersection Geometry (Continued)

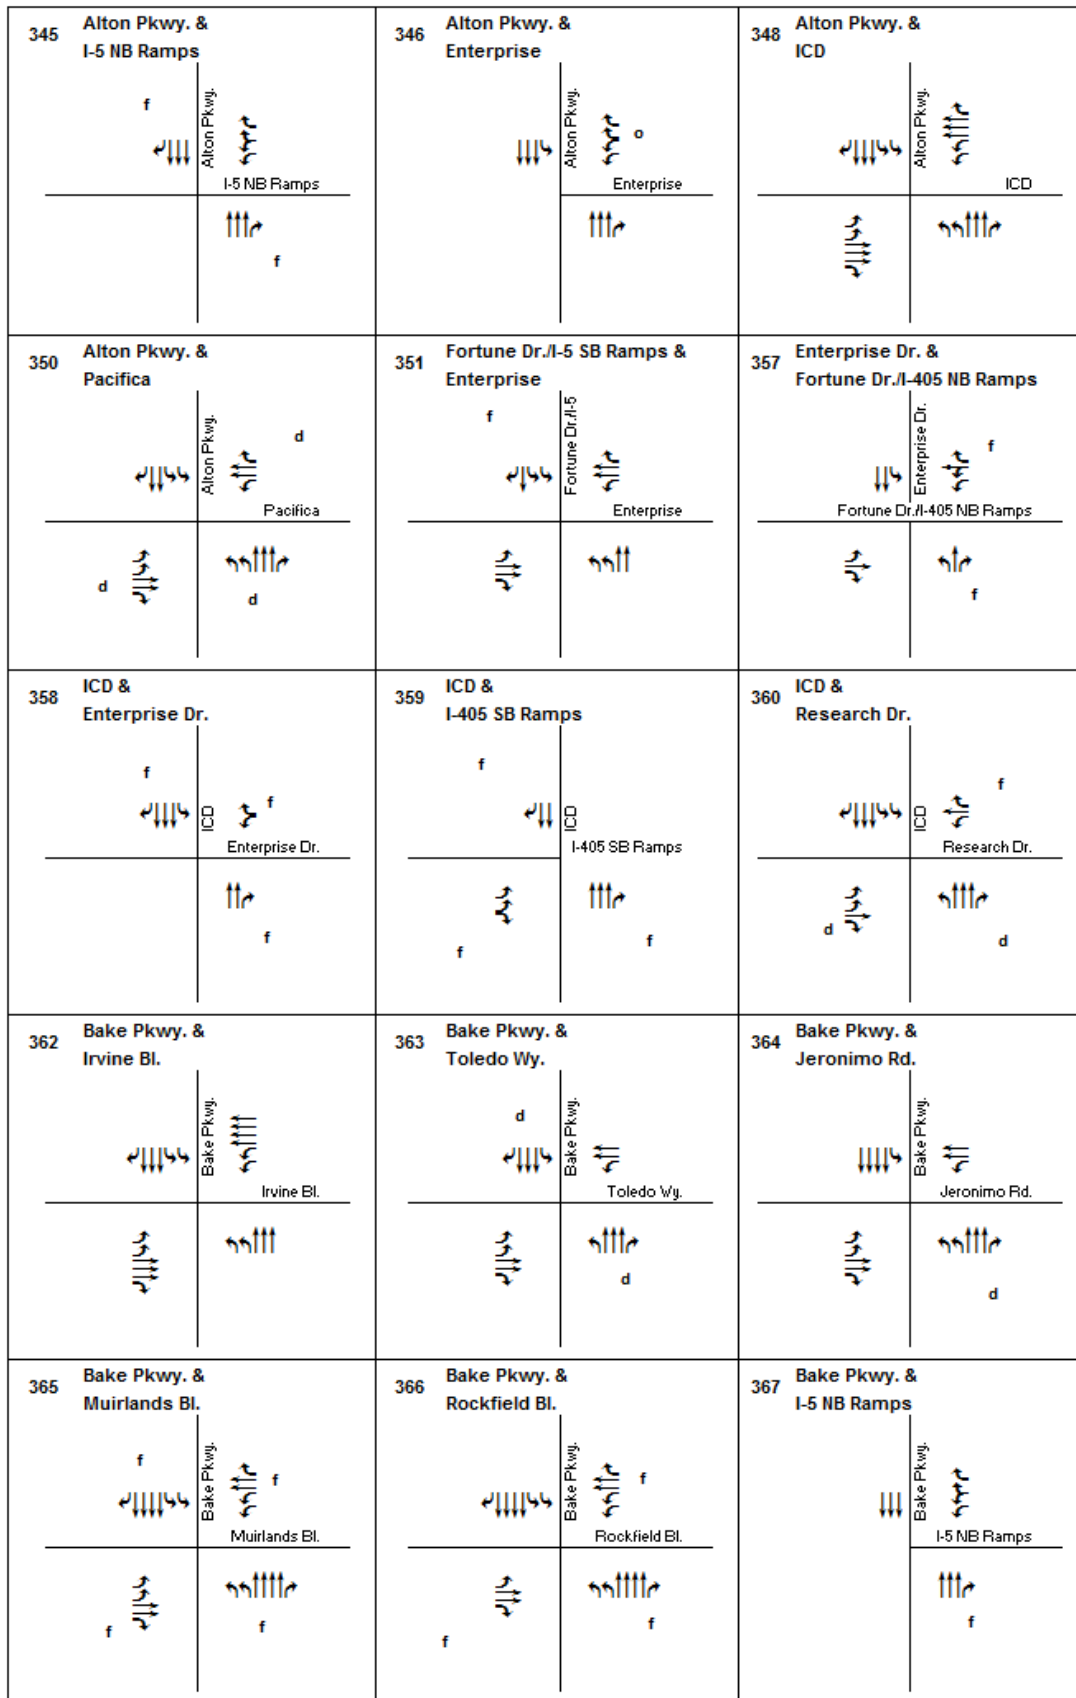

Figure IV-2: 2017 Intersection Geometry (Continued)

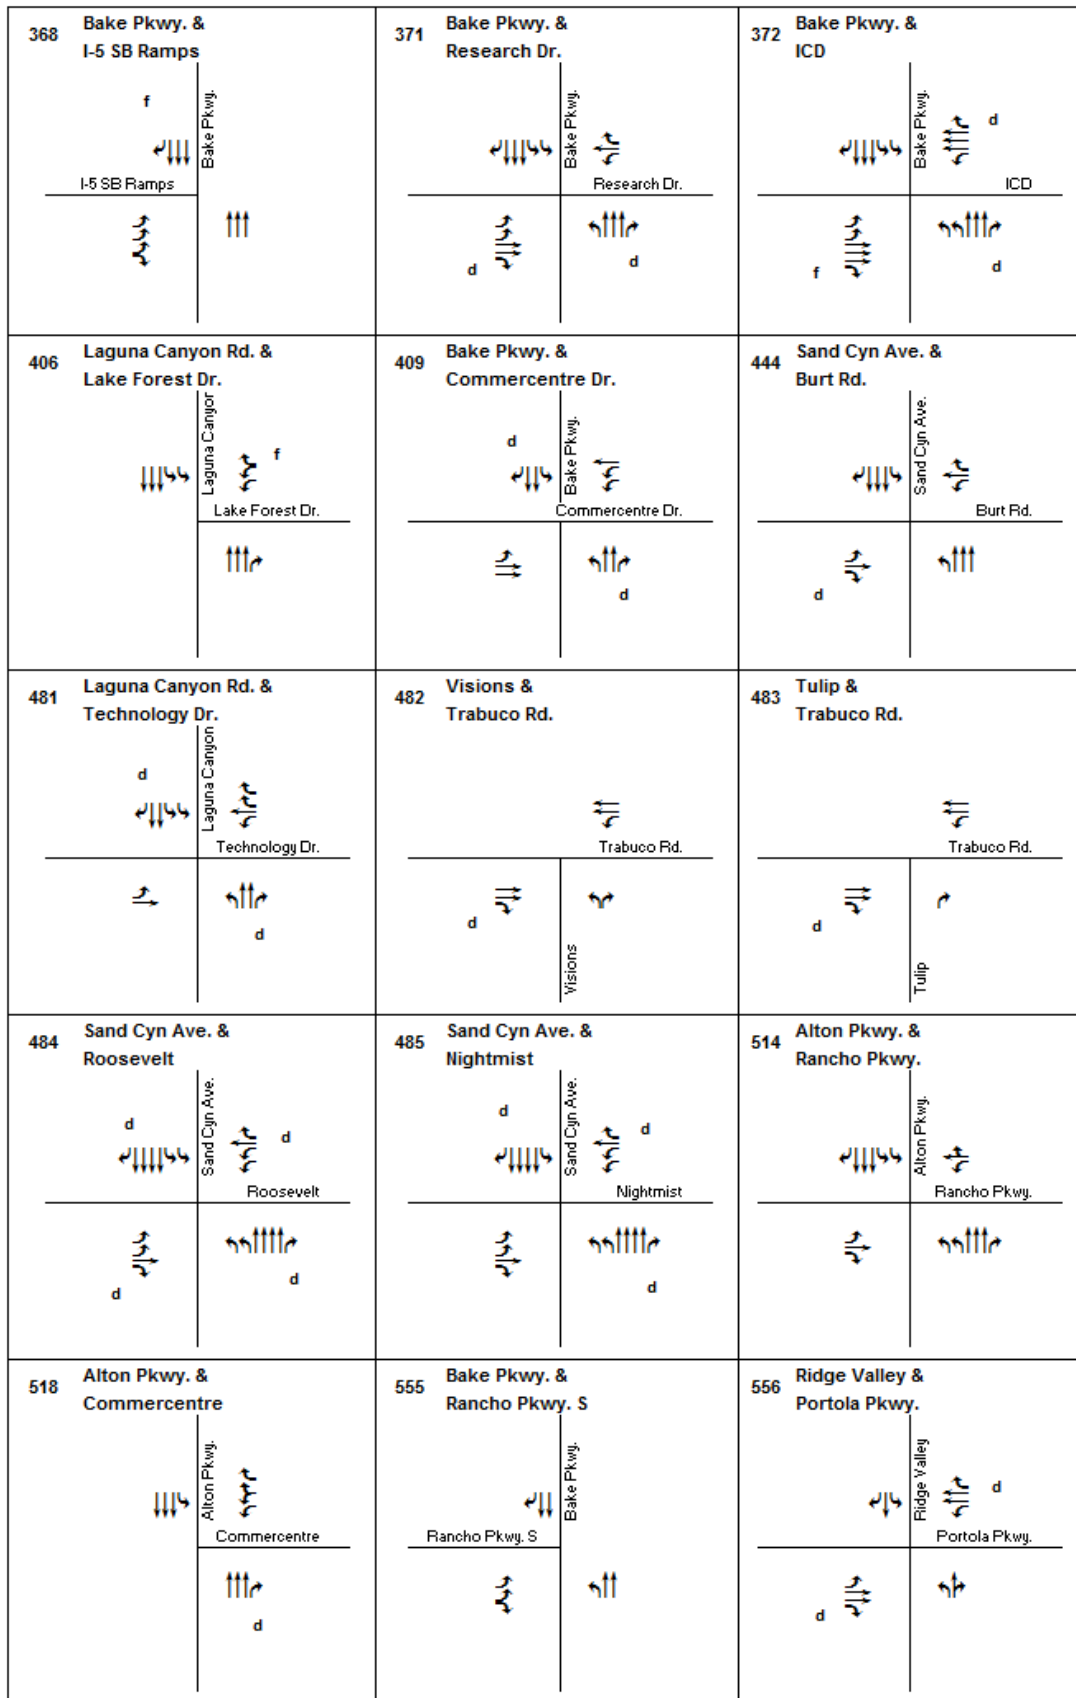

Figure IV-2: 2017 Intersection Geometry (Continued)

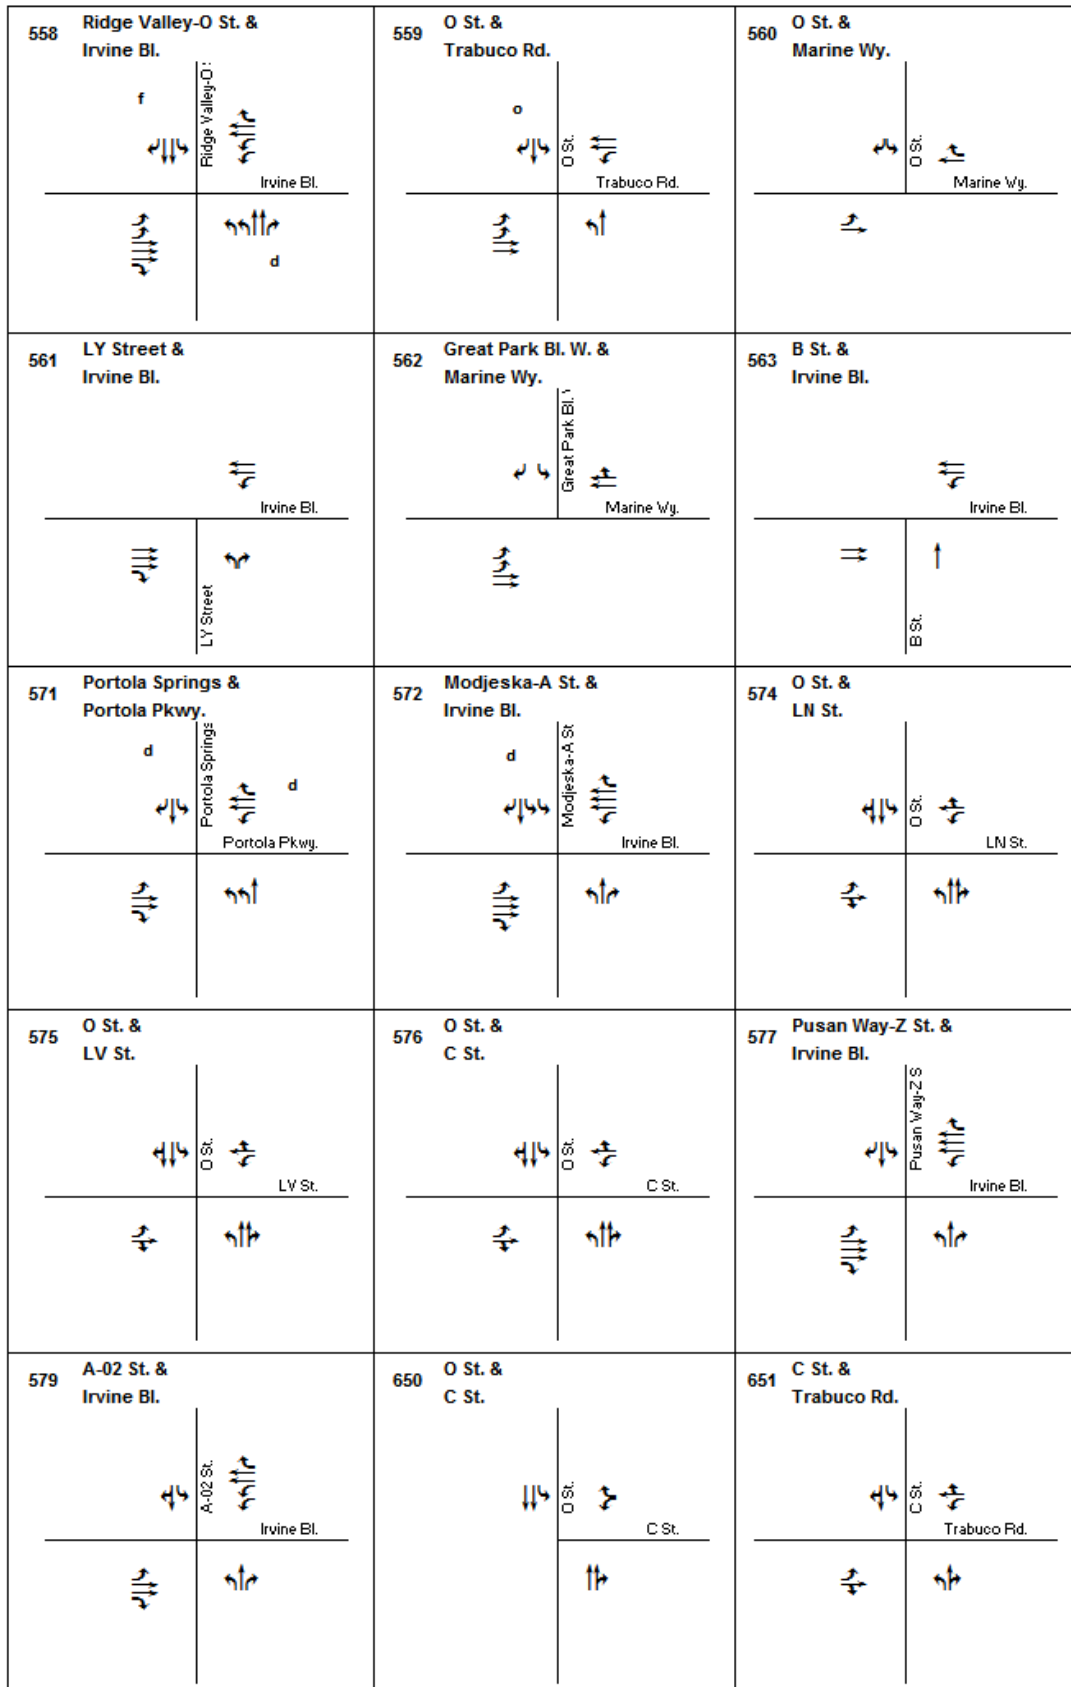

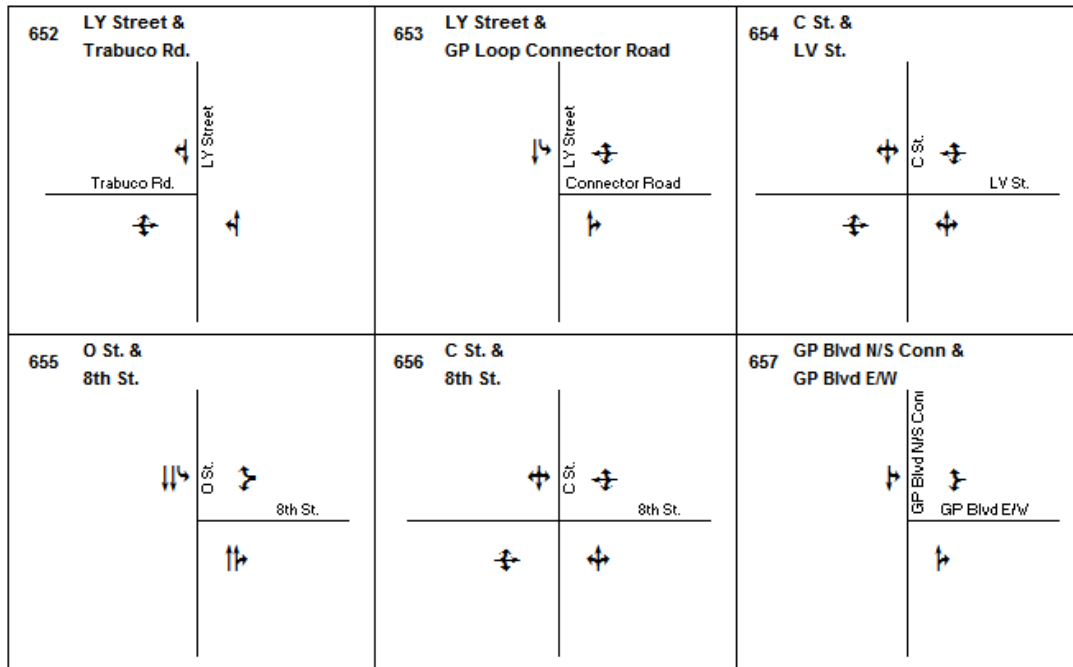

Figure IV-2: 2017 Baseline Intersection Geometry (Continued)

Note: The recommended lane configurations are based on technical traffic analysis and are subject to concurrence and approval by the City Engineer. Changes to these technical recommendations may occur from modifications of future buildout of the OCGP and Planning Area 40.

V. PERFORMANCE CRITERIA

Two levels of traffic analysis were conducted consistent with the approved Scope of Work (see Appendix A). These are: 1) daily and peak hour arterial link volume to capacity ratio level of service analysis and peak hour Intersection Capacity Utilization (ICU – for signalized intersections) or Highway Capacity Manual (HCM – for unsignalized intersections); and 2) intersection design analysis per the City’s Transportation Guidelines (TG). The following section describes the performance measures.

Daily Arterial Volume to Capacity Level of Service Analysis

For each arterial link within the study area a daily link level of service is based on the average daily traffic (ADT) volume/capacity (V/C) ratios, based on the following capacities:

City of Irvine

Major Arterial	8-lane	72,000
	6-lane	54,000
Primary Arterial	4-lane	32,000
Secondary Arterial	4-lane	28,000
Commuter	2-lane	13,000

Outside City of Irvine

Major Arterial	8-lane	75,000
	6-lane	56,300
Primary Arterial	4-lane	37,500
Secondary Arterial	4-lane	25,000 (24,000 – City of Orange)
Commuter	2-lane	12,500 (12,000 – City of Orange)

The performance standards for the daily volume to capacity ratios for all links is LOS D or a V/C ratio less than or equal to 0.90 except arterials in Irvine Planning Area 33 (Spectrum I) and Planning Area 36 (Irvine Business Complex/IBC), and Congestion Management Plan arterials outside the City of Irvine where the threshold is LOS E where daily volume to capacity ratio must be less than or equal to 1.00.

Daily and Peak Hour Arterial Volume to Capacity Level of Service Analysis

As required by the City of Irvine Peak Hour Link Capacity Analysis guidelines, arterial links that exceed the daily volume to capacity ratio level of service analysis thresholds must conduct a peak hour link volume to capacity ratio analysis.

AM and PM Peak Hour Intersection Capacity Utilization

To determine significant impacts at signalized intersections, the ICU methodology was used for intersections within the study area. The ICU methodology compares the volume-to-capacity (v/c) ratios of conflicting turn movements at an intersection, sums these critical conflicting v/c ratios for

each intersection approach, and determines the overall ICU. The resulting ICU is expressed in terms of level of service (LOS), where LOS A represents free-flow activity and LOS F represents overcapacity operation. Parameters set by the City for ICU calculations, including lane capacity, right-turn treatment, and clearance interval, which are included in the analysis. According to the City Traffic Impact Analysis Guidelines (adopted by City Council on August 24, 2004), level of service at an intersection or roadway is considered to be unsatisfactory when the ICU exceeds 0.90 (LOS D). In addition, the City General Plan has identified intersection locations in which an ICU is acceptable when less than or equal to 1.0 (LOS E) in Planning Area 33, Planning Area 36, CMP intersections outside the City of Irvine, intersections of Bake Parkway/I-5 northbound and southbound ramps, Alton Parkway/Irvine Boulevard, Bake Parkway/Irvine Boulevard, Lake Forest Drive /I-5 southbound ramps-Avenida de la Carlotta and Lake Forest Drive/Irvine Center Drive.

A project impact is identified if the project results in an ICU greater than the acceptable level of service, the project contribution is required to bring the intersection back to acceptable level of service, or when the projects results in an ICU of 0.02 or greater for an already deficient location, the project contribution is required back to no-project conditions.

The intersection turn movements and level of service is presented in Appendix C. The ICU level of service calculation sheets are presented in the Appendix D.

AM and PM Peak Hour Unsignalized Intersection Level of Service Analysis

To determine adequacy of peak-hour operations at unsignalized intersections, the HCM methodology was used. The HCM methodology evaluates conflicting flows and applies gap acceptance criteria to determine delay and level of service for stop controlled unsignalized intersection. The Unsignalized Intersection Level of Service calculation sheets are presented in Appendix E.

VI. ALTERNATIVES ANALYSIS

The following chapter provides an evaluation of each of the six alternatives. This analysis includes:

1. OCGP Project Trip Distribution
2. Daily Traffic Link Volume Forecasts and Volume/Capacity Level of Service Analysis
3. Peak Hour Link Analysis (for those alternatives and links which exceeded the daily thresholds)
4. Signal Warrant Analysis to determine which intersections warrant signalization and will be evaluated with Intersection Capacity Utilization level of service and which intersections will be stop controlled and evaluated per the Highway Capacity Manual unsignalized intersection level of service analysis.
5. Peak Hour Intersection Level of Service Analysis

The Transportation Guidelines (TG) analyses are presented in Section VII.

Project Trip Distribution

The forecast OCGP 688 Acre Park Development Plan trip distribution percentages provide an understanding as to where trips traveling to and from the OCGP will travel and which roadways and intersections might be affected. A select zone analysis was conducted that aggregated all of the affected TAZs associated with the proposed OCGP 688 Acre Park Development Plan to determine how traffic is distributed throughout the roadway network. The OCGP 688 Acre Park Development Plan trip distribution is presented in Figure VI-1.

Daily Traffic Forecasts and Volume/Capacity Ratio Level of Service Analysis

Based on the ITAM, daily traffic forecasts were prepared for each alternative. Utilizing these daily forecasts and daily threshold capacities from Chapter V, the daily volume to capacity ratio level of service analysis was performed.

Figures VI-2 through VI-13 presents the average daily traffic and the resulting daily volume to capacity level of service for each of the six alternatives. The links, which were identified as over the daily threshold, are highlighted on the volume to capacity level of service maps.

Figure VI-1: Great Park 688 Acre Park Development Plan Trip Distribution

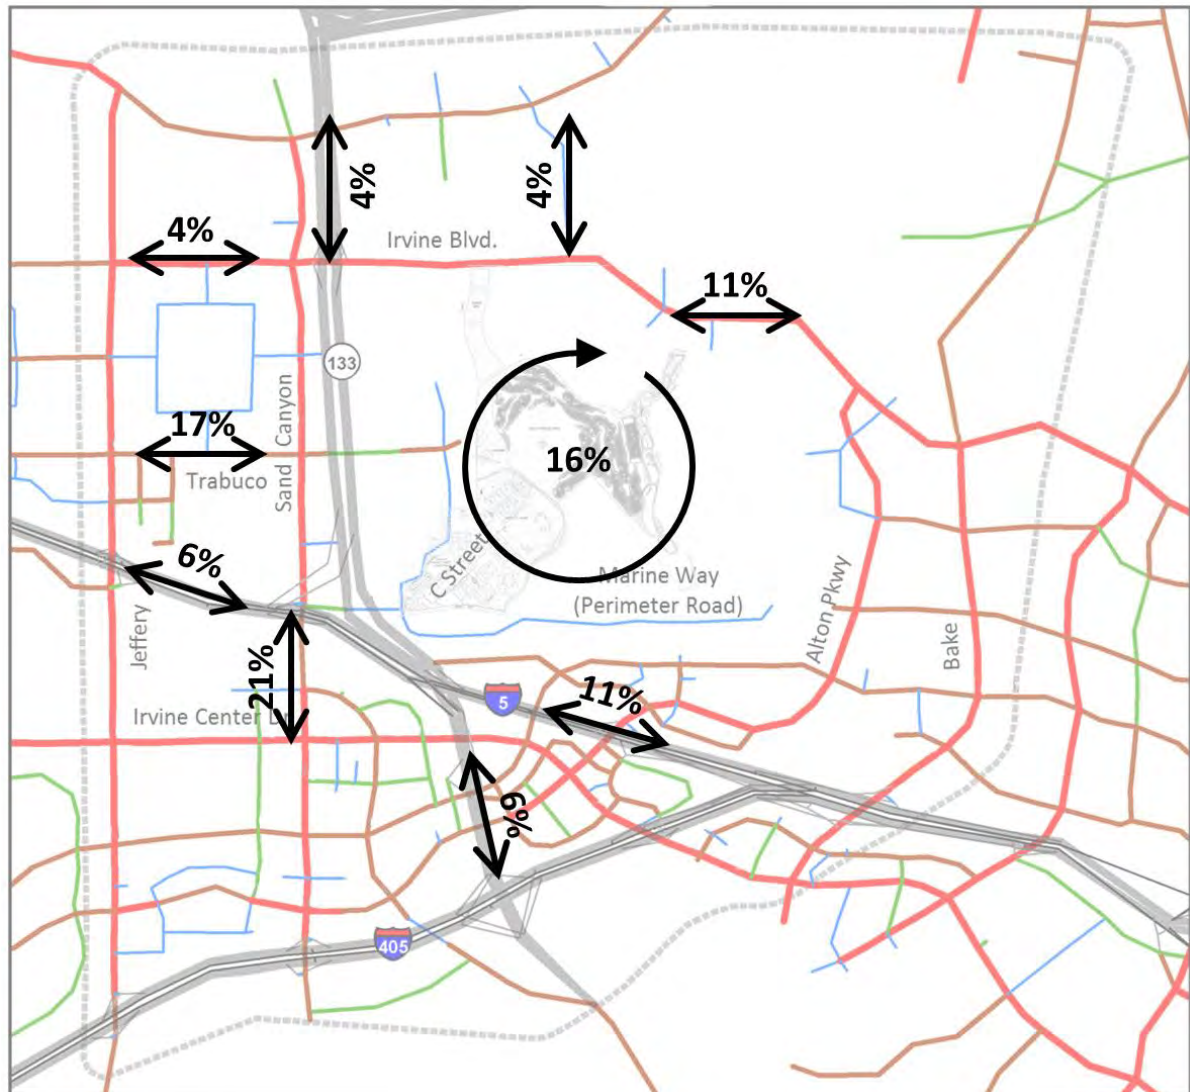

Figure VI-2: Alternative 1 - Existing Conditions Average Daily Traffic

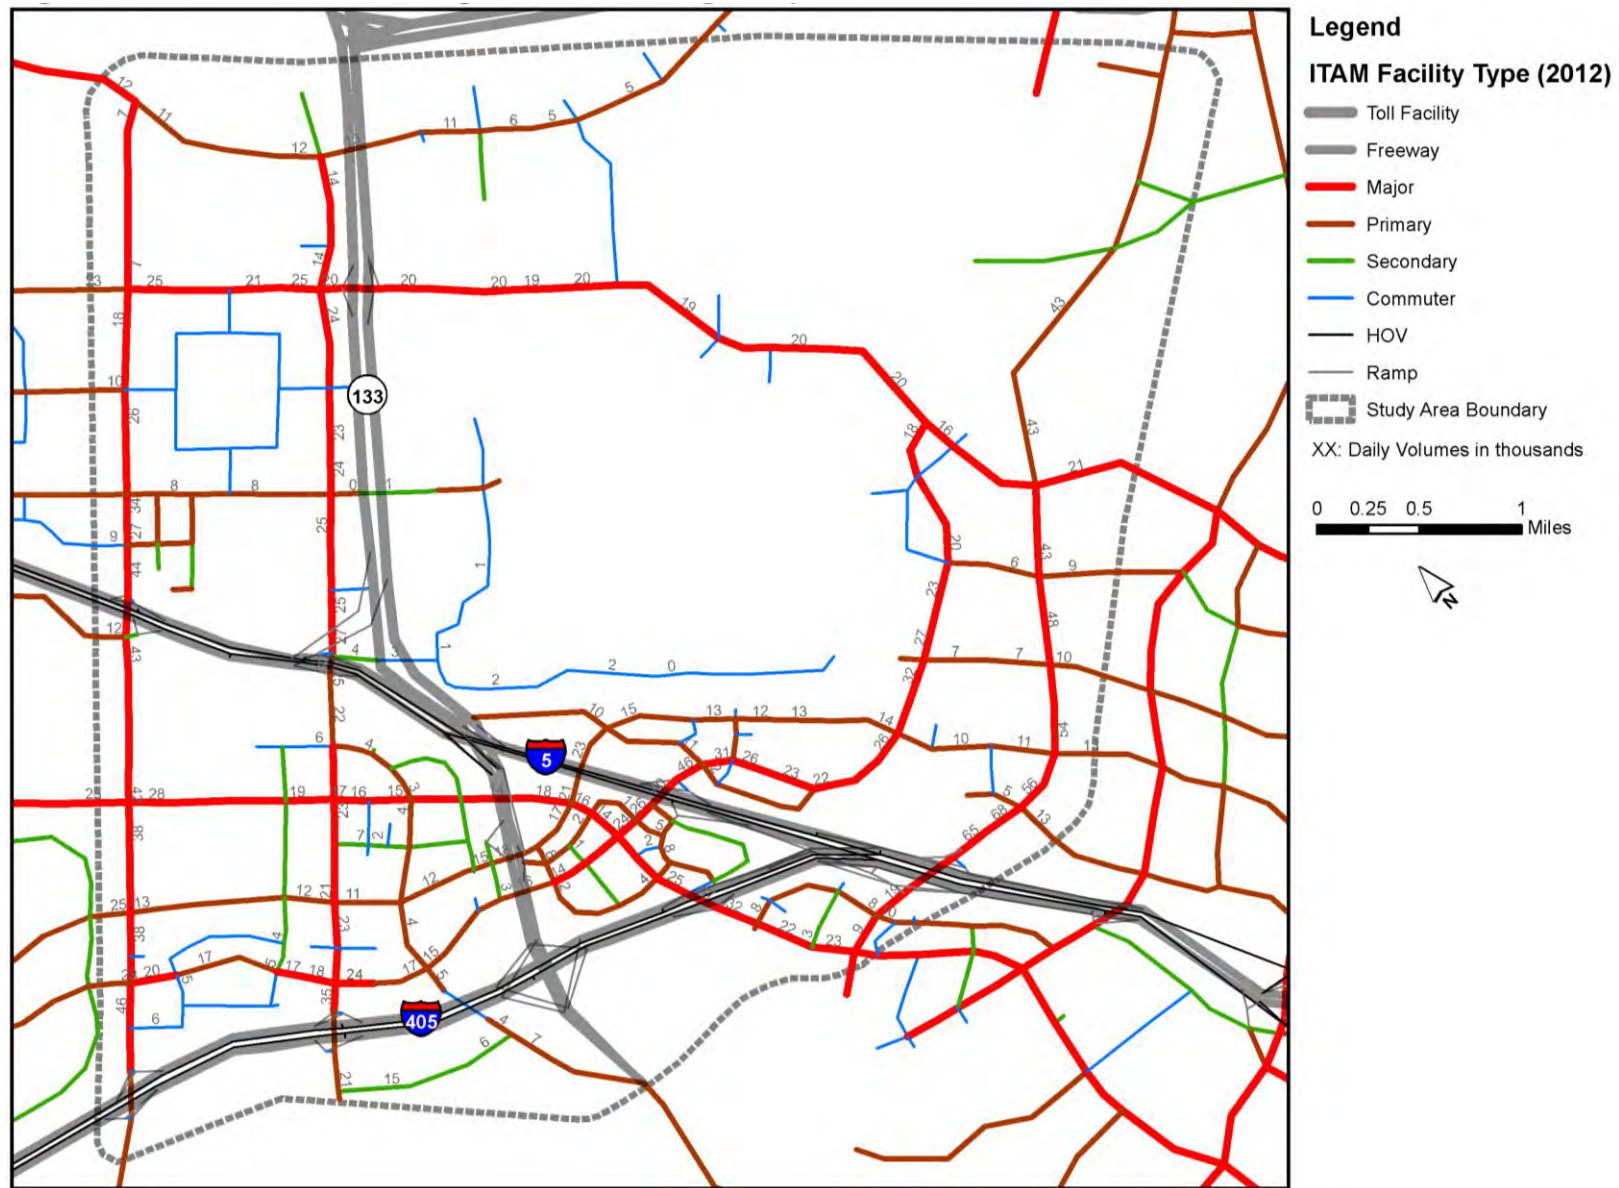

Figure VI-3: Alternative 1 - Existing Conditions Daily V/C Level of Service

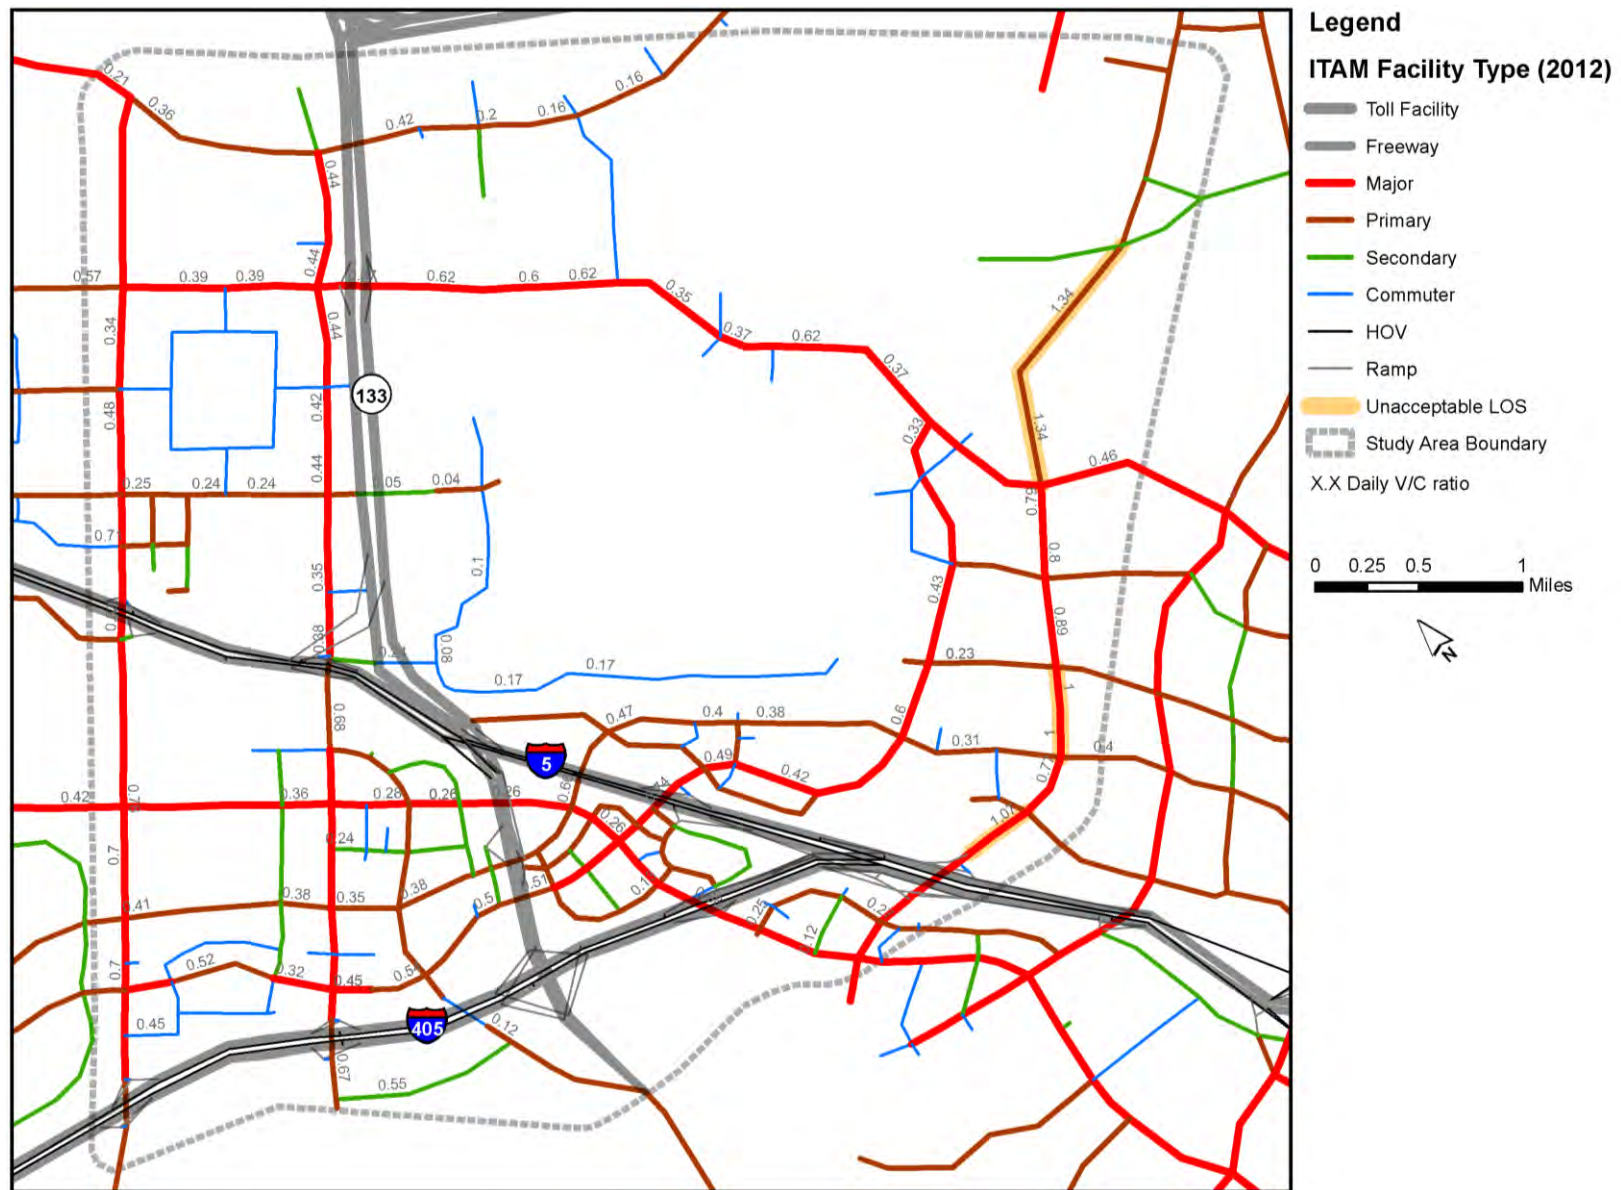

Figure VI-4: Alternative 2 - Existing plus 688 Acre Park Development Plan Average Daily Traffic

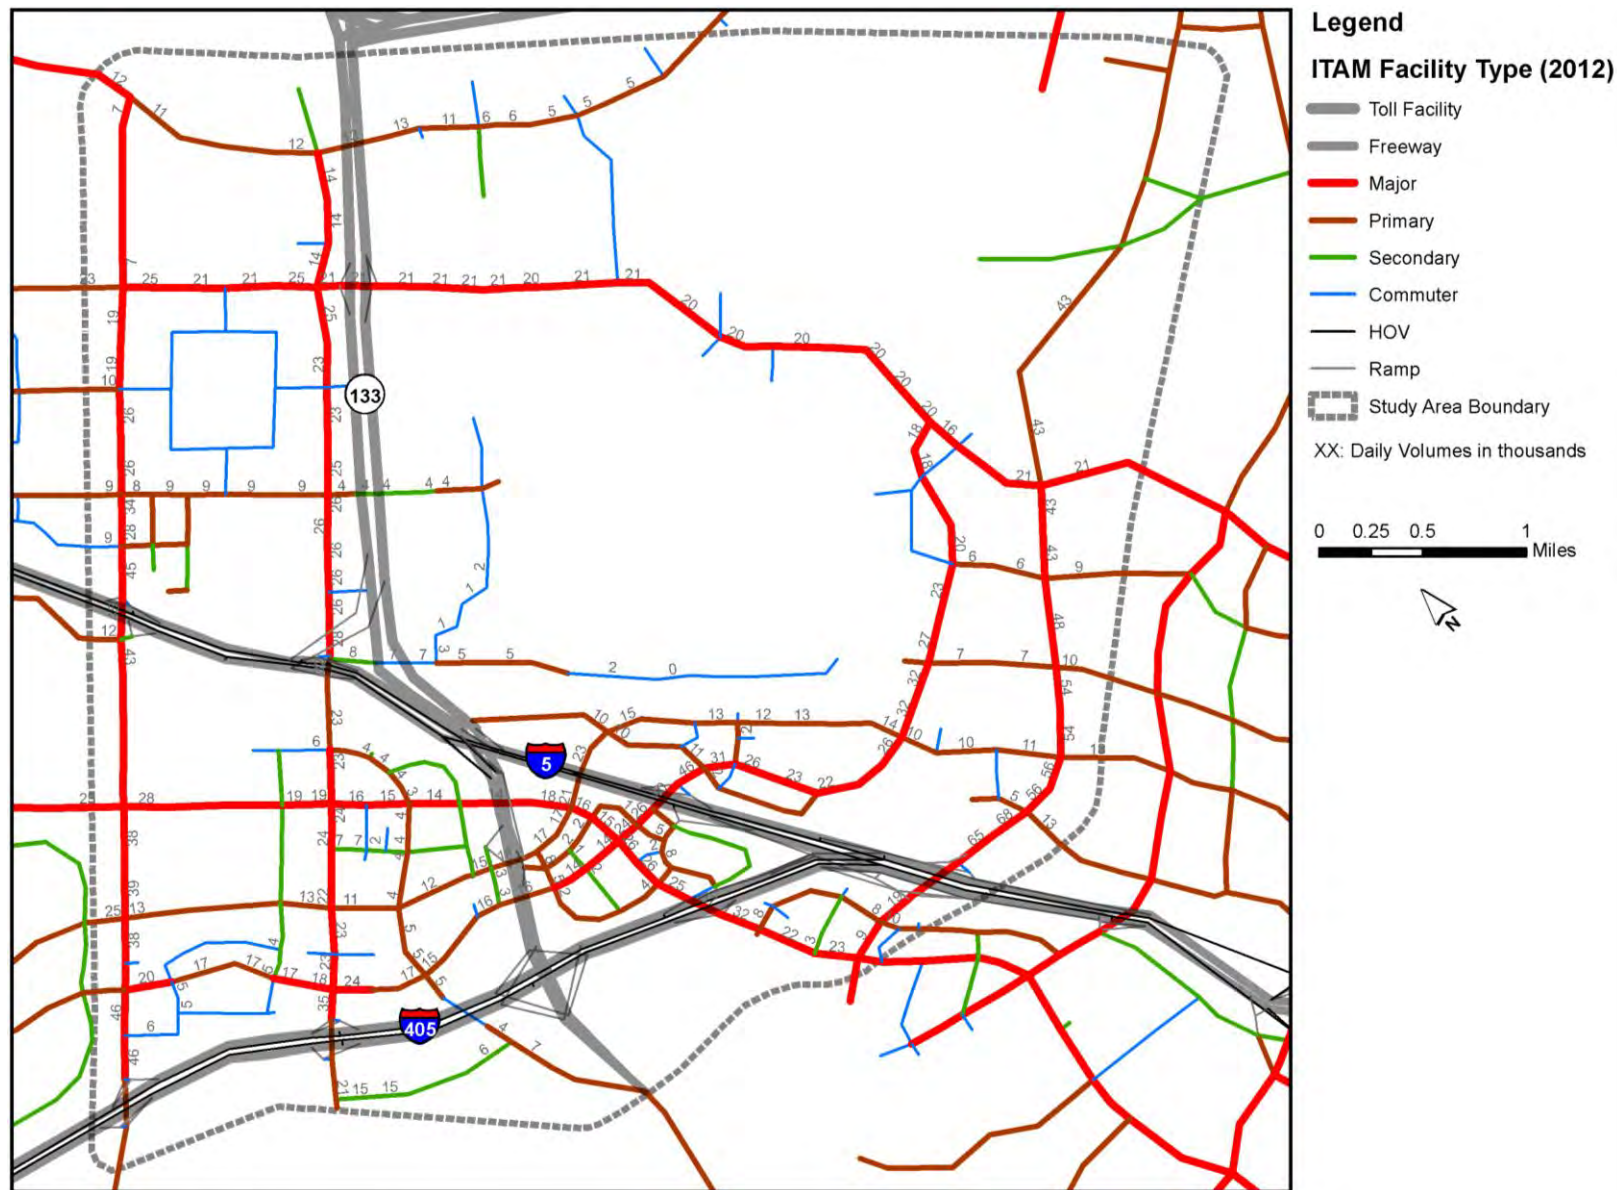

Figure VI-5: Alternative 2 - Existing plus 688 Acre Park Development Plan Daily V/C Level of Service

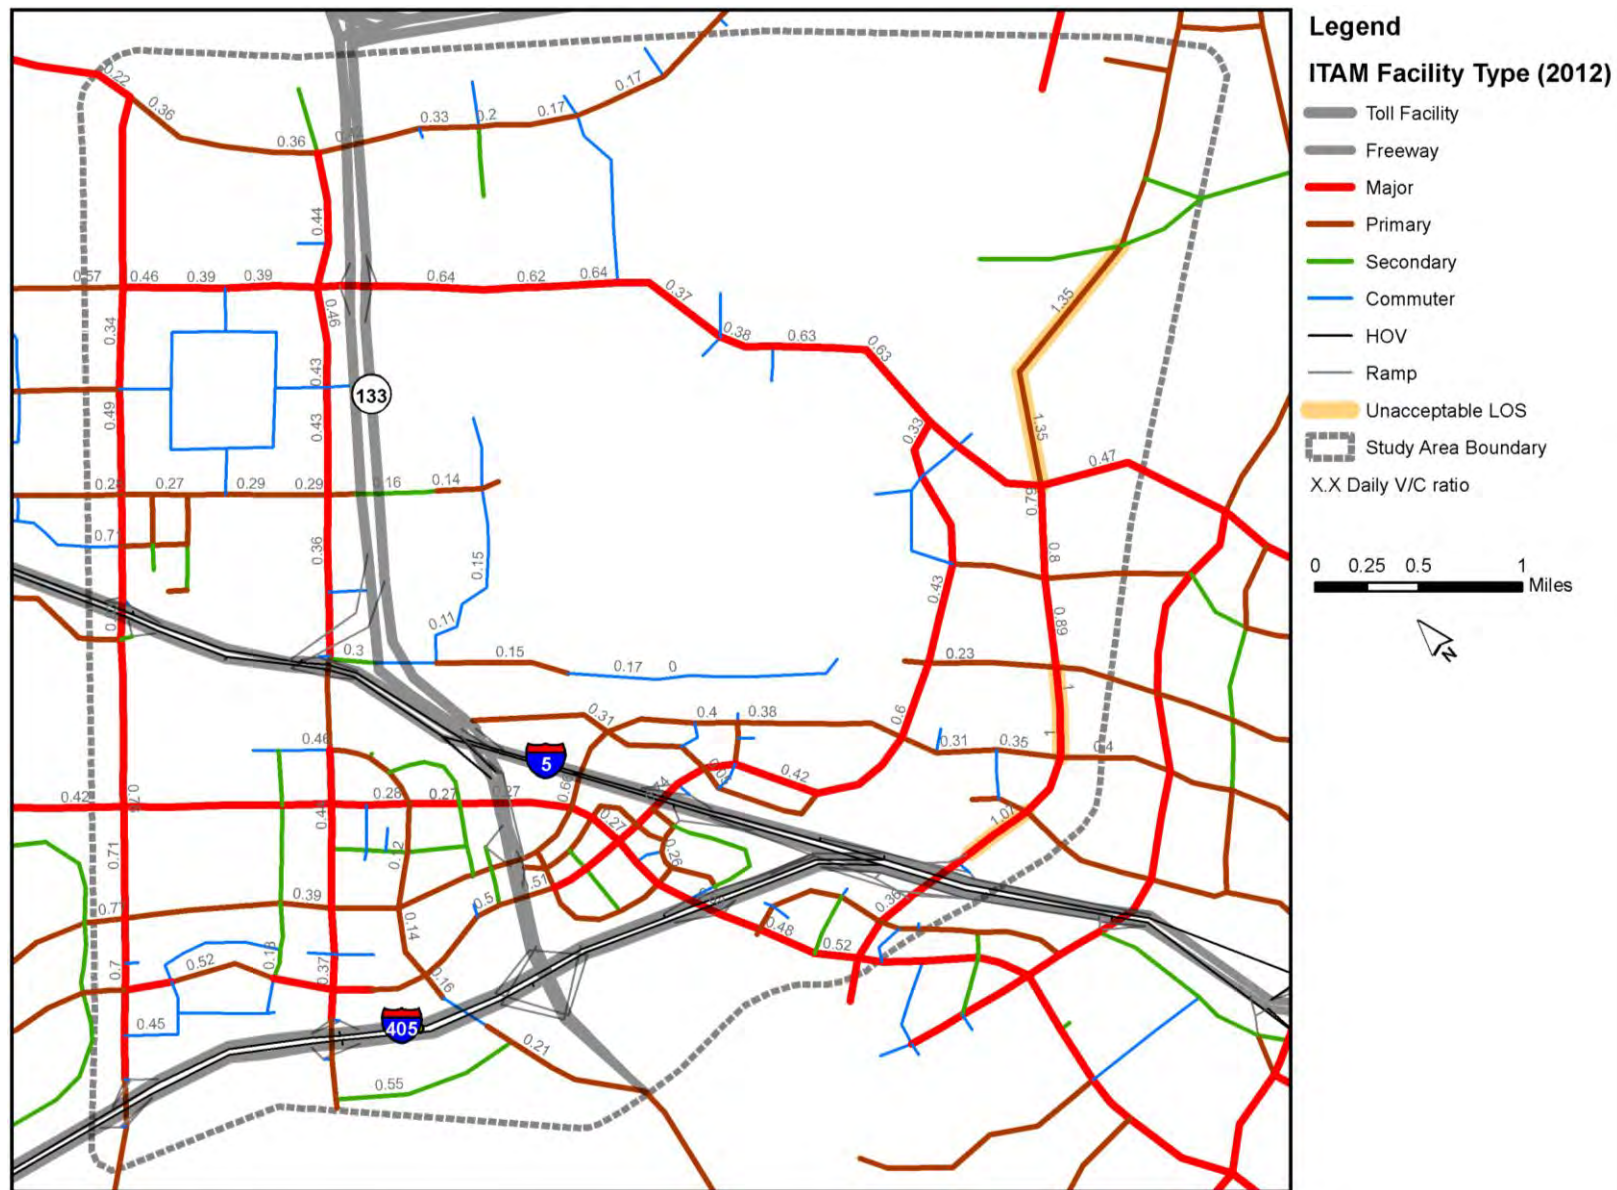

Figure VI-6: Alternative 3 - 2017 Baseline No Project Average Daily Traffic

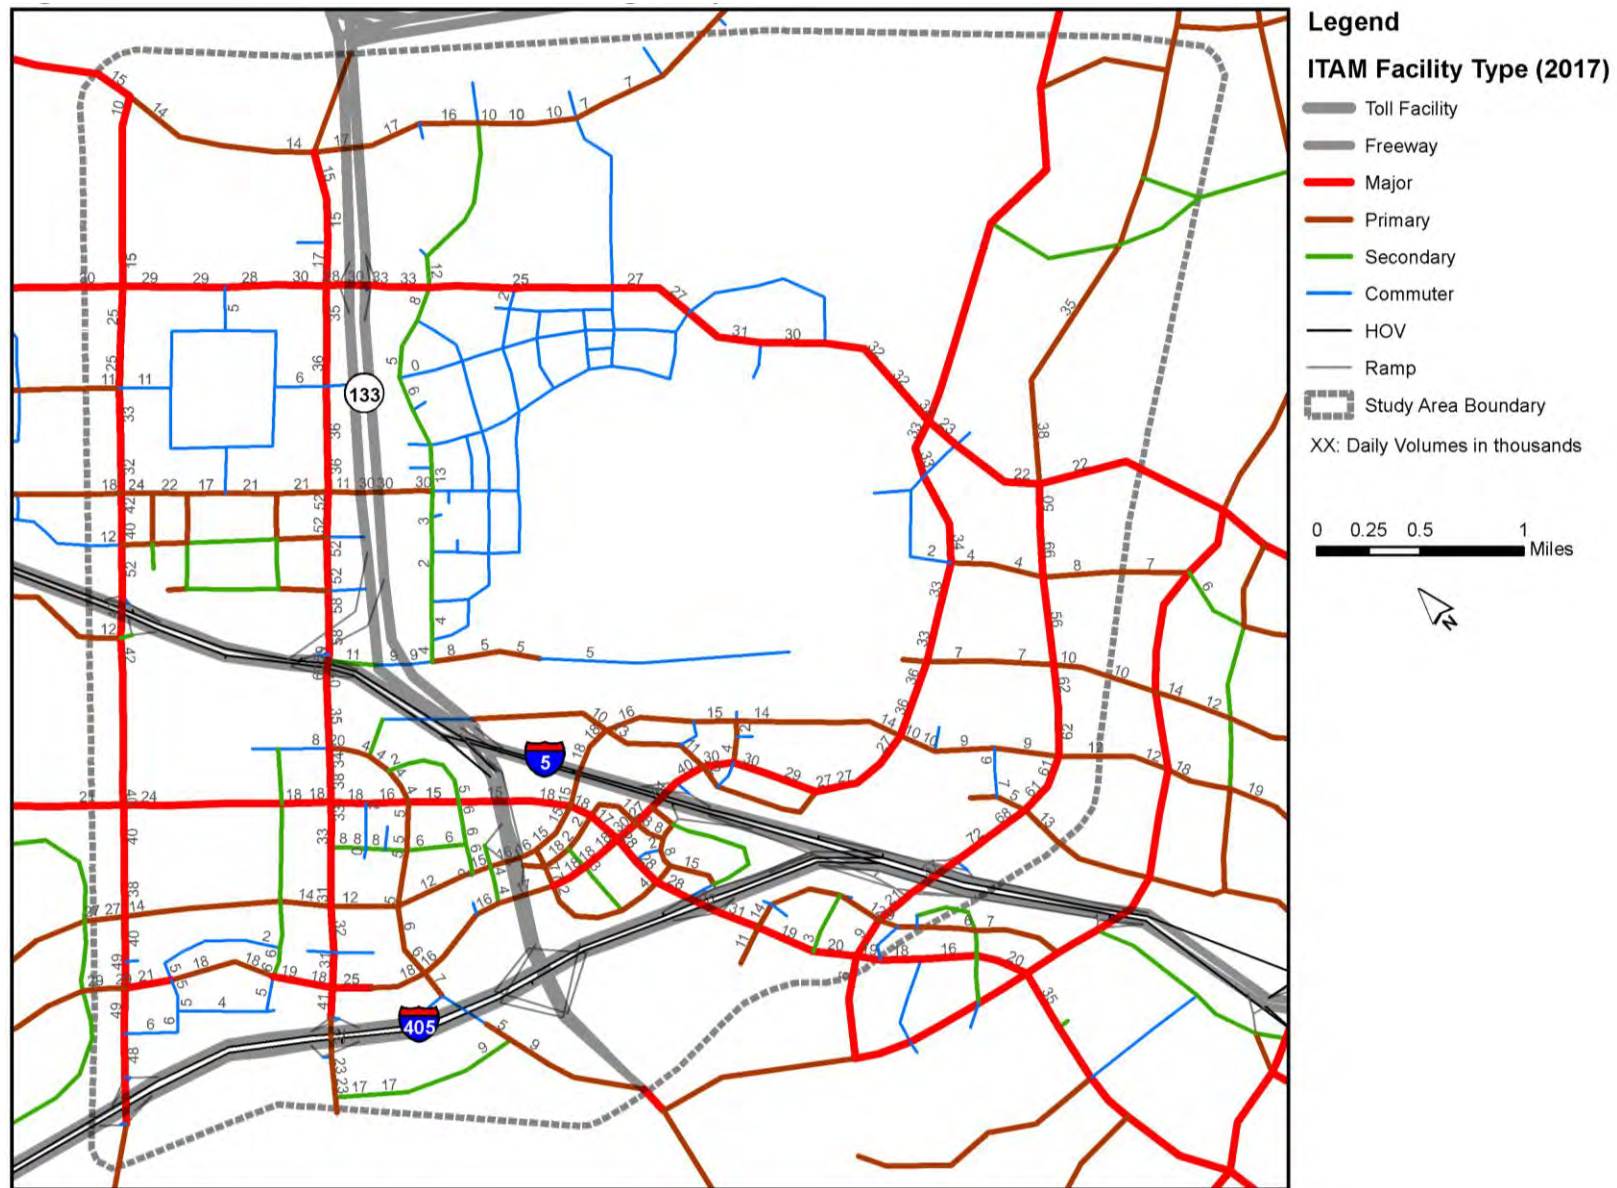

Figure VI-7: Alternative 3 - 2017 Baseline No Project Daily V/C Level of Service

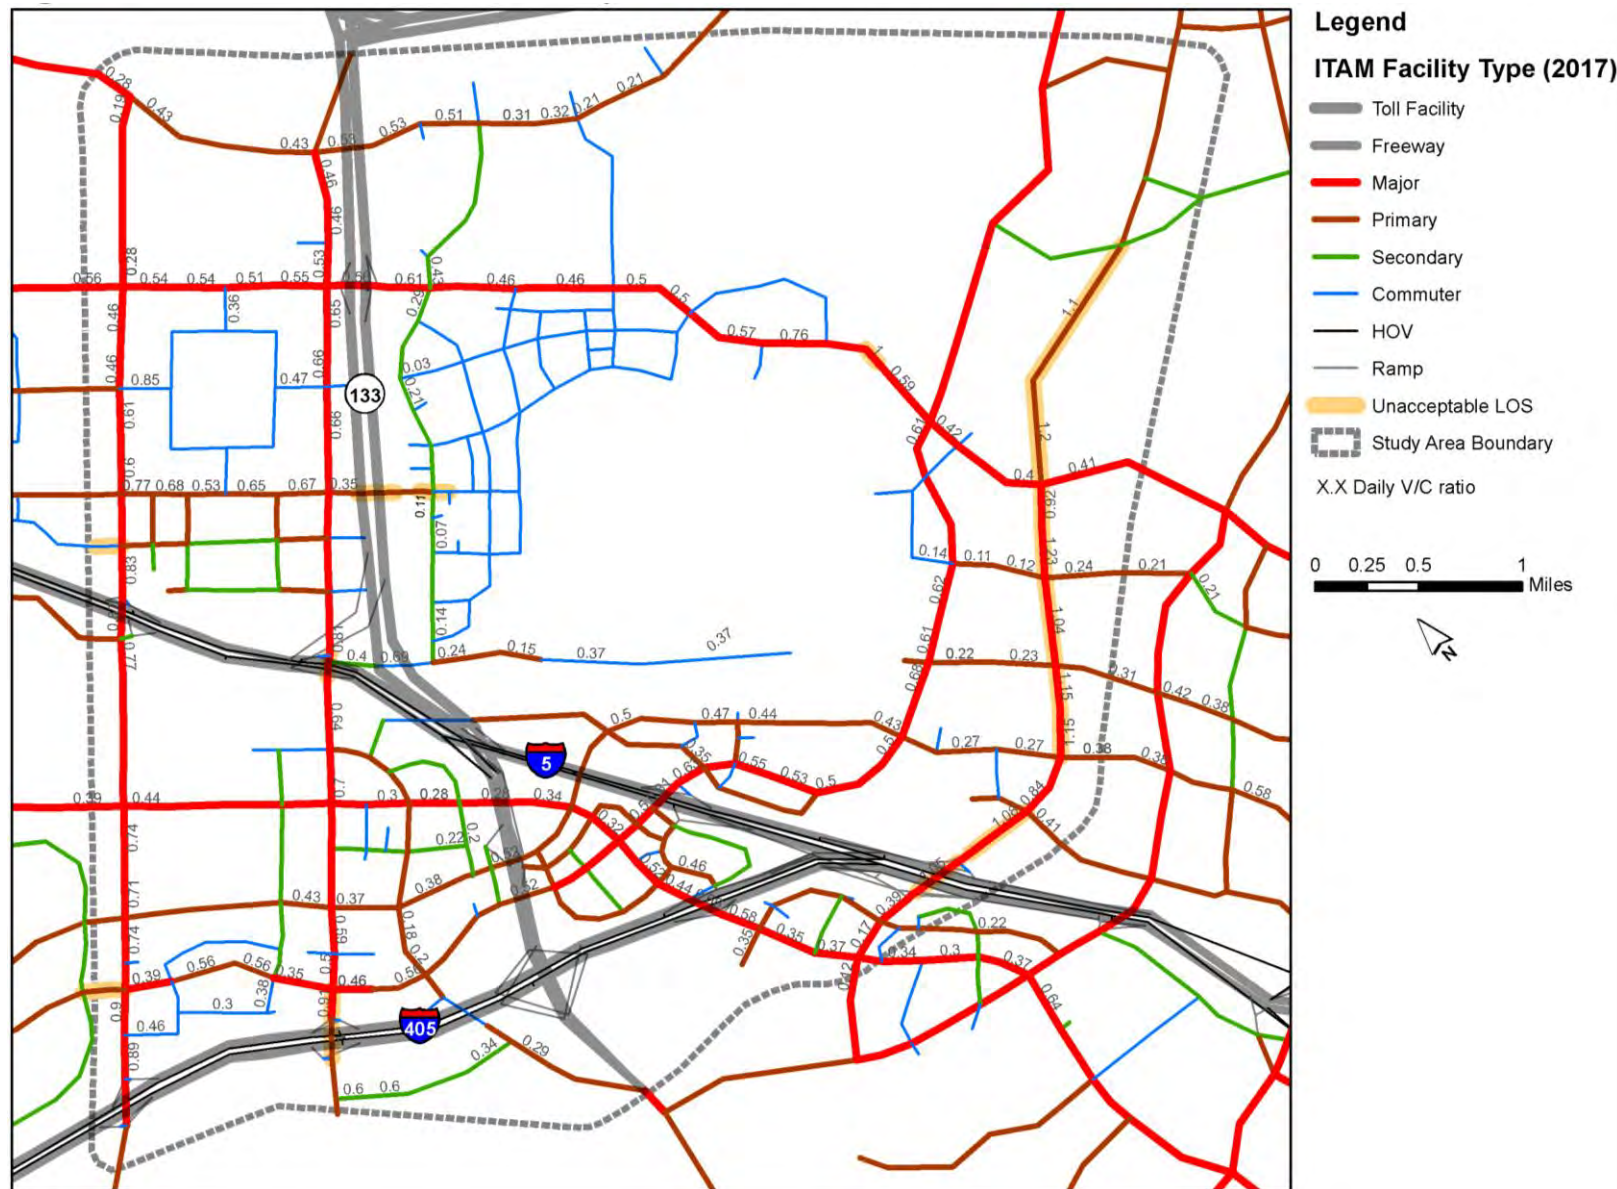

Figure VI-8: Alternative 4 - 2017 Baseline + 688 Acre Park Development Plan Average Daily Traffic

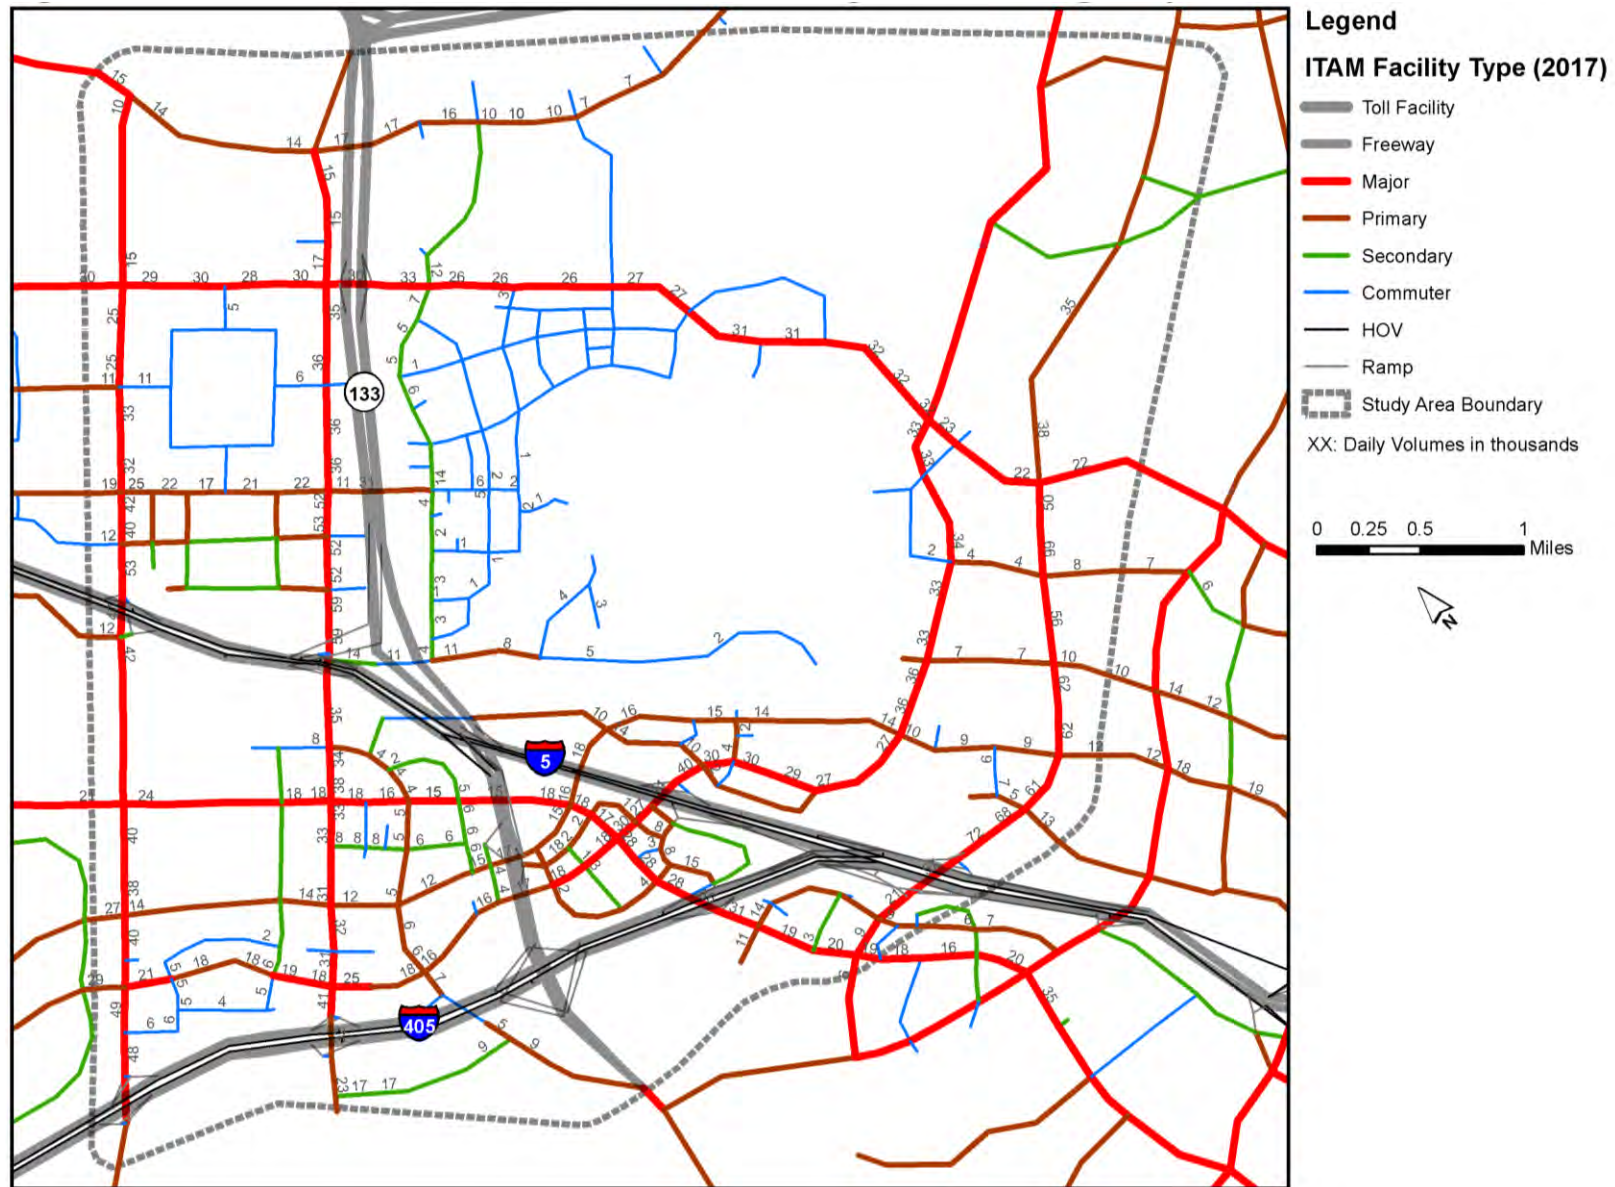

Figure VI-9: Alternative 4 - 2017 Baseline + 688 Acre Park Development Plan Daily V/C Level of Service

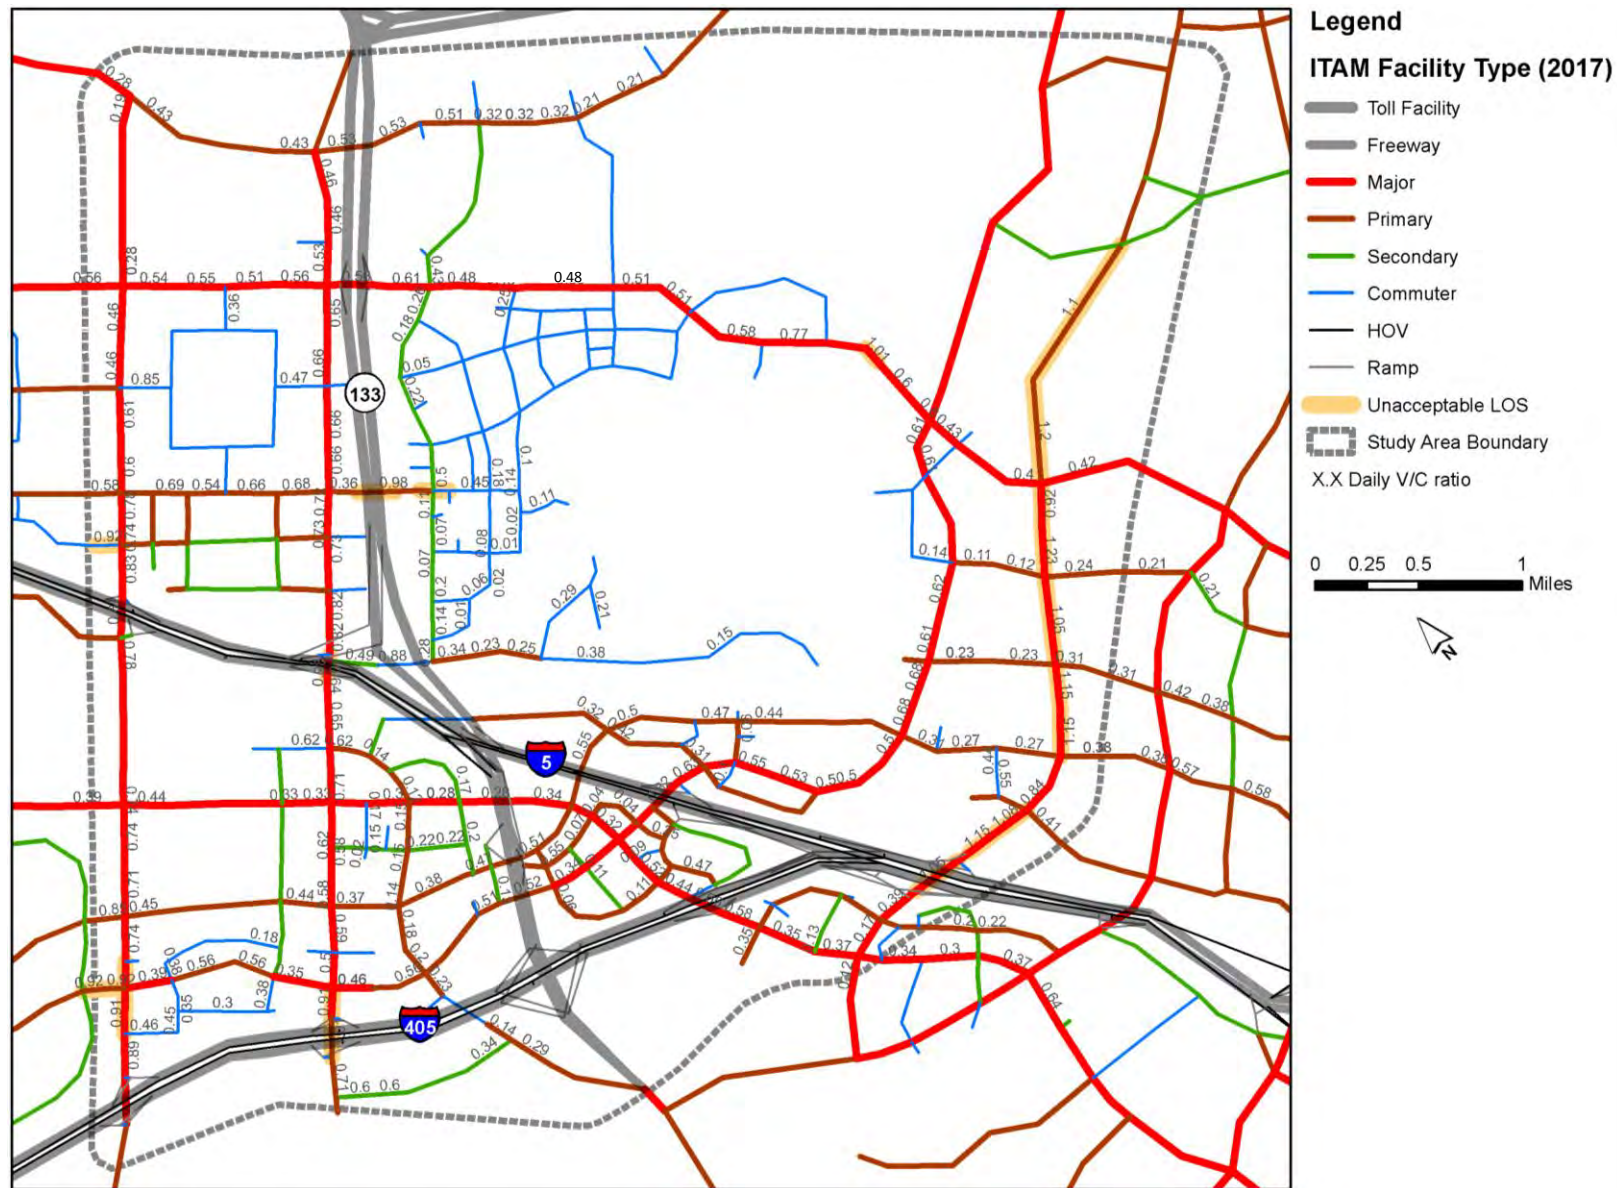

Figure VI-10: Alternative 5 - 2017 Baseline + 688 Acre Park Development Plan with FivePoint Option 1 Average Daily Traffic

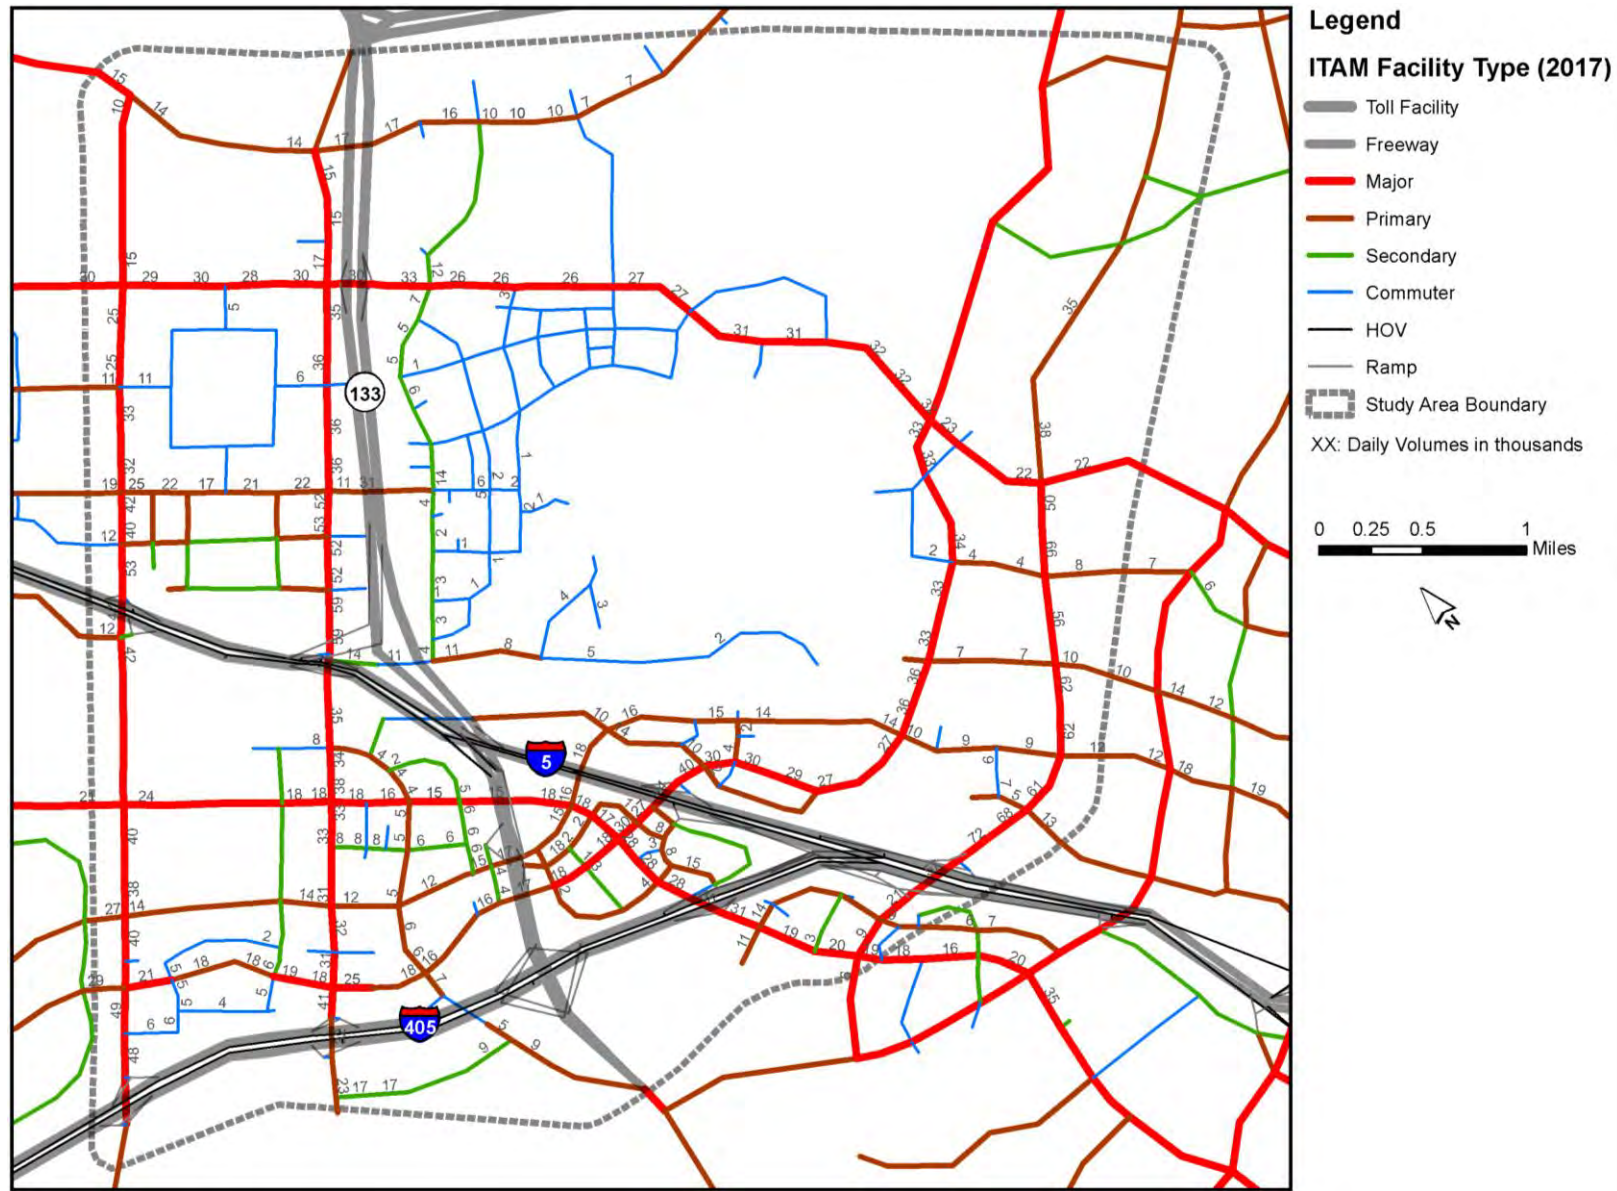

Figure VI-11: Alternative 5 - 2017 Baseline + 688 Acre Park Development Plan with FivePoint Option 1 Daily V/C Level of Service

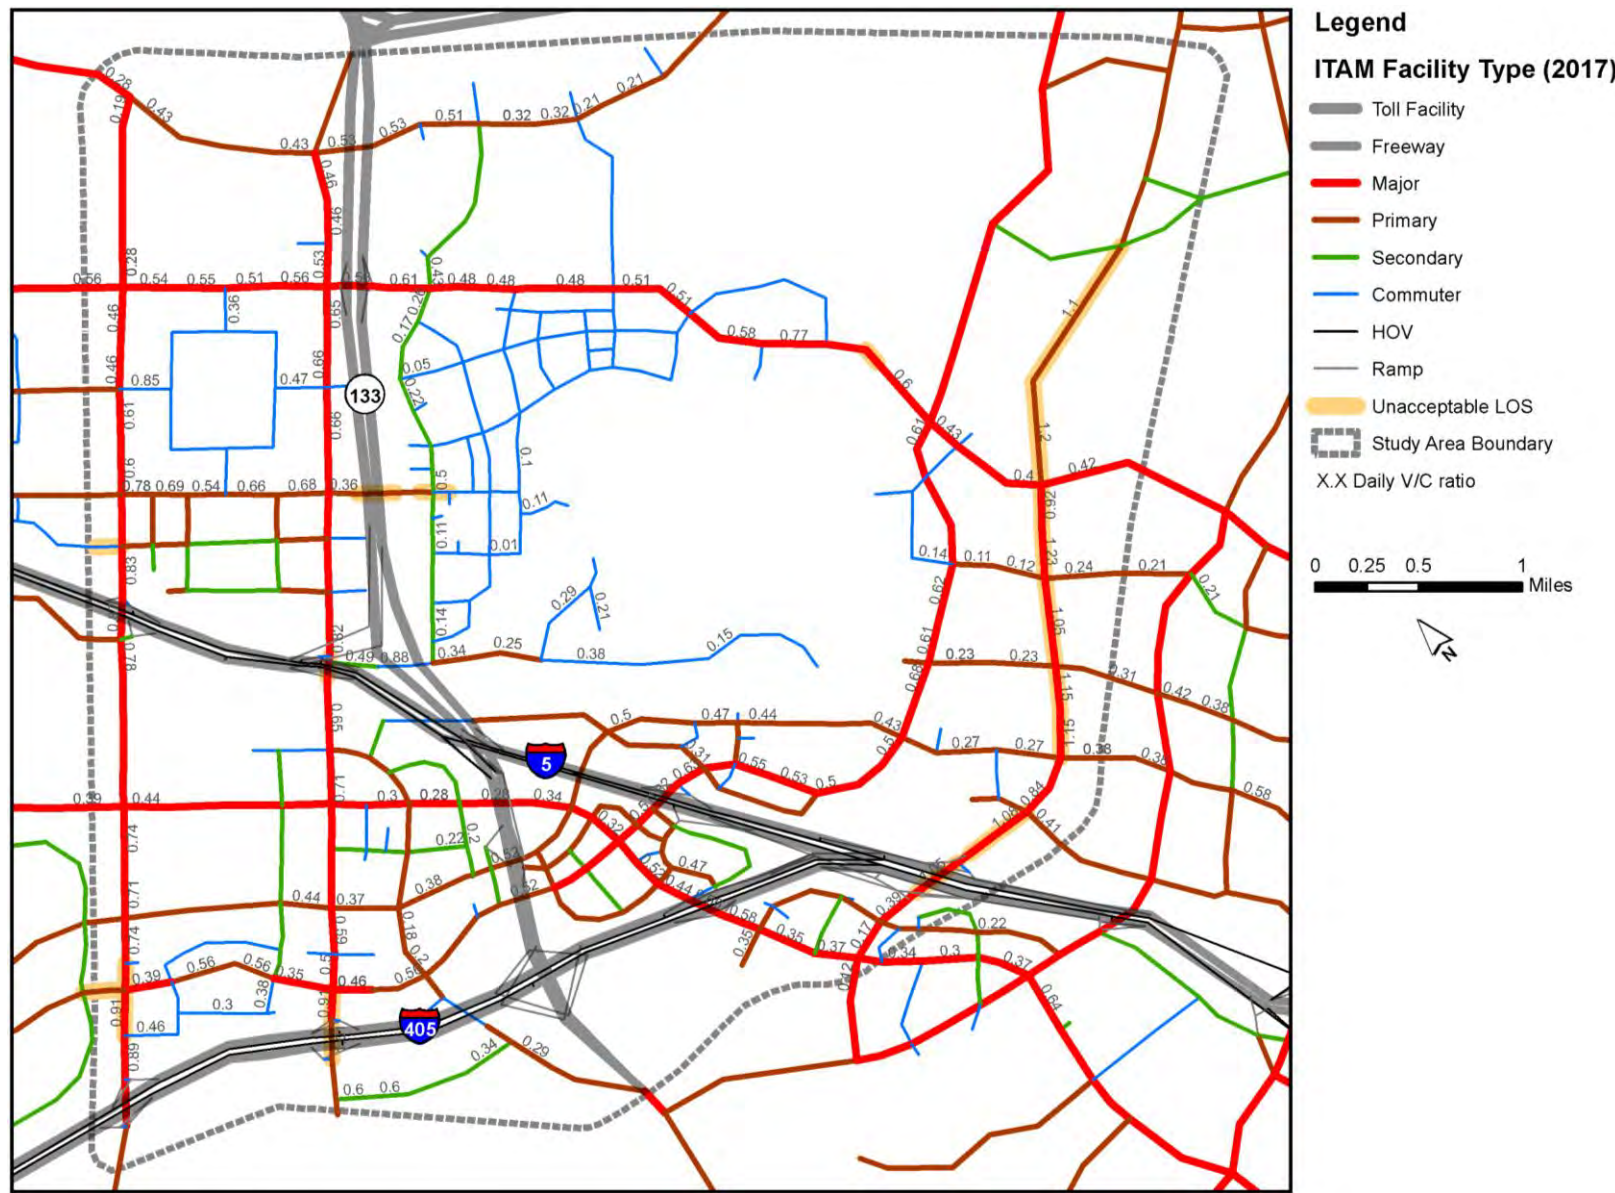

Figure VI-12: Alternative 6 - 2017 Baseline + 688 Acre Park Development Plan with N/S Connector Road Average Daily Traffic

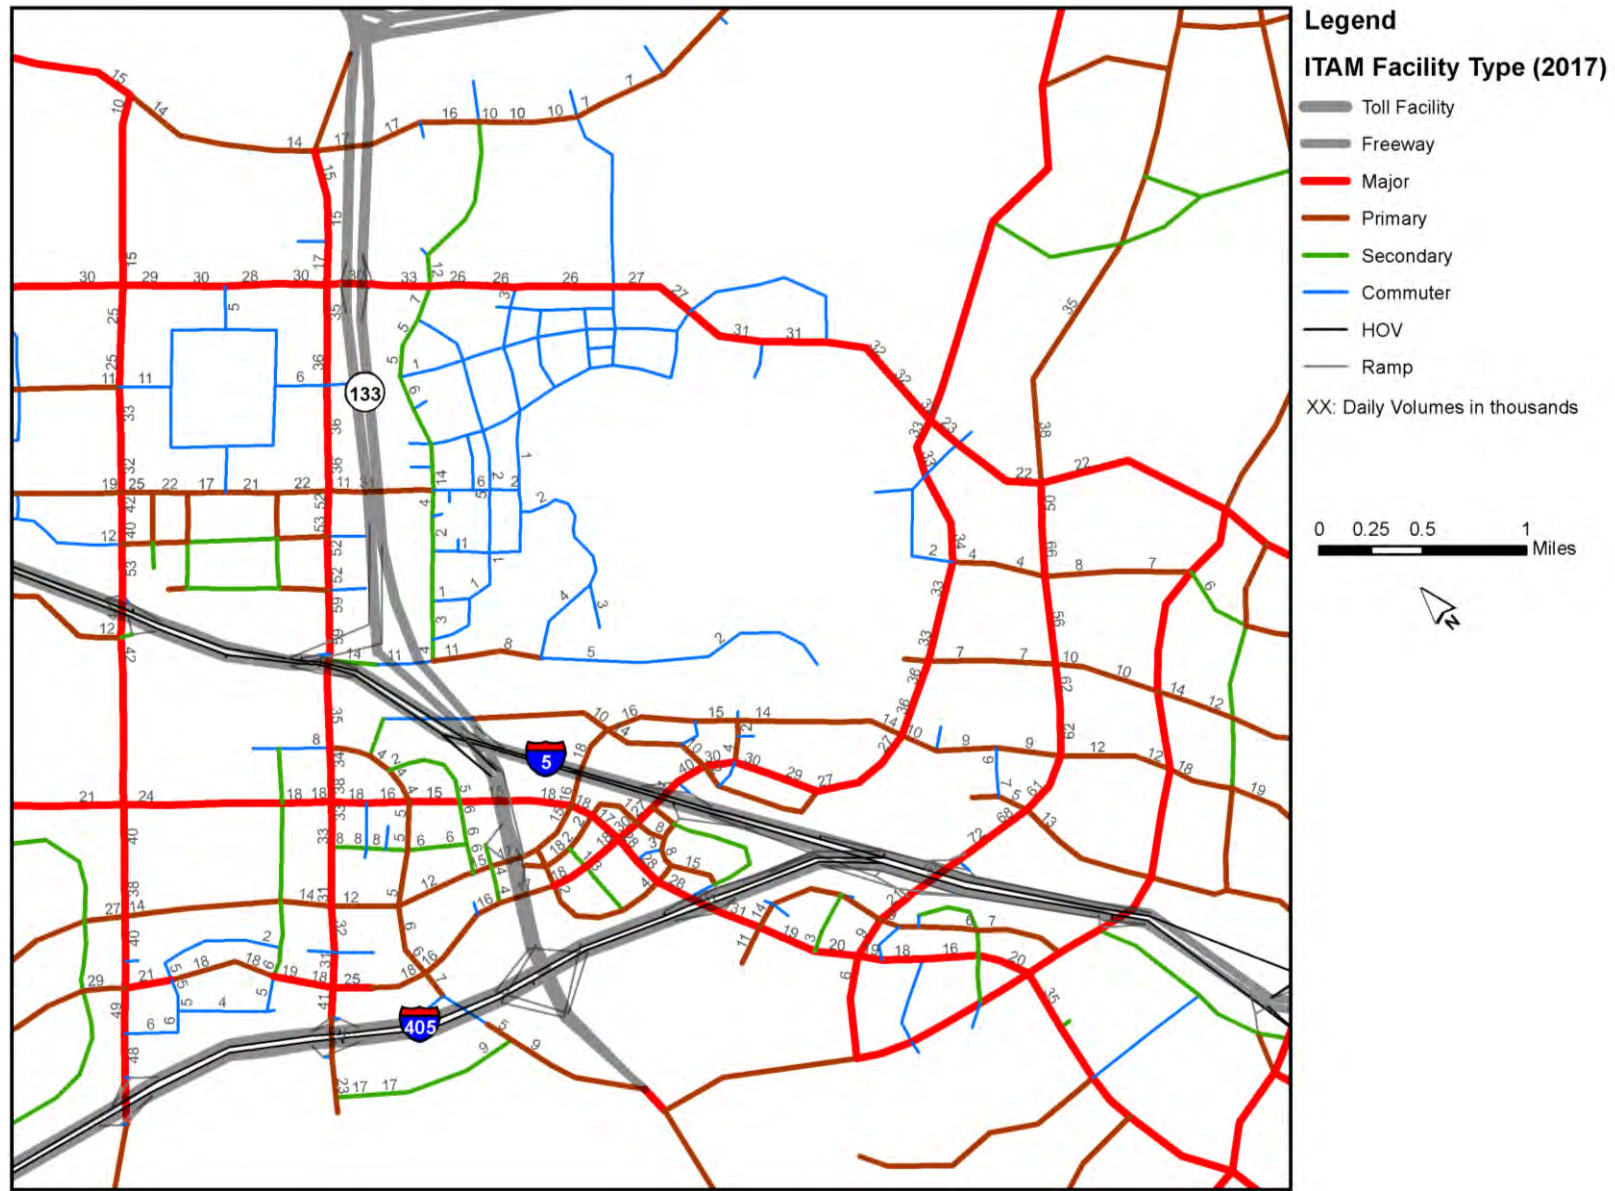

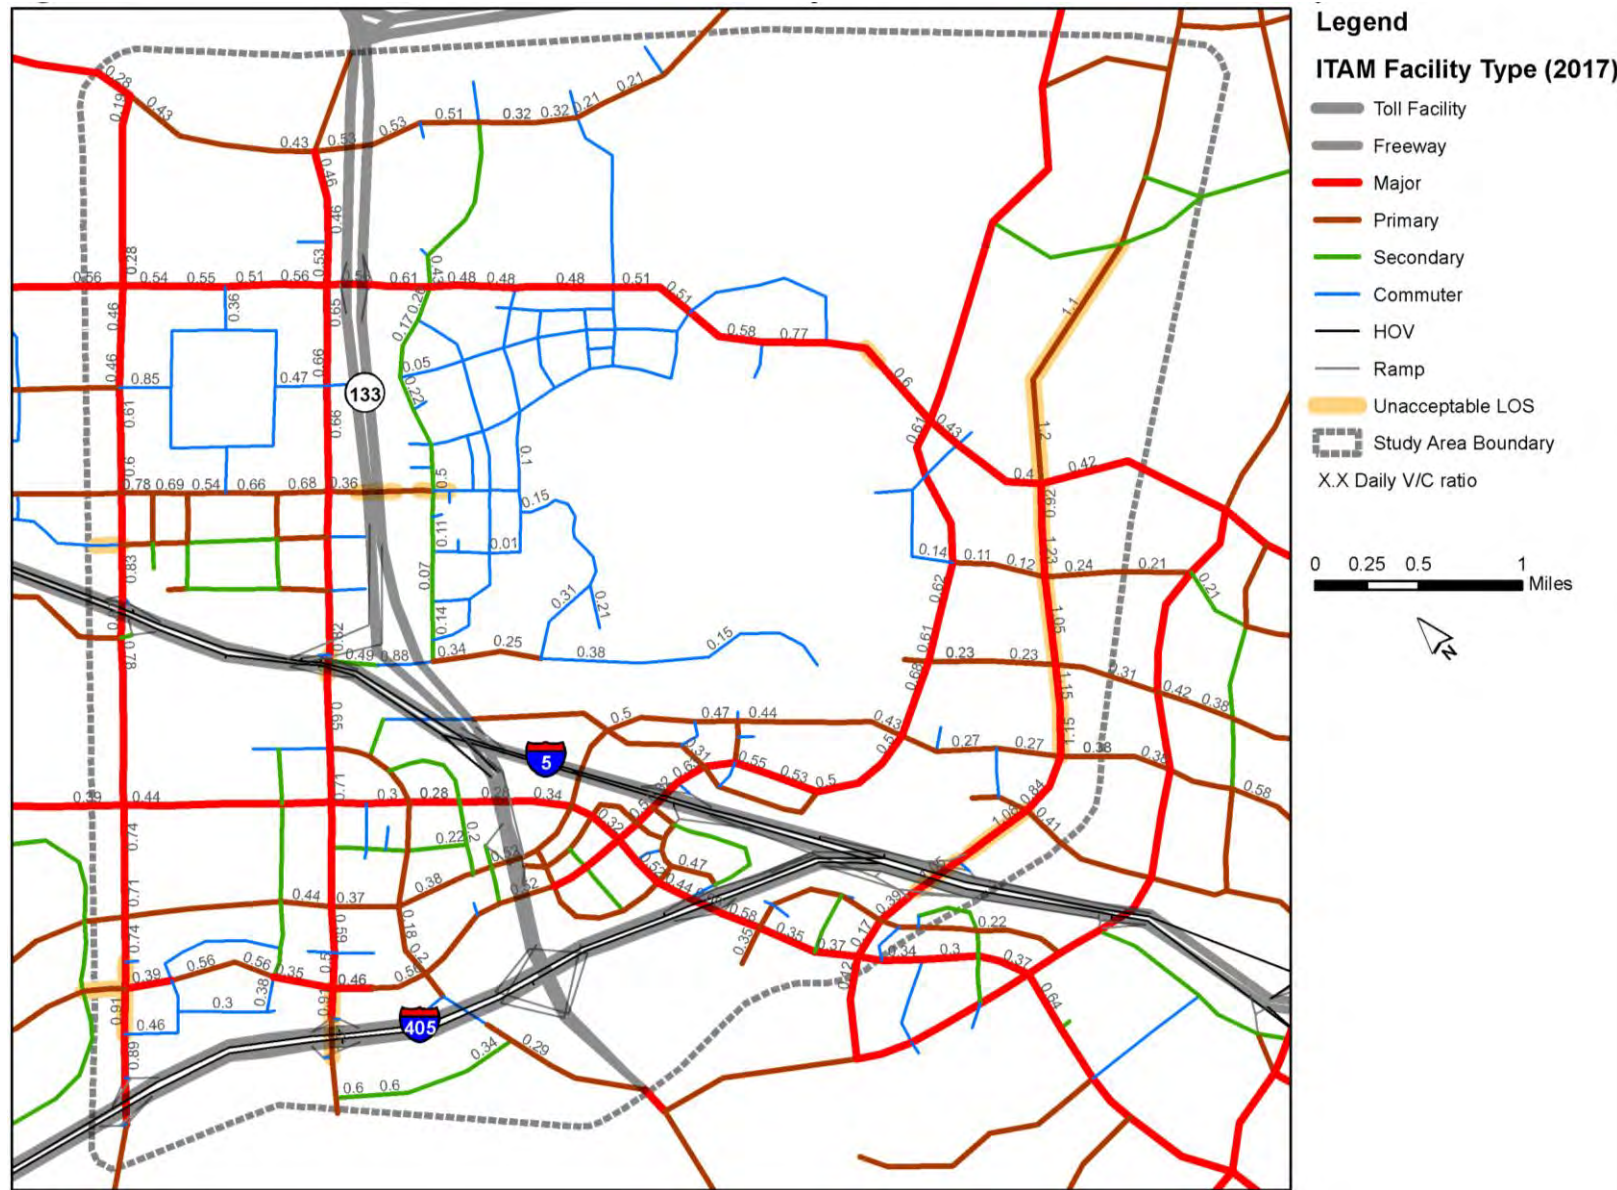

Figure VI-13: Alternative 6 - 2017 Baseline + 688 Acre Park Development Plan with N/S Connector Road Daily V/C Level of Service

As presented in the Figures VI-2 through VI-13, there were six links for Alternative 1: Existing Conditions and Alternative 2: Existing plus OCGP 688 Acre Park Development Plan, which exceeded the City of Irvine's daily capacity thresholds. The addition of the OCGP traffic to the existing traffic volumes did not result in any additional links being impacted.

There were 23 links for Alternative 3: 2017 Baseline which exceeded the daily threshold. There were no project alternatives (Alternative 4 through 6), which resulted in additional links being impacted.

AM and PM Peak Hour Link Analysis

The City of Irvine's Traffic Impact Analysis Guidelines requires an AM and PM Peak Hour level of service link analysis for links which exceed the daily threshold. Presented in Table VI-1 and VI-2 are the AM and PM peak hour link analysis for the six roadway links for all six alternatives. Based on this analysis, all six links of the Existing and the Existing plus OCGP 688 Acre Park Development Plan resulted in acceptable AM and PM peak hour link levels of service.

In addition, all 23 links for the 2017 Baseline and all 2017 OCGP alternatives also resulted in acceptable AM and PM peak hour link levels of service.

Signal Warrant Analysis

The traffic impact analysis requires that each intersection identified in the Scope of Work be evaluated as to whether the intersection will result in acceptable levels of service. The methodology to evaluate peak hour intersection traffic for signalized intersections is Intersection Capacity Utilization. If an intersection is not signalized, then the peak hour intersection level of service analysis is based on the Highway Capacity Manual Unsignalized Intersection Level of Service analysis.

The majority of the intersections that were included in the Scope of Work for evaluation are existing intersections and already signalized. However, the project intersections included as part of the 688-Acre Park Design Plan are either currently not signalized or they have not been constructed. Therefore, to determine which, if any, of these intersections will warrant signalization, an unsignalized intersection level of service analysis was first required for all project or future intersections.

The signal warrant analysis is based on peak hour traffic volumes on the major street and the approaching minor street. Presented in Table VI-3 is the resulting signal warrant analysis. As presented in this table, there are six intersections that warrant signalization based on forecast 2017 Base No Project traffic: Intersections 558 – Ridge Valley/"O" Street at Irvine Boulevard, Intersection 559 - "O" Street at Trabuco, Intersection 560 – "O" Street at Marine, Intersection 561 – "LY" Street at Irvine Boulevard, Intersection 572 – Modjeska-A Street at Irvine Boulevard and Intersection 577 - Pusan Way-Z Street at Irvine Boulevard. The signalization of these six intersections is similarly identified in the 2011 GPN VTTM traffic study as being needed for interim-year conditions. Intersection 562: Marine Way and Great Park Boulevard warrants a signal with the addition of the 688 Acre OCGP. The remaining intersections in the study area will not warrant signalization and the peak hour intersection level of service analysis is based on the Highway Capacity Manual unsignalized intersection level of service methodology. The signal warrant analysis by alternative is presented in Appendix B.

Notes: *Intersections where signals are warranted are shown in bold.*

* The 2011 GPN VTTM traffic study identified six intersections as warranting a signal in interim year conditions and is reflected in the baseline conditions

Peak Hour Intersection Level of Service Analysis

An AM and PM peak hour intersection level of service analysis was conducted for all intersections identified in the approved scope of work. The majority of these intersections are signalized and were evaluated based on the Intersection Capacity Utilization methodology. Intersections which did not warrant signalization were evaluated based on the High Capacity Manual unsignalized intersection level of service methodology.

The results of this analysis for all alternatives are presented in Table VI-4. Intersections which either exceeds the AM and PM peak hour level of service threshold and intersections that are impacted by the OCGP 688 Acre Park Development Plan are highlighted. The calculation sheets for the signalized intersections are presented in Appendix D, and for unsignalized in Appendix E.

As presented in Table VI-4, there are no existing intersections which were found to exceed the City of Irvine's acceptable level of service threshold.

In review of the 2017 alternatives, Alternative 3: 2017 Baseline (No Project), there were two intersections which were found to exceed the City of Irvine's peak hour level of service threshold. These intersections are at Jeffrey Road and Alton Parkway (#291) and at Laguna Canyon Road and Lake Forest Drive (#406). The City of Irvine's criteria for determining project impacts is whether the forecast Intersection Capacity Utilization for intersections exceeding the acceptable LOS threshold is increased by 0.02 or more with the addition of project traffic or if the LOS goes from acceptable to unacceptable LOS. Based on the Intersection Capacity Utilization analysis, there were no OCGP 688 Acre Park Development Plan alternatives (Alternatives 4-6) which added to existing deficiencies at either of these two intersections. Therefore, there are no intersection level of service impacts from the proposed project.

Notes:*Italics* indicates that LOS E is considered acceptable operation at these intersections. Indicates unsatisfactory LOS during the AM or PM peak hour.¹ At signalized intersections the intersection ICU is reported and used to determine peak hour levels of service.² At unsignalized intersections the intersection delay is reported and used to determine peak hour levels of service. At two-way stop controlled intersections, the worse case approach delay is reported.

VII. SPECIAL ISSUES – TRANSPORTATION GUIDELINES

Transportation Guidelines (TG)

The analysis includes the evaluation of project intersections based on the Transportation Guidelines (TGs), July 30, 1993, to determine consistency with the City's design requirements. Specific design elements to be evaluated include turn-pocket lengths (TG-1), signal spacing (TG-7), distance between driveways and intersections (TG-8), corner clearance (TG-9), left-turn in/out access (TG-10), right turn lanes at driveways (TG-11), signal warrants (TG-13), and driveway length (TG-15).

As previously presented, the signal warrant analysis (TG-13) was conducted for project intersections for each alternative and intersection to determine whether the intersection warranted being signalized and evaluated with the ICU capacity analysis methodology, or unsignalized, HCM methodology. Therefore, the following presents the analysis of the remaining Transportation Guidelines.

TG-1 Turn Lane Pocket Lengths

The lengths of left-turn pockets at signalized intersections are based on several parameters, including traffic control, turn volume, and cycle length.

The purpose of the turn pocket length is to allow the turning vehicle to exit the through movement and decelerate into the turn pocket without impacting the through movement. The minimum single-turn pocket length for Commuter and Local streets is 90 feet. For Major, Primary, and Secondary arterials, the minimum allowed left turn pocket is 150 feet. The maximum length of a single left turn pocket is 300 feet. For purposes of this analysis, a conservative 120-second cycle length, 10% truck mix, and 95% confidence level have been assumed.

For each intersection, the required left turn bay length was identified according to TG guidelines. Consistent with NITM Program traffic studies, where pocket lengths exceed the standard 150 feet for public arterials or 90 feet for commuter and local roadways, the recommended length is based on 1-foot per peak hour left-turn volume (highest of AM and PM) and rounded into increments of 10 feet. The resulting left turn pocket storage requirement for each signalized intersection and alternative is presented in Table VII-1.

At Great Park Boulevard (West) and Marine Way (562), dual 250-foot eastbound turn lanes are a design feature of the project.

Legend / Notes:

XXX

Locations where left turn lane recommendations exceed 150 feet for arterials or 90 feet for collector/local streets.

Locations where a dual left-turn lanes was not proposed in ITAM, but the volumes recommend a second left-turn lane.

¹ Proposed Lane Geometry.² The higher left-turn peak hour volume was used to determine the required left-turn storage length.³ All storage lengths are reported in feet.⁴ A project design feature of dual 250 foot left turn lanes is proposed by OCGP.

Based on the 2017 analysis, there was one left turn pocket length demand which exceeded the 300-foot threshold. This was the westbound left turn lane from Irvine Boulevard to “Z” Street/Pusan Way (577). This left turn lane is not recommended to be widened to two lanes because this intersection will operate at an acceptable LOS (LOS A/B) with a single westbound left-turn lane. Additionally, the OCGP Access Study indicates that the westbound left turn demand drops significantly at Post 2030 buildout with additional anticipated network improvements, and a single westbound left turn lane will operate acceptably.

TG-7 Distance Between Signalized Intersections

Adequate separation between signalized intersections along highways is a key parameter for maintaining signal progression. Marine Way is a Primary Highway with a desirable spacing of one mile between signalized intersections and a minimum of one-half mile between signalized intersections.

The intersection of “O” Street and Trabuco Road (#559) warrants a signal in the 2017 Baseline No Project Alternative as well as in all With Project alternatives. The distance between these two future signalized intersections exceed the minimum thresholds as presented in Table VII-2.

It should also be noted that based on the Post 2035 analysis performed as part of the Orange County Great Park Access Study, there are three signals proposed along Marine Way: at “O” Street, Great Park Boulevard (West), and Great Park Boulevard (East). As presented in Table VII-2, the distances between both sets of signals exceed the minimum spacing requirements.

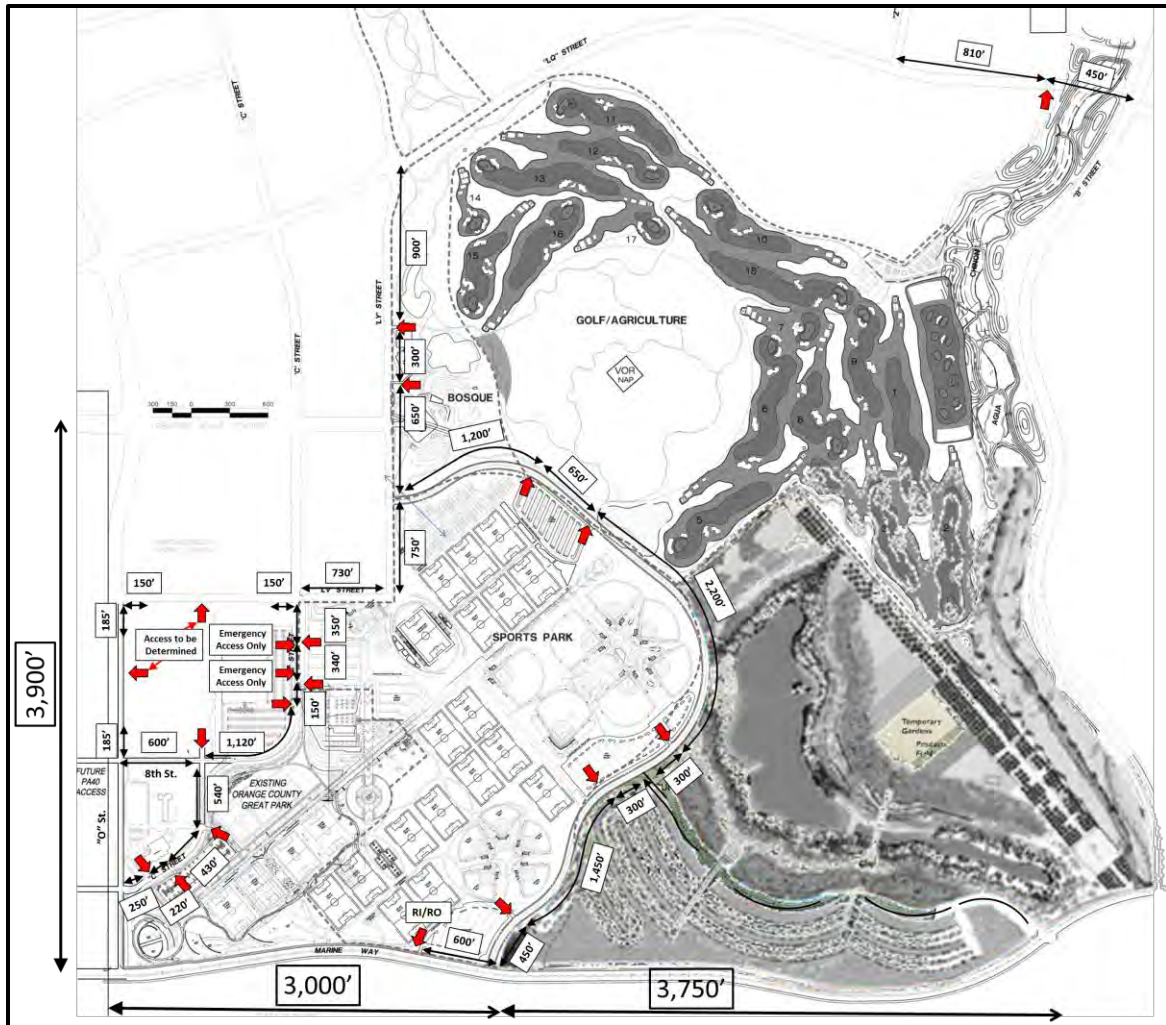

Table VII-2: Distances between Signalized Intersections

Street	From	To	Desirable	Minimum Distance	Measured Distance	Exceeds Minimum Spacing
Marine Way	“O” Street	Great Park Boulevard West	2,640	1,320	3,000	Yes
	Great Park Boulevard West	Great Park Boulevard East (build-out condition)	2,640	1,320	3,750	Yes
“O” Street	Marine Way	Trabuco Road	1,320	400	3,900	Yes

TG-8 Distance Between Driveways and Intersections

Driveway and intersection spacing requirements are provided in TG-8. The minimum separation for Primary Highways is 230 feet (Marine Way), for Secondary Highways is 185 feet (“O” Street), for Commuter Streets is 150 feet, and for Local Streets is 105 feet. As presented in Figure VII-1, all driveways equal or exceed the minimum TG-8 requirement for distances between intersections and driveways.

Figure VII-1: Driveway Spacing

TG-9 Corner Clearance

TG-9 ensures that access driveways do not interfere with nearby signalized intersections. The following items are considered for each unsignalized driveway that is adjacent to one or more signalized intersections:

1. Downstream right turn considerations (right turns at the nearest adjacent intersection must not back up as to the unsignalized driveway);
2. Downstream left turn considerations (right turning vehicles must be able to adequately maneuver into the left turn lane at the nearest adjacent intersection); and
3. Sufficient spacing for major street left turn bays.

There is only one stop controlled driveway that could potentially impact a future signal. This is the proposed right-in and right-out access at driveway 669, which is 600 feet west of the future proposed intersection of Marine Way and Great Park Boulevard West (562). The 600 feet between this driveway and the intersection of Great Park Boulevard West allows sufficient distance to avoid right turn queue interference and adequate distance to merge to the left turn lane, if needed.

TG-10 Left Turn In / Left Turn Out Access

TG-10 provides procedures to determine whether left-in only or left-in/left-out access at unsignalized intersection locations will be considered along Major, Primary, Secondary, and Commuter streets. This procedure has been used along with Highway Capacity Manual unsignalized level of service analysis to determine the appropriate configurations.

Presented in Table VII-3 is the Left Turn In and Left Turn Out access analysis for project intersections for Alternatives 4 through 6, which include the 2017 plus Great Park 688 Acre Park Development Plan alternatives. As presented in Table VII-3, left turn in and out movements can be accommodated for all alternatives and intersections.

Table VII-3: Left Turn In and Out Access Analysis

TG-11 Right Turn Lanes at Driveways

Right turn lanes are required at unsignalized driveways on Major, Primary, and Secondary roadways when the turn volumes and through volumes could conflict and increase the potential for accidents. TG-11 provides guidelines for when right turn lanes are required at unsignalized driveways. TG-11 does not require right turn lanes on Commuter roadways.

Ideally, TG-11 should be based on buildout conditions and not interim year 2017 conditions as future year additional traffic might result in a threshold to be exceeded. Therefore, the ultimate improvement should be provided when the project is constructed as presented in Table VII-4. This Post 2035 data is utilized from the OCGP Access Study for which the Post 2035 data was developed.

Table VII-4: Right Turn Lanes at Driveways (Post 2035 Forecasts)

	669	Marine Way & Parking Area 8 RIRO	10 / 170	100	No*

* A project design feature of a 250-foot right turn pocket is proposed.

There are three project driveways/intersections along “O” Street. “O” Street is designed as a Secondary Highway which requires a right turn lane if either the AM or PM peak hour volumes exceeds 200. Based on Post 2035 plus OCGP traffic developed for the OCGP Access Study, right turn volumes are below the threshold and a right turn lane is not required.

At the Marine Way right in/right out driveway (669) located west of Great Park Boulevard that provides access to Parking Area 8, a 250-foot long westbound right turn lane will be provided as a design feature of the project..

TG-15 Driveway Length

Primary driveways should be of sufficient length to allow vehicles to enter the parking area without causing subsequent vehicles to back out onto City streets. Driveways should be measured from the back of the sidewalk or the stop bar exiting the site to the near curb line of the first intersection parking stall or traffic control measure (internal drive aisle or pedestrian crosswalk) located on site. The minimum driveway length is based on one foot per entering vehicle rounded up to the next 25-foot.

Similar to TG-11 Right Turn Lanes at Driveways, TG-15 utilizes Post 2035 buildout traffic volumes from the OCGP Access Study. The Post 2035 traffic forecasts and resulting driveway lengths for each project access are presented in Table VII-5.

Table VII-5: Driveway Length Requirements

673	Parking Area 9 (East)/GP Blvd (E/W)	120 (140)	150	120 (140)	150	124 (130)	150

VIII. SPECIAL ISSUES – ALTERNATIVE ACCESS TO PARKING AREAS 3 & 4

The Orange County Great Park Access Study analyzed four Post 2035 Alternatives, a base Post 2035 alternative without the Great Park 688 Acre Park Development Plan (No Project), a Post 2035 Base with the project, and two additional OCGP alternatives, one with a Heritage Fields Option 1 and second with a loop connector road between “LY” and Marine Way.

All three of the OCGP alternatives evaluated had two “T” intersection access locations on “C” Street to Parking Area 4 (664 and 665) and one access to Parking Area 3 (675). As identified in the Access Analysis, none of the three intersections warranted a signal, all had acceptable levels of service, and all met each of the Transportation Guidelines (TG).

As part of the design process for the OCGP, an alternative has been proposed to create two full access intersections along “C” at 664 and 665 that would provide access to both Parking Area 3 and 4. With this alternative, the intersection at 675 would be eliminated.

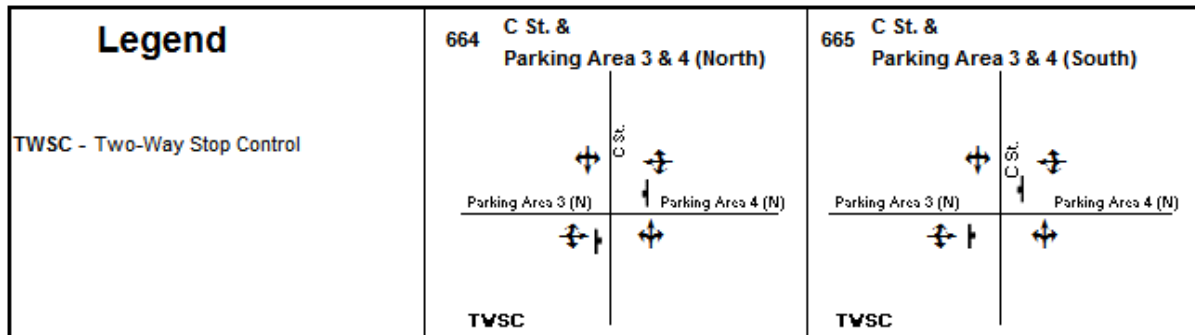

To determine if the proposed access alternative would result in any impacts, a sensitivity analysis was conducted which includes the following:

1. Post 2035 Project Intersection and Driveway Geometry
2. Signal Warrant Analysis (TG-13)
3. Intersection Level of Service Analysis
4. TG-1: Turn Lane Pocket Lengths
5. TG-8: Distance Between Driveways and Intersections
6. TG-10: Left Turn In/Out Access
7. TG-11: Right Turn Lanes at Driveways.
8. TG- 15: Driveway Length

This analysis was based on Alternative 2: Post 2035 ITAM Base Condition + 688 Acre Park Development Plan as it was identified as being the worst case alternative.

Post 2035 Project Intersection and Driveway Geometry

The proposed project intersection and driveway geometry for the “C” Street north intersection (664) and south intersection (665) is presented in Figure VIII-1. As presented, these intersections would include one lane for all approaches that provide for left, through and right turn movements. “C” Street would not be stop controlled, but all driveway approaches from Parking Area 3 and 4 would be stop controlled.

Figure VIII-1: Special Issue - Parking Areas 3 and 4 Intersection and Driveway Geometry**Signal Warrant Analysis (TG-13)**

A signal warrant analysis was conducted for both intersections based on Post 2035 peak hour volumes as presented in Appendix F and intersection lane geometrics as presented in Figure VIII-1. The Signal Warrant worksheets for each alternative and intersection are included in Appendix F. As presented in Table VIII-1, neither intersection warrants a signal.

Table VIII-1: Special Issue – “C” Street and Parking Area 3 & 4 Signal Warrant Analysis

Int. ID	Intersection Name	AM Peak Hour Volumes		PM Peak Hour Volumes		Signal Warrant
		(Dir)	(Dir)	(Dir)	(Dir)	
664	C St./Parking Area 3 & 4 North	120 (NB/SB)	7 (WB)	126 (NB/SB)	69 (WB)	No
665	C St./Parking Area 3 & 4 South	100 (NB/SB)	5 (EB)	114 (NB/SB)	46 (WB)	No

Intersection Level of Service Analysis

An unsignalized intersection level of service analysis was conducted for each of the two intersections. The Level of Service work sheets are presented in Appendix F and the resulting intersection level of service at each intersection is presented in Table VIII-2.

Table VIII-2: Special Issue – “C” Street and Parking Area 3 & 4 Intersection LOS

Int. ID	Intersection Name	Control	Special Issue - Parking Area 3 & 4 Intersection Level of Service Analysis	
			Delay (AM/PM)	LOS
664	C St./Parking Area 3 & 4 (North)	TWSC	9.7 / 10.0 Seconds	A /B
665	C St./Parking Area 3 & 4 (South)	TWSC	9.4 / 9.3 Seconds	A /A

As presented, both intersections will operate at acceptable level of service.

TG-1 Turn Lane Pocket Lengths

The length of left turn lanes is based on peak hour left turn volumes for intersections which warrant left turn lanes. The aligned intersections of 664 and 665 along “C” Street operate with acceptable levels of service with single lane that serves left, through and right turns. Therefore, determining the length of the turn lane is not required.

TG-8 Distance Between Driveways and Intersections

Driveway and intersection spacing requirements are provided in TG-8. The minimum separation for driveways and intersections on Commuter Streets is 150 feet and for Local Streets is 105 feet. As presented in Figure VIII-2, the distances between the “C” Street and Parking Area 3 & 4 North and Parking Area 3 & 4 South exceeds the minimum requirements for a Commuter or Local Street. These two driveways also exceed the minimum distance requirements between “C” Street and “LV” Street and “C” Street and 8th Street.

Figure VIII-2: Special Issue – Driveway Spacing

TG-10 Left Turn In/Out Access

TG-10 determines whether left-in only or left-in/left-out access at unsignalized intersection locations will be considered along Major, Primary, Secondary, and Commuter streets.

Presented in Table VIII-3 is the Left Turn In and Left Turn Out access analysis for the “C” Street driveways and Parking Area 3 and 4 North and Parking Area 3 and 4 South. As presented, both intersections will accommodate forecast left in and out turn movements.

Table VIII-3: Special Issue –TG-10: Left Turn In/Out Access

Int. ID	Intersection Name	Conflicting Left In Volume AM (PM)	Left In Volume AM (PM)	Conflicting Left Out Volume AM (PM)	Left Out Volume AM (PM)	Left In & Out Acceptable
664	C St./ Parking Area 3 (North)	67 / 34	- / -	113 / 182	1 / 1	Yes / Yes
	C St./ Parking Area 4 (North)	18 / 25	33 / 35	114 / 120	2 / 5	Yes / Yes
665	C St./Parking Area 3 (South)	60 / 23	2 / 1	99 / 154	1 / 5	Yes / Yes
	C St./Parking Area 4 (South)	31 / 88	7 / 2	100 / 113	1 / 2	Yes / Yes

TG-11 Right Turn Lanes at Driveways

Right turn lanes are required on major, primary and secondary roadways if peak hour right turn volumes exceed the TG’s minimum volume warrant. “C” Street is a Commuter roadway and right turn lanes are not required.

TG-15 Driveway Length

Primary driveways should be of sufficient length to allow vehicles to enter the parking area without causing subsequent vehicles to back out onto City streets. The minimum driveway length is based on one foot per entering vehicle rounded up to the next 25-foot. The resulting driveway lengths for the Parking Area 3 and 4 North and the Parking Area 3 and 4 South on “C” Street are presented in Table VIII-4.

Table VIII-4: Special Issue –TG-15: Drive Length

Int. ID	Intersection Name	Entering AM (PM) Peak Hour Volumes	Minimum Driveway Length
664	C St./ Parking Area 3 (North)	12 (18)	25
	C St./ Parking Area 4 (North)	39 (39)	50
665	C St./Parking Area 3 (South)	9 (12)	25
	C St./Parking Area 4 (South)	23 (44)	50

IX. SPECIAL ISSUES – ALTERNATIVE TRAVEL MODES

Pedestrian and Bicycle Circulation

When complete, the OCGP will include a comprehensive trail network for bicyclist and pedestrians. The proposed bicycle and pedestrian connectivity plan is illustrated in Figure VIII-1. As presented, the project will include an internal trail network, Class I (Off-Street) trails, as well as other off-street trails.

Pedestrian and bicycle connections are also available along the Timeline. Bicycles are considered as part of the mixed-flow on the Timeline and are not intended to be confined to a specified bicycle lane. Pedestrian connections are provided between existing uses in the Western Sector Park Development Plan and to future development areas in the OCGP.

Almost the entire pedestrian network provides the user the ability to walk without having to cross any major roadways.

POLICIES A, B, AND C OF GENERAL PLAN OBJECTIVE B-3 (PEDESTRIAN CIRCULATION) AND OBJECTIVE B-4 (BICYCLE CIRCULATION): The following discusses how Policies A, B, and C of General Plan Objective B-3 and applicable policies of Objective B-4 will be met with implementation of this project.

It should be noted that at buildout, the OCGP will provide a comprehensive trail network for pedestrians and bicyclists. In the interim condition, with the development of the OCGP 688 Acre Park Development Plan, the initial elements of the plan framework will be developed.

Objective B-3, Pedestrian Circulation

- **Policy (a):** *Link residences with schools, shopping centers, and other public facilities, both within a planning area and to adjacent planning areas, through an internal system of trails.*

Bicycle connections between the OCGP and neighborhood residences, schools, shopping centers, and other public facilities are important. The project includes an extensive internal trail network and will provide connections to regional trails, as well as the surrounding Great Park Neighborhoods development.

- **Policy (b):** *Require development to provide safe, convenient, and direct pedestrian access to surrounding land uses and transit stops. Issues such as anticipated interaction between pedestrians and vehicles, proposed infrastructure improvements and design standards shall be considered.*

Presented in the Connectivity Plan (Figure IX-1) are locations of pedestrian entry points and potential transit stops. These entry points and transit stops are connected to the park through the extensive hierarchy of pedestrian and bicycle trails.

Figure IX-1: Great Park Connectivity Plan

Legend

	11' REGIONAL CLASS I BICYCLE AND PEDESTRIAN TRAIL
	11' CLASS I BIKE TRAIL (PRIMARY)
	11' OR 8' SIDEWALK
	5' SIDEWALK
	5' SIDEWALK AND MODERATE SINGLE TRACK TRAIL
	MODERATE SINGLE TRACK TRAIL
	EXISTING O.C.G.P. SIDEWALKS
	V.O.R. ACCESS
	EXISTING MODERATE SINGLE TRACK TRAIL
	PEDESTRIAN ENTRY POINTS
	POTENTIAL TRANSIT STOPS

- **Policy (c):** *Design and locate land uses to encourage access to them by non-automotive means.*

The project proposes an extensive internal pedestrian and bicycle system, which will provide easy pedestrian and bicycle connections from one area of the park and another. Several large parking areas are provided rather than many smaller lots, allowing visitors to park and access various uses through other non-automotive means. Non-automotive access is facilitated by regional transit opportunities via the Irvine Station and OCTA will be encouraged to provide direct drop offs to the park, additionally the City's trail system will provide multiple points of access to park uses.

Objective B-4, Bicycle Circulation

Similar the discussion above, the OCGP has an extensive system of all types of bicycle trails and paths for bicyclist. The OCGP 688 Acre Park Development Plan provides the second phase of the improvements along with the Western Sector Park Development Plan area, and will be complemented with the future Cultural Terrace.

- **Policy (a):** *Use the Trails Network diagram as a basis for detailed planning of the bicycle trail system. Detailed planning shall occur though the development process outlined in the City's Zoning and Subdivision Ordinances.*

The internal bicycle and pedestrian system provides connections to Class I (Off-Street) and Class II (On-Street) trails consist with the City of Irvine trail network.

- **Policy (b):** *Require a system of bicycle trails, both on and off street, in each planning area. Such trails shall be linked to the system shown in Figure B-4. The on street trails shall be designed for the safety of the cyclist.*

The internal trail system is consistent with trail network shown on General Plan Figure B-4 (Trails Network). The internal bicycle trails within the OCGP has minimal vehicle conflicts for increased level of safety. These paths are integrated with the existing development from the Western Sector Park Development Plan. Where bicycle trails interact with vehicles, appropriate classification design will be implemented.

- **Policy (c):** *The trail system shall be designed to accommodate cyclists of all levels of experience and shall provide for both recreation and transportation.*

The bicycle paths and trails will provide opportunities for all levels of experience from the easy and safe cycling along a Class I Trail.

- **Policy (d):** *Require bicycle trail linkages between residential areas, employment areas, schools, parks, community facilities, commercial centers and transit facilities.*

Class I (Off-Street) Trails as well as other pedestrian trails will be provided as a part of the development of the OCGP. These trails provide linkages connecting to the City's existing

trail system and expanded trail network for future development areas such as the Irvine Station, surrounding Great Park Neighborhoods development and commercial uses nearby.

- **Policy (e):** *Require pedestrian and bicycle circulation plans detailing access to the subject property and adjacent properties in conjunction with new development.*

The OCGP Pedestrian and Bicycle network will provide connections to the Great Park Neighborhoods development and to the future Marine Way improvements.

- **Policy (f):** *Require the bicycle trip destinations, including community facilities, commercial centers, and transit facilities to be equipped with appropriate bicycle facilities, including but not limited to the provision of showers and bike racks.*

The OCGP is a recreational destination with extensive bike trail connectivity to the park and trails within the park for bike use, therefore, it will include bicycle facilities, including bike racks within the park. In addition, the OCGP will participate in the future “Orange Bike Program” which emphasizes connecting the Great Park Neighborhoods to the OCGP.

- **Policy (g):** *Require traffic control devices and traffic signal phasing for bicycle crossing, turning and through movements.*

No traffic control devices, such as traffic signals, are proposed within the OCGP 688 Acre Park Development Plan.

- **Policy (h):** *Require grade separated crossing for Class I bikeways at major intersections, wherever feasible, to increase safety and efficiency.*

No grade separated crossings are proposed.

- **Policy (i):** *Provide off-street bicycle trails in areas with minimal cross traffic, such as open space spine, flood control and utility easements where possible.*

As stated previously, the entire OCGP will provide a comprehensive off-street bicycle path and trails network with very limited cross traffic.

- **Policy (j):** *Support programs to increase public awareness of bicycle safety and bicycling as an alternative mode of transportation.*

A wide-variety of programs will be offered through the OCGP to educate the public on alternative mode of transportation. Bicycling and bicycling safety will be an important topic, which will be available at various events and kiosks located around the park as well as a bike sharing program.

- **Policy (k):** *Incorporate, where appropriate, school and park locations within the design of the bikeway system.*

The OCGP is a park and incorporates a comprehensive bikeway system.

Transit

Transit is an important element of the transportation mobility opportunities for the OCGP. With buildout of the OCGP, transit will provide regional and local access to and from the park. Yet to be established, OCTA bus transit service will be both permitted and encouraged to enter the OCGP and provide passenger drop-offs and pick-ups at the various sites. Surrounding the OCGP with convenient access to many of the amenities, potential transit service has been identified at a conceptual level. The identified network is comparable to the recommended Preferred Alternative and Complementary OCTA Services scenarios evaluated in the citywide Irvine Transit Vision report. Special transit service for key events is also anticipated.

Riding and Hiking

There are no proposed riding or hiking trails within the OCGP 688 Acre Park Development Plan. However, these facilities are proposed in subsequent phases of development.

X. CONCLUSIONS AND RECOMMENDATIONS

Based on the OCGP 688 Acre Park Development Plan Traffic Study, the following findings are summarized.

<p>The 2017 Base No Project assumes signals at six locations:</p> <ul style="list-style-type: none"> - Intersections 558 – Ridge Valley/"O" Street at Irvine Boulevard, - Intersection 559 - "O" Street at Trabuco, - Intersection 560 – "O" Street at Marine Way, - Intersection 561 – "LY" Street at Irvine Boulevard, - Intersection 572 – Modjeska-A Street at Irvine Boulevard, and - Intersection 577 - Pusan Way-Z Street at Irvine Boulevard.
<p>As a design feature of the project dual 250-foot long eastbound left-turn pockets will be provided at Marine Way and Great Park Boulevard West (562).</p>
<p>As a design feature of the project, a 250-foot long westbound right turn lane will be provided at the Marine Way right in/right out driveway (669), located west of Great Park Boulevard (West).</p>

- The OCGP 688 Acre Park Development Plan will generate approximately 5,444 daily trips. This trip generation will not result in significant impacts to the local and regional roadway network.
- Under existing conditions, there are six links where the existing traffic volume to capacity ratio exceeds the City Standards. Based on the peak hour volume to capacity ratios, all six links are within City level of service standards. The proposed OCGP 688 Acre Park Development Plan does not result in any additional links to fail the City volume to capacity ratio standards.
- Based on the Existing Conditions ICU level of service analysis, there are no intersections that exceed the City of Irvine level of service standards. All intersections continue to operate at acceptable conditions with the addition of the OCGP 688 Acre Park Development Plan traffic.
- Based on Alternative 3, the 2017 Baseline alternative without the OCGP 688 Acre Park Development Plan (i.e., 2017 No Project), there are 23 arterial links which will have volume to capacity ratios which exceed the daily thresholds. Based on the peak hour link analysis, all 23 links will result in acceptable peak hour volume to capacity ratios.
- There are no additional links that will exceed the daily thresholds with any of the 2017 OCGP 688 Acre Park Development Plan alternatives. All 23 peak hour links will result in acceptable peak hour volume to capacity ratios.
- Based on the 2017 Conditions ICU level of service analysis, there are no intersection level of service impacts from the proposed project.

- There are six intersections in which signalization is assumed in the 2017 Base No Project condition: Intersections 558 – Ridge Valley/"O" Street at Irvine Boulevard, Intersection 559 – "O" Street at Trabuco, Intersection 561 – "LY" Street at Irvine Boulevard, Intersection 560 – "O" Street at Marine, Intersection 572 – Modjeska-A Street at Irvine Boulevard and Intersection 577 - Pusan Way-Z Street at Irvine Boulevard. The signalization of these six intersections is previously identified in the 2011 GPN VTTM traffic study as being needed for interim-year conditions.
- The OCGP 688 Acre Park does not warrant any additional signals with the Baseline 2017 plus 688 Acre OCGP alternatives. At "O" Street and 8th Street, while a signal is currently not warranted, the permanent location of a future Fire Station in the vicinity will likely require that this intersection be signalized. At "O" Street and "C" Street, while a signal is also currently not warranted, the left in/left out analysis for Post 2035 (see OCGP Access Study) presents left turn volumes that exceed thresholds. A traffic signal would provide the necessary gaps to address the left turn volumes and therefore should be considered. The ultimate determination of traffic signals at these locations is subject to the review and approval of the City Engineer."
- For Marine Way at Great Park Boulevard (562), dual 250-foot eastbound left turn lanes are a design feature of the project.
- The OCGP 688 Acre Park Development Plan as proposed will accommodate adequate signal spacing between signalized intersections (TG-7), adequate distance between driveways and intersections (TG-8), and adequate corner clearance (TG-9). All proposed left turn in and out intersections and driveways are acceptable.
- At the Marine Way right in/right out driveway located west of Great Park Boulevard (669), a 250-foot long westbound right turn lane is a design feature of the project.

APPENDIX A

APPROVED SCOPE OF WORK

**ORANGE COUNTY GREAT PARK
688 ACRE PARK DEVELOPMENT PLAN (PDP) TRAFFIC STUDY
DRAFT SCOPE OF WORK
(CASE NO. 00598938-PPD)**

The Orange County Great Park site is located north of Marine Way, east of "O" Street, south of Irvine Boulevard and the proposed FivePoint Communities development, and west of Alton Parkway in the City of Irvine (City), California. The project proposes the construction of a multi-activity super regional park at the former location of the El Toro Marine Corp Air Station.

The proposed 688 Acre Park Development Plan (PDP) traffic study will be developed in general accordance with the North Irvine Transportation Mitigation (NITM) Program requirements per City Council Resolution 03-61, applicable sections of the City's Transportation Guidelines (1993), and the City of Irvine Traffic Impact Analysis Guidelines (2004).

The traffic study will analyze the potential impacts of the proposed project on the circulation system and will identify appropriate improvements where needed. The analysis will assess the potential impacts of the project based on the Irvine Transportation Analysis Model (ITAM) short-range horizon year scenario (ITAM – 2017).

The traffic study will be developed in general accordance with the requirements of the NITM Traffic Study Scope of Work with a limited study area to reflect the size of the project and relationship to prior studies and will include the following key elements.

I. EXECUTIVE SUMMARY

This section will provide a short, clear, and concise description of the project and the traffic study findings. The proposed study recommendations will also be included in this section. A discussion will be included to indicate that for purposes of this traffic analysis the Western Sector Park Development Plan and the proposed 688 Acre Park Development Plan will be fully built-out in the short range horizon year (Interim Year - 2017), however, future improvements for the Great Park Cultural Area will not be included.

II. INTRODUCTION

This section of the report will include a comprehensive description of the 688 Acre Park Development Plan and key elements of the proposed project. The following elements are identified for the purpose of conducting the traffic study.

Approved 
Date 4/3/14

A. Project Site

The 688 Acre Park Development Plan (PDP) site is generally bounded by Marine Way on the south, the future "O" Street on the west, and the FivePoint Communities Great Park Neighborhoods on the north and west. A project vicinity map and a project site plan will be included in this section of the report.

B. Traffic Study Boundary

The traffic study boundary, as presented in Exhibit A, reflects the scale and magnitude of the project. If there are project impacts at the boundaries of the proposed study area, the boundary will be expanded until no impacts are revealed.

C. Existing, General Plan and Proposed Site Uses

Existing site uses and zoning, as included in the Orange County Great Park Environmental Impact Report and associated addenda, shall be described. The existing Great Park uses include both those currently existing and in operation and uses as defined in the Western Sector Park Development Plan previously approved. Proposed future uses are those defined in the 688 Acre Park Development Plan.

III. EXISTING CONDITIONS

A. Existing Site Uses

Existing land uses on-site and in the vicinity of the project site will be identified.

B. Existing Roadways and Intersections

The characteristics of the site's surrounding roadway network will be documented and mapped to include existing number of lanes, traffic signal locations, intersection configurations, and other visible factors that may have to be analyzed, such as medians, turn pockets, curbside parking, and sight visibility concerns (i.e., horizontal or vertical curvature). This section will provide a summary of site characteristics.

Existing roadway volumes, volume/capacity (V/C), and Level of Service (LOS) at intersections will be included for the existing roadways and intersections within the study area.

Exhibit A provides a map of all roadways and intersections to be included in the traffic study.

IV. METHODOLOGY/APPROACH

The 688 Acre Park Development Plan (PDP) Traffic Study will be based on the latest version of the Interim Year 2017 Irvine Transportation Analysis Model (ITAM). The analysis will report the "No Project" (2017 Baseline) and "With Project" conditions. The 2017 Baseline ITAM model run that will be used for the "No Project" includes approved project improvements and infrastructure backbone improvements assumed in ITAM for the 2017 interim conditions. The "With Project" conditions will add the 688 Acre Park Development Plan (PDP) uses which have not been constructed or approved. The

Approved 

Date 4/3/14

analysis will include, an alternative high school site location, two options for the FivePoint development and an option for a new road that would connect LY through the Great Park and connect with Marine Way.

The following summarizes the alternatives to be evaluated:

1. Existing Conditions
2. Existing plus 688 Acre Park Development Plan
3. 2017 Baseline (Assumes FivePoint Option 2 and High School Site A)
4. 2017 Baseline + 688 Acre Park Development Plan
5. 2017 Baseline + 688 Acre Park Development Plan with Five Point Option 1
6. 2017 Baseline + 688 Acre Park Development Plan with High School Site B
7. 2017 Baseline + 688 Acre Park Development Plan with connector roadway between LY and Marine Way.

A table summarizing the intersection and roadway network assumptions will be provided for all 2017 alternatives, including the known funding source, project or jurisdictional response.

The ITAM model might be modified to reflect changes to the network and traffic analysis zones for the Great Park 688 Acre Park Development Plan to better reflect the proposed plan. These changes will only be made with approval of the City of Irvine's Transportation Modeling staff.

The Great Park peak hour trips will be based on an updated Trip Generation and Parking Demand Analysis that will be concurrently prepared with this study and will reflect the current proposed Great Park Master Plan and the 688 Acre Park Development Plan.

Traffic distribution, assignment, peak hour intersection forecasts and Intersection Capacity Utilization will be based on ITAM. The study will include a figure representing the project trip distribution.

LSA will prepare an AM and PM peak hour intersection capacity utilization (ICU) analysis for each of the alternatives listed above per the City of Irvine's most recent release of the ITAM model.

The baseline data for traffic forecasts from the Lake Forest Traffic Analysis Model (LFTAM) will be provided by the City of Irvine. This will be used as a basis for analyzing intersection and link levels of service within the City of Lake Forest.

The 688 Acre Park Development Plan access and internal circulation analysis will ensure that the proposed intersections and points of access will meet or exceed the requirements within the City's Transportation Guidelines (1993). The operation of the un-signalized access locations will be reviewed and will be subject to comparison to applicable TGs and signal warrants. This includes the need for turn-lane pocket lengths, distance between driveways and intersections, corner clearance, left-turn in/out access, acceleration/deceleration lanes, and driveway lengths.

Approved 

Date 4/3/14

V. PERFORMANCE CRITERIA

The City of Irvine Transportation Guidelines (1993) will be used as the performance criteria to evaluate the design features of the proposed 688-Acre Park Development Plan.

The performance criteria to determine the project impact and mitigation will be consistent with the City's criteria as utilized in the NITM Program analysis, which are consistent with the criteria used in Environmental Impact Reports (EIR) for Northern Sphere, and the City's Great Park. The traffic analysis performance criteria are further detailed in Exhibit B, attached. For non-signalized intersections, a Highway Capacity Manual (HCM) analysis may be warranted to determine the level of service (LOS) at stop-controlled intersections.

VI. PROPOSED PROJECT IMPACTS

LSA will identify the potential impacts of the project using an ICU analysis for all signalized intersections identified in the project study area as reflected in Exhibit C. This will include the scenarios noted in IV.

Intersections and points of access to the 688 Acre Park Development Plan will be evaluated using the **City's Transportation Guidelines (1993)** to determine consistency with the City's design requirements (with the exception of roundabouts which will be evaluated per the Transportation Design Procedures (TDP-17) with appropriate software). Specific design features to be evaluated include turn-pocket lengths (TG-1), left-turn in/out access (TG-10), signal spacing (TG-7), distance between points of access and intersections (TG-8), corner clearance (TG -9), right turn lanes at driveways (TG-11), signal warrants (TG-13), and driveway length (TG -15).

- Where significant volumes of u-turns are anticipated due to raised medians, left-turn lengths will be sized according to TG-1.
- If access points to the park are designed to have right-in/right-out and left-turn in access, TG-10 will be consulted to determine feasibility. In order for staff to determine the benefits of allowing the left-in access, an alternative restricted right-in/right-out only will be included in the analysis for these access points as well.
- Intersections meeting signal warrants will be subject to review based on TG-7 signal spacing. Where requested by City staff, a signal progression analysis will be prepared.
- Un-signalized intersections will be evaluated using the Highway Capacity Manual (HCM) two-way stop-controlled intersection methodology.
- Any one- or two-way stop-controlled intersections that have significant delay per HCM or do not meet the criteria for in or out access should also be evaluated using TG-13, signal warrant.

Approved 1/2
Date 4/3/14

VII. SPECIAL ISSUES

A. Transit

LSA will provide a discussion of existing transit service and a description of any proposed transit improvements by 2017 and any shuttle system (if proposed) including alignment, explanation of operation, schedule (day/hours), and location of stops.

B. Pedestrian

Pedestrian circulation on-site and connections to adjacent public facilities (such as public sidewalks, trails and bus stops) will be documented, discussed, and evaluated in this section. The traffic study will include a discussion of how Policies A, B, and C of General Plan Objectives B-3 will be met with implementation of this project.

LSA will review the site plan and label areas wherever there are raised medians wider than 24 feet. If pedestrians are allowed to use these areas for recreation or congregation, the study will identify the appropriate pedestrian access and crosswalks. If these areas are for recreational use, appropriate barriers will need to be provided to prevent accidental interaction between objects hit or thrown by recreation users from the median into the travel lanes (such as Frisbees and croquet balls, etc.).

C. Bicycle

Bicycle connections to adjacent bicycle facilities will be discussed in this section. LSA will document how the project will conform to applicable policies of Objective B-4 of the City's General Plan, an exhibit depicting the bicycle network shall be provided, and the connections to the Great Park shown.

D. Riding and Hiking

Riding and Hiking circulation on-site and connection to adjacent trails will be discussed in this section. LSA will document how the project will conform to applicable policies of Objective B-5 of the City's General Plan. An exhibit depicting the riding and hiking trail networks shall be provided and the connections to the Great Park will be shown.

VII. PROJECT DESIGN FEATURES AND/OR RECOMMENDATIONS

Project design features will be identified for the analysis horizon year (2017). Based upon the results of the analysis, physical and/or operational improvements required in order to address any potentially adverse project impacts will be identified in the traffic study. If NITM Improvements are proposed to be constructed as part of the project, the analysis shall be performed to identify the Level of Service at the location of the NITM Improvement both with and without the proposed NITM Improvement. If applicable, fair share responsibility shall be determined consistent with NITM fair share methodology.

Approved 1/2

Date 4/3/14

If the analysis identifies any design feature impacts at a location where there are no proposed NITM Improvements, then the project must implement the required improvement.

Conceptual details, striping or layout sheets for proposed improvements will be provided. An improvement implementation phasing plan will be prepared based on the traffic analysis to identify the timing of each identified improvement and the responsible development area/or the level of development in the project area, which will be required to implement the improvement.

A summary of the proposed project and results of the analysis will be prepared. Based upon these results, recommendations will be presented for the design of internal circulation, project access driveways, and intersections identified in the traffic analysis. These recommendations will be consistent with the City's TG's.

VIII. CONCLUSIONS

A summary of the results of the analysis and recommended improvements will be prepared.

IX. REVISIONS TO TRAFFIC STUDY

Revisions to the traffic study will be provided to respond to City of Irvine comments regarding the analysis contained in the study.

X. SIGNATURE

The traffic study will be prepared under the supervision of, and signed, stamped, and dated by, a registered traffic engineer or a registered professional civil engineer with appropriate engineering and/or planning credentials.

EXHIBIT B

PERFORMANCE CRITERIA FOR LOCATIONS ANALYZED WITHIN THE STUDY AREA

I. Arterial Roads

V/C Calculation Methodology

Level of service to be based on average daily traffic (ADT) volume/capacity (V/C) ratios calculated using the following capacities:

City of Irvine

Major Arterial	8 lane	72,000
	6 lane	54,000
Primary Arterial	4 lane	32,000
Secondary Arterial	4 lane	28,000
Commuter	2 lane	13,000

Outside City of Irvine

Major Arterial	8 lane	75,000
	6 lane	56,300
Primary Arterial	4 lane	37,500
Secondary Arterial	4 lane	25,000 (24,000 – City of Orange)
Commuter	2 lane	12,500 (12,000 – City of Orange)

As required by the City of Irvine Link Capacity Analysis guidelines, arterial deficiencies identified based on ADT V/C ratios are to be further examined using peak hour data.

Performance Standard

Arterials in Irvine Planning Area 33 (Spectrum I) and Planning Area 36 (Irvine Business Complex/IBC) and CMP arterials outside the City of Irvine: Level of Service E (peak hour V/C less than or equal to 1.00).

All other arterials: Level of Service D (peak hour V/C less than or equal to .90).

Mitigation Requirement

For V/C greater than the acceptable level of service, mitigation of the project contribution is required to bring link location back to acceptable level of service or to no-project conditions if project contribution is greater than .03 for CMP roadways outside the City of Irvine (the impact threshold specified in the CMP), 0.01 or greater for locations in the County of Orange, or 0.02 or greater for all other arterial roads in the study area.

Approved 1/2

Date 4/3/14

PERFORMANCE CRITERIA FOR LOCATIONS ANALYZED WITHIN THE STUDY AREA

II. Intersections

V/C Calculation Methodology

Level of service to be based on peak hour intersection capacity utilization (ICU) values calculated using the following assumptions:

Saturation Flow Rate: 1,700 vehicles/hour/lane

Clearance Interval: .05

Right-Turn-On-Red Utilization Factor*: .00 for County of Orange Intersections, 0.75 for intersection in all other jurisdictions.

*"De-facto" right-turn lane is assumed in the ICU calculation if 19 feet from edge to outside of through-lane exists and parking is prohibited during peak periods.

Performance Standard

Intersections in Irvine Planning Area 33 (Spectrum I) and Planning Area 36 (Irvine Business Complex/IBC), CMP Intersections outside the City of Irvine, the intersections of Bake Parkway/I-5 northbound and southbound ramps, Alton Parkway/Irvine Boulevard, Bake Parkway/Irvine Boulevard, Lake Forest Drive/I-5 southbound ramps-Avenida de la Carlota and Lake Forest Drive/Irvine Center Drive: Level of Service E (peak hour ICU less than or equal to 1.00)."

All other intersections: Level of Service D (peak hour ICU less than or equal to .90).

Mitigation Requirement

For ICU greater than the acceptable level or service, mitigation of this project contribution is required to bring intersection back to acceptable level of service or to no-project conditions if project contribution is greater than .03 at CMP locations outside the City of Irvine (the impact threshold specified in the CMP), 0.01 or greater for location in the County of Orange, or 0.02 or greater for all other intersections in the study area.

III. Freeway Tollway Ramps

V/C Calculation Methodology

Level of service to be based on peak hour V/C ratios calculated using the following capacities:

Metered On-Ramps

Approved [Signature]
Date 4/13/14

A maximum capacity of 900 vehicles per hour (vph) for a one-lane metered on-ramp with only one mixed-flow lane at the meter.

A maximum capacity of 1,080 (20 percent greater than 900) vph for a one-lane metered on-ramp with one mixed-flow lane at the meter plus one high occupancy vehicle (HOV) preferential lane at the meter.

A maximum capacity of 1,500 vph for a one-lane metered on-ramp with two mixed-flow lanes at the meter.

A maximum capacity of 1,800 vph for a two-lane metered on-ramp with two mixed-flow lanes at the meter.

Toll Ramps (On-Ramps and Off-Ramps)

A maximum capacity of 1,500 vph for a one-lane toll ramp with one cash (stopped) lane and one FasTrak (unstopped) lane.

Non-Metered and Non-tolled On-Ramps and Off-Ramps

A maximum capacity of 1,500 vph for a one-lane ramp.

A maximum capacity of 2,250 (50% greater than 1,500) vph for a two-lane onramp that tapers to one merge lane at or beyond the freeway mainline gore point and for a two-lane off-ramp with only one auxiliary lane.

A maximum capacity of 3,000 for a two-lane on-ramp that does not taper to one merge lane and for a two-lane off-ramp with two auxiliary lanes.

Freeway to Freeway and Freeway to Tollway interchanges

A maximum capacity of 2,000 vph for 1-lane ramp

A maximum capacity of 4,000 vph for 2-lane ramp

Performance Standard

Level of Service E (peak hour V/C less than or equal to 1.00).

Mitigation Requirement

For V/C greater than the acceptable level of service, mitigation of the project contribution is required to bring ramp back to acceptable level or service or to no-project conditions if project contribution is greater than .03 for ramps at CMP intersections outside the City of Irvine (the

Approved 
Date 4/3/14

impact threshold specified in the CMP), 0.01 for ramps at County of Orange intersections, 0.02 or greater for all other ramps at intersections in the study area.

IV. Freeway/Tollway Mainline Segments

V/C Calculation Methodology

Level of service to be based on peak hour V/C ratios calculated using the following capacities:

2,000 vehicles per hour per lane (vphpl) for mixed-flow (general purpose) lanes
1,600 vphpl for a one-lane buffer-separated HOV facility
1,750 vphpl for a two-lane buffer-separated HOV facility

Performance Standard

Level of Service E (peak hour V/C less than or equal to 1.00).

Mitigation Requirement

For V/C greater than the acceptable level or service, mitigation of the project contribution is required to bring freeway/tollway mainline location back to acceptable level of service or to no project conditions if project contribution is greater than .03 (the impact threshold specified in the CMP).

1. Environmental Impact Report Addendum Summary

1.1 PURPOSE AND SCOPE

This Initial Study/Addendum provides the basis for augmenting the previously certified Final Environmental Impact Report (FEIR)(State Clearinghouse No. 2002101020) for the Orange County Great Park (OCGP) (subject of Addendum No. 4 and, because the OCGP Master Plan was modified in 2014, subject to Addendum No. 9) and serves as the California Environmental Quality Act (CEQA) documentation for the following:

- Minor Modification to OCGP Master Plan (00661956-PMPC)
- Adoption of this Addendum No. 10

The requested modification to the OCGP Master Plan does not propose any changes to approved and environmentally reviewed development intensities within the OCGP Master Plan area. This Addendum has been prepared pursuant to the provisions of CEQA (Public Resources Code Sections 21000 et seq.), the State CEQA Guidelines, and the City of Irvine (City) Local Guidelines for Implementing CEQA (Local CEQA Guidelines).

The term “proposed Project” refers to the proposed modifications to/expansion of the Community Ice Rink, while the term “project” refers to the total Marine Corps Air Station (MCAS) El Toro reuse plan analyzed in the OCGP FEIR (and its subsequent addenda) consisting of approximately 4,700 acres. The term “OCGP FEIR” refers to the 2003 Orange County Great Park FEIR as updated by its prior Addenda (i.e., Addendum No. 1 through Addendum No. 9) and two Supplemental Environmental Impact Reports (SEIRs). The term “Project site” refers to the location of the Community Ice Facility while “project site” refers to the OCGP Master Plan area.

1.2 ENVIRONMENTAL PROCEDURES

Pursuant to CEQA, the State CEQA Guidelines, and the Local CEQA Guidelines, this Initial Study/Addendum focuses on the proposed expansion of the Community Ice Facility to determine if the proposed Project would cause a change in the environmental impact conclusions of the OCGP FEIR, and if any change in circumstances or new information exists that would substantially change the conclusions of the OCGP FEIR.

Pursuant to Section 21166 of CEQA and Section 15162 of the State CEQA Guidelines, when an Environmental Impact Report (EIR) has been certified or a negative declaration adopted for a project, no subsequent EIR shall be prepared for the project unless the lead agency determines, on the basis of substantial evidence, that one or more of the following conditions are met:

1. EIR Addendum Summary

- (1) Substantial changes are proposed in the project that will require major revisions of the previous EIR due to the involvement of new significant environmental effects or a substantial increase in the severity of previously identified significant effects;*
- (2) Substantial changes occur with respect to the circumstances under which the project is undertaken that will require major revisions of the previous EIR due to the involvement of new significant environmental effects or a substantial increase in the severity of previously identified significant effects; or*
- (3) New information of substantial importance, which was not known and could not have been known with the exercise of reasonable diligence at the time the previous EIR was certified as complete, suggests any of the following:*
 - a) The project would have one or more significant effects not discussed in the previous EIR or negative declaration.*
 - b) Significant effects previously examined would be substantially more severe than identified in the previous EIR.*
 - c) Mitigation measures or alternatives previously found not to be feasible would in fact be feasible, and would substantially reduce one or more significant effects of the project, but the project proponent declines to adopt the mitigation measures or alternatives.*
 - d) Mitigation measures or alternatives that are considerably different from those analyzed in the previous EIR would substantially reduce one or more significant effects on the environment, but the project proponent declines to adopt the mitigation measures or alternatives.*

Section 15164 of the State CEQA Guidelines states that an Addendum to an EIR shall be prepared "if some changes or additions are necessary, but none of the conditions described in Section 15162 calling for preparation of a subsequent EIR have occurred." This Initial Study/Addendum reviews the changes proposed by the proposed Project and any changes to the existing conditions that have occurred since the OCGP FEIR was last augmented by OCGP Master Plan Modification No. 2 (approved by the Planning Commission in July 2014); and the Park Design for the 688-acre OCGP Improvement Area (approved by the City Council in July 2014). It also reviews any new information of substantial importance that was not known and could not have been known with exercise of reasonable diligence at the time that the OCGP FEIR was certified. It further examines whether, as a result of any changes or any new information, a subsequent or supplemental EIR may be required. This examination includes an analysis of the provisions of Section 21166 of CEQA and Section 15162 of the State CEQA Guidelines and their applicability to the proposed Project. This Initial Study/Addendum relies on the attached Environmental Analysis, which addresses environmental checklist issues on a section-by-section basis.

The City Environmental Checklist Form has been completed by the City and included in Section 3, *Environmental Checklist*. The Environmental Checklist Form is marked with the findings of the City's Community Development Director as to the environmental effects of the proposed Project in comparison

1. EIR Addendum Summary

with the findings of the OCGP FEIR. The checklist has been prepared pursuant to Section 15168(c)(4) of CEQA, which states that “where the subsequent activities involve site specific operations, the agency should use a written checklist or similar device to document the evaluation of the site and the activity to determine whether the environmental effects of the operation were covered in the program EIR.”

Using that approach, the City of Irvine, the Lead Agency, determined that an Addendum to the previously approved OCGP FEIR is the appropriate environmental clearance for the proposed Project.

1.3 PREVIOUS ENVIRONMENTAL DOCUMENTATION

The OCGP FEIR was originally certified by the City of Irvine in May 2003. The project analyzed in the OCGP FEIR consisted of the following actions: (1) Annexation, General Plan Amendment, Pre-Zoning (prior to annexation), and Zoning of the unincorporated portion of Planning Area (PA) 51; (2) Annexation of the unincorporated portion of PA 35 (Irvine Ranch Water District Parcel); (3) General Plan Amendment and Zone Change for PA 30 (the overall site originally included PAs 30 and 51, which were later merged into a single PA 51; for purposes of this document, both PA 30 and PA 51 will be referred to as the PA 51); and (4) Approval of the form of a Development Agreement vesting approval of overlay uses and intensities in consideration for dedication of land for public purposes and for developing and funding certain infrastructure improvements and maintenance of the public uses by the purchaser/developer and subsequent landowners and funding for specific park, roadways, and other circulation facilities and infrastructure. Together, these actions establish the policy and legislative structure to guide the development of the former MCAS El Toro property.

The OCGP FEIR mitigation measures are provided in the adopted Mitigation Monitoring and Reporting Program included in Appendix A. The table includes:

- Mitigation measure number and a description of the action;
- Timing for implementation;
- Approving authority and reviewing agency(s), if any; and
- Method of compliance

Subsequent to certification of the OCGP FEIR, 9 Addenda (i.e., Addendum No. 1 through Addendum No. 9) and two supplemental Environmental Impact Reports (SEIR and SSEIR) were approved and certified to address the potential environmental impacts associated with modifications to the OCGP FEIR. A brief overview of these documents is provided below.

- Addendum No. 1, approved by the City on May 18, 2006, augmented the OCGP FEIR to address the potential for environmental issues associated with the implementation of the OCGP Redevelopment Project Area Plan.
- Addendum No. 2 was approved by the City Council on October 24, 2006. This addendum analyzed the potential for environmental issues associated with adjustments to the boundary between the public and private areas of the OCGP; revisions to Zoning Ordinance text and figures related to PAs 30 and 51; the creation of a mixed-use zoning category called the Lifelong Learning District (LLD) within PA 51; and technical changes to the General Plan, as described in Section 2.3 of Addendum No. 2.

1. EIR Addendum Summary

- Addendum No. 3, approved by the City Planning Commission on May 17, 2007, addressed the potential for environmental issues associated with a proposal for the approval of Vesting Tentative Tract Map No. 17008 (Master Subdivision map).
- Addendum No. 4 was approved by the City Planning Commission on August 2, 2007. This addendum analyzed the development of the OCGP (Great Park Master Plan), which provides a conceptual design for the future build out of the 1,145-acre park with passive and active features.
- Addendum No. 5, approved by the City Council on July 22, 2008, analyzed changes to figures in the General Plan to reflect the Bake Parkway/Marine Way intersection relocation and the Rockfield Boulevard reconfiguration in the southern portion of PA 30, and amendments to the Orange County Transportation Authority's (OCTA) Master Plan of Arterial Highways; the City-Heritage Fields Development Agreement; and related changes to the City's General Plan and Zoning Ordinance.
- Addendum No. 6 was approved by the City Planning Commission on October 16, 2008, and analyzed the potential for environmental issues associated with requested entitlements: including amended Vesting Tentative Tract Map No. 17008, Vesting Tentative Tract Map No. 17283, Modification to OCGP Streetscape Design Guidelines, the Master Landscape and Trails Plan, and the Master Plan for Nonresidential Development within the LLD.
- Addendum No. 7 to the 2003 OCGP EIR, approved by the City on June 29, 2010, was prepared in connection with revisions to the North Irvine Transportation Mitigation (NITM) Program. The update removed planned traffic improvements at seven intersections from the list of traffic mitigation measures in the OCGP FEIR.

In 2011, Heritage Fields sought from the City a series of entitlements, including a General Plan amendment, a zone change, seven subdivision maps, six master plans and five park plan approvals associated with the private development of a portion of the Heritage Fields-owned property within PA 51 and former PA 30 (Modified Project). A supplement to the OCGP FEIR (SEIR) was prepared in connection with those entitlement applications. The SEIR was approved and certified by the City Council on August 30, 2011.

Addendum No. 8 was prepared analyzing the potential environmental issues associated with a minor modification to the Great Park Master Plan and Park Design, which was associated with implementation of the Western Sector Park Development Plan Phase I. The minor modification proposed transferring nonresidential square footage from the central area (i.e., Cultural Terrace) to the southwestern area of the OCGP (i.e., Sports Park); removing the Air Museum and Concessions/Retail and replacing them with the Artist in Residency Facility, the proposed Community Ice Facility, and the proposed Nature Education Garden; and replacing the existing Air Museum Hangar with Hangar 244. Addendum No. 8 was approved by the City on October 20, 2011.

In 2012, a Second Supplemental EIR (a supplement to the OCGP FEIR [SSEIR]) was prepared to analyze the 2012 Modified Project as compared to the 2011 Approved Project. The SSEIR addressed the environmental impacts associated with the implementation of the Heritage Fields 2012 General Plan Amendment and Zone Change Project, including the 688-acre OCGP Improvement Area. The 2012 Modified Project consisted of the reduction of 410,400 square feet of nonresidential intensity and a corresponding addition of 3,412 dwelling units, as well as 1,194 density bonus units for a total of 4,606 new dwelling units (i.e., 9,500 total dwelling units). The Modified Project proposed relocation of certain portions of the approved Wildlife Corridor Feature (Segments 2 and 3). The SSEIR also analyzed the

1. EIR Addendum Summary

potential impacts associated with two options for the Main Street development along Trabuco Road east of "O" Street. Additionally, the 2012 Modified Project included implementation of recreational facilities in the previously approved Sports Park District of the OCGP. PA 30 and PA 51 were also combined into a single PA, Combined PA 51, to create a cohesive development governed by a unified set of land use and development regulations. On November 26, 2013, the City Council certified the SSEIR.

Concurrent with the certification of the SSEIR, on November 26, 2013, the City Council also approved a contractual agreement (ALA II) with Heritage Fields that obligated Heritage Fields to construct 688 acres of the Great Park (the Design Package). The ALA II included provisions that allowed the City to unilaterally require program changes within the 688-acre OCGP Improvement Area, with respect to the following elements of the Design Package: a) sand volleyball, parking, and sports courts within the Sports Park subarea; b) the dog park and mini-amphitheater within the Bosque subarea. On March 18, 2014, the City Council approved the Unilateral Changes to the Design Package of the contractual agreement (ALA II). This action will be reflected in the discretionary action that the Planning Commission will be asked to make with regard to the Master Plan modification. Because CEQA clearance for the Design Package was established through the SSEIR, this Addendum document analyzes the Unilateral and Program Changes as approved by the City Council. The SSEIR served as the environmental clearance for the ALA II and its implementation.

Addendum No. 9 to the 2003 OCGP EIR, approved by the City in July , 2014, addressed potential environmental impacts associated with the modifications to the 688-acre OCGP Improvement Area, which included both the Unilateral Program Changes allowed in the ALA II and other staff-recommended changes to OCGP Improvement Area 1. The proposed modifications to the OCGP Improvement Area were within the Bosque and Sports Park Districts. Additionally, two design features of the Project that would be incorporated upon project implementation included dual 250-foot-long eastbound left-turn pockets at Marine Way and Great Park Boulevard West (Great Park Street 1) and a 250-foot-long westbound right-turn lane at the Marine Way right-in/right-out driveway, west of Great Park Boulevard (West) (Great Park Street 1).

The OCGP FEIR, as augmented by Addenda 1 through 9 (collectively, Addenda) and all of the associated technical documents, reports, and analyses are on file and can be reviewed at the City Community Development Department at One Civic Center Plaza, Irvine, California 92623.

1.4 ENVIRONMENTAL SETTING

The OCGP is in the central portion of Orange County, approximately 45 miles southeast of the County of Los Angeles. The project area is generally bounded by the Woodbury residential development to the west, the Portola Springs residential development to the north (under construction), the Irvine Spectrum to the south, and the City of Lake Forest to the east. Other nearby local jurisdictions include the Cities of Laguna Hills, Laguna Niguel, Laguna Woods, Mission Viejo, Aliso Viejo, and Tustin.

The Irvine Station, a major multimodal transit center linking OCTA bus, Metrolink commuter rail, and Amtrak rail services, is adjacent to the Southern California Regional Rail Authority (SCRRA) Metrolink tracks, which run south of the Project site.

The existing facilities and uses within the OCGP Master Plan area include existing portions of the Western Sector Park Development Plan (WSPDP) Phase I (e.g., the Balloon Park, Hangar 244, artist

1. EIR Addendum Summary

lofts, Central and West Timeline, North and South Lawns, Farm & Food Lab, Palm Court, and support parking). Consistent with the City's Zoning Ordinance, there are interim uses of the land and existing buildings which include Tierra Verde Industries, a composting and electronic waste recycling facility; agriculture; and a special event parking lot.

1.5 CONCLUSIONS OF ADDENDUM

Addendum No. 10 analyzes the potential impacts of the proposed modifications to the Community Ice Facility. The first phase of the OCGP, referred to as WSPDP Phase 1, includes sports fields, supportive uses, and displays consistent with the approved Master Plan. A community ice rink facility (Area L) and western picnic area (Area E) are included in the description of uses approved for this area of the OCGP. This area is bounded by "LV" Street to the north, 8th Street to the south, "G" Street to the east (a new north/south roadway between the special event parking area and the Project site, proposed as part of the project), and Ridge Valley to the west. The Community Ice Facility (approved as part of the modifications analyzed in Addendum No. 8) would include three sheets of ice, seating for up to 1,200 people at one rink and 100 each for the other two rinks (i.e., 1,400 total seats), and special events held up to 6 weekdays per year. An expansion to the approved Community Ice Facility portion of the Western Sector is proposed. The project proposes four sheets of ice, seating for up to 2,500 people at one rink and 500 each for the others (i.e., 4,000 total seats), and special events held up to 12 times per year. Section 4.0 of this document discusses the findings of the analysis in comparison to the OCGP FEIR.

The environmental analysis contained in this document focuses on the following environmental topics: Aesthetics, Agriculture and Forestry Resources, Air Quality, Biological Resources, Cultural Resources, Geology and Soils, Greenhouse Gas Emission, Hazards and Hazardous Materials, Hydrology and Water Quality, Land Use and Planning, Noise, Population and Housing, Public Services, Transportation/Traffic, and Utilities and Service Systems. The analysis concluded that the proposed modifications reflect a development program that is consistent with the existing land use designations and does not deviate from the development program for the area. No new uses or significant changes are proposed as part of the proposed Project, beyond those previously studied and disclosed, that would create new adverse impacts related to any of the above environmental topics or a substantial increase in the severity of previously identified significant effects.

Also, there are no mitigation measures or alternatives previously found not to be feasible that would in fact be feasible, and would substantially reduce one or more significant effects of the project, and there are no mitigation measures or alternatives that are considerably different from those analyzed in the previous EIR that would substantially reduce one or more significant effects on the environment. Therefore, no new mitigation measures are proposed, even though all original applicable mitigation measures from the OCGP FEIR and new mitigation measures; existing plans, programs, or policies (PPPs); and project design features (PDFs) from the supplemental EIRs (SEIR and SSEIR) have been carried forward into this document to further help reduce or avoid potential significant impacts.

2. Project Description

2.1 PROJECT LOCATION

The Orange County Great Park (OCGP), within PA 51, is northeast of the freeway junction at Interstate 5 (I-5), State Route 133 (SR-133), and Interstate 405 (I-405). The OCGP is in the central portion of County of Orange, approximately 45 miles southeast of the County of Los Angeles. Other nearby local jurisdictions include the Cities of Laguna Hills, Laguna Niguel, Laguna Woods, Mission Viejo, Aliso Viejo, and Tustin. Figure 2-1 shows the regional location of the OCGP.

A Community Ice Facility (Area L) and Western Picnic Area (Area E) are included in the approved OCGP Master Plan and WSPDP. Figure 2-2 provides an aerial photograph showing the relationship between the OCGP Master Plan, the WSPDP, and the Project site. The proposed Project would combine Area L and Area E. The proposed 14.06-acre Community Ice Facility site (Project site) is bounded by "LV" Street to the north, 8th Street to the south, "G" Street to the east (a new north/south roadway between the special event parking area and the project site, proposed as part of the project) and Ridge Valley to the west. Figure 2-3 provides the proposed Site Plan and shows the surrounding streets.

Surrounding land uses include the OCGP Balloon and Visitors Center to the east, commercial retail to the south, and the California Highway Patrol Orange County Communication Center, the California Department of Transportation (Caltrans) District 12 Management Center, and the Irvine Unified School District Office to the west, across SR-133.

2.2 PROJECT CHARACTERISTICS

2.2.1 Project Background

On May 27, 2003, the City Council certified the OCGP FEIR and adopted a General Plan amendment (GPA) and zone change (ZC) to implement the development of the OCGP. To develop at the maximum intensities allowed in the Overlay Plan shown in the General Plan and Zoning Ordinance, the land use entitlements required that the property owner enter into a development agreement with the City, which required, among other things, the dedication of land and the development or funding of certain infrastructure improvements.

Addendum No. 8 was prepared analyzing the potential environmental issues associated with a minor modification to the OCGP Master Plan and Park Design, which was associated with implementation of the WSPDP Phase I. The minor modification proposed transferring nonresidential square footage from the central area (i.e., Cultural Terrace) to the southwestern area of the OCGP (i.e., Sports Park); removing the Air Museum and Concessions/Retail, and replacing them with the Artist in Residency Facility, the proposed Community Ice Facility, and the proposed Nature Education Garden; and replacing the existing Air Museum Hangar with Hangar 244. Addendum No. 8 was approved by the City on October 20, 2011. The Community Ice Facility approved as part of the modification evaluated in Addendum No. 8, included three sheets of ice, seating for up to 1,200 people at one rink and 100 each for the other rinks (i.e., 1,400 total seats), and special events held up to 6 weekdays per year. The facility was approximately 117,635 square feet.

OCGP Community Ice Facility
OCGP Master Plan Boundary and WSPDP Area

2. *Project Description*

Currently, a refined program for the Project site proposes a larger Community Ice Facility with four sheets of ice as well as an additional spectator seating component and more special events. Environmental review is required to support the minor modification to the Master Plan for the proposed Project.

2.2.2 Project Components

This Addendum (Addendum No. 10) addresses the potential for environmental impacts associated with the proposed expansion of the Community Ice Facility. The approved OCGP Master Plan and WSPDP include plans for a future 117,635 square feet Community Ice Facility with three sheets of ice at the proposed location on the west side of the park. The approved Community Ice Facility included seating for up to 1,200 people at one rink and 100 for the other two rinks (i.e., 1,400 total seats), and special events held up to 6 weekdays per year.

The proposed Project would support the development of a four-sheet Community Ice Facility consisting of approximately 270,000 square feet, with the following uses that would be accessory to the sheets of ice (i.e., the primary services provided on the site):

- Locker Facilities;
- Lobby, skating support and retail spaces, including a pro shop, party rooms, and a restaurant;
- Dedicated Figure Skating room;
- Administrative space;
- Mechanical/Electrical space; and
- Training and team space.

One ice sheet/rink would be developed to Olympic standards (e.g., 100 feet by 200 feet), with a 2,500-seat seating area. Each of the remaining three ice sheets/rinks would be developed to National Hockey League (NHL) standards (e.g., 85 feet x 200 feet), with a 500-seat seating area (4,000 seats total). The Community Ice Facility would include the development of no less than 665 parking spaces on the premises.

Access to the proposed Community Ice Facility would be provided via a right-turn in/right-turn out (RIRO) only driveway on Ridge Valley and a full access driveway on "G" Street, which would be a new local roadway on the eastern boundary of the Project site between "LV" Street to the north and 8th Street to the south. It is located between Ridge Valley Street and "C" Street. The facility would maintain a strong presence along future "LV" Street. Proposed uses across the street include Community Commercial, Multi-use, and Medical and Science uses.

Although the proposed Project would increase the square footage and spectator seating in the community ice rink, the proposed Project would not result in new uses not previously anticipated in the OCGP Master Plan and the overall uses within the OCGP will not be exceeded. The proposed addition of building area for the Community Ice Facility site will not result in the maximum building square footage allocated for the overall uses within the OCGP being exceeded.

The proposed Project also entails cleanup actions to the OCGP Master Plan Building Summary Table to reflect further refinement of existing/planned building areas as a result of the availability of more detailed information. The changes to the OCGP Master Plan Building Summary Table are shown in Table 2.2-1.

2. Project Description

2. *Project Description*

The proposed cleanup actions are in keeping with previous OCGP Master Plan modifications that have refined building areas to reflect accessory areas of planned facilities, as details and uses of structures are determined. As these cleanup actions are ministerial in nature and have been fully analyzed in this and previous environmental analyses, this aspect of the Project is not further analyzed in Chapters 3 and 4 of this Addendum.

To accommodate the proposed larger facility with four sheets of ice, the project components include the following requested actions:

Minor Modification to OCGP Master Plan

The OCGP Master Plan covers approximately 1,145.3 acres at the former MCAS El Toro. In October 2011, a Community Ice Facility was approved as part of a minor modification to the OCGP Master Plan. Addendum No. 8 to the OCGP FEIR was approved concurrently to address potential environmental impacts associated with the minor modification to the OCGP Master Plan. The Master Plan anticipated a 117,635 square feet, three sheet, Community Ice Facility. The proposed minor modification of the Master Plan would increase the Community Ice Facility's square footage from 117,635 square feet to 270,000 square feet to accommodate an additional sheet of ice and accessory uses. Although the proposed Project would increase the square footage and spectator seating in the community ice rink, the proposed Project would not result in new uses not previously anticipated in the OCGP Master Plan and there would be a corresponding decrease in the square footage of another use within the OCGP. The proposed addition of building square feet for the Community Ice Facility site would be deducted from other approved uses so that the maximum building square footage allocated for the overall uses within the OCGP will not be exceeded.

2.3 DISCRETIONARY APPROVALS

Implementation of the Project includes the following discretionary actions to be undertaken by the City:

- Approval of Minor Modification to OCGP Master Plan (00661956-PMPC)
- Adoption of Addendum No. 10

The OCGP FEIR lists additional discretionary actions to be taken by the City and other public agencies at, or as part of, the completion of the project (OCGP FEIR pages 3-29 and 3-30). The actions and responsible public agencies include, but are not necessarily limited to, these approvals:

- Master plans and subdivisions for development (City)
- Community facilities districts or other assessment districts (City)
- Actions to improve interim use activities (City and United States Department of the Navy [DON])
- Transfer of parcels within PA 51 (DON)
- Clean Water Act section 404 permits (United States Army Corps of Engineers [USACE])
- Endangered Species Act compliance (United States Fish and Wildlife Service [USFWS])
- Clean Water Act section 401 and National Pollutant Discharge Elimination System (NPDES) permits (Regional Water Quality Control Board)

2. Project Description

- California Fish and Game Code 1602 permits (California Department of Fish and Game [CDFG])
- Revisions to the Orange County Master Plan of Arterial Highways (OCTA)

The City Environmental Information Form and Environmental Checklist Form have been completed by the City and are included on the following pages. The Environmental Checklist Form is marked with the findings of the Community Development Department as to the environmental effects of the proposed changes to the project in comparison with the findings of the certified OCGP FEIR.

As explained above, this comparative analysis has been undertaken pursuant to the provisions of CEQA to provide the City with the factual basis for determining whether any changes in the project, any changes in the circumstances, or any new information require additional environmental review or preparation of a subsequent or supplemental EIR. The basis for each of the findings listed in the attached Environmental Checklist Form in Section 3 is explained in Section 4 of the Addendum.

3. Environmental Checklist

3.1 CITY OF IRVINE INITIAL STUDY AND ENVIRONMENTAL EVALUATION

The City of Irvine Environmental Information Form and Environmental Checklist Form have been completed by the City and are included on the following pages. The Environmental Checklist Form is marked with the findings of the Community Development Department as to the environmental effects of the proposed expansion of the Community Ice Facility in comparison with the findings of the OCGP FEIR.

As explained above, this comparative analysis has been undertaken, pursuant to the provisions of CEQA, to provide the City with the factual basis for determining whether any changes in the project, any changes in the circumstances under which the project is undertaken, or any new information requires additional environmental review or preparation of a subsequent or supplemental EIR. The basis for each of the findings listed in the attached Environmental Checklist Form is explained in Section 4 of this Addendum.

1. Project Title:

Addendum No. 10: Minor Modification to the Orange County Great Park Master Plan for the Community Ice Facility.

2. Lead Agency Name and Address

City of Irvine Community Development Department
One Civic Center Plaza
Irvine, California 92623

3. Contact Person and Phone Number:

Barry Curtis, AICP, Manager of Planning Services, (949) 724-7453

4. Project Location:

The Community Ice Facility would be located between Ridge Valley and the existing Festival Site paved area opportunity pad area. The Project site would be bounded by 8th Street to the southwest, a regraded "G" Street to the southeast, the future "LV" Street to the northeast, and Ridge Valley to the northwest.

5. Project Sponsor's Name and Address:

City of Irvine Community Development Department
One Civic Center Plaza
Irvine, California 92623

3. Environmental Checklist

6. General Plan Designation:

Orange County Great Park

7. Zoning:

1.9 Orange County Great Park

8. Description of Project

See Section 2.2.2, *Project Components*

9. Surrounding Land Uses and Setting (briefly describe the project's surroundings):

The OCGP is in the central portion of Orange County, approximately 45 miles southeast of the County of Los Angeles. The OCGP is generally bounded by the Irvine Spectrum to the south, the City of Lake Forest to the east, the Woodbury residential community to the west, and the Portola Springs residential development to the north.

The Project site for the Community Ice Facility would be bounded by 8th Street to the southwest, "G" Street (part of the proposed Project) to the southeast, the future "LV" Street to the northeast, and the future Ridge Valley Street to the northwest.

10. Other Public Agencies Whose Approval Is Required (e.g., permits, financing approval, or participation agreement):

N/A

3. *Environmental Checklist*

3.2 ENVIRONMENTAL FACTORS POTENTIALLY AFFECTED

The environmental factors checked below would be potentially affected by this project, involving at least one impact that is a "Potentially Significant Impact" as indicated by the checklist on the following pages.

- | | | |
|---|---|---|
| <input type="checkbox"/> Aesthetics | <input type="checkbox"/> Agriculture & Forest Resources | <input type="checkbox"/> Air Quality |
| <input type="checkbox"/> Biological Resources | <input type="checkbox"/> Cultural Resources | <input type="checkbox"/> Geology/Soils |
| <input type="checkbox"/> Greenhouse Gas Emissions | <input type="checkbox"/> Hazards & Hazardous Materials | <input type="checkbox"/> Hydrology/Water Quality |
| <input type="checkbox"/> Land Use/Planning | <input type="checkbox"/> Mineral Resources | <input type="checkbox"/> Noise |
| <input type="checkbox"/> Population/Housing | <input type="checkbox"/> Public Services | <input type="checkbox"/> Recreation |
| <input type="checkbox"/> Transportation/Traffic | <input type="checkbox"/> Utilities/Service Systems | <input type="checkbox"/> Mandatory Findings of Significance |

3.3 DETERMINATION

On the basis of this initial evaluation:

- ☐ I find that the proposed Project COULD NOT have a significant effect on the environment, and a NEGATIVE DECLARATION will be prepared.
- ☐ I find that although the proposed Project could have a significant effect on the environment, there will not be a significant effect in this case because revisions in the project have been made by or agreed to by the project proponent. A MITIGATED NEGATIVE DECLARATION will be prepared.
- ☐ I find that the proposed Project MAY have a significant effect on the environment and an ENVIRONMENTAL IMPACT REPORT is required.
- ☐ I find that the proposed Project MAY have a "potentially significant impact" or "potentially significant unless mitigated" impact on the environment, but at least one effect (1) has been adequately analyzed in an earlier document pursuant to applicable legal standards, and (2) has been addressed by mitigation measures based on the earlier analysis as described on attached sheets. An ENVIRONMENTAL IMPACT REPORT is required, but it must analyze only the effects that remain to be addressed.
- ☒ I find that although the proposed Project could have a significant effect on the environment, because all potentially significant effects (a) have been analyzed adequately in an earlier EIR or NEGATIVE DECLARATION pursuant to applicable standards, and (b) have been avoided or mitigated pursuant to that earlier EIR or NEGATIVE DECLARATION, including revisions or mitigation measures that are imposed upon the proposed Project, nothing further beyond an Addendum to the earlier EIR is required.

Barry Curtis, AICP, Manager of Planning Services

2.17.16
Date

3. Environmental Checklist

3.4 EVALUATION OF ENVIRONMENTAL IMPACTS

- 1) A brief explanation is required for all answers except "No Impact" answers that are adequately supported by the information sources a lead agency cites in the parentheses following each question. A "No Impact" answer is adequately supported if the referenced information sources show that the impact simply does not apply to projects like the one involved (e.g., the project falls outside a fault rupture zone). A "No Impact" answer should be explained where it is based on project-specific factors as well as general standards (e.g., the project will not expose sensitive receptors to pollutants, based on a project-specific screening analysis).
- 2) All answers must take account of the whole action involved, including off-site as well as on-site, cumulative as well as project-level, indirect as well as direct, and construction as well as operational impacts.
- 3) Once the lead agency has determined that a particular physical impact may occur, the checklist answers must indicate whether the impact is potentially significant, less than significant with mitigation, or less than significant. "Potentially Significant Impact" is appropriate if there is substantial evidence that an effect may be significant. If there are one or more "Potentially Significant Impact" entries when the determination is made, an EIR is required.
- 4) "Negative Declaration: Less Than Significant With Mitigation Incorporated" applies where the incorporation of mitigation measures has reduced an effect from "Potentially Significant Impact" to a "Less Than Significant Impact." The lead agency must describe the mitigation measures, and briefly explain how they reduce the effect to a less than significant level.
- 5) Earlier analyses may be used where, pursuant to the tiering, program EIR, or other CEQA process, an effect has been adequately analyzed in an earlier EIR or negative declaration. Section 1 5063(c) (3) (D). In this case, a brief discussion should identify the following:
 - a) **Earlier Analysis Used.** Identify and state where they are available for review.
 - b) **Impacts Adequately Addressed.** Identify which effects from the above checklist were within the scope of and adequately analyzed in an earlier document pursuant to applicable legal standards, and state whether such effects were addressed by mitigation measures based on the earlier analysis.
 - c) **Mitigation Measures.** For effects that are "Less Than Significant With Mitigation Incorporated," describe the mitigation measures that were incorporated or refined from the earlier document and the extent to which they address site-specific conditions for the project.
- 6) Lead agencies are encouraged to incorporate into the checklist references to information sources for potential impacts (e.g., general plans, zoning ordinances). Reference to a previously prepared or outside document should, where appropriate, include a reference to the page or pages where the statement is substantiated.

3. *Environmental Checklist*

- 7) Supporting Information Sources: A source list should be attached, and other sources used or individuals contacted should be cited in the discussion.
- 8) This is only a suggested form, and lead agencies are free to use different formats; however, lead agencies should normally address the questions from this checklist that are relevant to a project's environmental effects in whatever format is selected.
- 9) The explanation of each issue should identify:
 - a) the significance criteria or threshold, if any, used to evaluate each question; and
 - b) the mitigation measure identified, if any, to reduce the impact to less than significant.

ENVIRONMENTAL ISSUES	Subsequent or Supplemental EIR				Addendum to EIR	
	Substantial Change in Project Requiring Major EIR Revisions	Substantial Change in Circumstances Requiring Major EIR Revisions	New Information Showing Greater Significant Effects than Previous EIR	New Information Showing Ability to Reduce Significant Effects in Previous EIR	Less Than Significant Impacts/No Changes or New Information Requiring Preparation of an EIR	No Impact
I. AESTHETICS: Would the project:						
a) Have a substantial adverse effect on a scenic vista?					X	
b) Substantially damage scenic resources, including, but not limited to, trees, rock outcroppings, and historic buildings within a State scenic highway or local scenic expressway, scenic highway, or eligible scenic highway?					X	
c) Substantially degrade the existing visual character or quality of the site and its surroundings?					X	
d) Create a new source of substantial light or glare which would adversely affect day or nighttime views in the area?					X	
II. AGRICULTURE AND FORESTRY RESOURCES: In determining whether impacts to agricultural resources are significant environmental effects, lead agencies may refer to the California Agricultural Land Evaluation and Site Assessment Mode (1997) prepared by the California Department of Conservation as an optional model to use in assessing impacts on agriculture and farmland. Would the project:						
a) Convert Prime Farmland, Unique Farmland, or Farmland of Statewide Importance (Farmland), as shown on the maps prepared pursuant to the Farmland Mapping and Monitoring Program of the California Resources Agency, to nonagricultural use?						X

3. Environmental Checklist

	Subsequent or Supplemental EIR				Addendum to EIR	
ENVIRONMENTAL ISSUES	Substantial Change in Project Requiring Major EIR Revisions	Substantial Change in Circumstances Requiring Major EIR Revisions	New Information Showing Greater Significant Effects than Previous EIR	New Information Showing Ability to Reduce Significant Effects in Previous EIR	Less Than Significant Impacts/No Changes or New Information Requiring Preparation of an EIR	No Impact
b) Conflict with existing zoning for agricultural use or with a Williamson Act contract?						X
c) Conflict with existing zoning for, or cause rezoning of, forest land (as defined in Public Resources Code section 12220(g)), timberland (as defined by Public Resources Code section 4526), or timberland-zoned Timberland Production (as defined by Government Code section 51104(g))?						X
d) Result in the loss of forest land or conversion of forest land to nonforest use?						X
e) Involve other changes in the existing environment which, due to their location or nature, could result in conversion of farmland to nonagricultural use or conversion of forest land to nonforest use?					X	
III. AIR QUALITY: Where available, the significance criteria established by the applicable air quality management district or air pollution control district may be relied upon to make the following determinations. Would the project:						
a) Conflict with or obstruct implementation of the applicable air quality plan?						X
b) Violate any air quality standard or contribute substantially to an existing or projected air quality violation?					X	
c) Result in a cumulatively considerable net increase of any criteria pollutant for which the project region is in nonattainment under an applicable federal or State ambient air quality standard (including releasing emissions which exceed quantitative thresholds for ozone precursors)?					X	
d) Expose sensitive receptors to substantial pollutant concentrations?					X	
e) Create objectionable odors affecting a substantial number of people?						X

3. Environmental Checklist

IV. BIOLOGICAL RESOURCES: Would the project:						
a) Have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special-status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Game or U.S. Fish and Wildlife Service?						X
b) Have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations or by the California Department of Fish and Game or U.S. Fish and Wildlife Service?						X
c) Have a substantial adverse effect on federally protected wetlands as defined by Section 404 of the Clean Water Act (including, but not limited to, marsh, vernal pool, and coastal) through direct removal, filling, hydrological interruption, or other means?						X
d) Interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites?					X	
e) Conflict with any local policies or ordinances protecting biological resources (e.g., a tree preservation policy or ordinance)?						X
f) Conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or State habitat conservation plan?						X

3. Environmental Checklist

	Subsequent or Supplemental EIR				Addendum to EIR	
	Substantial Change in Project Requiring Major EIR Revisions	Substantial Change in Circumstances Requiring Major EIR Revisions	New Information Showing Greater Significant Effects than Previous EIR	New Information Showing Ability to Reduce Significant Effects in Previous EIR	Less Than Significant Impacts/No Changes or New Information Requiring Preparation of an EIR	No Impact
ENVIRONMENTAL ISSUES						
V. CULTURAL RESOURCES: Would the project:						
a) Cause a substantial adverse change in the significance of a historical resource as defined in §15064.5 of the CEQA Guidelines?					X	
b) Cause a substantial adverse change in the significance of an archaeological resource pursuant to §15064.5 of the CEQA Guidelines?					X	
c) Directly or indirectly destroy a unique paleontological resource or site or unique geological feature?					X	
d) Disturb any human remains, including those interred outside of formal cemeteries?					X	
VI. GEOLOGY AND SOILS: Would the project:						
a) Expose people or structures to potential substantial adverse effects, including the risk of loss, injury, or death involving:						
i) Rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known fault? (Refer to Division of Mines and Geology Special Publication 42)						X
ii) Strong seismic ground shaking?					X	
iii) Seismic-related ground failure, including liquefaction?						X
iv) Landslides?						X
b) Result in substantial soil erosion or the loss of topsoil?					X	
c) Be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on- or off-site landslide, lateral spreading, subsidence, liquefaction, or collapse?						X

3. Environmental Checklist

	Subsequent or Supplemental EIR				Addendum to EIR	
	Substantial Change in Project Requiring Major EIR Revisions	Substantial Change in Circumstances Requiring Major EIR Revisions	New Information Showing Greater Significant Effects than Previous EIR	New Information Showing Ability to Reduce Significant Effects in Previous EIR	Less Than Significant Impacts/No Changes or New Information Requiring Preparation of an EIR	No Impact
ENVIRONMENTAL ISSUES						
d) Be located on expansive soil, as defined by Table 18-1-B of the Uniform Building Code (1994), creating substantial risks to life or property?					X	
e) Have soils incapable of adequately supporting the use of septic tanks or alternative waste water disposal systems where sewers are not available for the disposal of waste water?						X
VII. GREENHOUSE GAS EMISSIONS: Would the project:						
a) Generate greenhouse gas emissions, either directly or indirectly, that may have a significant impact on the environment?						*
b) Conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of greenhouse gases?						*
VIII. HAZARDS AND HAZARDOUS MATERIALS: Would the project:						
a) Create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials?					X	
b) Create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment?						X
c) Emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within .25 mile of an existing or proposed school?						X
d) Be located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, would it create a significant hazard to the public or the environment?					X	

3. *Environmental Checklist*

	Subsequent or Supplemental EIR				Addendum to EIR	
	Substantial Change in Project Requiring Major EIR Revisions	Substantial Change in Circumstances Requiring Major EIR Revisions	New Information Showing Greater Significant Effects than Previous EIR	New Information Showing Ability to Reduce Significant Effects in Previous EIR	Less Than Significant Impacts/No Changes or New Information Requiring Preparation of an EIR	No Impact
ENVIRONMENTAL ISSUES						
e) For a project located within an airport land use plan, would the project result in a safety hazard for people residing or working in the project area?						X
f) For a project located within the vicinity of a private airstrip, would the project result in a safety hazard for people residing or working in the project area?						X
g) Impair implementation of, or physically interfere with, an adopted emergency response plan or emergency evacuation plan?						X
h) Expose people or structures to a significant risk of loss, injury, or death involving wildland fires, including where wildlands are adjacent to urbanized areas or where residences are intermixed						X
IX. HYDROLOGY AND WATER QUALITY: Would the project:						
a) Violate any water quality standards or waste discharge requirements?					X	
b) Substantially deplete groundwater supplies or interfere substantially with groundwater recharge such that there would be a net deficit in aquifer volume or a lowering of the local groundwater table level (e.g., the production rate of pre-existing nearby wells would drop to a level which would not support existing land uses or planned uses for which permits have been granted)?						X
c) Substantially alter the existing drainage pattern of the site or area, including through alteration of the course of a stream or river, in a manner which would result in substantial erosion or siltation on-site or off-site?					X	

3. Environmental Checklist

ENVIRONMENTAL ISSUES	Subsequent or Supplemental EIR				Addendum to EIR	
	Substantial Change in Project Requiring Major EIR Revisions	Substantial Change in Circumstances Requiring Major EIR Revisions	New Information Showing Greater Significant Effects than Previous EIR	New Information Showing Ability to Reduce Significant Effects in Previous EIR	Less Than Significant Impacts/No Changes or New Information Requiring Preparation of an EIR	No Impact
d) Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, or substantially increase the rate or amount of surface runoff in a manner which would result in flooding on-site or off-site?					X	
e) Create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of pollutant runoff?					X	
f) Otherwise substantially degrade water quality?					X	
g) Place housing within a 100-year flood hazard area as mapped on a Federal Flood Hazard Boundary or Flood Insurance Rate Map or other flood hazard delineation map?						X
h) Place within a 100-year flood hazard area structures which would impede or redirect flood flows?						X
i) Expose people or structures to a significant risk of loss, injury, or death involving flooding, including flooding as a result of the failure of a levee or dam?						X
j) Expose people or structures to inundation by seiche or mudflow?						X
X. LAND USE AND PLANNING: Would the project						
a) Physically divide an established community?						X
b) Conflict with any applicable land use plan, policy, or regulation of any agency with jurisdiction over the project (including, but not limited to the general plan, specific plan, local coastal program, or zoning ordinance) adopted for the purpose of avoiding or mitigating an environmental effect?					X	
c) Conflict with any applicable habitat conservation plan or natural community conservation plan?						X

3. *Environmental Checklist*

	Subsequent or Supplemental EIR				Addendum to EIR	
	Substantial Change in Project Requiring Major EIR Revisions	Substantial Change in Circumstances Requiring Major EIR Revisions	New Information Showing Greater Significant Effects than Previous EIR	New Information Showing Ability to Reduce Significant Effects in Previous EIR	Less Than Significant Impacts/No Changes or New Information Requiring Preparation of an EIR	No Impact
ENVIRONMENTAL ISSUES						
XI. MINERAL RESOURCES: Would the project:						
a) Result in the loss of availability of a known mineral resource that would be of value to the region and the residents of the State?						X
b) Result in the loss of availability of a locally-important mineral resource recovery site delineated on a local general plan, specific plan, or other land use?						X
XII. NOISE: Would the project result in:						
a) Exposure of persons to or generation of noise levels in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?					X	
b) Exposure of persons to or generation of excessive groundborne vibration or groundborne noise levels?					X	
c) A substantial permanent increase in ambient noise levels in the project vicinity above levels existing without the project?					X	
d) A substantial temporary or periodic increase in ambient noise levels in the project vicinity above levels existing without the project?					X	
e) For a project located within an airport land use plan, would the project expose people residing or working in the project area to excessive noise levels?						X
f) For a project within the vicinity of a private airstrip, heliport, or helistop, would the project expose people residing or working in the project area to excessive noise levels?						X

3. Environmental Checklist

ENVIRONMENTAL ISSUES	Subsequent or Supplemental EIR				Addendum to EIR	
	Substantial Change in Project Requiring Major EIR Revisions	Substantial Change in Circumstances Requiring Major EIR Revisions	New Information Showing Greater Significant Effects than Previous EIR	New Information Showing Ability to Reduce Significant Effects in Previous EIR	Less Than Significant Impacts/No Changes or New Information Requiring Preparation of an EIR	No Impact
XIII. POPULATION AND HOUSING: Would the project:						
a) Induce substantial population growth in an area, either directly (e.g., by proposing new homes and businesses) or indirectly (e.g., through the extension of roads or other infrastructure)?					X	
b) Displace substantial numbers of existing housing, necessitating the construction of replacement housing elsewhere?						X
c) Displace substantial numbers of people, necessitating the construction of replacement housing elsewhere?						X
XIV. PUBLIC SERVICES: Would the project result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times or other performance objectives for any of the public services:						
a) Fire protection?					X	
b) Police protection?					X	
c) Schools?					X	
d) Parks?					X	
e) Other public facilities?					X	
XV. RECREATION: Would the project:						
a) Increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated?					X	
b) Include recreational facilities or require the construction or expansion of recreational facilities which might have an adverse physical effect on the environment?					X	

3. Environmental Checklist

ENVIRONMENTAL ISSUES	Subsequent or Supplemental EIR				Addendum to EIR	
	Substantial Change in Project Requiring Major EIR Revisions	Substantial Change in Circumstances Requiring Major EIR Revisions	New Information Showing Greater Significant Effects than Previous EIR	New Information Showing Ability to Reduce Significant Effects in Previous EIR	Less Than Significant Impacts/No Changes or New Information Requiring Preparation of an EIR	No Impact
XVI. TRANSPORTATION/TRAFFIC: Would the project:						
a) Conflict with an applicable plan, ordinance, or policy establishing measures of effectiveness for the performance of the circulation system, taking into account all modes of transportation including mass transit and non-motorized travel and relevant components of the circulation system, including but not limited to intersections, streets, highways and freeways, pedestrian and bicycle					X	
b) Conflict with an applicable congestion management program, including, but not limited to level of service standards and travel demand measures, or other standards established by the county congestion management agency for designated roads or highways?					X	
c) Result in a change in air traffic patterns, including either an increase in traffic levels or change in location that results in substantial safety						X
d) Substantially increase hazards due to a design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment)?						X
e) Result in inadequate emergency access?					X	
f) Conflict with adopted policies, plans, or programs supporting alternative transportation (e.g., bus stops/routes, bicycle lanes, sidewalks,						X
XVII. UTILITIES AND SERVICE SYSTEMS: Would the project:						
a) Exceed wastewater treatment requirements of the applicable Regional Water Quality Control Board?					X	

3. Environmental Checklist

ENVIRONMENTAL ISSUES	Subsequent or Supplemental EIR				Addendum to EIR	
	Substantial Change in Project Requiring Major EIR Revisions	Substantial Change in Circumstances Requiring Major EIR Revisions	New Information Showing Greater Significant Effects than Previous EIR	New Information Showing Ability to Reduce Significant Effects in Previous EIR	Less Than Significant Impacts/No Changes or New Information Requiring Preparation of an EIR	No Impact
b) Require or result in the construction of new water or wastewater treatment facilities or expansion of existing facilities, the construction of which could cause significant environmental effects?					X	
c) Require or result in the construction of new storm water drainage facilities or expansion of existing facilities, the construction of which could cause significant environmental effects?					X	
d) Have sufficient water supplies available to serve the project (including large scale developments as defined by Public Resources Code Section 21151.9 and described in Question No. 20 of the Environmental Checklist) from existing entitlements and resources, or are new or expanded entitlements needed?					X	
e) Result in a determination by the wastewater treatment provider which serves or may serve the project that it has adequate capacity to serve the project's projected demand in addition to the provider's existing commitments?					X	
f) Be served by a landfill with sufficient permitted capacity to accommodate the project's solid waste disposal needs?					X	
g) Comply with Federal, State, and local statutes and regulations related to solid waste?					X	
XVIII. MANDATORY FINDINGS OF SIGNIFICANCE						
a. Does the project have the potential to degrade the quality of the environment, substantially reduce the habitat of a fish or wildlife species, cause a fish or wildlife population to drop below self-sustaining levels, threaten to eliminate a plant or animal community, reduce the number or restrict the range of a rare or endangered plant or animal or eliminate important examples of the					X	

3. *Environmental Checklist*

ENVIRONMENTAL ISSUES	Subsequent or Supplemental EIR				Addendum to EIR	
	Substantial Change in Project Requiring Major EIR Revisions	Substantial Change in Circumstances Requiring Major EIR Revisions	New Information Showing Greater Significant Effects than Previous EIR	New Information Showing Ability to Reduce Significant Effects in Previous EIR	Less Than Significant Impacts/No Changes or New Information Requiring Preparation of an EIR	No Impact
major periods of California history or prehistory?						
b. Does the project have impacts that are individually limited, but cumulatively considerable? ("Cumulatively considerable" means that the incremental effects of a project are considerable when viewed in connection with the effects of past projects, the effects of other current projects, and the effects of probable future projects.)					X	
c. Does the project have environmental effects which will cause substantial adverse effects on human beings, either directly or indirectly?					X	

* The Environmental Checklist questions above related to greenhouse gas (GHG) emissions are not answered because GHG emissions was not an issue identified and analyzed in the May 2003 certified OCGP Final Environmental Impact Report (FEIR) for a general plan amendment (GPA) and zone change (ZC) to implement the development of the Orange County Great Park. At the time of the FEIR certification, GHG emissions had been recognized as an environmental issue since the 1970s when the United States Congress enacted the National Climate Program Act (92 Stat.601, 1978) which required the President to establish a program to assist in understanding and responding to natural and human-induced climate processes, and since the 1980s when the Intergovernmental Panel on Climate Change (IPCC) was formed to assess scientific information related to climate change. Thus, issues related to climate change were known, or could have been known, at the time of the certification of the OCGP FEIR.

When an EIR has been certified for a project, no subsequent environmental document needs to be prepared by the lead agency (the City) unless there is substantial evidence that one or more of the following has occurred:

1. Substantial changes are proposed in the project involving new significant environmental effects or a substantial increase in the severity of previously significant effects;
2. Substantial changes occur with response to the project due to involvement of new significant environmental effects or a substantial increase in the severity of previously identified significant effects; or

3. Environmental Checklist

3. New information of substantial importance, which was unknown or could not have been known with the exercise of reasonable diligence at the time the previous EIR was adopted shows any of the following:
 - a. The project will have one or more significant effects not discussed in the previous EIR;
 - b. Significant effects previously examined will be substantially more severe than shown in the previous EIR.
 - c. Mitigation measures or alternatives previously found to be infeasible would be feasible, and would substantially reduce one or more significance effects of the project, but the project proponents declined to adopt the mitigation measure or alternative; or
 - d. Mitigation measures or alternatives which are considerably different from those analyzed in the previous EIR would substantially reduce one or more significant effects on the environment, but the project proponents declined to adopt the mitigation measure or alternative.

In this case, the proposed Project does not meet the Section 15162 criteria for preparing a subsequent environmental document and no analysis of GHG emissions is required based on the following supporting information:

1. As documented throughout this Initial Study, the proposed Project does not include substantial changes proposed that involve new significant environmental impacts or a substantial increase in the severity of previously identified significant effects. As for GHG emissions, the issue was not considered potentially significant in 2003 and the GHG emissions associated with the OCGP Master Plan Minor Modification have not increased beyond those expected with the 2003 approved project, because the proposed changes allowed by the OCGP Master Plan Minor Modification has not increased over that allowed by the 2003 approved project.
2. GHG emissions has been recognized as an environmental issue for at least three decades and the approved project contribution to GHG emissions is not new information that was unknown or could not have been known with the exercise of reasonable diligence at the time the EIR was certified in 2003.
3. A GHG analysis that analyzed the projected emissions for both the public and private development in PA 51 (which includes former PA 30) was prepared in connection with the Supplement to the OCGP FEIR (SEIR) that was circulated for public review on June 2, 2011. That analysis concluded that the emissions per service population falls below the 4.8 MTons per service population threshold proposed by South Coast Air Quality Management District (SCAQMD) and utilized as a threshold of significance by the City in the SEIR.
4. In 2012 a GHG analysis was conducted that compared the 2012 Modified Project's GHG emissions to the impacts of the 2011 Approve Project's GHG emissions. The significance of the 2012 Modified Project's emissions was assessed using the SCAQMD's threshold of 4.8 MTons of CO₂e per service population per year. Similar to the 2011 Approved Project, the analysis concluded that the 2012 Modified Project's construction and operational emissions, with and without the optional conversion, were below the SCAQMD's efficiency metric of 4.8 MTons per service population per year. Therefore, under both scenarios, the 2012 Modified Project would have a less than significant impact on GHG emissions.

3. Environmental Checklist

This page intentionally left blank.

4. Discussion of Checklist and Mitigation Measures

This section provides evidence to substantiate the conclusions set forth in the Environmental Checklist. It briefly summarizes the conclusions of the 2003 Orange County Great Park FEIR, as updated by its prior Addenda and Supplemental EIRs (SEIR and SSEIR). Collectively all of these CEQA documents are known as, "OCGP FEIR". Finally this section discusses whether the proposed Project is consistent with the findings contained in the OCGP FEIR.

4.1 AESTHETICS

4.1.1 Environmental Setting

The OCGP FEIR addressed the potential aesthetic and visual impacts associated with the development of the former MCAS El Toro. The OCGP FEIR discussed the visual setting associated with the location of the OCGP Master Plan area adjacent to various arterial and State and federal highways. None of these roadways are designated as a County or State scenic highway; however, Sand Canyon Avenue is designated as a highway with rural/natural character. The City's General Plan also designates I-5 as an urban character Scenic Highway.

Generally, views of the former military base are from the surrounding highways. From these highways, a variety of land uses, structures, and facilities of differing ages, sizes, and architectural styles can be viewed. Although agricultural areas are adjacent to and within the base, the predominant views are associated with the military use of the base, including runways, aprons, hangars, warehouses, barracks housing, recreational facilities, single-family housing, offices, and commercial structures. However, since certification of the 2003 OCGP FEIR, many of the base facilities have been demolished along with portions of the runway. Additionally, the OCGP WSPDP (Phase 1) has been established on the western edge of the former military base. The newly constructed Beacon Park residential neighborhood, located in Development District 1-North, is less than one mile north of the proposed Project site. Additionally, grading of the future sports park has commenced.

The City of Lake Forest and the James A. Musick Branch Jail are located to the southeast of the OCGP; the Irvine Spectrum is to the east and south; and existing and developing residential areas are to the north and west of the project site. Further to the south are the residential developments of the cities of Laguna Woods and Laguna Hills. Portions of these residential developments are at higher elevations and have panoramic views of the Project site.

There are minimal light sources within the OCGP Master Plan area. Existing lighting is mostly associated with outdoor nighttime parking areas, field lighting and security lighting.

4.1.2 Impacts Identified in the OCGP FEIR

The OCGP FEIR discussed the potential aesthetic effects associated with development of the project site under the adopted Overlay Plan and found that future development of PA 51 would introduce new sources of light within the project area. These sources include street lighting along planned roadways and various forms of exterior lighting, including security lighting, parking lots, educational facilities, institutional and commercial developments, and lighting associated with athletic fields. The OCGP FEIR concluded that significant light impacts would occur if proposed light sources were directed into or located near

4. Discussion of Checklist and Mitigation Measures

existing or planned residential uses, which are sensitive to light intrusion during nighttime hours. However, it further noted that with the mitigation ultimately adopted by the City, these potential impacts would be less than significant.

The OCGP Master Plan (the subject of Addendum No. 4) identified one potential source of nighttime illumination not previously identified in the OCGP FEIR described as illuminated iconic park elements, such as the helium tethered balloon. However, it was noted that such lighting is focused on the iconic element and not away from it. Lighting of this type would exhibit a degree of luminosity substantially lower than some of the other types already considered in the OCGP FEIR, such as lighting associated with athletic fields. As a consequence, the extent of any impact associated with the illumination of iconic park elements has already been adequately addressed in the OCGP FEIR.

No other significant or potentially significant aesthetic impacts were identified in the previous CEQA documents.

4.1.3 Impacts Associated with the Expansion of the Community Ice Facility

The proposed Project consists of expanding the approved Community Ice Facility (Area L) into the future Western Picnic Area (Area E) to accommodate the additional sheet of ice as well as accessory uses. The Community Ice Facility's square footage would increase from approximately 117,635 square feet to approximately 270,000 square feet. Additionally, the 6.8-acre Western Sector Picnic Area would be removed from the Master Plan.

The approved OCGP Master Plan and WSPDP include plans for a future 117,635-square-foot Community Ice Facility with three sheets of ice at the proposed location within the WSPDP. The approved Community Ice Facility included seating for up to 1,200 people at one rink and 100 for the other two rinks (i.e., 1,400 total seats), and special events held up to 6 weekdays per year. The proposed Project would support the development of a four-sheet Community Ice Facility consisting of approximately 270,000 square feet, with accessory uses. The facility would include parking lot lighting, pedestrian lighting, and security lighting on the exterior of the building.

There are no scenic routes, scenic resources, or unique geologic or topographic features within the Project site.

The proposed Project would not introduce additional new light sources or highly reflective building materials that would result in new sources of potential glare beyond those already considered by the OCGP FEIR and Addenda. The proposed Project would incorporate and/or comply with Mitigation Measures A1, A1, and PPP-1 in order to avoid and reduce potential impacts related to light and glare to a less than significant level. No other significant or potentially significant aesthetic impacts besides new sources of lighting are anticipated.

4.1.4 Findings

Major FEIR Revisions Not Required. Based on the foregoing analysis and information, there is no evidence that the Proposed project would require a major change to the certified OCGP FEIR. The proposed modification to the OCGP Master Plan and the WSPDP, which does not include any major change to park development areas identified in the approved OCGP Master Plan, will not result in any

4. Discussions of Checklist and Mitigation Measures

new significant environmental impact nor will there be a substantial increase in the severity of impacts from that described in the certified OCGP FEIR.

No Substantial Change in Circumstances Requiring Major FEIR Revisions. There is no information in the record or otherwise available that indicates that there are substantial changes in circumstances pertaining to aesthetics effects that would require major changes to the certified OCGP FEIR.

No New Information of Substantial Importance Showing Greater Significant Effects Than Previous FEIR. This Environmental Evaluation has analyzed all available relevant information and has determined that there is no new information of substantial importance, which was unknown and could not have been known with the exercise of reasonable diligence at the time the OCGP FEIR was approved, augmented, and/or updated, indicating that the project will have one more significant effects not discussed in the previous FEIR or result in a substantial increase in the severity of previously identified effects.

No New Information of Substantial Importance Showing Ability to Reduce Significant Effects in Previous FEIR. This Environmental Evaluation has analyzed all available relevant information and has determined that there is no new information of substantial importance, which was unknown and could not have been known with the exercise of reasonable diligence at the time the OCGP FEIR was approved, augmented, and/or updated, indicating that: (1) mitigation measures or alternatives previously found not to be feasible would in fact be feasible, and would substantially reduce one or more significant effects of the project, but the project proponent declines to adopt the mitigation measures or alternatives; or (2) mitigation measures or alternatives that are considerably different from those analyzed in the previous FEIR would substantially reduce one or more significant effects on the environment, but the project proponent declines to adopt the mitigation measures or alternatives. There are no alternatives to the project or additional mitigation measures that would substantially reduce one or more of the significant aesthetic effects identified in and considered by the approved OCGP FEIR.

4.1.5 Mitigation from the OCGP FEIR and Applicability to the Expanded Community Ice Facility

The OCGP FEIR identified Mitigation Measures A1 and A2, which, if implemented, would reduce the effects of the proposed Project to a less than significant level. Those mitigation measures were modified in the SEIR, to make them consistent with the City of Irvine adopted conditions of approval.

Of the Mitigation Measures listed below, applicable measures will be incorporated into the proposed Project upon project implementation.

- A1** Prior to issuance of building permits, lighting plans and signage plans for residential or nonresidential new development shall be reviewed by the Community Development Department to ensure that minimal light intrusion and spillover into adjacent residential areas occurs.
- A2** Prior to the issuance of building permits for residential and nonresidential development, and during the master plan review process for future development in the project area, the Director of Community Development shall ensure that mirrored and highly reflective surfaces are discouraged or, where proposed, shall be accompanied by a design-level glare impact analysis that demonstrates no adverse visual impairment to motorists or other visual nuisance occurs.

4. Discussion of Checklist and Mitigation Measures

Additionally, the SSEIR identified the following measure as existing plans, programs, or policies (PPP) that apply to the proposed Project and will help reduce or avoid potential aesthetics and light and glare impacts. The following PPP, as applicable, will be incorporated into the proposed Project upon project implementation.

PPP 1-1 Prior to issuance of building permits, the applicant shall demonstrate it has met the Irvine Uniform Security Code requirements for lighting by providing the below listed items for a complete review by the Police Department. Failure to provide a complete lighting package will result in the delay of satisfaction of this condition (City Standard Condition 3.6).

- a. Electrical plan showing light fixture locations, type of light fixture, height of light fixture, and point-by-point photometric lighting analysis overlaid on the landscape plan with a tree legend. The photometric plan should only show those fixtures used to meet the Irvine Uniform Security Code requirements.
- b. Corresponding fixture cut-sheets (specifications) of those lights used to meet the Irvine Uniform Security Code.
- c. Site plan demonstrating that landscaping shall not be planted so as to obscure required light levels.
- d. Site plans that are full-scale and legible.

4.2 AGRICULTURE AND FORESTRY RESOURCES

4.2.1 Environmental Setting

The OCGP FEIR identified approximately 659 acres of designated Prime Farmland, 70 acres of designated Unique Farmland, and 99 acres of designated Farmland of Statewide Importance (as defined below). No agricultural land within the project area is currently covered by Williamson Act contracts.

The OCGP FEIR described the Farmland Mapping and Monitoring Program (FMMP Program) of the California Department of Conservation Division of Land Resources Protection classifications of agricultural lands present within the project area as follows (California Department of Conservation, 2014):

- **Prime Farmland:** Land which has the best combination of physical and chemical features able to sustain long-term production of agricultural crops. This land has the soil quality, growing season, and moisture supply needed to produce sustained high yields. Land must have been used for irrigated agricultural production at some time during the four years prior to the mapping date.
- **Farmland of Statewide Importance:** Similar to Prime Farmland, except this land has minor shortcomings such as greater slopes or less ability to store soil moisture than Prime Farmland. Land must have been used for production of irrigated crops at some time during the four years prior to the mapping date.
- **Unique Farmland:** Lesser quality soils used for the production of the state's leading agricultural crops. This land is usually irrigated, but may include non-irrigated orchards or vineyards as found in

4. Discussions of Checklist and Mitigation Measures

some climate zones in California. This land is used for the production of specific high economic value crops such as oranges, olives, avocados, rice, grapes, or cut flowers. Land must have been cropped at some time during the four years prior to the mapping date.

- **Farmland of Local Importance:** Land of importance to the local agricultural economy as determined by each county's board of supervisors and a local advisory committee.
- **Grazing Land:** Land on which the existing vegetation is suited to the grazing of livestock. This category was developed in cooperation with the California Cattlemen's Association, University of California Cooperative Extension, and other groups interested in the extent of grazing activities.

Although the OCGP FEIR identified approximately 659 acres of designated Prime Farmland, 70 acres of designated Unique Farmland, and 99 acres of designated Farmland of Statewide Importance within OCGP overall, based on information provided through the California Department of Conservation's FMMP, land within the OCGP Master Plan area project site falls into the Urban and Built-Up Land agricultural land use designation. The location of all of the OCGP land classifications are identified in Figure 4.2-1, Farmland Map.

City of Irvine Policies and Programs

The project site is designated for a variety of urban uses in the City General Plan. The OCGP Master Plan encourages agriculture as an interim land use prior to development of the land. The City General Plan Objective L-10, as amended in 2002 and presented in the OCGP FEIR, includes the following policies to "encourage the maintenance of agriculture in undeveloped areas of the City until the time of development, and in areas not available for development".

Policy (a): Provide for farming opportunities in the community, where feasible and appropriate, through an Agricultural Legacy Program facilitating limited scale agricultural operations and programs on public lands. The program may include components such as edible landscape, metro-farming, heritage farming, model farming, education and community service farming and other farm or farm market programs. Locations for implementation of the Agricultural Legacy Program to be considered should, at a minimum, include:

- Designated open space spine network
- Designated open space areas not subject to the Natural Community Conservation Plan (NCCP)
- Other appropriate publicly owned lands

Policy (b): Consider creating a "working model" farm to act as a center for education and enjoyment of all age groups pursuant to the Agricultural Legacy Program in conjunction with the City's planning efforts concerning the reuse of MCAS El Toro, or with the South Coast Research Extension owned by UC Regents.

Policy (c): Permit agricultural use of land that is unsuitable for building because it is within flood plains, or is subject to hazards to public health, safety, and welfare or similar constraints precluding development. Conversion from agricultural use may be allowed where the identified hazard conditions have been eliminated.

OCGP Community Ice Facility
Farmland Map

4. Discussions of Checklist and Mitigation Measures

Policy (d): Permit agriculture uses, on an interim basis, on land designated for development, and consider agricultural uses as part of the City's planning efforts for the reuse of MCAS El Toro.

Policy (e): Encourage and support federal and State legislation proposed for the purpose of preservation of agricultural lands that are compatible with the City's goals and objectives.

Policy (f): Allow for conversion of interim and permanent agricultural uses to development to provide land for the construction of housing units consistent with the Land Use and Housing Elements, and the development of commercial and industrial buildings consistent with the provision of job opportunities as described in the Land Use Element, where such conversion does not conflict with other L-10 policies.

Policy (g): Pursue the open space policies contained in the Conservation and Open Space Element and address any open space or aesthetic impacts from the conversion of interim and permanent agricultural uses to development as part of the City's existing policies for the preservation of open space and existing policies for mitigation of views and aesthetic impacts under the policies in the Conservation and Open Space Element.

4.2.2 Impacts Identified in the OCGP FEIR

The OCGP FEIR determined the Overlay Plan would preserve in perpetuity 303 acres¹ of land for agricultural use, of which 251 acres are classified as Prime Farmland, Unique Farmland, and Farmland of Statewide Importance. The locations of the 303 acres of permanent agricultural land are listed below and can be found in the OCGP FEIR as Figure 5.8-1.

- **Former PA 30:** 13 acres within Planning Area Zone (PAZ) 26; and
- **PA 51:** 90 acres within PAZ 4; 200 acres within PAZ 1.

The Overlay Plan also resulted in the permanent loss of 802 acres of designated farmland comprised of 651 acres of Prime Farmland, 63 acres of Unique Farmland, and 88 acres of Farmland of Statewide Importance. This impact was considered significant and unavoidable in the OCGP FEIR.

It was determined the Overlay Plan resulted in a significant impact associated with the conversion of agricultural land to nonagricultural use. The OCGP FEIR noted the context of agricultural production in Orange County, including development pressures that have contributed to the decrease in agricultural production in the County over time, which suggested that conversion of agricultural land to urban uses would occur with or without the development of the OCGP.

Addendum No. 5 determined that the removal of 173 acres of designated Prime Farmland in PAZ 1 would not result in new significant impacts to agricultural resources (Section 4.2.3 of Addendum No. 5). Despite the Prime Farmland designation, none of the soils in PAZ 1 were used for agricultural production. In addition, existing regulatory programs, namely the City of Irvine General Plan Objective L-10 and establishment of the Irvine Agricultural Legacy Program, addressed and mitigated the loss of agricultural land. Since certification of the OCGP FEIR, an additional 508 acres within PA 1 (Orchard Hills) has been designated "Exclusive Agriculture" and added to the Agricultural Legacy Program. As a result, overall

¹ There is a typographical error within the OCGP FEIR: Table 1-2 on page 1-8 and Table 3-4 on pages 3-12 and 3-13 identify the total agricultural land as 303 acres (correct acreage); however, on page 5.8-10 the agricultural use acreage is noted as 307.

4. Discussion of Checklist and Mitigation Measures

acreage enrolled within the Agricultural Legacy Program was greater than that assumed in the certified OCGP FEIR.

4.2.3 Impacts Associated with the Expanded Community Ice Facility

Similar to the 2011 approved modification of the OCGP Master Plan, the Project contains a Community Ice Facility. The proposed Project consists of modifications to the Community Ice Facility to include a fourth sheet of ice. The proposed land use is consistent with the OCGP Master Plan and is evaluated in the FEIR and Addenda, and the proposed modifications do not introduce new uses or designations that would conflict with zoning (1.9 Orange County Great Park) or result in conversion of agriculture land or forest land to non-agriculture and non-forest land. The General Plan land use designation of the proposed Project site is "Orange County Great Park" and the proposed Project is consistent with the land uses approved in concert with the certification and updates to the OCGP FEIR.

The proposed modifications to the Community Ice Facility involve increasing the number of ice sheets from three to four. This modification would reflect a development program that is consistent with the General Plan Land Use and Zoning designations for PA 51 and would occur within areas that are not designated for agriculture use. No new uses and facilities are proposed that would affect the agriculture and forestry resources, as none exists within the Project area. Consequently, the proposed Project would not result in any additional impact, beyond that previously studied and disclosed, on agricultural resources. The proposed Project would not result in conflicts with agricultural zoning, convert farmland to non-farmland uses, result in a loss of forest land, or create any new impacts to agriculture and forest resources beyond those evaluated in the OCGP FEIR.

4.2.4 Findings

Major FEIR Revisions Not Required. Based on the foregoing analysis and information, there is no evidence that the Proposed project would require a major change to the certified OCGP FEIR. The proposed modification to the OCGP Master Plan and the WSPDP, which does not include any major change to park development areas identified in the approved OCGP Master Plan, will not result in any new significant environmental impact nor will there be a substantial increase in the severity of impacts from that described in the certified OCGP FEIR.

No Substantial Change in Circumstances Requiring Major FEIR Revisions. There is no information in the record or otherwise available that indicates that there are substantial changes in circumstances pertaining to agricultural resources that would require major changes to the certified OCGP FEIR.

No New Information of Substantial Importance Showing Greater Significant Effects Than Previous FEIR. This Addendum has analyzed all available relevant information and has determined that there is no new information of substantial importance that was unknown and could not have been known with the exercise of reasonable diligence at the time the OCGP FEIR was approved, augmented, and/or updated, indicating that the Project will have one or more significant effects not discussed in the previous FEIR or result in a substantial increase in the severity of previously identified effects.

No New Information of Substantial Importance Showing Ability to Reduce Significant Effects in Previous FEIR. This Addendum has analyzed all available relevant information and has determined that there is no new information of substantial importance that was unknown and could not have been known

4. Discussions of Checklist and Mitigation Measures

with the exercise of reasonable diligence at the time the OCGP FEIR was approved, augmented, and/or updated, indicating that: (1) mitigation measures or alternatives previously found not to be feasible would in fact be feasible, and would substantially reduce one or more significant effects of the Project, but the Project proponent declines to adopt the mitigation measures or alternatives; or (2) mitigation measures or alternatives that are considerably different from those analyzed in the previous EIR would substantially reduce one or more significant effects on the environment, but the project proponent declines to adopt the mitigation measures or alternatives. There are no alternatives to the Project or additional mitigation measures that would substantially reduce one or more of the significant effects on agriculture and forest resources identified in and considered by the approved OCGP FEIR.

4.2.5 Mitigation from the OCGP FEIR and Applicability to the Expanded Community Ice Facility

Mitigation Measures AG1 through AG3 will be implemented in conjunction with Master Plan review and subsequent development permits.

AG1 In order to encourage agriculture as an interim land use pending development on the project site by warning future residents that they are buying or renting a house adjacent to existing agricultural operators, disclosure statements shall include the following for subdivisions proposed adjacent to existing agricultural operations:

Prior to issuance of building permits, the applicant shall submit, and the Director of Community Development shall have approved, a completed occupancy disclosure form for the project. The approved disclosure form, along with its attachments, shall be included as part of the rental/lease agreement and as part of the sales literature for the project. The disclosure statement shall include the following information:

- Continuation of agricultural operations adjacent to the site and their potential effects (spraying of pesticides, noise, dust, odor, etc.) on future residents or tenants.

AG2 Heritage and community service/educational farming operations shall be encouraged within utility easements and other lands. Heritage farming is defined as small-scale specialty farming operations that can be accommodated in an urban environment. An example would be the Edible Landscape project located adjacent to Harvard Avenue within the Edison right-of-way.

AG3 Future landowners and the City shall work cooperatively with farmers to minimize conflicts between agricultural operation and adjacent urban uses.

Additionally, the SSEIR identified the following measure as existing PPP that apply to the proposed Project and will help reduce or avoid potential agriculture and forestry resources impacts. The following PPP, as applicable, will be incorporated into the proposed Project upon project implementation.

PPP2-1 The City shall continue to implement the Agricultural Legacy Program outlined in City of Irvine General Plan Open Space and Conservation Element. Objective L-10 is intended to mitigate the conversion of agricultural land to nonagricultural uses citywide by facilitating limited-scale agricultural operations and programs on public lands within Irvine. As part of the Agricultural Legacy Program, specific sites in Irvine will be identified and made available for metro- farming within five years. Metro-farming generally includes small-scale agricultural operations and

4. Discussion of Checklist and Mitigation Measures

activities that can be accommodated in an urban environment. Such activities could include, but not limited to, small-scale specialty farming, model farming, heritage farming, and community service/educational farming.

4.3 AIR QUALITY

4.3.1 Environmental Setting

The OCGP FEIR described the air quality conditions regarding the following regulated pollutants: ozone (O_3), carbon monoxide (CO), nitrogen dioxides (NO_2), sulfur dioxide (SO_2), lead and particulate matter (PM), which is subdivided into two classes based on particle size: PM equal to or less than 10 micrometers in diameter (PM_{10}) and PM equal to or less than 2.5 micrometers in diameter ($PM_{2.5}$).

The proposed Project site is located in the Orange County portion of the South Coast Air Basin. Table 4.3-1 shows the pollutants and associated attainment status for the South Coast Air Basin. Orange County is designated as a federal non-attainment area for O_3 , and $PM_{2.5}$, maintenance for CO and PM_{10} , and an attainment area for SO_2 , NO_2 , and lead. Orange County is designated as a State non-attainment area for O_3 , PM_{10} , and $PM_{2.5}$, and an attainment area for CO, SO_2 , NO_2 , and lead.

Table 4.3-1. Attainment Status for the Orange County Portion of the South Coast Air Basin

Pollutant	Attainment Status	
	Federal	State
O_3 – 1-Hour	–	Non-attainment
O_3 – 8-hour	Nonattainment (Extreme)	Non-attainment
PM_{10}	Attainment/Maintenance	Non-attainment
$PM_{2.5}$	Nonattainment	Non-attainment
CO	Attainment/Maintenance	Attainment
NO_2	Attainment	Attainment
SO_2	Attainment	Attainment
Lead	Attainment	Attainment

Sources: EPA (2014); ARB (2014).

ARB = California Air Resources Board

CO = carbon monoxide

EPA = United States Environmental Protection Agency

NO_2 = nitrogen dioxides

O_3 = ozone

PM_{10} = PM equal to or less than 10 micrometers in diameter

$PM_{2.5}$ = PM equal to or less than 2.5 micrometers in diameter

SO_2 = sulfur dioxide

4.3.2 Impacts Identified in the OCGP FEIR

The OCGP FEIR identified significant air quality impacts associated with construction and operation of the Overlay Plan. The OCGP FEIR described the construction air impacts after mitigation as significant and unavoidable. Addenda No. 3 and 4 included an analysis to determine the projected emissions associated with more recent, precise and refined information regarding the Revised Overlay Plan and OCGP Conceptual Master Plan. The Addenda determined that earthmoving activities would be consistent with

4. Discussions of Checklist and Mitigation Measures

the emissions inventory assumed in the certified OCGP FEIR and within the scope of the original air quality analysis.

The analysis was conducted using URBEMIS 2007 Version 9.2, which was in accordance with SCAQMD's recommendations for preparation of air quality analyses at the time the document was developed. The emission estimates from Addendum No. 4 are provided in Table 4.3-2.

Table 4.3-2. Comparison of Daily Construction Emissions for OCGP Construction Activities

Emissions Inventory	Emission Totals (lbs/day)				
	CO	NO _x	PM ₁₀	VOC	SO _x
OCGP FEIR	280	840	1,440	4,660	40
OCGP Site Grading	174	343	663	37	<1
SCAQMD Significance Threshold	550	100	150	75	150
Over (Under)	(376)	243	513	(38)	(149)
Significant for OCGP FEIR?	No	Yes	Yes	Yes	No
Significant for OCGP Equipment Mix?	No	Yes	Yes	No	No

Source: PCR Services Corporation (2007).

CO = carbon monoxide

FEIR = Final Environmental Impact Report

NO_x = nitrogen oxides

OCGP = Orange County Great Park

PM₁₀ = PM equal to or less than 10 micrometers in diameter

SCAQMD = South Coast Air Quality Management District

SO_x = sulfur dioxide

VOC = volatile organic compounds

As shown in Table 4.3-2 above and as Addendum No. 4 concluded, no new significant impacts and no substantial increase in the severity of previously identified impacts would occur as a result of implementation of the OCGP.

The site grading and demolition would most likely occur in a phased approach, over the course of several years. A technical consultant (PCR) also conducted an analysis for Addendum No. 4 to determine whether the construction emissions inventory for a maximum worst case day (consisting of concurrent grading of the OCGP Master Plan along with site grading activities for Heritage Fields, the Agua Chinon, and the wildlife corridor and runway demolition activities) is consistent with the emissions inventory presented in the OCGP FEIR and is within the scope of the original air quality impact assessment.

The emissions from the concurrent construction activities are presented in Table 4.3-3. Concurrent grading and demolition activities estimated for Addendum No. 4 resulted in a slight decrease in equipment exhaust emissions and fugitive dust PM₁₀ emissions, as compared to those levels estimated for the OCGP FEIR.

4. Discussion of Checklist and Mitigation Measures

Table 4.3-3. Comparison of Daily Construction Emissions for Concurrent OCGP Construction Activities

Emissions Inventory	Emission Totals (lbs/day)				
	CO	NO _x	PM ₁₀	VOC	SO _x
Certified EIR	280	840	1,440	4,660	40
OCGP Site Grading	174	343	663	37	<1
Heritage Fields Site Grading	171	332	663	37	<1
Runway Demolition	66	165	76	17	<1
Total	411	839	1,402	91	<1
SCAQMD Significance Threshold	550	100	150	75	150
Over (Under)	(139)	739	1,252	16	(149)
Significant for OCGP	No	Yes	Yes	Yes	No
Significant for concurrent activities?	No	Yes	Yes	Yes	No

Source: PCR Services Corporation (2007).

CO = carbon monoxide

EIR = Environmental Impact Report

lbs = pounds

NO_x = nitrogen oxides

OCGP = Orange County Great Park

PM₁₀ = PM equal to or less than 10 micrometers in diameter

SCAQMD = South Coast Air Quality Management District

SO_x = sulfur dioxide

VOC = volatile organic compounds

Among the various sources of a project's operational emissions, those attributable to mobile sources (i.e. vehicular traffic) comprise the largest proportion of emissions. Mobile source emissions are a function of both the number and trip length characteristics of vehicle trips directly and indirectly associated with the project under consideration. Operational emissions for project area and mobile sources were estimated at above the significance thresholds for volatile organic compounds (VOC), nitrogen oxides (NO_x), CO, and PM₁₀, and are described in the OCGP FEIR and Addenda as significant and unavoidable after mitigation. In addition, the OCGP FEIR included the results of the CO "hotspots" analysis, in which no intersections in the traffic study area were expected to result in one-hour or eight-hour CO concentrations above the State standard of 20 parts per million (ppm) for one-hour concentrations and 9 ppm for eight-hour concentrations. No other construction- and operations-related significant air quality impacts were identified in the OCGP FEIR.

The SSEIR stated that the 2012 Modified Project would also result in significant and unavoidable short-term construction air quality impacts due to emissions of VOC, NO_x, CO, PM₁₀ and PM_{2.5} at levels above the applicable thresholds. PPPs 3-1 through 3-4 and Mitigation Measures AQ-1 and AQ-2 would reduce construction emissions to the extent feasible. However, the impact would remain significant and unavoidable even after mitigation.

In addition, long-term operation of the 2012 Modified Project (with and without optional conversion) would result in significant and unavoidable impacts due to emissions of VOC, NO_x, CO, and PM_{2.5}. PPP 3-5, PDFs 4-7, and 4-8, and Mitigation Measures AQ-3 through AQ-5 would reduce operational phase air quality impacts to the extent feasible. However, the impact would remain significant and unavoidable even after mitigation.

4. Discussions of Checklist and Mitigation Measures

4.3.3 Impacts Associated with the Expanded Community Ice Facility

Construction Impacts

The OCGP Community Ice Facility would generate air pollutant emissions for both the construction and operations phases of the project. The previous project description for the OCGP Community Ice Facility involved the development of three ice sheets on a 12.1 acre site, whereas the current project description envisions the development of four ice sheets as well as accessory facilities that support this recreational use on a 14.06 acre site. The proposed Project also includes construction of G Street. Construction activities produce emissions from off-road construction vehicle exhaust, asphalt off-gassing, application of architectural coatings, fugitive dust, and exhaust from on-road vehicles associated with construction workers making material delivery trips. Construction emissions were quantified using the California Emissions Estimator Model (CalEEMod), Version 2013.2.2.

The emissions for the construction phase for both the previous and current OCGP ice facilities are presented below in Table 4.3-4. The OCGP Community Ice Facility would require off-road vehicles for site preparation, grading, trenching, and building construction for both the current and previously proposed ice facility. As such, the maximum daily emissions for both facilities would result in comparable levels of emissions with the exception of VOCs which are greater for the currently proposed OCGP Community Ice Facility due to the more extensive application of architectural coatings.

Table 4.3-4. Comparison of Daily Construction Emissions for OCGP Ice Facilities

Emissions Inventory	Maximum Daily Emission Totals, lbs/day				
	CO	NO _x	PM ₁₀	VOC	SO _x
Previously Proposed OCGP Ice Facility	50	75	12	56	<1
Currently Proposed OCGP Ice Facility	50	75	12	123	<1
Net Change in Emissions	0	0	0	67	<1

Source: LSA Associates, Inc. (2016).

CO = carbon monoxide

lbs = pounds

NO_x = nitrogen oxides

OCGP = Orange County Great Park

PM₁₀ = PM equal to or less than 10 micrometers in diameter

SO_x = sulfur dioxide

VOC = volatile organic compounds

The net increase in construction-related emissions for the proposed Project are shown in comparison with the emissions generated for the concurrent OCGP construction activities in Table 4.3-5. As shown in the table, the proposed Project would not increase the maximum daily air pollutant emissions generated above the significance thresholds established by SCAQMD. The OCGP FEIR concluded that air pollutant emissions associated with construction and demolition activities of the Overlay Plan were considered a significant and unavoidable impact. The construction air emissions associated with the proposed Project are anticipated to not significantly increase overall emissions and would result in total Master Plan emissions similar to those addressed in the OCGP FEIR and, therefore, would not result in any new significant impacts.

Table 4.3-5. Comparison of Daily Construction Emissions for Concurrent OCGP Construction Activities

4. Discussion of Checklist and Mitigation Measures

Emissions Inventory	Emission Totals (lbs/day)				
	CO	NO _x	PM ₁₀	VOC	SO _x

lbs = pounds

NO_x = nitrogen oxides

OCGP = Orange County Great Park

PM₁₀ = PM equal to or less than 10 micrometers in diameter

SCAQMD = South Coast Air Quality Management District

SO_x = sulfur dioxide

VOC = volatile organic compounds

Regional Operational Impacts

Operation of the proposed Project would result in long-term regional emissions associated with area and mobile sources. Area-source emissions would be associated with equipment used for landscaping and maintenance of the park. Mobile-source emissions would include project-generated vehicle trips associated with workers, recreational users, and visitors to the project site. Mobile-source emissions from vehicle trips to the project site would be the primary source of criteria pollutant emissions.

The emission estimates in the OCGP FEIR documents were all developed using different models recommended by SCAQMD at the time of the analysis. Therefore, the comparison of emissions from those documents will be affected by changes to the project description, as well as any changes to assumptions in the model.

Operational emissions associated with the proposed Project were quantified using CalEEMod, Version 2013.2.2. The operational emissions associated with the activities for the proposed Project were quantified using CalEEMod to determine the net change in operational emissions associated with the proposed Project. Mobile sources of emissions are attributable to vehicle trips from worker commutes, visitors, and supply deliveries. Mobile-source emissions from vehicle trips to the project site would be the primary source of criteria pollutant emissions. *The Limited Scope Traffic Impact Analysis Great Park Community Ice Facility* states that the previously proposed three ice sheet facility would generate 240 average daily trips (ADT), whereas the currently proposed four ice sheet facility would generate 960 ADT. The emissions for the operations phase for both the previously and currently proposed OCGP ice facilities are presented below in Table 4.3-6.

Table 4.3-6. Comparison of Daily Operations Phase Emissions for OCGP Ice Facilities

	Emissions (lbs/day)
--	---------------------

4. Discussions of Checklist and Mitigation Measures

Source	CO	NO _x	PM ₁₀	VOC	SO _x
Previously Proposed OCGP Ice Facility	6	1	1	9	<1
Currently Proposed OCGP Ice Facility	24	4	4	15	<1
Net Change in Emissions	18	3	3	6	<1

Source: LSA Associates, Inc. (2016).

CO = carbon monoxide

lbs = pounds

NO_x = nitrogen oxides

OCGP = Orange County Great Park

PM₁₀ = PM equal to or less than 10 micrometers in diameter

SO_x = sulfur dioxide

VOC = volatile organic compounds

Regional area- and mobile-source emissions were modeled based on proposed land use types and sizes as indicated in the Project Description (Section 2.0 of this Addendum) and the change in trip generation from the Traffic Study (LSA, 2016). Emissions associated with the proposed Project and the Master Plan emissions from the EIR are shown in Table 4.3-7 and are evaluated against the SCAQMD operations phase significance thresholds.

Table 4.3-7. Summary of Modeled Long-Term Operational Emissions

Source	Emissions (lbs/day)				
	CO	NO _x	PM ₁₀	VOC	SO _x
Certified EIR	2,300	1,200	13,700	1,280	20
Net Emissions from the Proposed Project	18	3	3	6	<1
Total	2,318	1,203	13,703	1,286	20
SCAQMD Significance Threshold	550	100	150	75	150
Significant for OCGP	Yes	Yes	Yes	Yes	No
Significant for concurrent activities?	No	No	No	No	No

Source: LSA Associates, Inc. (2016).

As shown in Table 4.3-7, the proposed Project would not increase emissions above SCAQMD's significance thresholds and is, therefore, not considered to substantially increase the maximum daily air pollutant emissions generated during operational activities. The OCGP FEIR concluded that air pollutant emissions associated with operational activities of the Overlay Plan were considered a significant and unavoidable impact. The additional emissions associated with the proposed Project would not change the overall magnitude of emissions generated by the operation of the land uses proposed in the Master Plan. As such, the operational air emissions associated with the proposed Project and Master Plan are anticipated to be comparable to those addressed in the OCGP FEIR and, therefore, would not adversely contribute to the impacts otherwise caused by the project analyzed in the OCGP FEIR.

Consistency Determination with the Air Quality Management Plan

The OCGP FEIR included a consistency evaluation with the SCAQMD's Air Quality Management Plan (AQMP). The consistency evaluation concluded development of the adopted Overlay Plan would have a negligible impact on the overall air quality within the South Coast Air Basin. Since the approval of the OCGP, the SCAQMD has adopted a revised AQMP. The applicable AQMP for the proposed Project was adopted by the SCAQMD in December 2012. The 2012 AQMP is the legally enforceable blueprint for how the region will meet and maintain federal ozone and PM_{2.5} air quality standards in the South Coast Air Basin.

4. Discussion of Checklist and Mitigation Measures

Projects that are consistent with the land use development assumptions used in the AQMP are considered to not conflict with or obstruct the attainment of the air quality levels identified in the plan. As demonstrated by the less-than-significant increases in operations phase emissions shown in Table 4.3-6, the proposed Project would not result in a substantial increase in vehicle miles traveled (VMT) or new land uses that would change the consistency evaluation in the OCGP FEIR.

Localized Construction Impacts

As stated previously, the proposed Project would not increase the maximum daily air pollutant emissions generated during construction activities. However, the OCGP FEIR identified significant localized air quality impacts based on the extent and schedule of construction activities, primarily from particulate matter (PM₁₀ and PM_{2.5}) emissions associated with fugitive dust. The OCGP FEIR concluded that air pollutant emissions were considered a significant unavoidable adverse impact. The construction air emissions associated with the proposed Project are anticipated to be comparable to those addressed in the OCGP FEIR, and therefore would not adversely contribute to the impacts otherwise caused by the project analyzed in the OCGP FEIR.

Localized Operational Impacts

The OCGP FEIR did not identify significant localized air quality impacts for operational activities. Because the proposed Project would not result in a substantial increase in operations phase regional emissions, the proposed Project would likewise not increase the concentrations of air pollutant emissions generated during operational activities.

Odors

The OCGP FEIR identified that development of former PA 30 and PA 51 would not handle large amounts of solid waste, chemicals associated with heavy industry, or other uses that would generate objectionable odors and that no significant odor impacts would occur. The proposed Project would not result in new activities or new land uses that would change the odor evaluation in the OCGP FEIR and Addenda.

4.3.4 Findings

Major FEIR Revisions Not Required. Based on the foregoing analysis and information, there is no evidence that the Proposed project would require a major change to the certified OCGP FEIR. The proposed modification to the OCGP Master Plan and the WSPDP, which does not include any major change to park development areas identified in the approved OCGP Master Plan, would not result in any new significant environmental impact nor would there be a substantial increase in the severity of impacts from that described in the certified OCGP FEIR.

No Substantial Change in Circumstances Requiring Major FEIR Revisions. There is no information in the record or otherwise available that indicates that there are substantial changes in circumstances pertaining to Air Quality that would require major changes to the certified OCGP FEIR.

No New Information of Substantial Importance Showing Greater Significant Effects Than Previous EIR. All available relevant information has been analyzed, and there is no new information of substantial

4. Discussions of Checklist and Mitigation Measures

importance, that was unknown and could not have been known with the exercise of reasonable diligence at the time the OCGP EIR was approved, augmented, and/or updated, indicating that the proposed Project would have one or more significant effects not discussed in the OCGP FEIR or result in a substantial increase in the severity of previously identified effects.

No New Information of Substantial Importance Showing Ability to Reduce Significant Effects in Previous EIR. All available relevant information has been analyzed, and there is no new information of substantial importance, that was unknown and could not have been known with the exercise of reasonable diligence at the time the OCGP FEIR was approved, augmented, and/or updated, indicating that; 1) mitigation measures or alternatives previously found not to be feasible would in fact be feasible, and would substantially reduce one or more significant effects of the project, but the project proponent declines to adopt the mitigation measures or alternatives; or 2) mitigation measures or alternatives that are considerably different from those analyzed in the previous EIR would substantially reduce one or more significant effects on the environment, but the project proponent declines to adopt the mitigation measures or alternatives. There are no alternatives to the proposed Project or additional mitigation measures that would substantially reduce one or more of the significant air quality effects identified in and considered by the OCGP FEIR.

4.3.5 Mitigation from the OCGP FEIR and Applicability to the Expanded Community Ice Facility

The OCGP FEIR identified Mitigation Measures AQ1 through AQ5, which reduce the air quality effects of construction and operations of development under the adopted Plan. However, as noted above, the OCGP FEIR found that short-term and long-term air quality impacts would remain significant and unavoidable. The measures are applicable to future development under the proposed Project. However, the mitigation measures were modified in the SEIR to account for the latest improvements in emission control technologies and updated SCAQMD recommendations for reducing air pollutant emissions.

Of the Mitigation Measures listed below, applicable measures will be incorporated into the proposed Project upon project implementation.

Construction Phase

AQ1 Prior to the start of demolition and construction within the project area, adjacent sensitive receptors shall be informed of the planned demolition and construction activities. Measures to avoid significantly impacting these receptors shall be developed and implemented by the project proponent in coordination with these uses. Other applicable mitigation measures such as erection of fences around construction areas; staggered use of equipment near sensitive receptors; diversion of truck trips away from receptors; etc.; shall be employed as necessary. Compliance with this measure shall be verified by the Director of Community Development.

AQ2 Prior to the commencement of construction activities required to demolish and/or remove existing DON structure, including, runways, the Director of Community Development shall receive and approve a construction emissions mitigation plan from the chosen demolition contractor. Prior to the issuance of grading permits, the applicant of any future development project shall submit, and the Director of Community Development shall approve a construction emissions mitigation plan. The plans shall identify implementation procedures for each of the following emissions reduction measures and all feasible mitigation measures shall be

4. Discussion of Checklist and Mitigation Measures

implemented. If certain measures are determined infeasible, an explanation thereof shall be provided.

- Utilize off-road construction equipment that conforms to Tier 3 of the United States Environmental Protection Agency (USEPA), or higher emissions standards for construction equipment over 50 horsepower (hp) that are commercially available. The construction contractor shall be made aware of this requirement prior to the start of construction activities. Use of commercially available Tier 3 or higher off-road equipment, which is:
 - Year 2006 or newer construction equipment for engines rated equal to 175 hp and greater;
 - Year 2007 and newer construction equipment for engines rated equal to 100 hp but less than 175 hp; and
 - Year 2008 and newer construction equipment for engines rated equal to or greater than 50 hp but less than 100 hp.

The use of such equipment shall be stated on all grading plans. The construction contractor shall maintain a list of all operating equipment in use on the project site. The construction equipment list shall state the makes, models, and numbers of construction equipment on-site.

- Water exposed soils at least three times daily and maintain equipment and vehicle engines in good condition and in proper tune.
- Wash off trucks leaving the site.
- Replace ground cover on construction sites when it is determined that the site will be undisturbed for lengthy periods.
- Reduce speeds on unpaved roads to less than 15 miles per hour.
- Halt all grading and excavation operations when wind speeds exceed 25 miles per hour.
- Suspend all emission generating activities during smog alerts.
- Use propane- or butane-powered on-site mobile equipment instead of diesel/gasoline, whenever feasible.
- Properly maintain diesel-powered on-site mobile equipment.
- Prohibit nonessential idling of construction equipment to five minutes or less in compliance with California Air Resources Board's Rule 2449.
- Sweep streets with SCAQMD Rule 1186 compliant PM₁₀-efficient vacuum units at the end of the day if substantial visible soil material is carried over to the adjacent streets.

4. Discussions of Checklist and Mitigation Measures

- Use electricity from power poles rather than temporary on-site diesel- or gasoline-powered generators, whenever feasible.
- Use of low-VOC asphalt.
- Maintain a minimum 24-inch freeboard on trucks hauling dirt, sand, soil, or other loose materials and tarp materials with a fabric cover or other suitable means. Provide temporary traffic controls (e.g., flag persons) during all phases of construction to ensure minimum disruption of traffic.
- Schedule construction activities that affect traffic flow on adjoining streets to off-peak hours to the extent possible.
- Reroute construction trucks away from congested streets, whenever feasible.
- Provide dedicated turn lanes for movement of construction trucks and equipment on- and off- site, whenever feasible.
- Use coatings and solvents with a volatile organic compound (VOC) content lower than required under SCAQMD Rule 1113 (i.e., Super Compliant Paints). All architectural coatings shall be applied either by (1) using a high-volume, low-pressure spray method operated at an air pressure between 0.1 and 10 pounds per square inch gauge to achieve a 65 percent application efficiency; or (2) manual application using a paintbrush, hand-roller, trowel, spatula, dauber, rag, or sponge, to achieve a 100 percent applicant efficiency. The construction contractor shall also use precoated/natural colored building, where feasible. Use of low-VOC paints and spray method shall be included as a note on architectural building plans.

Operational Phase

AQ3 Prior to the issuance of building permits for any future development, the applicant shall submit, and the Director of Community Development shall have approved, an operation-emissions mitigation plan. The plan shall identify implementation procedures for each of the following emissions reduction measures and all feasible mitigation measures shall be implemented. If certain measures are determined infeasible, an explanation thereof shall be provided.

- Utilize built-in energy-efficient appliances to reduce energy consumption and emissions.
- Utilize energy-efficient and automated controls for air conditioners and lighting to reduce electricity consumption and associated emissions.
- Install special sunlight-filtering window coatings or double-paned windows to reduce thermal loss, whenever feasible.
- Utilize light-colored roofing materials as opposed to dark roofing materials to conserve electrical energy for air-conditioning.

4. *Discussion of Checklist and Mitigation Measures*

- Provide shade trees in residential subdivisions as well as public areas, including parks, to reduce building heating and cooling needs, whenever feasible.
- Ensure that whenever feasible, commercial truck traffic is diverted from local roadways to off-peak periods.
- Centralize space heating and cooling for multiple-family dwelling units and commercial space.
- Orient buildings north/south for reducing energy-related combustion emissions.
- Use solar energy, when feasible.
- Use high rating insulation in walls and ceilings.

AQ4 Prior to the issuance of building permits, future sales information on available housing and employment opportunities within the project area shall be provided to employees and residents of the project area, so as to encourage employees to live within the residential developments planned on-site and future residents to find employment nearby.

AQ5 Prior to the issuance of building permits, the applicant shall demonstrate to the satisfaction of the Director of Community Development that future employment generating nonresidential development shall include measures to reduce vehicle trips including: the promotion of carpool incentives and alternative work schedules, easy access to public transit systems, trail linkages between uses, low-emissions vehicle fleets, and the provision of on-site facilities such as banking and food courts, and bicycle parking facilities, and other transportation demand management measures, as deemed appropriate.

Additionally, the SSEIR identified the following measures as existing PPPs that apply to the proposed Project and will help reduce or avoid potential air quality impacts. Of the PPPs listed below, applicable measures will be incorporated into the proposed Project upon project implementation.

PPP 3-1 SCAQMD Rule 201 – Permit to Construct: The SCAQMD requires developers who build, install, or replace any equipment or agricultural permit unit, which may cause new emissions of or reduce, eliminate, or control emissions of air contaminants to obtain a permit to construct from the Executive Officer.

PPP 3-2 SCAQMD Rule 402 – Nuisance Odors: The SCAQMD prohibits the discharge of any quantities of air contaminants or other material that cause injury, detriment, nuisance, or annoyance to any considerable number of persons or to the public, or that endanger the comfort, repose, health or safety of any such persons or the public, or that cause, or have a natural tendency to cause, injury or damage to business or property to be emitted within the SoCAB.

PPP 3-3 SCAQMD Rule 403 – Fugitive Dust (PM₁₀ and PM_{2.5}): The SCAQMD prohibits any person to cause or allow the emissions of fugitive dust from any active operation, open storage

4. Discussions of Checklist and Mitigation Measures

pile, or disturb surface area such that: (a) the dust remains visible in the atmosphere beyond the property line of the emission source; or (b) the dust emission exceeds 20 percent opacity (as determined by the appropriate test method included in the Rule 403 Implementation Handbook) if the dust emission is the result of movement of a motorized vehicle.

PPP 3-4 SCAQMD Rule 1403 – Asbestos Emissions from Demolition/Renovation Activities: This rule specifies work practice requirements to limit asbestos emissions from building demolition and renovation activities, including the removal and associated disturbance of asbestos- containing materials (ACM). All operators are required to maintain records, including waste shipment records, and are required to use appropriate warning labels, signs, and markings.

PPP 3-5 SCAQMD Rule 445 – Wood-Burning Devices: SCAQMD prohibits installation of wood-burning devices such as fire places and wood-burning stoves in new development unless the development is located at an elevation above 3,000 feet or if existing infrastructure for natural gas service is not available within 150-feet of the development. All fireplaces installed within the proposed Project site will be natural gas fueled fireplaces.

The SSEIR also identified the following measures as PDFs that apply to the proposed Project and will help reduce or avoid potential air quality impacts. Of the PDFs listed below, applicable measures will be incorporated into the proposed Project upon project implementation.

PDF 4-1 Compact/Mixed-Use Development: The California Energy Commission (CEC) considers compact development forms beneficial for minimizing energy consumption that leads to GHG emissions. In fact, the CEC's report on the connections between land use and climate change identifies density as the project feature most predictive of the number of vehicle trips and vehicle miles traveled ("VMT") by project occupants. Like the 2011 Approved Project, the 2012 Modified Project increases the density of development on the proposed Project site. Doing so will tend to reduce VMT on a local and regional basis. For the purpose of this analysis, it was assumed that there would be only a 25 percent reduction in VMT, which is within the range observed in Southern California.

PDF 4-2 High Rate of Internal Trip Capture: With the inclusion of a mix of land uses including office, commercial, industrial, and residential in the proposed Project site, the 2012 Modified Project significantly reduces trips outside the proposed Project site. This reduces trip length and congestion on the local circulation system outside the proposed Project site.

PDF 4-7 Energy Star Appliances: EnergyStar appliances (excluding refrigerators) (e.g., dishwashers, clothes washers, clothes dryers, air conditions, furnaces, and water heaters), shall be offered or installed in all residential dwelling units.

PDF 4-8 Building Energy Efficiency: Residential dwellings and nonresidential buildings will be constructed so that they achieve 15 percent higher energy efficiency than the applicable standards set forth in the 2008 California Building and Energy Efficiency Standards (Title 24, Part 6 of the California Building Code) or meet the standards in effect at the time of issuance of building permit. The Energy Commission's 2013 Building Energy Efficiency

4. Discussion of Checklist and Mitigation Measures

Standards are 25 percent more efficient than the 2008 standards for residential construction and 30 percent more efficient for nonresidential construction. The 2013 Energy Efficiency Standards, which take effect on January 1, 2014, offer builders more efficient windows, insulation, lighting, ventilation systems and other options that would reduce energy consumption in homes and businesses.

4.4 BIOLOGICAL RESOURCES

4.4.1 Environmental Setting

The OCGP FEIR described the biological resources within PA 51 (including former PA 30), including a 995-acre parcel of land in the easternmost portion of PA 51 retained in federal ownership and designated as both "habitat reserve" and a part of the Orange County Central-Coastal Subregion NCCP/Habitat Conservation Plan (HCP). The areas outside the habitat reserve were described as: 1) providing minimal native or undisturbed habitat, and, 2) consisting of agricultural, ornamental, and domestic landscapes.

The OCGP FEIR identified nine vegetative communities within the project site, including Venturan-Diegan sage scrub, southern cactus scrub, chaparral, woodland, riparian scrub, grassland, open water, agriculture, and predominately disturbed or developed areas. Several sensitive plant species and a large number of mature trees also were identified as potentially occurring within the project site. The sensitive plant species potentially occurring in PA 51 included the southern tarplant, Palmer's grappling hook, many-stemmed dudleya, Coulter's Matilija poppy, Catalina mariposa lily, and intermediate mariposa lily. The OCGP FEIR also noted the Coulter's saltbush, Laguna Beach dudleya, San Fernando Valley spineflower, and the Lewis's evening-primrose as having a moderate potential for occurrence. Species with a low potential for occurrence included the Los Angeles sunflower, south coast saltscale, Santa Monica Mountains dudleya, heart-leafed pitcher sage, coast wooly-heads, slender-horned spineflower, Santa Barbara morning glory, tecate cypress, and salt spring checkerbloom.

The OCGP FEIR documented an observation of one sensitive wildlife species, a burrowing owl. This individual, observed during the protocol focus studies for a nearby development proposal, was outside the habitat reserve at the southwest end of PA 51 along Serrano Creek. Forty other sensitive wildlife species or species of local concern were identified as having a potential to occur on the site.

The OCGP FEIR also described the Wildlife Corridor Concept Plan that would be incorporated into the eastern portion of the project site (Refer to pp. 5.9-9 through 5.9-14 of the OCGP FEIR) and explained the guidelines pursuant to which the ultimate corridor will be designed and constructed. The subject guidelines were primarily concerned with the creation and revegetation of wildlife habitats that would flourish in the proposed areas and serve as protective cover for target wildlife species that will presumably utilize the proposed corridor. A preliminary design concept for the creation and/or revegetation of the proposed route was also prepared consistent with the guidelines described below (Draft Irvine Wildlife Corridor Master Plan, November 2002). The draft recommended a series of actions to improve the environmental quality for wildlife:

- Creation (establishes historical ecosystems on lands that did not previously support that ecosystem or on severely altered sites)
- Revegetation

4. Discussions of Checklist and Mitigation Measures

- Reduce the amount of noise pollution and urban influence.
- Remove and restore the unnecessary developed (paved) areas within the corridor right-of-way.
- Create a protective habitat along the entire length of the corridor.
- Apply minimum height/width requirements based on the specific wildlife species.

OCGP FEIR Mitigation Measure BIO3 ensures that the City will continue to work with State and federal agencies to implement the revegetation/restoration plan necessary to create a viable wildlife corridor within the Project area. The City has prepared the Irvine Wildlife Corridor Master Plan, which is independent of this project.

4.4.2 Impacts Identified in the OCGP FEIR

The OCGP FEIR concluded that implementation of the overall project could result in the occurrence of the following potentially significant effects:

- The southern tarplant, a federal species of concern, might be adversely affected by the overall OCGP Master Plan project development.
- Although very limited in aerial extent and highly disturbed, isolated riparian habitat remnants that could be adversely impacted by the OCGP Master Plan project implementation.

The project site contains a large number of trees, many of them mature, representing a wide range of species. The OCGP project implementation may result in damage and destruction to the trees. A significant impact related to conflicts with the City of Irvine's Urban Forestry Ordinance could occur.

Addendum No. 4 (OCGP Master Plan) stated that the OCGP Master Plan portion of the overall OCGP project included essentially the same land uses and encompassed the same land area as depicted in the OCGP FEIR. Therefore, it concluded that, the OCGP FEIR adequately described the nature and severity of the environmental effects of OCGP Master Plan implementation on biological resources.

OCGP FEIR Mitigation Measure BIO1 stated that prior to approval of a subdivision map for each project area, a focused survey for the southern tarplant, mountain plover, and burrowing owl shall be conducted. MM BIO1 also stated that prior to approval of a subdivision map for development within, or in proximity to Serrano Creek, a focused survey shall be conducted for the least Bell's vireo and southwestern willow flycatcher. Should the focused survey identify a significant population of southern tarplant or mountain plover, or the presence of burrowing owl, least Bell's vireo, or southwestern willow flycatcher in an area proposed for development, impacts shall be avoided through incorporation of the species into an open space easement or, if impacts cannot be avoided, then mitigation shall be negotiated through consultation with the USFWS and the CDFG. Mitigation Measure BIO1 would continue to apply to this proposed Project (see Mitigation Measure BIO1, below).

The OCGP FEIR also stated that prior to approval of a subdivision map for each project area, a jurisdictional wetland delineation shall be performed for all areas within the Master Plan subarea that contain the potential for wetland habitat and/or jurisdictional waters. The loss of impacted wetlands shall be mitigated through the implementation of a Wetland Mitigation Plan prepared and accepted by the appropriate agency (i.e., USACE, USFWS, CDFG). For wetlands impacted, on-site replacement,

4. *Discussion of Checklist and Mitigation Measures*

recreation (i.e., within the proposed wildlife corridor), and/or revegetation is deemed acceptable by the appropriate jurisdictional agencies. Accordingly, Mitigation Measure BIO2 below would also continue to apply to the proposed Project.

The OCGP FEIR required that several focus surveys be conducted on PA 51 (including former PA 30) for sensitive plant and wildlife species prior to development. PCR Services prepared a *Biological Resources Assessment for Lennar Heritage Fields, Orange County, California* in November of 2005 and an updated assessment was prepared in June of 2006.¹ This biological resources assessment complies with mitigation measures BIO1, requiring a focus survey for the southern tarplant, mountain plover, and burrowing owl, and BIO2 requiring a wetlands delineation to be prepared for all areas within the Master Plan subarea that contain the potential for wetland habitat and/or jurisdictional waters. The subject study and each of its constituent focused technical studies cover a land area of approximately 3,700 acres and includes the OCGP Master Plan.

Jurisdictional Wetlands and Waters of the United States

A Jurisdictional Delineation for the site has been performed (*Investigation of Jurisdictional Wetlands and Waters of the U.S. Lennar Heritage Fields*, June 2006 PCR). The property supports six intermittent drainage systems and a variety of associated ephemeral tributaries. Five of the drainages have their headwaters in undeveloped areas of the Lomas de Santiago Foothills to the north. San Diego Creek originates in an eastern portion of the watershed that is occupied by substantial residential and commercial development. Disturbances such as channelization of large stretches of the drainages and dumping of debris and trash into portions of drainages have significantly altered several waterways and obscured many drainage features. Other disturbances on site include vegetation clearing to create roads and structures, agricultural runoff, and invasion by exotic species. Current and historic land uses associated with the establishment of the former MCAS El Toro (military structures, roads, agriculture, and residential development) have significantly changed the overall drainage patterns within the San Diego Creek watershed. The cumulative impact to each wash or creek has resulted in habitat and water quality impairment within the San Diego Creek watershed.

These impacts include increased sediment and debris transport due to concrete-lined stream channels, increased flow velocities and scouring, increased bank erosion, increases in the presence of non-native plant species, and an overall reduction in the amount and the quality of the riparian habitat within the watershed. Alternatively, the disturbances have increased the amount of jurisdictional areas due to the creation of freshwater marsh habitat resulting from impoundment of storm water runoff within and adjacent to drainages. In total, the site contains 31,102.11 linear feet of jurisdictional streambed that includes 22.02 acres of USACE jurisdictional "Waters of the U.S.," and, of which, 1.66-acres meet the three parameter definition of a jurisdictional wetland. CDFG jurisdictional streambed and associated riparian habitat total 38.61 acres.

¹ This report is available for review at the City of Irvine.

4. Discussions of Checklist and Mitigation Measures

Sensitive Biological Resources

There are numerous plant and wildlife species present, or potentially present within the project area that have received special recognition by federal, State, or local resource conservation agencies and organizations. Their status is principally due to the species decline or limited population size, usually resulting from habitat loss. Protected sensitive species are those species identified by either State or federal resource management agencies, or both, as threatened or endangered under provisions of the California and Federal Endangered Species Acts, respectively.

Sensitive species that occur or could potentially occur within the project area are based on one or more of the following:

- The direct observation of the species within the project area during one of the biological surveys.
- A record reported in the California Natural Diversity Database (CNDDDB).
- The project area is within a known distribution of a species and contains appropriate habitat.

Sensitive Plant Communities

The OCGP Master Plan area is dominated by highly disturbed habitat types and only small areas of native vegetation exist. A total of 9.7 acres of southern willow scrub occurs in scattered patches throughout the project site. Southern willow scrub is a high priority inventory community in the CNDDDB. This community is considered sensitive because it has experienced a sharp decline in California and because it has the ability to support a number of sensitive bird species such as least Bell's vireo and southwestern willow flycatcher.

Sensitive Plant Species

Sensitive plants include those that are either candidates or are currently listed by the CDFG and USFWS and those that are considered sensitive by the California Native Plant Society (CNPS). Several sensitive plant species were reported in the CNDDDB from the surrounding region. In accordance with the mitigation measures of the OCGP FEIR, focused surveys for southern tarplant were conducted on June 3 and June 8, 2005. No species were found. The highly disturbed character of the site and reduced presence of habitat capable of supporting sensitive plant species make it highly unlikely that any listed plant species will occur on the site.

Sensitive Wildlife Species

Forty-nine sensitive wildlife species were reported in the CNDDDB as occurring with the USGS 7.5-minute El Toro quadrangle map and the eight surrounding maps. Habitat suitability assessments for these species were conducted concurrently with the site investigation throughout the 2005 fieldwork. The intent of the habitat assessment was to evaluate habitat for its ability to support sensitive species and ascertain which sensitive species are likely to be present within the project area based on expected habitat use, geographic range, and information collected in the vicinity of the project area.

4. Discussion of Checklist and Mitigation Measures

The OCGP Master Plan is not within a proposed or listed critical habitat area. Six sensitive wildlife species were observed within the project area during initial field investigations: northern harrier (*Circus cyaneus*), merlin (*Falco columbarius*), Cooper's hawk (*Accipiter cooperii*), California horned lark (*Eremophila alpestris actia*), cactus wren (*Campylorhynchus brunneicapillus*), and loggerhead shrike (*Lanius ludovicianus*). Three of these species (northern harrier, merlin, and Cooper's hawk) were also observed during wintering bird surveys. In addition, the golden eagle (*Aquila chrysaetos*), burrowing owl (*Athene cunicularia*), and ferruginous hawk (*Buteo regalis*) were observed utilizing the site during these subsequent wintering bird surveys. Surveys for mountain plover (*Charadrius montanus*), in accordance with the OCGP FEIR mitigation measures, were conducted during the wintering bird surveys as part of Addendum No. 3; no individuals of this species, were observed on site during those field investigations.

In a follow-up report ³on wintering birds dated October 30, 2006 with surveys conducted between October 2005 and March 2006, PCR Services searched the site for activity. No burrowing owls were observed until February 2006. Although the project site is open, its vegetation becomes dense and over two feet tall in most areas. A single owl occupied a burrow during the late winter but abandoned the area as the vegetation surrounding the burrow became three feet high and very dense. There was no indication that breeding activity had been initiated. Because the habitat became unsuitable as a natural result of not being mowed, PCR Services determined that no mitigation would be required.

Summary of the Biological Status of the Site

The OCGP FEIR required that focus surveys be conducted on the project site for several sensitive plant and wildlife species prior to development. The required surveys were carried out during 2005 and 2006. No species of endangered plants or wildlife were recorded on site during these investigations, conducted by PCR Services. The sensitive plant community of willow scrub extant on site is heavily disturbed and fragmented. As such, PCR Services did not recommend attempting to preserve any of the remnant stands or streambeds as they currently exist. It was also determined that the presence of several sensitive species would be addressed through mitigation designed to avoid disturbance of nesting avian species. PCR Services' findings did not indicate a need to consult formally with the USFWS.

4.4.3 Impacts Associated with the Expansion of the OCGP Community Ice Facility

The proposed Project consists of expanding the approved Community Ice Facility (Area L) into the future Western Picnic Area (Area E) to accommodate the additional sheet of ice and as well as accessory uses. The Community Ice Facility's square footage would increase from approximately 117,635 to approximately 270,000 square feet. Additionally, the 6.8-acre Western Sector Picnic Area would be removed from the Master Plan.

The approved OCGP Master Plan and WSPDP include plans for a future 117,635-square-foot Community Ice Facility with three sheets of ice at the proposed location within the WSPDP. The approved Community Ice Facility included seating for up to 1,200 at one rink and 100 for the other two (1,400 total seats), and special events up to 6 weekdays per year. The proposed Project would support the development of a four-sheet Community Ice Facility consisting of approximately 270,000 square feet, with accessory uses. The facility would include parking lot lighting, pedestrian lighting, and security lighting on the exterior of the building.

4. Discussions of Checklist and Mitigation Measures

The Project encompasses the same land area proposed for park development as depicted in the OCGP FEIR. Therefore, the OCGP FEIR adequately describes the nature and severity of the environmental effects of the proposed expansion of the OCGP Community Ice Facility, the subject of this Addendum, on biological resources.

The proposed Project would not cause a substantial adverse change in the significance of any impacts to any sensitive species, riparian habitat or other sensitive natural community, and/or federally protected wetlands, as none exists within the Project site. Additionally, the proposed Project would not cause a substantial adverse change in the significance of any impacts related to the movement of any native resident or migratory fish or wildlife species; conflict with any local policies or ordinances protecting biological resources and adopted Habitat Conservation Plan. Additionally, the proposed expansion of the Community Ice Facility would not result in any changes within the Wildlife Corridor. Consequently, no changes to the OCGP FEIR would be required as a result of the proposed modifications. Therefore, the discussion of impacts related to biological resources disclosed in the OCGP FEIR remains valid and the proposed additional ice sheet would not result in any significant impacts or require changes to the OCGP FEIR.

4.4.4 Findings

Major FEIR Revisions Not Required. Based on the foregoing analysis and information, there is no evidence that the Proposed project would require a major change to the certified OCGP FEIR. The proposed modification to the OCGP Master Plan and the WSPDP, which does not include any major change to park development areas identified in the approved OCGP Master Plan, will not result in any new significant environmental impact nor will there be a substantial increase in the severity of impacts from that described in the certified OCGP FEIR.

No Substantial Change in Circumstances Requiring Major FEIR Revisions. There is no information in the record or otherwise available that indicates that there are substantial changes in circumstances pertaining to biological resources that would require major changes to the certified OCGP FEIR.

No New Information of Substantial Importance Showing Greater Significant Effects Than Previous FEIR. This Environmental Evaluation has analyzed all available relevant information and has determined that there is no new information of substantial importance, which was unknown and could not have been known with the exercise of reasonable diligence at the time the OCGP FEIR was approved, augmented, and/or updated, indicating that the Project will have one or more significant effects not discussed in the previous FEIR or result in a substantial increase in the severity of previously identified effects.

No New Information of Substantial Importance Showing Ability to Reduce Significant Effects in Previous FEIR. This Environmental Evaluation has analyzed all available relevant information and has determined that there is no new information of substantial importance, which was unknown and could not have been known with the exercise of reasonable diligence at the time the OCGP FEIR was approved, augmented, and/or updated, indicating that: (1) mitigation measures or alternatives previously found not to be feasible would in fact be feasible, and would substantially reduce one or more significant effects of the project, but the project proponent declines to adopt the mitigation measures or alternatives; or (2) mitigation measures or alternatives that are considerably different from those analyzed in the previous FEIR would substantially reduce one or more significant effects on the environment, but the project

4. Discussion of Checklist and Mitigation Measures

proponent declines to adopt the mitigation measures or alternatives. There are no alternatives to the project or additional mitigation measures that would substantially reduce one or more of the significant biological effects identified in and considered by the certified OCGP FEIR.

4.4.5 Mitigation from the OCGP FEIR and Applicability to the Expanded Community Ice Facility

Mitigation measures BIO1 through BIO4 will be implemented in conjunction with master plan review and subsequent development permits.

- BIO1** Prior to approval of a subdivision map for each project area, a focused survey for the southern tarplant, mountain plover, and burrowing owl shall be conducted. Prior to approval of a subdivision map for development within or in proximity to Serrano Creek, a focused survey shall be conducted for the least Bell's vireo and southwestern willow flycatcher. Should the focused survey identify a significant population of southern tarplant or mountain plover, or the presence of burrowing owl, least Bell's vireo, or southwestern willow flycatcher in an area proposed for development, impacts shall be avoided through incorporation of the species into an open space easement, or if impacts cannot be avoided, then mitigation shall be negotiated through consultation with the United States Fish and Wildlife Service (USFWS) and the California Department of Fish and Game (CDFG).
- BIO2** Prior to approval of a subdivision map for each project area, a wetland delineation shall be performed for all areas within the master plan subarea that contain the potential for wetland habitat and/or jurisdictional waters. The loss of impacted wetlands shall be mitigated through the implementation of a wetland mitigation plan prepared and accepted by the appropriate agency (i.e., USACE, USFWS, CDFG). Wetlands impacted on-site shall be mitigated through on-site or off-site replacement, recreation (i.e., within the proposed wildlife corridor), and/or revegetation as deemed acceptable by the appropriate jurisdictional agencies.
- BIO3** The City shall continue to work with State and federal agencies during the implementation of the proposed project to implement the revegetation/restoration plan for the wildlife corridor. Measures (e.g., sight and sound barriers, including artificial sound walls and natural diversions [e.g., hedges and tree lines]) shall be incorporated into corridor design to ensure the viability of the corridor. The City shall implement the corridor consistent with the design criteria and viability analysis established in the Final FEIR.
- BIO4** Prior to issuance of a grading permit for each project area, a complete inventory of all trees of trunk diameter at breast height (DBH) greater than six inches and any significant (as determined by a certified arborist selected by the City) plants on the project site, excluding those within the habitat preserve shall be prepared. This inventory shall be prepared by an arborist certified by the International Society of Arboriculture and shall include (but not be limited to) data for each tree such as species, variety, DBH, condition (excellent, good, fair, poor, dead), and any recommendations. All trees in this inventory shall be considered Significant Trees under the City of Irvine's Urban Forestry Ordinance (UFO) (Sections 5-7-401 et al.) and the UFO shall apply to all trees included in this inventory.

4. Discussions of Checklist and Mitigation Measures

4.5 CULTURAL RESOURCES

4.5.1 Environmental Setting

Archaeological and Historical Resources

This discussion of cultural resources includes archaeological and historical resources. The OCGP FEIR presented information pertaining to the regional setting of former MCAS El Toro from both a prehistoric and historic perspective. The OCGP FEIR reported the presence of ten prehistoric archaeological sites and eight isolated prehistoric artifacts that have been recorded in the northeastern habitat preserve portions of PA 51. These sites are generally on the ridges between Borrego Canyon Wash and the Agua Chinon Wash.

The former MCAS El Toro was surveyed to determine whether any of the structures would be eligible for the National Register. Generally, a structure that has achieved significance in the past 50 years is not considered eligible for the National Register unless it is of exceptional importance. The evaluation was expanded to include eligibility under the Legacy Cold War Project (Public Law No. 101-511, Section 8120). Portions of PA 51, including former PA 30, (the former MCAS El Toro) were established during World War II, and no structure earlier than this period is at the former MCAS El Toro. Therefore, the historical significance of any structures at the former military base would be as part of the Cold War Legacy. Surveys conducted by the USACE and the DON in conjunction with the bases closure concluded there were no structures eligible for designation as Cold War Legacy or for inclusion in the National Register.

Paleontological Resources

The OCGP FEIR reported that a majority of PA 51, including former PA 31, is on the Tustin Plain, a coastal alluvial plain. Alluvium from the Late Pleistocene to Holocene Epochs immediately underlies the majority of the project area, including the part occupying the coastal plain and washes in the eastern portion of PA 51. The Pleistocene Alluvium formation is widespread and believed to extend to depths of 1,000 feet in former PA 30. A significant deposit of Pleistocene terrestrial vertebrates was recovered during excavation of a flood control basin four miles from former PA 30; thus, it is possible that similar beds underlie the former PA 30 (OCGP FEIR 5.10-2).

The eastern portion of PA 51 is in the western foothills of the northern Santa Ana Mountains. The hills and ridges in the eastern part of PA 51 are composed of older, underlying marine and non-marine rock units of early Oligocene to late Pleistocene (23 million to 2 million years ago). In order of decreasing geologic age, these latter rock units include the undifferentiated Sespe and Vaqueros Formations, Topanga and Monterey Formations, Oso Member of the Capistrano Formation, Niguel Formation, and Non marine Terrace Deposits. Non marine Terrace Deposits also underlie the terraces at the south corner of PA 51.

The northwestern corner of PA 51 contains a small portion of the Santa Ana Mountains foothills, which were separated from the main formation by erosion. This small portion is composed of undifferentiated late Cretaceous (135 million years ago) Marine Williams Formation. The rock units underlying portions of PA 51 have previously yielded important fossil remains at recorded fossil sites on and near the site. There are three recorded fossil sites in PA 51. These sites occur in undifferentiated Sespe and Vaqueros

4. Discussion of Checklist and Mitigation Measures

Formations and in the Topanga Formation. Fossil types include marine invertebrates and vertebrates, continental vertebrates, land plants, and land mammals. The three recorded fossil sites lie within the proposed habitat preserve portion of PA 51.

4.5.2 Impacts Identified in the OCGP FEIR

Archaeological and Historical Resources

The OCGP FEIR determined that development according to the adopted Overlay Plan would not cause a substantial adverse change in the significance of any historical structure. The consequence of grading activities associated with future development, however, could potentially result in a substantial adverse change in the significance of an archaeological resource. The OCGP FEIR also stated that grading activities could uncover previously unknown human remains, including those interred outside formal cemeteries.

Although the entire project area was the subject of previous cultural resources investigations as part of the Base Realignment and Closure process, it was later determined that an updated survey and report was necessary to supplement the previous work. PCR Services performed an additional Phase I and II cultural resources investigation, the results of which can be found in the *Cultural Resources Update and Review, Heritage Fields/The Great Park, City of Irvine, Orange County, California* report dated September 2006.

Later, the OCGP Master Plan reflected a development program that was consistent with the General Plan Land Use and Zoning designations for PA 51. Earth moving activities were also projected to be the same as that analyzed in the OCGP FEIR.

Paleontological Resources

The OCGP FEIR stated that earthmoving operations associated with grading and trenching have the greatest potential to impact buried paleontological resources in the moderately to highly sensitive areas in the coastal plain and washes, northeastern, northwestern, and southern portions of PA 51. The OCGP FEIR considered the potential impact associated with earthmoving operations as a significant impact for which mitigation was necessary.

The OCGP Master Plan findings were also consistent with the OCGP FEIR, and the mitigation measures proposed in the OCGP FEIR were applicable and necessary in addressing potential impacts of future development.

The SSEIR document did not analyze cultural resources, because cultural resources was screened out during the initial environmental assessment and initial study process.

4.5.3 Impacts Associated with the Expanded Community Ice Facility

The proposed Project is located within the OCGP Master Plan area. Therefore, the OCGP FEIR adequately describes the nature and severity of the environmental effects of OCGP Master Plan and its current minor modification associated with the expansion of the Community Ice Facility, the subject of this Addendum, on cultural resources.

4. Discussions of Checklist and Mitigation Measures

Archaeological and Historical Resources

The proposed Project would not cause a substantial adverse change in the significance of any historical structure, but grading associated with construction could still potentially result in substantial adverse change in the significance of an unknown (i.e., buried) archaeological resource, or uncover previously unknown human remains. As such, the cultural resources mitigation measures developed for the OCGP FEIR remain applicable to, and sufficient to mitigate impacts associated with development of the expanded Community Ice Facility.

The proposed expansion of the Community Ice Facility reflects a development program that is consistent with the General Plan Land Use and Zoning designations for PA 51. Therefore, the discussion of impacts on archaeological and historical resources disclosed in the OCGP FEIR remains valid and the proposed additional ice sheet would not result in any significant impacts or require changes to the OCGP FEIR.

Paleontological Resources

The OCGP Master Plan and the proposed expansion of the Community Ice Facility reflect a development program that is consistent with the General Plan Land Use and Zoning designations for PA 51. Further, the extent of earth movement activities required to facilitate development of the expansion of the Community Ice Facility is projected to be essentially the same as that assessed and presented in the OCGP FEIR and Addenda. Given the foregoing, the discussion of potential impacts on paleontological resources attributable to the Great Park portion of the overall OCGP Project disclosed in the OCGP FEIR remains valid. As such, the paleontological mitigation measure developed for the OCGP FEIR remains applicable to, and sufficient to mitigate impacts associated with development of the expanded Community Ice Facility.

4.5.4 Findings

Major FEIR Revisions Not Required. Based on the foregoing analysis and information, there is no evidence that the Proposed project would require a major change to the certified OCGP FEIR. The proposed modification to the OCGP Master Plan and the WSPDP, which does not include any major change to park development areas identified in the approved OCGP Master Plan, will not result in any new significant environmental impact nor will there be a substantial increase in the severity of impacts from that described in the certified OCGP FEIR.

No Substantial Change in Circumstances Requiring Major FEIR Revisions. There is no information in the record or otherwise available that indicates that there are substantial changes in circumstances pertaining to cultural or paleontological resources that would require major changes to the certified OCGP FEIR.

No New Information of Substantial Importance Showing Greater Significant Effects Than Previous FEIR. All available relevant information has been analyzed, and there is no new information of substantial importance, which was unknown and could not have been known with the exercise of reasonable diligence at the time the OCGP FEIR was approved, augmented, and/or updated, indicating that the proposed Project will have one or more significant effects not discussed in the OCGP FEIR or result in a substantial increase in the severity of previously identified effects.

4. *Discussion of Checklist and Mitigation Measures*

No New Information of Substantial Importance Showing Ability to Reduce Significant Effects in Previous FEIR. All available relevant information has been analyzed, and there is no new information of substantial importance, which was unknown and could not have been known with the exercise or reasonable diligence at the time the OCGP FEIR was approved, augmented, and/or updated, indicating that: (1) mitigation measures or alternatives previously found not to be feasible would in fact be feasible, and would substantially reduce one or more significant effects of the proposed Project, but the project proponent declines to adopt the mitigation measures or alternatives; or (2) mitigation measures or alternatives that are considerably different from those analyzed in the previous FEIR would substantially reduce one or more significant effects on the environment, but the project proponent declines to adopt the mitigation measures or alternatives. There are no alternatives to the proposed Project or additional mitigation measures that would substantially reduce one or more of the significant cultural and paleontological effects identified in and considered by the OCGP FEIR.

4.5.5 Mitigation from the OCGP FEIR and Applicability to the Expanded Community Ice Facility

Cultural Resources

The OCGP FEIR identified mitigation measures CULT1 through CULT4 which, if fulfilled, would reduce the effects of the proposed Project to a level less than significant.

Of the Mitigation Measures listed below, applicable measures will be incorporated into the proposed Project upon project implementation.

CULT1 Prior to subdivision for development, a detailed archaeological report(s) shall be prepared within PAs 51 and 30. This report(s) shall specifically address the potential for encountering archaeological resources at the time specific development is proposed. The report(s) shall provide recommendations to prevent degradation of archaeological resources such as site avoidance and data recovery. Recommendations contained in the report shall be implemented. Compliance with this measure shall be verified by the Community Development Department.

CULT2 Monitoring of excavation and grading activities associated with future development in PAs 51 and 30 shall be conducted by a certified archaeologist in accordance with the report required in Mitigation Measure CULT1. If resources are encountered in the course of ground disturbance, the archaeological monitor shall be empowered to halt grading and to initiate an archaeological testing program. The testing shall include recordation of artifacts, controlled removal of the materials, and an assessment of their importance under CEQA and the City's local guidelines. Compliance with this measure shall be verified by the Community Development Department.

CULT3 Prior to the issuance of grading permits and/or building permits for any future development in PAs 51 and 30, a detailed mitigation program shall be submitted by the applicant to the City to address archaeological resources discovered during grading. Provisions of the program shall include an immediate evaluation of the find by a qualified archaeologist. If the find is determined to be a unique archaeological resource, contingency funding and a time allotment sufficient to allow for implementation of avoidance measures or appropriate mitigation shall be available. Work may continue on other parts of the construction site while archaeological resource mitigation takes place. The City has standard conditions applied prior to the issuance of grading

4. Discussions of Checklist and Mitigation Measures

permits when a project includes potentially significant archaeological sites. These include retaining a qualified archaeologist, establishing procedures for cultural and scientific resource surveillance, and protection of any resources discovered during the grading process. Compliance with this measure shall be verified by the Community Development Department.

CULT4 Prior to the issuance of any grading and/or building permits, a mitigation program shall be submitted by the developer to the City to address the accidental discovery or recognition of any human remains. The program shall include the following:

There shall be no further excavation or disturbance of the site or any nearby area reasonably suspected to overlie adjacent human remains until:

- The county coroner must be contacted to determine that no investigation of the cause of death is required, and

If the coroner determines the remains to be Native American:

- The coroner shall contact the Native American Heritage Commission within 24 hours.
- The Native American Heritage Commission shall identify the person or persons it believes to be the most likely descended from the deceased Native American.
- The most likely descendent may make recommendations to the landowner or the person responsible for the excavation work, for the means of treating or disposing of, with appropriated dignity, the human remains and any associated grave goods as provided in Public Resources Code Section 5097.98, or
- Where the following conditions occur, the landowner or his authorized representative shall rebury the Native American human remains and associated grave goods with appropriate dignity on the property in a location not subject to further subsurface disturbance.
 - The Native American Heritage Commission is unable to identify a most likely descendent or the most likely descendent failed to make a recommendation within 24 hours after being notified by the commission;
 - The descendant identified fails to make a recommendation; or
 - The landowner or his authorized representative rejects the recommendation of the descendant, and the mediation by the Native American Heritage Commission fails to provide measures acceptable to the landowner.

Compliance with this measure shall be verified by the Community Development Department.

Paleontological Resources

The OCGP FEIR identified Mitigation Measure P1, which, if fulfilled, would reduce the effects of the proposed Project to a level less than significant.

4. Discussion of Checklist and Mitigation Measures

Of the Mitigation Measures listed below, applicable measures will be incorporated into the proposed Project upon project implementation.

- P1** Prior to issuance of a grading permit for any portion of the project area, a qualified paleontologist shall be retained by the City or designee to carry out an appropriate paleontology investigation of the area proposed for grading. (A qualified paleontologist is defined as an individual with an M.S. or Ph.D. in paleontology or geology who is familiar with paleontological procedures and techniques.) The City of Irvine has standard conditions applied prior to the issuance of grading permits when a project site includes potentially significant paleontological sites, and paleontological monitoring conditions have not been attached to the previous map approval. These standard conditions include retaining a qualified paleontologist, establishing procedures for cultural and scientific resource surveillance, and protection of any resources discovered during the grading process.

When fossils are discovered, the paleontologist (or paleontological monitor) shall recover them. In most cases, this fossil salvage can be completed in a short period of time. However, some fossil specimens (such as a complete large mammal skeleton) may require an extended salvage period. In these instances the paleontologist (or paleontological monitor) shall be allowed to temporarily direct, divert or halt grading to allow recovery of fossil remains in a timely manner. Because of the potential for the recovery of small fossil remains, such as isolated mammal teeth, it may be necessary in certain instances to set up a screening-washing operation on-site.

Fossil remains collected during the monitoring and salvage portion of the mitigation program shall be cleaned, repaired, sorted, and cataloged. Compliance with this measure shall be verified by the Community Development Department.

4.6 GEOLOGY AND SOILS

4.6.1 Environmental Setting

The OCGP FEIR describes the topography of the OCGP as nearly flat and gently sloping down to the west to southwest with elevations ranging from 450 feet above mean sea level (msl) to 200 feet above msl. The proposed Project is located in PA 51, which includes some slopes of the Santa Ana foothills which reach elevations of 750 feet above msl. Alluvial soils of six major soil associations consisting predominantly of varying sands, silts, and clayey silty sands are present within PA 51. The foothill portions of the project area are underlain by sedimentary bedrock units, mantled by only a thin soil cover.

The OCGP FEIR identified the primary potential seismic hazard in the area as ground motion. Seismic Response Area (SRA) designations are used by the City to assess the geologic and seismic risk associated with potential development. A majority of PA 51 is within SRA-2 (denser soils/deeper groundwater) and is considered suitable for development.

No known active faults crossing or projecting into the project area were identified; however, the proposed Project site is within the seismically active southern California region and two active faults, Whittier-Elsinore Fault and Newport-Inglewood Fault, are located within 14 miles of the site.

4. Discussions of Checklist and Mitigation Measures

4.6.2 Impacts Identified in the OCGP FEIR

The OCGP FEIR disclosed the potential for future development of the OCGP area to result in the exposure of people or structures to strong ground shaking in the event of a major earthquake along anyone of the active faults in the region. The OCGP FEIR noted that new construction would be required to adhere to current seismic safety building codes which address seismic concerns. Existing buildings within PA 51 do not meet current seismic codes; therefore, the temporary or permanent reuse of the existing buildings and the associated exposure of people or structures to potential substantial adverse effects due to strong seismic-related ground shaking were considered significant impacts.

Because of the documented landslides in the northeastern Santa Ana foothills area of the site, the OCGP FEIR analysis concluded that the OCGP project would result in a significant impact associated with landslides in the affected area of PA 51 east of Irvine Boulevard, where future development of habitable structures could occur under the adopted Overlay Plan. The OCGP FEIR also concluded future development has the potential to result in soil erosion or the loss of topsoils and risk to life and property with the presence of expansive soils, and that these impacts are considered significant.

The conclusions drawn in the OCGP Master Plan were consistent to those in the OCGP FEIR. No new impacts were identified, and the OCGP FEIR had adequately described the environmental impacts of the project relative to soils, geologic hazards, and seismic safety, as well as the severity of the impacts.

4.6.3 Impacts Associated with the Expanded Community Ice Facility

The geology and soil conditions on the Project site are the same as the geology and soil conditions analyzed in the OCGP FEIR and Addenda. In addition, the proposed Project includes the same land uses and development areas that were analyzed as part of the adopted WSPDP and OCGP Master Plan. Impacts related to seismic hazards, landslides, expansive soils, and loss of topsoil or soil erosion are not intensified by the Project; therefore, the conclusions drawn in the OCGP FEIR adequately describe the environmental effects of the Project relative to soils, geologic hazards, and seismic safety, as well as the severity of the impacts. The proposed Project would incorporate the specific engineering techniques identified in the OCGP EIR that would avoid risk associated with geologic conditions. The proposed Project would also comply with the most current California Building Code (CBC). There are no new or increased significant adverse project-specific or cumulative impacts with regard to geology and soils that are identified as a result of the implementation of the proposed Project. There is no new information relative to geology and soils that was not in existence at the time the FEIR was prepared. Therefore, implementation of the proposed Project would be consistent with the FEIR, and no new mitigation measures are required in relation to impacts to geology and soils.

4.6.4 Findings

Major FEIR Revisions Not Required. Based on the foregoing analysis and information, there is no evidence that the Proposed project would require a major change to the certified OCGP FEIR. The proposed modification to the OCGP Master Plan and the WSPDP, which does not include any major change to park development areas identified in the approved OCGP Master Plan, will not result in any new significant environmental impact nor will there be a substantial increase in the severity of impacts from that described in the certified OCGP FEIR.

4. *Discussion of Checklist and Mitigation Measures*

No Substantial Change in Circumstances Requiring Major FEIR Revisions. There is no information in the record or otherwise available that indicates that there are substantial changes in circumstances pertaining to geology and soils that would require major changes to the certified OCGP FEIR.

No New Information of Substantial Importance Showing Greater Significant Effects Than Previous FEIR. All available relevant information has been analyzed, and there is no new information of substantial importance that was unknown and could not have been known with the exercise of reasonable diligence at the time the OCGP FEIR was approved, augmented, and/or updated, indicating that the proposed Project will have one or more significant effects not discussed in the OCGP FEIR or result in a substantial increase in the severity of previously identified effects.

No New Information of Substantial Importance Showing Ability to Reduce Significant Effects in Previous FEIR. All available relevant information has been analyzed, and there is no new information of substantial importance that was unknown and could not have been known with the exercise of reasonable diligence at the time the OCGP FEIR was approved, augmented, and/or updated, indicating that: (1) mitigation measures or alternatives previously found not to be feasible would in fact be feasible, and would substantially reduce one or more significant effects of the proposed Project, but the project proponent declines to adopt the mitigation measures or alternatives; or (2) mitigation measures or alternatives that are considerably different from those analyzed in the previous EIR would substantially reduce one or more significant effects on the environment, but the project proponent declines to adopt the mitigation measures or alternatives. There are no alternatives to the proposed Project or additional mitigation measures that would substantially reduce one or more of the significant geological effects identified in and considered by the OCGP FEIR.

4.6.5 Mitigation from the OCGP FEIR and Applicability to the Expanded Community Ice Facility

The OCGP FEIR identified Mitigation Measures GS1 through GS4, which, if fulfilled, would reduce the effects of development under the adopted Overlay Plan to a level of less than significant.

Of the Mitigation Measures listed below, applicable measures will be incorporated into the proposed Project upon project implementation.

- GS1** Prior to issuance of a building permit, the City of Irvine shall require that all development be designed in accordance with the seismic design provisions outlined in future proposed development geotechnical reports and specified in the latest Building Codes adopted by the City of Irvine. Compliance with this measure shall be verified by the Community Development Department.
- GS2** Prior to issuance of a building permit, as per existing City policies, geotechnical studies shall be prepared at the time specific development projects are proposed to address site specific geotechnical considerations. The scope of each geotechnical study is based on the underlying geotechnical conditions of the individual site. These reports will provide measures to prevent settlement.

4. Discussions of Checklist and Mitigation Measures

1. Prior to design and construction of any future developments within the project area, a comprehensive geotechnical evaluation, including development-specific subsurface exploration and laboratory testing, shall be conducted. The purpose of the subsurface evaluation is to:

- a. Further evaluate the subsurface conditions in the area of the proposed structures.
- b. Provide specific data on potential geologic and geotechnical hazards.
- c. Provide information pertaining to the engineering characteristics of earth materials in the project area.

From this data, recommendations for grading/earthwork, surface, and subsurface drainage, temporary and/or subsurface drainage, temporary and/or permanent dewatering, foundations, pavement structural section, and other pertinent geotechnical design considerations may be formulated and shall be included in the grading and building plans for individual developments. General recommendations are as follows:

- Seismic Ground Shaking - Measures to prevent risk of loss, injury or death involving seismic ground shaking include constructing new development to the latest adopted building codes. In addition, new development should not be located near active earthquake faults.
- Erosion or Loss of Topsoil - Erosion and sediment control measures shall be implemented as required by the City's Grading and Water Quality ordinances.
- Where Expansive Soils Exist - Measures for the design of foundation, slabs, flatwork and other improvements subject to drainage from expansive soils.

Compliance with this measure shall be verified by the Community Development Department.

- GS3** Prior to issuance of building permits for the occupancy of any existing structure at the former MCAS El Toro, or occupancy of any existing structure if a building permit is not issued, a seismic evaluation of the structure including recommendations for seismic improvements required for compliance with current Building Codes for use of existing structures adopted by the City of Irvine and plans for any required seismic improvements shall be submitted to the Chief Building Official for review and approval.

- GS4** Prior to issuance of a grading permit, detailed geotechnical and hydrology reports shall be prepared prior to any development approval or grading activities. These reports shall specifically address erosion control and surface runoff for both construction and long-term operations on the site. Recommendations contained in these reports to prevent soil erosion, siltation, and debris influx into the drainage system shall be implemented. Compliance with this measure shall be verified by the Community Development Department.

4. Discussion of Checklist and Mitigation Measures

4.7 GREENHOUSE GAS EMISSIONS

As discussed in more detail in Section 3.4, the proposed Project does not meet the Section 15162 criteria for preparing a subsequent environmental document and no analysis of GHG emissions is required. However, the SSEIR included an analysis of GHG emissions and a discussion of measures that are applicable to the proposed Project. The SSEIR identified the following measures as existing PPP that apply to the proposed Project and will help reduce or avoid potential GHG impacts:

Of the PPPs listed below, applicable measures will be incorporated into the proposed Project upon project implementation.

PPP 4-1 City of Irvine Construction and Demolition (“C&D”) Debris Recycling and Reuse Ordinance: The C&D ordinance requires that (1) all residential projects of more than one unit, (2) nonresidential developments on 5,000 sf or larger, and (3) nonresidential demolition/renovations with more than 10,000 sf of building, recycle or reuse a minimum of 75 percent of concrete and asphalt and 50 percent of nonhazardous debris generated.

PPP 4-2 SCAQMD Rule 445 – Wood-Burning Devices: SCAQMD prohibits installation of wood-burning devices such as fireplaces and wood-burning stoves in new development unless the development is at an elevation above 3,000 feet or if existing infrastructure for natural gas service is not available within 150 feet of the development. All fireplaces installed within the proposed Project site will be natural gas-fueled fireplaces.

PPP 4-3 Building and Energy Efficiency Standards (CCR Title 24): Prior to the issuance of a building permit for residential, commercial, or office structures in the proposed Project site, development plans for these structures shall be required to demonstrate that the project meets the 2008 Building and Energy Efficiency Standards. Commonly known as Title 24, these standards are updated periodically to allow consideration and possible incorporation of new energy efficiency technologies and methods. The 2008 standards are approximately 15 percent more energy efficient than the 2005 Building and Energy Efficiency Standards. Plans submitted for building permits shall include written notes demonstrating compliance with the 2008 energy standards and shall be reviewed and approved by the Public Utilities Department prior to issuance of building permits. Design strategies to meet this standard may include maximizing solar orientation for daylighting and passive heating/cooling, installing appropriate shading devices and landscaping, utilizing natural ventilation, and installing cool roofs. Other techniques include installing insulation (high R value) and radiant heat barriers, low-e window glazing, or double-paned windows.

PPP 4-4 Title 24 Code Cycles: Net-Zero Buildings (Residential and Nonresidential): The California Public Utilities Commission adopted its Long-Term Energy Efficiency Strategic Plan on September 18, 2008, presenting a roadmap for all new residential and commercial construction to achieve a zero-net energy standard. This Plan outlines the goal of reaching zero-net energy in residential construction by 2020 and in commercial construction by 2030. Achieving this goal will require increased stringency in each code cycle of California’s Energy Code (Title 24).

4. Discussions of Checklist and Mitigation Measures

- PPP 4-5 California Renewable Portfolio Standard:** The California Air Resources Board (CARB) Renewable Portfolio Standard (RPS) is a foundational element of the State's emissions reduction plan. In 2002, Senate Bill 1078 established the California RPS program, requiring 20 percent renewable energy by 2017. In 2006, Senate Bill 107 advanced the 20 percent deadline to 2010, a goal which was expanded to 33 percent by 2020 in the 2005 Energy Action Plan II. On September 15, 2009, Governor Arnold Schwarzenegger signed Executive Order S-21-09 directing CARB to adopt regulations increasing RPS to 33 percent by 2020. These mandates apply directly to investor-owned utilities, which in the case of the 2012 Modified Project is Southern California Edison (SCE).
- PPP 4-6 California Low Carbon Fuel Standard:** On January 18, 2007, Gov. Schwarzenegger issued Executive Order S-1-07 requiring the establishment of a Low Carbon Fuel Standard (LCFS) for transportation fuels. This statewide goal requires that California's transportation fuels reduce their carbon intensity by at least 10 percent by 2020. Regulatory proceedings and implementation of the LCFS have been directed to CARB. The LCFS has been identified by CARB as a discrete early action item in the Scoping Plan. CARB expects the LCFS to achieve the minimum 10 percent reduction goal; however, many of the early action items outlined in the Scoping Plan work in tandem with one another. To avoid the potential for double-counting emission reductions associated with Assembly Bill (AB) 1493 (Pavley), the Scoping Plan has modified the aggregate reduction expected from the LCFS to 9.1 percent.
- PPP 4-7 Federal Corporate Average Fuel Economy (CAFE) Standards:** The 2007 Energy Bill creates new federal requirements for increases in fleetwide fuel economy for passenger vehicles and light trucks. The federal legislation requires a fleetwide average of 35 miles per gallon (mpg) to be achieved by 2020. The National Highway Traffic Safety Administration is directed to phase in requirements to achieve this goal. Analysis by CARB suggests that this will require an annual improvement of approximately 3.4 percent between 2008 and 2020.
- PPP 4-8 California Assembly Bill 1493 – Pavley Standards:** On July 22, 2002, Governor Gray Davis signed AB 1493 requiring CARB to develop and adopt regulations designed to reduce GHGs emitted by passenger vehicles and light-duty trucks beginning with the 2009 model year. The standards set within the Pavley regulations are expected to reduce GHG emissions from California passenger vehicles by about 22 percent in 2012 and about 30 percent in 2016. California had petitioned the USEPA in December 2005 to allow these more stringent standards and California executive agencies have repeated their commitment to higher mileage standards. On July 1, 2009, the USEPA granted California a waiver that will enable the State to enforce stricter tailpipe emissions on new motor vehicles.
- PPP 4-9 SB 375:** Senate Bill (SB) 375 requires the reduction of GHG emissions from light trucks and automobiles through land use and transportation efforts that will reduce VMT. In essence, SB 375's goal is to control GHGs by curbing urban sprawl and through better land use planning. SB 375 essentially becomes the land use contribution to the GHG reduction requirements of AB 32, California's global warming bill enacted in 2006. The Modified Project is consistent with SB 375 strategies to reduce VMT and associated GHG emissions in that it represents a compact, mixed-use development, improves the jobs/housing balance in the City and the Orange County Council of Governments Subregion, and provides access to mass transit. According to SCAG's 2008 Regional Comprehensive Plan, SCAG's Land Use

4. *Discussion of Checklist and Mitigation Measures*

and Housing Action Plan can be expected to result in a 10 percent reduction in VMT in 2035 when compared to current trends.

PPP 4-11 Comprehensive Signal Retiming and Coordination Program: Emissions are highest at the lowest travel speeds. The City is currently retiming and coordinating signals throughout Irvine under its ITEMS (Irvine Traffic Engineering System) program. A program to retime and coordinate traffic signals would produce more even traffic flows, so that vehicles are not starting and stopping constantly. These types of programs can improve vehicular level of service (LOS), thereby decreasing emissions for the same volume of vehicles.

PPP 4-12 Waste Reduction: The City adopted a Zero Waste program in 2007 to approach waste management. The City recovers approximately 66 percent of its waste for recycling and composting, which exceeds the state's AB 939 waste diversion goals. Furthermore, waste haulers establish rate schedules according to bin size and frequency of collection. Commercial customers that subscribe to smaller bins (e.g., 2 cubic-yard bins) are routinely charged less by haulers. This pricing structure encourages waste reduction and recycling, and tends to minimize hauler pickups.

The SSEIR also identified the following measures as PDFs that apply to the proposed Project and will help reduce or avoid potential GHG impacts:

Of the PDFs listed below, applicable measures will be incorporated into the proposed Project upon project implementation.

PDF 4-1 Compact/Mixed-Use Development: The California Energy Commission (CEC) considers compact development forms beneficial for minimizing energy consumption that leads to GHG emissions. In fact, the CEC's report on the connections between land use and climate change identifies density as the project feature most predictive of the number of vehicle trips and VMT by project occupants. The 2012 Modified Project intensified the residential development on the proposed Project site as compared to the 2011 Approved Project, and locates additional housing opportunities near major employment and transportation centers. Doing so will tend to reduce VMT on a local and regional basis.

PDF 4-2 High Rate of Internal Trip Capture: With the inclusion of a mix of land uses including office, commercial, industrial, and residential in the proposed Project site, the 2012 Modified Project significantly reduces trips outside the proposed Project site. This reduces trip length and congestion on the local circulation system outside the proposed Project site.

PDF 4-3 Low-Flow Fixtures: The 2012 Modified Project incorporates low-flow water fixtures that will meet the requirements of the California Green Building Standards Code standards. Prior to issuance of building permit, the Applicant or its successor shall submit evidence to the satisfaction of the Director of Community Development that toilets, urinals, sinks, showers, and other water fixtures installed on-site are low-flow water fixtures that meet the California Green Building Standards Code standards.

4. Discussions of Checklist and Mitigation Measures

- PDF 4-4 Landscaping and Irrigation Systems:** The 2012 Modified Project incorporates automated, high-efficiency landscaping irrigation systems on all master landscaped areas that reduce water use, such as evapotranspiration “smart” weather-based irrigation controllers, and bubbler irrigation; low-angle, low-flow spray heads; moisture sensors; and use of a California-friendly landscape palette. Prior to approval of landscape plans, the Applicant or its successor shall submit evidence to the satisfaction of the City’s Director of Community Development that such landscaping irrigation systems will be installed so as to make the 2012 Modified Project consistent with the intent of the California Water Conservation in Landscaping Act of 2006 (AB 1881), including provisions to reduce the wasteful, uneconomic, inefficient, and unnecessary consumption of water.
- PDF 4-5 Use of Reclaimed Water on All Master Landscaped Areas:** Prior to approval of landscape plans, the Applicant or its successor shall submit evidence to the satisfaction of the City’s Director of Community Development and the Irvine Ranch Water District (IRWD) that the landscape plans incorporate the use of reclaimed water in all master landscaped areas, including master landscaped commercial, multifamily, common, roadways, and park areas. Master landscapes shall also incorporate weather-based controllers and efficient irrigation system designs to reduce overwatering, combined with the application of a California-friendly landscape palette.
- PDF 4-6 Material Recovery:** The 2012 Modified Project incorporates measures to reduce waste generated by proposed Project site residents, occupants and visitors, and to encourage recycling of solid wastes, utilizing the Orange County Integrated Waste Management Department’s material recovery facilities to recycle glass, plastic, cans, junk mail, paper, cardboard, greenwaste (e.g., grass, weeds, leaves, branches, yard trimmings, and scrap wood), and scrap metal. Future employees, residents, and customers would participate in these programs. These measures include the requirement to include on-site recycling facilities at all commercial, retail, industrial, and multifamily residential developments. In addition, educational materials identifying available recycling programs shall be distributed to all land uses, including single-family residential.
- PDF 4-7 Energy Star Appliances:** EnergyStar appliances (excluding refrigerators) (e.g., dishwashers, clothes washers, clothes dryers, air conditions, furnaces, and water heaters, shall be offered or installed in all residential dwelling units.
- PDF 4-8 Building Energy Efficiency:** Residential dwellings and nonresidential buildings will be constructed so that they achieve 15 percent higher energy efficiency than the applicable standards set forth in the 2008 California Building and Energy Efficiency Standards (Title 24, Part 6 of the California Building Code) or meet the standards in effect at the time of issuance of building permit. The Energy Commission’s 2013 Building Energy Efficiency Standards are 25 percent more efficient than the 2008 standards for residential construction and 30 percent more efficient for nonresidential construction. The 2013 Energy Efficiency Standards, which take effect on January 1, 2014, offer builders more efficient windows, insulation, lighting, ventilation systems and other options that would reduce energy consumption in homes and businesses.

4. *Discussion of Checklist and Mitigation Measures*

PDF 4-9 Carbon Sequestration: The 2012 Modified Project incorporates landscaping and a plant palette that will foster carbon sequestration within the proposed Project site that is comparable to the landscaping and plant palette that was already incorporated into the 2011 Approved Project.

PDF 4-10 Softscape Landscaped Areas: Consistent with the sustainable practices and modern landscaping standards, and consistent with the landscaping used in the 2011 Approved Project, the 2012 Modified Project reduces softscape (e.g., plants/horticultural elements of landscape design) landscaped areas by 28 percent as compared to the default assumption in CalEEMod.

4.8 HAZARDS AND HAZARDOUS MATERIALS

4.8.1 Environmental Setting

Hazardous Materials and Hazardous Wastes

The OCGP FEIR discussed an environmental baseline survey (EBS) that was conducted for the project area. Information was used from the Base Realignment and Closure Business Plan for Marine Corps Air Station (MCAS) EI Toro dated May 2002; the EBS dated 1995; and an update to the EBS-April 2003 Draft Final EBS. The 2003 EBS identified “76 potential release locations, all of which require further evaluation for potential releases to the environment and subsequent remediation, if required” (Refer to OCGP FEIR p. 5.5-5).

The Installation Restoration Program (IRP) for the former MCAS EI Toro was authorized in 1984. The IRP outlined hazardous remediation needs and identified 24 sites (Sites 1-22, 24, and 25) for investigation at the former MCAS EI Toro. The IRP sites were originally divided into two categories: No Further Action sites (Table 4.8-1) and Action Required sites (Table 4.8-2). The IRP Sites identified as Action Required sites are depicted on Figure 4.8-1, *Installation Restoration Program Sites*. The Action Required IRP sites that are located within the 688-acre OCGP Improvement Area include sites 5 and 16.

IRP Site 5 (Perimeter Landfill), which covers approximately 1.8 acres, operated between 1955 and the late-1960s as a cut-and-fill disposal facility. Typical of municipal landfills, Site 5 contains a variety of materials. Reportedly, almost any waste generated at former MCAS EI Toro may have been disposed at IRP Site 5, including burnable trash; municipal solid waste; cleaning fluids; scrap metals; paint residues; and unspecified fuels, oils, and solvents. Wastes were typically burned in place to reduce volume prior to burial. A Remedial Action Completion Report (RACR) dated August 2012 has been prepared and documents that the landfill has been remediated and is protective of human health and the environment. An Operations and Maintenance/Long-Term Monitoring (LTM) Plan dated November 2010 has been prepared and approved by the Department of Toxic Substances Control. The post-construction LTM activities at IRP Site 5 monitor the effectiveness of the landfill cap, surface-water drainage structures, landfill gas monitoring system, groundwater monitoring network, and site security features.

Installation Restoration Program (IRP) Sites

4. Discussions of Checklist and Mitigation Measures

At IRP Site 16 (Crash Crew Pit No. 2), aviation fuels (JP-5, AVGAS), chlorinated solvents, hydraulic fluid, crankcase oil, white phosphorus, magnesium phosphate, and napalm were burned in unlined pits for fire training from 1972 to 1985. The Draft Remedial Action Completion Report (RACR) prepared for Site 16 documents that the deep vadose zone (from 10 feet below ground surface [bgs] to groundwater, which is present at approximately 170 feet bgs) response action (i.e., monitoring) is complete and No Further Action is required for the deep vadose zone at Site 16. The Draft RACR Report meets the requirements of a Closure Report as specified in the Final Record of Decision (ROD). The Final ROD documented No Further Action for surface and shallow soil (0-10 feet bgs) at IRP Site 16. Based on the results of soil gas monitoring, petroleum corrective actions including soil vapor extraction and MPE remediation, and modeling results, it is unlikely for VOCs to further impact groundwater (due to infiltration) at concentrations exceeding drinking water standards. As a result, it has been recommended that the requirements for positive drainage within the Main Pit on Site 16 be eliminated.

Of the 404 underground storage tanks (USTs) identified at the Base, 357 had been remediated and received findings of "no further action" at the time the OCGP FEIR was prepared. Of the 39 aboveground storage tanks (ASTs) on the property, 36 had been remediated and received findings of "no further action."

Evaluation and remediation of previously identified Installation Restoration Program (IRP) sites within the project site continues with the resulting changes in the condition of the property largely anticipated in the OCGP FEIR. Subsequent to certification of the OCGP FEIR, the DON completed environmental related findings that support the suitability to transfer (FOST) real property made available through the Base Realignment and Closure process and to support the lease of areas not yet suitable for transfer.¹ Please see Figure 4.8-1 for IRP locations.

The areas suitable for lease encompassed locations of concern identified in the 1995 and 2003 EBS, and in the OCGP FEIR, where future evaluation and/or actions are ongoing or required. These areas were identified as "carve-outs" in the DON documentation.²

Subsequent to certification of the OCGP FEIR, a total of seven FOSTs have documented that all necessary remediation has been completed to protect human health and the environment on approximately 3,478 acres of the former MCAS El Toro. Information concerning remediation is subject to periodic change as additional information is generated from cleanup programs and activities that are being planned for, or are in progress.

Emergency Plans

The OCGP FEIR described the former MCAS El Toro site (PA 51, including former PA 30) as a potential emergency response staging area because of its capacity for processing and storing large quantities of cargo. The Orange County Emergency Plan, which incorporates the statewide standardized emergency management system (SEMS), guides multijurisdictional response to emergency conditions. No

¹ U.S. Department of the Navy, 2004. *Final Finding of Suitability to Transfer, Parcel IV and Portions of Parcels I, II, and III, Former Marine Corps Air Station, El Toro, California*, July 2004; *Final Finding of Suitability to Lease for Carve-outs Within Parcels I, II, and III, Former Marine Corps Air Station, El Toro, California*, July 2004.

² U.S. Department of the Navy, 2004a. *Final Finding of Suitability to Lease for Carve-outs within Parcels I, II, and III, Former Marine Corps Air Station, El Toro, California*, July 2004.

4. Discussion of Checklist and Mitigation Measures

substantial change to the description of the setting regarding emergency plans has occurred that would alter the analysis and conclusions of the OCGP FEIR on emergency plans and response.

Wildland Fires

The OCGP FEIR identified high fire hazard areas within open space, undeveloped land northeast of and adjacent to PA 51. The City has no construction records of existing buildings and structures on the property. No substantial change to the description of the setting relative to wild land fires has occurred that would alter the analysis and conclusions of the OCGP FEIR regarding wild land fires.

4.8.2 Impacts Identified in the OCGP FEIR

Hazardous Materials and Wastes

The OCGP FEIR identified no significant impacts associated with the No Further Action IRP sites, which are listed in Table 4.8-1. Table 4.8-2 identifies each Action Required IRP site and its location relative to the adopted Overlay Plan. The OCGP FEIR disclosed the following environmental consequences of the adopted Overlay Plan as significant impacts:

- Construction activities involving demolition and possible substantial remodeling of existing structures in the project area as the project area develops could result in the disturbance of structures and soils containing asbestos-containing building materials (ACM) and lead-based paint.
- IRP site 24 is located in the 6.1 Institutional and 1.9 Orange County Great Park zoning districts. The site may be conveyed with temporary restrictions on use that are not appropriate for transportation facility use. This is considered a significant impact.
- Future uses of IRP site 3 may be potentially constrained by the implementation of institutional controls.
- IRP site 16 (Crash Crew Pit No.2) is located in the 1.9 Orange County Great Park zoning district. The site may be conveyed with temporary restrictions on use that are not appropriate for recreational land uses.

Emergency Plans

The OCGP FEIR determined the Overlay Plan would not be expected to interfere with emergency response and evacuation plans on the basis that other sites within Orange County are already designated as emergency staging areas and portions of the OCGP would remain available to non-aviation emergency response equipment. Accordingly, the OCGP FEIR concluded that the adopted Overlay Plan would not result in a significant impact related to emergency response and evacuation plans.

Wildland Fires

The OCGP FEIR concluded that the Habitat Reserve, Wildlife Corridor, and Recreational areas in the northeastern portion of PA 51 would be exposed to the highest level of fire risk from wildland fires under the adopted Overlay Plan, and that reuse of existing buildings require inspection for conformance to fire life safety code requirements. The OCGP FEIR identified the wild land fire impacts as potentially significant.

4. Discussions of Checklist and Mitigation Measures

4.8.3 Impacts Associated with the Expanded Community Ice Facility

The proposed Project is located within the OCGP Master Plan area. Therefore, the OCGP FEIR adequately describes the nature and severity of the environmental effects of the OCGP Master Plan and its current minor modification associated with the expansion of the Community Ice Facility, the subject of this Addendum, related to hazards and hazardous materials.

Hazardous Materials and Wastes

Implementation of the proposed Project would not cause any direct impacts to hazards and hazardous materials beyond those identified in the OCGP FEIR. As discussed above, since certification of the OCGP FEIR, a total of seven FOSTs have documented that all necessary remediation has been completed to protect human health and the environment on approximately 3,478 acres of the former MCAS El Toro. Information concerning remediation is subject to periodic change as additional information is generated from cleanup programs and activities that are being planned, or are in progress. The proposed Project site is located near IRP Site 18, a volatile organic compound (VOC) Groundwater Contamination Plume. This plume of Trichloroethylene (TCE) extends below the ground surface into the aquifer system on-site of the former MCAS El Toro/OCGP Master Plan area. This contamination does not impact the existing or proposed land uses on the Project site and would not impact, or be impacted by, the proposed expansion of the Community Ice Facility. In addition, any hazardous materials used during the operation of the Community Ice Facility would be in compliance with existing State and federal laws. The use, transport, storage, and disposal of such chemicals are strictly regulated by federal, State, and local laws and regulations. Overall, the proposed modification to the OCGP Master Plan would not change the OCGP FEIR conclusions; with mitigation measures HH1, HH2, HH5, and HH6, the Project would result in less than significant impacts related to hazardous materials and wastes. No new or modified mitigation measures are required.

Emergency Plans

Construction and operation of the expanded Community Ice Facility would not be expected to interfere with emergency response and evacuation plans since other sites within Orange County are already designated emergency staging areas and portions of the OCGP would remain available to emergency response equipment. Accordingly, the proposed Project would not change the OCGP FEIR conclusions; the proposed Project would not result in a significant impact related to emergency response and evacuation plans.

Wildland Fires

Under the OCGP Master Plan, the Habitat Reserve, Wildlife Corridor, and recreational areas in the northeastern portion of PA 51 would be exposed to the highest level of fire risk from wildland fires and would require inspection for conformance to fire life safety code requirements.

As the potential significant wildland fire impacts of the OCGP Master Plan are similar to those disclosed in the OCGP FEIR, the proposed Project would not substantially change the findings and conclusions of the OCGP FEIR regarding wildland fires.

4. Discussion of Checklist and Mitigation Measures

4.8.4 Findings

Major FEIR Revisions Not Required. Based on the foregoing analysis and information, there is no evidence that the Proposed project would require a major change to the certified OCGP FEIR. The proposed modification to the OCGP Master Plan and the WSPDP, which does not include any major change to park development areas identified in the approved OCGP Master Plan, will not result in any new significant environmental impact, nor will there be a substantial increase in the severity of impacts from that described in the certified OCGP FEIR.

No Substantial Change in Circumstances Requiring Major FEIR Revisions. There is no information in the record or otherwise available that indicates that there are substantial changes in circumstances pertaining to hazards or hazardous materials that would require major changes to the certified OCGP FEIR.

No New Information of Substantial Importance Showing Greater Significant Effects Than Previous FEIR. All available relevant information has been analyzed, and there is no new information of substantial importance, which was unknown and could not have been known with the exercise of reasonable diligence at the time the OCGP FEIR was approved, augmented, and/or updated, indicating that the proposed Project will have one or more significant effects not discussed in the OCGP FEIR or result in a substantial increase in the severity of previously identified effects.

No New Information of Substantial Importance Showing Ability to Reduce Significant Effects in Previous FEIR. All available relevant information has been analyzed, and there is no new information of substantial importance which was unknown and could not have been known with the exercise or reasonable diligence at the time the OCGP FEIR was approved, augmented, and/or updated, indicating that (1) mitigation measures or alternatives previously found not to be feasible would in fact be feasible, and would substantially reduce one or more significant effects of the proposed Project, but the project proponent declines to adopt the mitigation measures or alternatives; or (2) mitigation measures or alternatives that are considerably different from those analyzed in the previous FEIR would substantially reduce one or more significant effects on the environment, but the project proponent declines to adopt the mitigation measures or alternatives. There are no alternatives to the proposed Project or additional mitigation measures that would substantially reduce one or more of the significant hazards or hazardous materials effects identified in and considered by the OCGP FEIR.

4.8.5 Mitigation from the OCGP FEIR and Applicability to the Expanded Community Ice Facility

The OCGP FEIR identified six mitigation measures to reduce the effects of the adopted Overlay Plan on public health and safety, specifically environmental effects associated with hazardous materials and waste, emergency response, and wildland fires, to a level less than significant. However, the mitigation measures were modified and new measures were adopted in the SEIR. An explanation for the new mitigation measures is provided below. In addition, the SSEIR proposed to make two minor modifications to Mitigation Measures HH2 and HH3 adopted by the City for the 2011 Approved Project. The modification to HH2 was made to update the reference to the SSEIR. The modification to HH3 was made to note that the high fire hazard maps are occasionally updated and does not affect the substance of the mitigation measure.

4. Discussions of Checklist and Mitigation Measures

The certified OCGP FEIR's Mitigation Measure HH1 was updated because much of the abatement it required has been completed. In addition, many of its requirements are triggered upon the transfer of the property from the DON to the City, and that transfer has already occurred for a substantial portion of the property associated with the Modified Project. The new Mitigation Measure HH1 is provided below.

Of the Mitigation Measures listed below, applicable measures will be incorporated into the proposed Project upon project implementation.

- HH1** For any remaining structures known to contain asbestos-containing materials (ACMs) that will be renovated and/or demolished, Heritage Fields shall ensure that all asbestos is removed and disposed of in accordance with applicable federal, State, and local regulatory requirements.

Prior to occupancy, renovation or demolition of any remaining structures constructed before October 1988, and in which the presence of ACMs is unknown, an asbestos survey shall be conducted by Heritage Fields. This requirement can be waived if an architect or project engineer responsible for the construction of the structure or an accredited asbestos inspector signs a statement that no ACM was specified as a building materials, and to the best of their knowledge, no ACMs were used as a building materials, if the asbestos survey identifies ACMs, the applicant shall ensure that all asbestos is removed and disposed of in accordance with applicable federal, State and local regulatory requirements.

Any existing structures in which ACMs have been identified and which will remain in use shall be addressed in an Operation and Maintenance Plan and must be managed in accordance with applicable laws.

Any renovation and/or lead-based paint (LBP) abatement activities on residential units at former MCAS El Toro shall be conducted in accordance with all applicable federal, State, and local regulatory requirements. The certified OCGP FEIR's Mitigation Measure HH2 required updating because its requirements were triggered upon the transfer of the property from the DON to the City, and that transfer has already occurred for a substantial portion of the property associated with the Modified Project. In addition, since the certified OCGP FEIR was prepared, FOSTs 4, 5, 6, and 7 have been issued and each specifies in detail the nature of the restrictions and institutional controls that must be implemented. The new Mitigation Measure HH2 is provided below:

- HH2** The portions of the Proposed Project site located on the active Installation Restoration Program (IRP) Sites listed in Table 5.5-2, *Action Required IRP Sites and Zoning – 2012 Modified Project*, of the DSSEIR for the 2012 Modified Project shall be used only in accordance with the requirements of the applicable Final FOST or Finding of Suitability to Lease, including in strict compliance with all lease restrictions (such as restrictions against soil or groundwater disturbance without approval from the DON and regulators) and all institutional controls (e.g., restrictions against disturbing the integrity of physical remedial components like caps or groundwater treatment systems and other restrictions imposed by the DON).

4. *Discussion of Checklist and Mitigation Measures*

- HH3** The Community Development Department, in coordination with the Orange County Fire Authority (OCFA), will be responsible for review of all development plans, which would include evaluation of very high fire severity zones, special fire protection plans, and any requirements for fuel modification zones. Projects potentially impacted by wild land fire hazards will be subject to OCFA Guidelines for "Development Within and Exclusion from Very High Fire Severity Zones" and "Fuel Modification Plans and Maintenance." Additionally, all demolition, renovation, and construction activities in the project area will be subject to review by OCFA to ensure adequate fire protection, water flow, emergency access, design features, etc., according to the standards of the Uniform Fire Code and the California Fire Code. Due to the implementation of these standard fire protection procedures and based on the revised Fire Hazard Maps, the 2012 Modified Project is not anticipated to result in significant short- or long-term adverse impacts related to fire hazards.
- HH4** Prior to issuance of occupancy permits of any existing structure at the former MCAS El Toro, a fire life-safety evaluation of the structure including recommendations for improvements required for compliance with current Building Codes for use of existing structures adopted by the City and plans for any required improvements shall be submitted to the Chief Building Official for review and approval.
- HH5** Prior to the issuance of a grading permit, the applicant shall prepare and the Director of Community Development shall approve a protocol plan (including but not limited to worker training, health and safety precautions, additional testing requirements, and emergency notification procedures) in the event that unknown hazardous materials are discovered during grading, construction, and/or related development activities. Additionally, said protocol plan will be revised should the discovery of previously unknown hazardous materials be made during any of the above mentioned development activities. The applicant and/or property owner that discovers contamination due to past military operations not previously identified by the DON shall be responsible for notifying the DON, appropriate regulatory agencies, and the Director of Community Development of the City in a timely manner. Additionally, said Protocol Plan shall be revised should the discovery of previously unknown hazardous materials be made during any of the above mentioned development activities.
- HH6** The City shall develop and maintain the location and status, as well as other pertinent information, of all monitoring wells on the former MCAS El Toro in a geographic information systems database (GIS). The City will review all permit applications on the former air station for monitoring well locations that may be affected by a permit, and require applicants to maintain appropriate access. Access to monitoring wells will be limited to authorized personnel.

Additionally, the SSEIR identified the following measures as existing PPP that apply to the proposed Project and will help reduce or avoid potential hazards and hazardous materials impacts:

Of the PPPs listed below, applicable measures will be incorporated into the proposed Project upon project implementation.

4. Discussions of Checklist and Mitigation Measures

- PPP 5-1** If any underground storage tanks (USTs) are encountered during site grading and excavation activities, they shall be removed in accordance with the existing standards and regulations of, and oversight by, the Orange County Health Care Agency (OCHCA), based on compliance authority granted through the California Code of Regulations, Title 23, Division 3, Chapter 16, Underground Tank Regulations. The process for UST removal is detailed in OCHCA's "Underground Storage Tanks: The Basics." Soil samples from areas where storage tanks have been removed or where soil contamination is suspected shall be analyzed for hydrocarbons including gasoline and diesel in accordance with procedures set forth by OCHCA. If hydrocarbons are identified in the soil, the appropriate response/remedial measures will be implemented as directed by OCHCA with support review from the Regional Water Quality Control Board until all specified requirements are satisfied and a Tank Closure Letter is issued. Any aboveground storage tank (AST) in existence at the commencement of site development shall be removed in accordance with all applicable regulations under the oversight of the OCFA. Compliance requirements relative to the removal/closure of storage tanks are set forth through California Health and Safety Code Sections 25280 through 25299.
- PPP 5-2** During demolition, grading, and excavation, workers shall comply with the requirements of Title 8 of the California Code of Regulations, Section 1532.1, which provides for exposure limits, exposure monitoring, respiratory protection, and good working practice by workers exposed to lead. Lead-contaminated debris and other wastes shall be managed and disposed of in accordance with the applicable provision(s) of the California Health and Safety Code.
- PPP 5-3** Prior to approval of a conditional use permit, project applicants shall prepare a Fire Master Plan for submittal to the OCFA consistent with OCFA Guideline B-09 (Fire Master Plans for Commercial and Residential Development).
- PPP 5-4** Federal law requires compliance with Rule 29 of the Code of Federal Regulations (CFR) Part 1926. Prior to site demolition activities, building materials shall be carefully assessed for the presence of lead-based paint, and its removal, where necessary, must comply with State and federal regulations, including Occupational Safety and Health Administration (OSHA) 29 CFR Part 1926. The OSHA rule establishes standards for occupational health and environmental controls for lead exposure. The standard also includes requirements addressing exposure assessment, methods of compliance, respiratory protection, protective clothing and equipment, hygiene facilities and practices, medical surveillance, medical removal protection, employee information and training, signs, recordkeeping, and observation of monitoring. Furthermore, the requirements of California Code of Regulations, Title 17, Division 1, Chapter 8, identify procedures that must be followed for accreditation, certification, and work practices for lead-based paint and lead hazards. Section 36100 thereof specifically sets forth requirements for lead-based paint abatement in public and residential buildings.
- PPP 5-5** Prior to site demolition activities, building materials must be carefully assessed for the presence of ACM, and removal of this material, where necessary, must comply with State and federal regulations, including SCAQMD Rule 1403, which specifies work practices with the goal of minimizing asbestos emissions during building demolition and renovation activities, including the removal and associated disturbance of ACMs. The requirements for demolition and renovation activities include asbestos surveying; notification; ACM removal procedures and time

4. *Discussion of Checklist and Mitigation Measures*

schedules; ACM handling and cleanup procedures; and storage, disposal, and landfill disposal requirements for asbestos-containing waste materials.

PPP 5-6 During site decommissioning and demolition activities, hazardous wastes must be managed in accordance with the requirements of Title 22, Division 4.5 of the California Code of Regulations. Title 22 sets forth the requirements with which hazardous-waste generators, transporters, and owners or operators of treatment, storage, or disposal facilities must comply. These regulations include the requirements for packaging, storage, labeling, reporting, and general management of hazardous waste prior to shipment. In addition, the regulations identify standards applicable to transporters of hazardous waste such as the requirements for transporting shipments of hazardous waste, manifesting, vehicle registration, and emergency accidental discharges during transportation.

PPP 5-7 During demolition, grading, and excavation, workers shall comply with the requirements of Title 8 of the California Code of Regulations, Section 1529, which provides for exposure limits, exposure monitoring, respiratory protection, and good working practices by workers exposed to asbestos. Asbestos-contaminated debris and other wastes shall be managed and disposed of in accordance with the applicable provision(s) of the California Health and Safety Code.

PPP 5-8 Evidence of soil and/or groundwater contamination (e.g., chemical odors and staining) unrelated to above/underground storage tank releases may be encountered during site development. The appropriate agency (e.g., OCHCA, DTSC, or the Regional Water Quality Control Board [RWQCB]) shall be notified if these conditions are encountered during construction or grading activities. With their oversight, an environmental site assessment shall be completed and a determination shall be made as to whether cleanup is required. Cleanup activities are required to be consistent with all applicable federal, State and local rules, regulations, and laws. A cleanup would not be considered complete until confirmatory samples of soil and/or groundwater reveal levels of contamination below the standards established by the oversight agency. Alternatively, a risk assessment may be prepared for the site to determine that there are no human or environmental risks associated with leaving contamination below specific levels in place. Construction in the impacted area shall not proceed until a "no further action" clearance letter or similar determination is issued by the oversight agency, or until a land use covenant is implemented.

4.9 HYDROLOGY AND WATER QUALITY

4.9.1 Environmental Setting

The OCGP FEIR describes the project site as being within the San Diego Creek watershed, which includes the San Diego Creek, Peters Canyon Channel, and the tributaries to these water courses. The major drainage channels that traverse the site (PA 51) are the Marshburn Channel, Bee Canyon Channel, Agua Chinon Channel, and Borrego Canyon Channel.

San Diego Creek and Upper Newport Bay are listed as impaired water bodies under Section 303(d) of the Clean Water Act. Accordingly, Total Maximum Daily Load (TMDL) for pollutants that have impaired these water bodies has been established and was included in the OCGP FEIR (OCGP FEIR Table 5.7-2). The OCGP FEIR also noted that the County of Orange and the City of Irvine hold a Nationwide Pollution

4. Discussions of Checklist and Mitigation Measures

Discharge Elimination System (NPDES) permit for the storm drain systems, and that the State has issued a NPDES general permit relating to construction activities on sites over five acres in the area. Lastly, the flood control improvements associated with the SR-133 toll road were noted in the OCGP FEIR as having reduced the 100-year flood zone north and west of the property.

4.9.2 Impacts Identified in the OCGP FEIR

The OCGP FEIR identified several significant impacts on hydrology and water quality associated with future development under the adopted Overlay Plan before mitigation. First, grading and excavation activities required for future development could result in the exposure of bare soils to both wind- and water-related erosion and associated significant water quality impacts (specifically, a violation of water quality standards or waste discharge requirements). Compliance with City grading and water quality regulations, including the NPDES discharge permitting requirements and preparation of a Storm Water Pollution Prevention Plan (SWPPP) and a Water Quality Management Plan (WQMP), are the primary means of controlling the potential impacts of grading and excavation activities. These City requirements, which are described in mitigation measures H/WQ1 and H/WQ2, will reduce the impact to a less-than-significant level.

According to the OCGP FEIR, the existing drainage patterns and stream courses would not be substantially altered by future development under the adopted Overlay Plan. In addition, the potential for inundation is reduced by improvements to upstream flood-control facilities. Without project-related flood-control facilities, the rate or amount of surface runoff due to new development would result in flooding on- and off-site, depending on the nature of the specific development. Although this impact was identified as significant, the effect of increased runoff would be reduced to a less-than-significant level through preparation and implementation of hydraulic studies, recommendations for each specific development and the construction of flood-control improvements commensurate with each specific development (Mitigation Measure H/WQ3).

The impact analysis for the Overlay Plan assumed development of the land use patterns created by the zoning designations for the Overlay Plan area and a backbone storm drain system. The storm drain system took into consideration and included improvements identified in the San Diego Creek Flood Control Master Plan. The drainage plan for the Overlay Plan area included improvements to the major drainages, including Marshburn Channel, Bee Canyon Channel, Agua Chinon Channel, and the Borrego Channel, the Wildlife Corridor and Serrano Creek, and San Diego Creek, as described in the OCGP FEIR and addenda.

While conceptually defined in the OCGP FEIR, the foregoing area-wide drainage and flood control facility system has since been undergoing increasingly more definitive design engineering refinement. The latest formal expression of these system enhancements is memorialized in the following documents: Master Plan of Drainage, Fuscoe Engineering February 23, 2007, Orange County Great Park - Hydrology/Hydraulic Report, Fuscoe Engineering June 12, 2007 (collectively, Fuscoe Reports); PAs 30 and 51 Bee Canyon, Agua Chinon, Borrego, Serrano and Upper San Diego Creek Update, RBF Consulting February 27, 2008, and PA 51 Marshburn Watershed Update, RBF Consulting March 14, 2008 (collectively, RBF Reports). These reports refine the drainage control system components described in the OCGP FEIR. The on-site channels will continue to drain the project site under existing conditions. Additional backbone storm drain facilities will be designed to accommodate the changes in the land use

4. Discussion of Checklist and Mitigation Measures

surface runoff within the Great Park Neighborhoods development. The post development hydrology was analyzed per the Orange County Hydrology Manual for a 100-year peak storm design event.

OCGP FEIR Mitigation Measure H/WQ3 states that prior to approval of the first tentative tract or parcel map in the project area, detailed hydrologic and hydraulic analysis shall be conducted. Studies and analyses shall be prepared in accordance with Orange County Flood Control District (OCFCD) methodologies and standards and the Flood Control Master Plan for San Diego Creek, as well as any additional guidelines in effect at the time of project design. Recommendations contained in the hydrology studies and/or hydraulic analysis to address drainage/flooding issues related to proposed development shall be implemented. In compliance with the mitigation measure, the Fuscoe Reports, and RBF Reports were prepared.

4.9.3 Impacts Associated with the Expanded Community Ice Facility

The proposed Project is located within the OCGP Master Plan area. Therefore, the OCGP FEIR adequately describes the nature and severity of the environmental effects of OCGP Master Plan and its current minor modification associated with the expansion of the Community Ice Facility, the subject of this Addendum, related to hydrology and water quality.

Grading and construction activities for the expansion of the Community Ice Facility have the potential to compact soil, which can alter drainage patterns and increase runoff during construction. Construction activities also have the potential to introduce pollutants of concern (e.g., sediments, trash, petroleum products, concrete waste [dry and wet], sanitary waste, and chemicals) into surface waters within the project site. As described in mitigation measures H/WQ1 and H/WQ2, the proposed Project would be required to prepare a Stormwater Pollution Prevention Plan (SWPPP) and implement construction Best Management Practices (BMPs) aimed at reducing pollutants of concern in storm water runoff, including those impacts associated with short-term hydrologic changes (e.g., increased runoff). The requirements of the current Construction General Permit are similar to, but more stringent than, the requirements of the permit in place at the time the OCGP FEIR was certified. Compliance with the current General Permit would ensure that no potential short-term construction impacts to hydrology and water quality would occur. Compliance with the current Construction General Permit would ensure consistency with the findings of the OCGP FEIR. Therefore, in consideration of the information above, the proposed Project would not require major revisions to the OCGP FEIR and would not result in new or substantially greater construction-related hydrology or water quality impacts than what was previously identified in the OCGP FEIR.

Development projects have the potential to alter the hydrologic regime of a project area by increasing runoff, decreasing infiltration, altering the volumes and timing of storm water runoff, and increasing postdevelopment downstream erosion, which includes secondary impacts (e.g., increasing turbidity and causing adverse impacts to aquatic and riparian habitat). Project operations also have the potential to introduce pollutants of concern into surface waters within the project area (e.g., suspended solids and sediments, trash and debris, nutrients, pesticides, heavy metals, oils and grease, and oxygen-demanding compounds). As described in mitigation measures H/WQ1 and H/WQ2, the proposed Project would be required to ascertain its impact on the project site's hydrologic regime and include the findings as part of the Water Quality Management Plan. If a hydrologic condition of concern exists, then the Water Quality Management Plan must evaluate whether the proposed project would adversely impact downstream erosion, sedimentation, or stream habitat. If adverse impacts are likely to occur, the proposed Project

4. Discussions of Checklist and Mitigation Measures

must implement BMPs to address the project's impacts from hydromodification. The proposed Project would also be required to implement BMPs to limit pollutants generated by its operation. The requirements of the updated NPDES Permit, the Drainage Area Management Plan (DAMP), and the Local Implementation Plan (LIP) expand upon and are more stringent than the requirements of the previous permit.

Compliance with the Municipal NPDES Permit, the DAMP, and the LIP would require implementation of BMPs to target pollutants of concern in stormwater runoff from the project site, which would ensure that potential operational impacts to hydrology and water quality are less than significant. Compliance with the approved Municipal Permit, the DAMP, and the LIP would also ensure consistency with the findings of the OCGP FEIR. Therefore, in consideration of the information above, the proposed Project would not require major revisions to the OCGP FEIR and would not result in new or substantially greater operation-related hydrology or water quality impacts than what was previously identified in the OCGP FEIR. Therefore, no mitigation is required for the proposed Project.

4.9.4 Findings

Major FEIR Revisions Not Required. Based on the foregoing analysis and information, there is no evidence that the Proposed project would require a major change to the certified OCGP FEIR. The proposed modification to the OCGP Master Plan and the WSPDP, which does not include any major change to park development areas identified in the approved OCGP Master Plan, will not result in any new significant environmental impact nor will there be a substantial increase in the severity of impacts from that described in the certified OCGP FEIR.

No Substantial Change in Circumstances Requiring Major FEIR Revisions. There is no information in the record or otherwise available that indicates that there are substantial changes in circumstances pertaining to hydrology and/or water quality that would require major changes to the certified OCGP FEIR.

No New Information of Substantial Importance Showing Greater Significant Effects Than Previous FEIR. All available relevant information has been analyzed, and there is no new information of substantial importance, which was unknown and could not have been known with the exercise of reasonable diligence at the time the OCGP FEIR was approved, augmented, and/or updated, indicating that the proposed Project will have one or more significant effects not discussed in the OCGP FEIR or result in a substantial increase in the severity of previously identified effects.

No New Information of Substantial Importance Showing Ability to Reduce Significant Effects in Previous FEIR. All available relevant information has been analyzed, and there is no new information of substantial importance which was unknown and could not have been known with the exercise or reasonable diligence at the time the OCGP FEIR was approved, augmented, and/or updated, indicating that (1) mitigation measures or alternatives previously found not to be feasible would in fact be feasible, and would substantially reduce one or more significant effects of the proposed Project, but the project proponent declines to adopt the mitigation measures or alternatives; or (2) mitigation measures or alternatives that are considerably different from those analyzed in the previous FEIR would substantially reduce one or more significant effects on the environment, but the project proponent declines to adopt the mitigation measures or alternatives. There are no alternatives to the proposed Project or additional

4. *Discussion of Checklist and Mitigation Measures*

mitigation measures that would substantially reduce one or more of the significant effects on hydrology and/or water quality identified in and considered by the OCGP FEIR.

4.9.5 Mitigation from the OCGP FEIR and Applicability to the Expanded Community Ice Facility

The OCGP FEIR identified four mitigation measures to reduce the effects of the project on hydrology and water quality. All of the mitigation measures are applicable to the proposed Project and would be carried forward to future development of the project site. Implementation of Mitigation Measures H/WQ 1 through H/WQ 4 would reduce project impacts to a less than significant level. The mitigation measures were modified in the SEIR.

Of the Mitigation Measures listed below, applicable measures will be incorporated into the proposed Project upon project implementation.

H/WQ1 Prior to issuance of a grading permit, the applicant shall provide evidence that the development of the project area shall comply with City-adopted Grading and Water Quality Ordinances to ensure that the potential for soil erosion is minimized on a project-by-project basis. Specifically, the NPDES discharge permitting requirements to which the City is obligated will ensure that construction activities reduce, to the maximum extent feasible, the water quality impacts of construction activities. The NPDES permit guidance states that "industrial/commercial construction operations that result in a disturbance of one acre or more of total land area ... and residential construction sites that result in the disturbance of five acres or more ... shall be required to develop and implement BMPs ... to control erosion and siltation and contaminated runoff from the construction sites." Note: In March 2003 this provision will apply to residential construction sites that result in the disturbance of 1 acre or more.

The City's standard conditions of approval indicate that a SWPPP shall be prepared prior to the approval of grading permits for any project site in order to reduce sedimentation and erosion. The SWPPP shall include the adoption of erosion and sediment control practices such as desilting basins and construction site chemical control management measures.

Additionally, prior to the issuance of a grading permit, project applicants must submit, and the Director of Community Development or designee must have approved, a Water Quality Management Plan (WQMP). The WQMP must identify the BMPs that will be used on the site to control predictable pollutant runoff after the site is occupied. Ongoing operations after construction would be subject to the Countywide Municipal NPDES Stormwater Permit, for which the City is a Co-Permittee. This WQMP shall identify, at a minimum, the routine, structural, and nonstructural measures specified in the Countywide NPDES DAMP Appendix which are applicable to a project, the assignment of long-term maintenance responsibilities (specifying the developer, parcel owner, maintenance association, lessee, etc.), and shall reference the location(s) of structural BMPs.

Also in accordance with standard City project permitting and approval procedures, Notices of Intent (NOI) for coverage of projects under the General Construction Activity Storm Water Runoff Permit will be submitted to the State Water Resources Control Board prior to issuance of grading permits in the project area. This requirement will be met to the

4. Discussions of Checklist and Mitigation Measures

satisfaction of the Director of Community Development of any disturbance of one acre or more of soil in the project area. Also in force during the period of construction would be the General Dewatering NPDES permit of the Santa Ana RWQCB, as well as the provisions of the Countywide Permit.

The Mitigation Measures will be implemented in accordance with local and State regulatory requirements. As future projects are planned and designed in the project area, specific BMPs and other water quality control methods will be utilized to reduce water quality degradation in the Newport Bay watershed. Future projects in the proposed project area will acknowledge and implement those additional requirements that may be imposed by the RWQCB in the future. Compliance with these measures shall be verified by the Community Development Department.

H/WQ2 Prior to issuance of a grading permit, evidence (e.g., in the form of a construction management plan) shall be provided that demonstrates that all stormwater runoff and dewatering discharges from the project area shall be managed to the maximum extent practicable or treated as appropriate to comply with water quality requirements identified in the Santa Ana RWQCB Basin Plan, including the Total Maximum Daily Load (TMDL) Implementation Plan adopted for this watershed.

H/WQ3 Prior to approval of the first tentative tract or parcel map in the project area, detailed hydrologic and hydraulic analysis shall be conducted. Studies and analysis shall be prepared in accordance with OCFCD methodologies and standards and the Flood Control Master Plan for San Diego Creek, as well as any additional guidelines in effect at the time of project design. Recommendations contained in the hydrology studies and/or hydraulic analysis to address drainage/flooding issues related to proposed development shall be implemented. Compliance with this measure shall be verified by the Community Development Department.

H/WQ4 Prior to issuance of a building permit for any unit within the 100-year floodplain, developers with property located in the newly delineated 100-year floodplain shall be required to construct such improvements as necessary to remove the property from the 100-year floodplain. Additionally, the developer shall prepare a Letter of Map Revision (LOMR) request to have the Flood Insurance Rate Maps (FIRMs) revised to remove the development areas from the 100-year floodplain upon completion of the approved flood control facilities. The LOMR request shall be filed upon completion of design of the flood control improvements to contain or redirect the 100-year flood flows away from the property.

After the improvements are constructed, Record Drawings and a maintenance agreement with, or letter from, a public agency shall be submitted to the Federal Emergency Management Agency (FEMA) to complete the LOMR process.

Additionally, the SSEIR identified the following measures as existing PPP that apply to the proposed Project and will help reduce or avoid potential hydrology and water quality impacts:

4. *Discussion of Checklist and Mitigation Measures*

Of the PPPs listed below, applicable measures will be incorporated into the proposed Project upon project implementation.

PPP 6-1 Prior to the issuance of a precise grading permit, the applicant shall submit a hydrology and hydraulic analysis of the site. The analysis shall be prepared by a professional civil engineer versed in flood control analysis and shall include the following information and analysis (Standard Condition A.6):

- a. Hydrology/hydraulic analysis of 100-year surface water elevation at the project site to determine building elevation or flood proofing elevation.
- b. Analysis of existing and post-development peak 100-year storm flow rates, including mitigation measures to reduce peak flows to existing conditions.

An analysis demonstrating that the volume of water ponded on the site and stored underground in the drainage system outside of the building envelope in the proposed condition is greater than or equal to the corresponding volume in the existing condition. The water surface used to determine the ponded volume shall be based on the water surface in the major flood control facility that the site is tributary to.

PPP 6-2 Prior to the issuance of a precise grading permit, the applicant shall submit a groundwater survey of the site. The analysis shall be prepared by a geotechnical engineer versed in groundwater analysis and shall include the following information and analysis (Standard Condition A.7):

- a. Potential for perched groundwater intrusion into the shallow groundwater zone upon buildout.
- b. Analysis for relief of groundwater buildup and properties of soil materials on-site.
- c. Impact of groundwater potential on building and structural foundations.
- d. Proposed mitigation to avoid potential for groundwater intrusion within 5 feet of the bottom of the footings.

PPP 6-3 This project will result in soil disturbance of 1 or more acres of land that has not been addressed by an underlying subdivision map. Prior to the issuance of preliminary or precise grading permits, the applicant shall provide the City Engineer with evidence that a NOI and relevant Permit Registration Documents have been filed with the State Water Resources Control Board and that a Waste Discharge Identification ("WDID") Number is issued. Such evidence shall consist of a copy of the NOI Receipt letter with WDID retrieved from the State Water Resources Control Board Stormwater Multi-Application and Report Tracking System (SMARTS) website or the RWQCB, or a letter from either agency stating that the NOI has been filed (Standard Condition A.10).

PPP 6-4 Prior to the issuance of precise grading permits, the applicant shall submit, and the Director of Community Development shall have approved, a project WQMP. The WQMP shall identify the BMPs that will be used on the site to control predictable pollutant runoff (Standard Condition A.13).

4. Discussions of Checklist and Mitigation Measures

4.10 LAND USE AND PLANNING

4.10.1 Environmental Setting

The OCGP FEIR described the existing and former land uses in PA 51, including former PA 30, and other areas adjoining and surrounding these planning areas. Subsequent to the City's approval of the GPA/ZC for the Overlay Plan, DON initiated an auction process for the sale of the former MCAS El Toro property. To facilitate the transfer, the property was divided and presented to prospective buyers as four distinct parcels. Interested parties were invited to bid on one or more of the parcels. In 2005, Heritage Fields, El Toro, LLC successfully purchased all four parcels from the DON (3,671 acres), and entered into a Development Agreement with the City on July 12, 2005. The Development Agreement sets forth the terms and conditions of subsequent development and implementation of the Great Park, including dedication in fee of 1,096 acres of the property for development of the Great Park Master Plan.

The existing facilities and uses within the OCGP Master Plan area include existing portions of the Western Sector Park Development Plan (WSPDP) Phase I (e.g., the Balloon Park, Hangar 244, artist lofts, Central and West Timeline, North and South Lawns, Farm & Food Lab, Palm Court, and support parking). Consistent with the City's Zoning Ordinance, there are interim uses of the land and existing buildings which include Tierra Verde Industries, a composting and electronic waste recycling facility; agriculture; and a special event parking lot.

4.10.2 Impacts Identified in the OCGP FEIR

The OCGP FEIR identified no significant impact to established communities. There were no residents living within the PA 51 at the time the OCGP FEIR was prepared. There are now residents living within Development District 1-North, however, there are no residents living within the proposed Project site. The OCGP FEIR analyzed certain amendments to the City's General Plan that were adopted on May 27, 2003, as part of the City's adoption of the Overlay Plan. The adopted Overlay Plan was determined to be consistent with each element of the General Plan.

Additionally, the detailed General Plan and Zoning Ordinance consistency analysis conducted in the SSEIR also concluded that the 2012 Modified Project was consistent with the applicable goals and policies of the General Plan. The 2012 Modified Project proposed to include various changes to the City's Zoning Ordinance, not consistent with the zoning at that time, which could potentially create a significant land use impact. However, it was concluded that implementation of the zone changes that were proposed would bring the zoning into compliance and no impact would result.

4.10.3 Impacts Associated with the Expanded Community Ice Facility

The proposed Project is consistent with the land uses approved in concert with the certification and Addenda to the OCGP FEIR. The proposed Project would implement approved development, and therefore would not affect the goals, objectives or policies, or the facilities and services described in any of the General Plan Elements. No changes or new impacts would occur. In addition, the proposed Project does not contain elements that would alter the findings, conclusions and mitigation measures since all proposed Project development remains within the previously established OCGP Master Plan boundaries. Although the proposed Project would increase the square footage and spectator seating in the community

4. Discussion of Checklist and Mitigation Measures

ice rink, the proposed Project would not result in new uses not previously anticipated in the OCGP Master Plan and there would be a corresponding decrease in the square footage of another use within the OCGP. The proposed addition of building square feet for the Community Ice Facility site would be deducted from other approved uses so that the maximum building square footage allocated for the overall uses within the OCGP will not be exceeded. The proposed Project also includes the construction of "G" Street, a new north/ south roadway between the special event parking area and the Project site. No new uses and facilities are proposed that would physically divide an established community; conflict with any applicable land use plan, policy or regulations; or conflict with any applicable habitat conservation plan or natural community conservation plan. The following analysis discusses the proposed Project, consisting of an additional sheet of ice for the Community Ice Facility, "G" Street, and the removal of the WSPDP picnic area, in consideration of each General Plan Element:

Circulation Element: The goal of the Circulation Element is "to provide a balanced transportation system." The proposed Project also includes the construction of "G" Street, a new north/south roadway between the special event parking area and the Project site. The construction of "G" Street would facilitate movement between the parking area and the Project site. "G" Street would be constructed to the City's current standards.

Housing Element: The goal of the Housing Element is to "provide for safe and decent housing for all economic segments of the community." The proposed Project would not increase or decrease the number of residential units approved for the project analyzed in the OCGP FEIR since only parkland is affected by the proposed modifications.

Cultural Resources: The proposed Project would not affect the adopted goals, objectives, and policies of this element. Development would be required to comply with this element's requirements and to implement mitigation measures found in the OCGP FEIR. With implementation of OCGP FEIR measures P1 and CULT1 through CULT4, the impacts of new development on paleontological and cultural resources would be less than significant. Furthermore, the proper disposition of such resources, if any are encountered prior to or during construction would be ensured; and through the information recovered, the community's understanding and appreciation for its historic and prehistoric heritage would have been enhanced.

Noise Element: The proposed Project would not affect the goal of this element (i.e., "to contribute to a healthy and safe environment by minimizing noise impacts") or the mobile noise, stationary noise, and noise abatement objectives and implementing policies of the element. The proposed Project modifies the existing set of planned park uses, but not in a way that would increase or decrease noise to a significant extent.

Public Facilities and Services Element: The proposed Project would not affect facilities or services described in the Urban Service Plan for the adopted Overlay Plan. As no substantive change in the Urban Service Plan is necessary, and that plan was a principle means of demonstrating consistency with the Public Facilities and Services Element, the proposed Project also is consistent with this element of the General Plan. In fact, development of the proposed Project facilitates accomplishment of the Public Facilities and Services Element by assisting in achieving the objectives and policies that ensure a full range of necessary public facilities and services that are convenient to the users.

4. Discussions of Checklist and Mitigation Measures

Integrated Waste Management Element: This element seeks to “encourage solid waste reduction and provide for the efficient recycling and disposal of refuse and solid waste material without deteriorating the environment.” The proposed Project would not affect the adopted objectives and implementing policies regarding solid waste, waste, wastewater, and solid waste facility siting requirements.

Growth Management Element: The goal of the Growth Management Element is to “ensure that growth and development are integrally planned with, and phased concurrently with, the City of Irvine’s ability to provide an adequate circulation system and public facilities.” When the OCGP FEIR was certified, it disclosed that, although it included changes to the Master Plan of Arterial Highways. The OCGP project would not change any of the objectives or implementing policies of the Growth Management Element. The proposed Project likewise would not alter any of the objectives or implementing policies because it would remain consistent with the development phasing already a part of the overall development plan.

Parks and Recreation Element: The goal of the Parks and Recreation Element is to “provide park and recreation opportunities at a level that maximizes available funds and enables residents of all ages to utilize their leisure time in a rewarding, relaxing, and creative manner.” The proposed Project facilitates achievement of this objective by adopting changes to the OCGP Master Plan that are necessary to proceed forward with development of the Community Ice Facility that is a component of the approved OCGP Master Plan.

Conservation and Open Space Element: The goal of this element is to “maintain and preserve the environmental systems as a major feature in the City.” This goal would continue to be achieved through the implementation of objectives L-1 through L-12 and corresponding policies. Objective L-10 encourages “the maintenance of agriculture in undeveloped areas of the City until the time of development, and in areas not available for development.” The proposed Project would not alter any of the objectives or implementing policies.

Seismic Element: The goal of the Seismic Element is to “minimize the loss of life, disruption of goods and services, and the destruction of property associated with an earthquake.” Five SRA designations are used to describe the magnitude and types of potential seismic hazards present within the City, and provide policy guidance. The OCGP FEIR reported that the majority of the El Toro property was in category SRA-2. The OCGP FEIR reported that no objectives or implementing policies would be changed as a result of the OCGP project. Likewise, the proposed Project would not alter that finding/conclusion because all proposed Project development remains within the previously established OCGP Master Plan boundaries.

Safety Element: The goal of the Safety Element is to “minimize the danger to life and property from manmade and natural hazards, including fire hazards, flood hazards, non-seismic geologic hazards, and air hazards.” The OCGP FEIR disclosed the need for fuel modification to mitigate potential wildland fire hazards and drainage improvements to lessen flood hazards associated with implementation of the project, and concluded no objectives or implementing policies would be changed as a result of the adopted Overlay Plan. Likewise, the proposed Project would not alter any of the objectives or implementing policies.

4.10.4 Findings

Major FEIR Revisions Not Required. Based on the foregoing analysis and information, there is no

4. Discussion of Checklist and Mitigation Measures

evidence that the Proposed project would require a major change to the certified OCGP FEIR. The proposed modification to the OCGP Master Plan, which does not include any major change to park development areas identified in the approved OCGP Master Plan, will not result in any new significant environmental impact nor will there be a substantial increase in the severity of impacts from that described in the certified OCGP FEIR.

No Substantial Change in Circumstances Requiring Major FEIR Revisions. There is no information in the record or otherwise available that indicates that there are substantial changes in circumstances pertaining to Land Use and Planning that would require major changes to the certified OCGP FEIR.

No New Information of Substantial Importance Showing Greater Significant Effects Than Previous FEIR. All available relevant information has been analyzed, and there is no new information of substantial importance that was unknown and could not have been known with the exercise of reasonable diligence at the time the OCGP FEIR was approved, augmented, and/or updated, indicating that the proposed Project will have one or more significant effects not discussed in the OCGP FEIR or result in a substantial increase in the severity of previously identified effects.

No New Information of Substantial Importance Showing Ability to Reduce Significant Effects in Previous FEIR. All available relevant information has been analyzed, and there is no new information of substantial importance that was unknown and could not have been known with the exercise of reasonable diligence at the time the OCGP FEIR was approved, augmented, and/or updated, indicating that (1) mitigation measures or alternatives previously found not to be feasible would in fact be feasible, and would substantially reduce one or more significant effects of the proposed Project, but the project proponent declines to adopt the mitigation measures or alternatives; or (2) mitigation measures or alternatives that are considerably different from those analyzed in the previous EIR would substantially reduce one or more significant effects on the environment, but the project proponent declines to adopt the mitigation measures or alternatives. There are no alternatives to the proposed Project or additional mitigation measures that would substantially reduce one or more of the significant effects on Land Use and Planning quality identified in and considered by the OCGP FEIR.

4.10.5 Mitigation from the OCGP FEIR and Applicability to the Expanded Community Ice Facility

The OCGP FEIR identified no significant land use impacts; therefore, no mitigation measures were proposed. However, the following existing PPPs and PDFs would help reduce and avoid potential impacts related to land use and planning.

Of the PPPs and PDFs listed below, applicable measures will be incorporated into the proposed Project upon project implementation.

- Aesthetics PPP 1-1
- Air Quality PPP 3-1 through 3-5
- Greenhouse Gas Emissions PPP 4-1 through 4-12
- Hazards and Hazardous Materials PPP 5-1 through 5-8
- Hydrology and Water Quality PPP 6-1
- Noise PPP 8-1 through 8-3

4. Discussions of Checklist and Mitigation Measures

- Public Services PPP 10-1 through 10-10
- Utilities and Service Systems PPP 13-1 through 13-8
- Greenhouse Gas Emissions PDFs 4-5, 4-7 and 4-8

4.11 NOISE

4.11.1 Environmental Setting

The OCGP FEIR described mobile noise sources from nearby freeways, roadways, rail facilities, and vehicle use at adjacent commercial businesses, light industrial facilities, and agricultural lands as the dominant noise source in the project area. Stationary sources of noise included temporary and intermittent noise from construction activities and agricultural operations, noise associated with the industrial/business parks to the east and the business park and entertainment uses to the south.

The OCGP FEIR presented the results of a noise survey, in which noise measurements were conducted at nine locations. Ambient noise levels at the four surveyed representative residential locations ranged from 58 A-weighted decibels (dBA) to 65 dBA Community Noise Equivalent Level (CNEL) (Refer to OCGP FEIR p. 5.4-18, Figure 5.4-6, and Table 5.4-7). The audible noise sources included local traffic, distant traffic, birds, aircraft, and human voices, all of which were characterized as typical of suburban areas.

4.11.2 Impacts Identified in the OCGP FEIR

The OCGP FEIR concluded that development of the Overlay Plan would not result in any significant noise effects. The noise assessment considered a worst-case condition of simultaneous demolition and construction activities with the combined sound level of 20 pieces of large mobile equipment operating at a distance of 5,000 feet; 5 concrete breakers operating at a distance of 6,000 feet; and 2 crusher plants operating at a distance of 10,000 feet from the nearest off-project area residential location. The distances represented the closest possible location of the construction equipment to the nearest off-project area residences during a heavy construction period. The nearest off-site residential uses (sensitive noise source) were located approximately 4,000 feet from the property boundary. Under this scenario, the analysis estimated sound levels of approximately 56 dBA at the nearest off-site residential location. (Refer to OCGP FEIR, p. 5.4-24 and Table 5.4-8)

As buildout of the project site was assumed to occur over time (years 2007–2025), construction-related noise impacts on residential areas within the proposed Project site were also estimated. Using the same construction equipment assumptions and a distance of 600 feet from the nearest residential area, the combined effect of the equipment was estimated at a sound level of 70 dBA at the nearest on-site residential locations during a heavy construction period. While the City of Irvine Noise Ordinance does not specify a limit on construction noise levels, it stipulates the days and hours during which construction activities may occur and when construction would not be allowed unless a temporary waiver is requested and granted; specifically, construction is allowed Monday through Friday between 7:00 a.m. and 7:00 p.m., and on Saturdays between 9:00 a.m. and 6:00 p.m.; no construction is allowed outside those hours, on Sundays, or on federal holidays unless a temporary waiver is granted by the Chief Building Official or authorized representative (Refer to OCGP FEIR, p. 5.4-31.)

The SSEIR concluded that operational noise levels of the Modified Project would not create a substantial

4. Discussion of Checklist and Mitigation Measures

permanent increase in ambient noise levels or expose persons to noise levels in excess of the exterior or interior noise level standards established in the City's Noise Ordinance and the Noise Element of the City's General Plan. In terms of ambient noise levels at sensitive receptors, the SSEIR concluded that with preparation of a noise study (interior and exterior noise) prior to obtaining building permits (Mitigation Measure N-1), the Modified Project's impacts would be less than significant. The SSEIR also indicated that with implementation of plans, programs and policies and project design features, the Modified Project's construction noise impacts to off-site noise-sensitive receptors would be less than significant. It was also concluded that the Modified Project would not result in cumulative noise impacts.

4.11.3 Impacts Associated with the Expanded Community Ice Facility

The OCGP FEIR noise assessment considered a worst-case condition of simultaneous demolition and construction activities. The worst-case assumptions described for the adopted Overlay Plan provide conservative assumptions for the proposed Project; no new information about future demolition and construction has become available that would increase the number of pieces of equipment to be operated simultaneously.

Construction Noise

Construction activities associated with the proposed Project would result in a short-term increase in ambient noise levels in proximity to construction activities on the proposed Project site. The proposed Project is approximately 1,600 feet from the nearest off site noise-sensitive use (i.e., residences along Sand Canyon Avenue). Noise is generally a concern if emanated within 1,000 feet between the noise source and the receptor. The newly constructed Beacon Park residential neighborhood, located in Development District 1-North, is less than one mile (approximately 2,725 feet) north of the proposed Project site. Construction noise from the proposed Project will be substantially attenuated by the large distance from the project site to these noise sensitive uses. In addition, the Eastern Transportation Corridor (i.e., Route 133) is adjacent to these residences and will mask the noise generated from the construction of the Project. Consequently, the proposed Project would not increase the forecasted noise levels generated during construction activities for the development of the Master Plan. Therefore, the construction noise levels associated with the proposed Project are anticipated to be less than those addressed in the OCGP FEIR and would not result in any significant impacts.

Construction Vibration

The OCGP FEIR identified that nuisance vibration (i.e., human annoyance) from construction activities associated with the adopted Overlay Plan would result in noticeable vibration levels in proximity to the construction activities. However, vibration annoyance from construction activities would be temporary, and occur during the daytime in proximity to construction activities; therefore, nuisance vibration would be less than significant. Existing structures are located sufficient distance away from construction activities such that structural damage from vibration would not occur (i.e., the nearest residence is 1,800 feet¹ from the construction activities). The proposed Project, consisting of modifications to the Community Ice Facility would not generate significantly higher levels of vibration. Therefore, the construction vibration

¹ At the property line, the nearest residential use is 1,600 feet from the Project site. For the purposes of the vibration analysis, the distance is measured to the nearest residential structure, which is 1,800 feet from the Project site.

4. Discussions of Checklist and Mitigation Measures

levels associated with the proposed Project are anticipated to be similar to those addressed in the OCGP FEIR, and would not result in any significant impacts.

Operation Noise

Current information regarding the noise impacts within the proposed Project site were previously evaluated in the OCGP FEIR. The OCGP FEIR concluded that noise associated with land uses would not be significant with use of acoustical design features (e.g., sound insulating construction, perimeter barrier walls, acoustical equipment enclosures, and operational restrictions) incorporated to comply with the local regulations. Stationary sources of noise associated with heating, ventilation, and air conditioning units and other sources would be attenuated by the large distance (approximately 1,600 feet) between the project site and off-site noise-sensitive land uses. Sports events held at the project site will occur in a closed structure which would substantially attenuate noise associated with spectator cheering, loudspeakers, and other sources of noise produced from competitive sports events. Additionally, the nearest off-site noise-sensitive uses are approximately 1,600 feet away, which would substantially attenuate noise generated within the enclosed facility. Therefore, noise levels associated with the proposed Project are anticipated to be similar to or less than those addressed in the OCGP FEIR and would not result in any significant impacts.

Traffic Noise

The Environmental Noise Assessment prepared for the OCGP FEIR identified a traffic noise screening analysis threshold of 1.5 dBA for all project-related traffic noise level increases where the resulting noise levels would be in excess of 65 dBA, and required further analysis where that screening threshold was met within residential and other sensitive areas. Although changes in noise levels of 3 dBA are considered "barely perceptible," and changes of 5 dBA are considered "clearly noticeable," the OCGP FEIR used this 1.5 dBA noise level screening threshold to be conservative. The OCGP FEIR concluded that the development within PA 51 would cause no significant impact on account of traffic noise.

The proposed expansion of the Community Ice Facility would increase project-related noise from mobile sources by a maximum of 96 vehicle trips in the PM peak hour and 720 trips throughout the day compared to the previously proposed ice facility based on the *Limited Scope Traffic Impact Analysis Great Park Community Ice Facility*. This increase in the magnitude of vehicle traffic would not result in traffic noise level changes that would substantially increase project-related traffic noise generated by the proposed Project or result in traffic noise levels that exceed 65 dBA at noise sensitive receptors. Therefore, noise levels associated with the proposed Project are anticipated to be similar to those addressed in the OCGP FEIR and would not result in any new significant impacts.

Airport Noise

The former MCAS El Toro operations have ceased and no public airport, public use airport, or airport land use plan exists in the proposed Project vicinity. Therefore, noise levels associated with the proposed Project are anticipated to be similar to those addressed in the OCGP FEIR and would not result in any significant impacts.

4. Discussion of Checklist and Mitigation Measures

Land Use Compatibility

In October 2011, a Community Ice Facility was approved as part of a minor modification to the OCGP Master Plan. Addendum No. 8 to the OCGP FEIR was approved concurrently to address potential environmental impacts associated with the minor modification to the OCGP Master Plan. The Master Plan anticipated a 117,635 square feet, three sheet, Community Ice Facility. The proposed minor modification of the Master Plan would increase the Community Ice Facility's square footage from 117,635 square feet to 270,000 square feet to accommodate an additional sheet of ice and accessory uses. Although the proposed Project would increase the square footage and spectator seating in the community ice rink, the proposed Project would not result in new uses not previously anticipated in the OCGP Master Plan and there would be a corresponding decrease in the square footage of another use within the OCGP. The proposed addition of building square feet for the Community Ice Facility site would be deducted from other approved uses so that the maximum building square footage allocated for the overall uses within the OCGP will not be exceeded. Because the OCGP FEIR did not identify any significant impacts related to land use compatibility, the proposed Project, consisting of modifications to the Community Ice Facility, is also compatible with the Irvine General Plan and zoning code for noise and vibration compatibility.

4.11.4 Findings

Major FEIR Revisions Not Required. Based on the foregoing analysis and information, there is no evidence that the Proposed project would require a major change to the certified OCGP FEIR. The proposed modification to the OCGP Master Plan, which does not include any major change to park development areas identified in the approved OCGP Master Plan, will not result in any new significant environmental impact nor will there be a substantial increase in the severity of impacts from that described in the certified OCGP FEIR.

No Substantial Change in Circumstances Requiring Major FEIR Revisions. There is no information in the record or otherwise available that indicates that there are substantial changes in circumstances pertaining to noise that would require major changes to the certified OCGP FEIR.

No New Information of Substantial Importance Showing Greater Significant Effects Than Previous FEIR. All available relevant information has been analyzed, and there is no new information of substantial importance, which was unknown and could not have been known with the exercise of reasonable diligence at the time the OCGP FEIR was approved, augmented, and/or updated, indicating that the proposed Project will have one or more significant effects not discussed in the OCGP FEIR or result in a substantial increase in the severity of previously identified effects.

No New Information of Substantial Importance Showing Ability to Reduce Significant Effects in Previous FEIR. All available relevant information has been analyzed, and there is no new information of substantial importance, which was unknown and could not have been known with the exercise of reasonable diligence at the time the OCGP FEIR was approved, augmented, and/or updated, indicating that (1) mitigation measures or alternatives previously found not to be feasible would in fact be feasible, and would substantially reduce one or more significant effects of the proposed Project, but the project proponent declines to adopt the mitigation measures or alternatives; or (2) mitigation measures or alternatives that are considerably different from those analyzed in the previous EIR would substantially reduce one or more significant effects on the environment, but the project proponent declines to adopt the mitigation measures or alternatives. There are no alternatives to the proposed Project or additional

4. Discussions of Checklist and Mitigation Measures

mitigation measures that would substantially reduce one or more of the significant noise effects identified in and considered by the OCGP FEIR.

4.11.5 Mitigation from the OCGP FEIR and Applicability to the Expanded Community Ice Facility

The OCGP FEIR identified no significant noise impacts; therefore no mitigation measures were proposed. However, the SEIR identified the following measures that apply to the proposed Project and will help reduce or avoid potential noise impacts:

Of the Mitigation Measures listed below, applicable measures will be incorporated into the proposed Project upon project implementation.

- N-1** Prior to the issuance of building permits for lots facing or located near major highways (e.g., Irvine Boulevard), the project applicant or its successor shall provide a final noise study to the Director of Community Development that demonstrates how the exterior and interior noise requirements (65 dBA CNEL and 45 dBA CNEL, respectively) of the City General Plan Noise Element will be met. To attain the exterior and interior noise requirements, the final noise study shall include, but not be limited to the following measures, in addition to such measures as the final noise study determines are required and shall be shown on the final map:

Exterior

- Provide a minimum 6-foot high noise barrier for single-family detached residences shown in Figures 5.7-3 through 5.7-7 of this Draft Subsequent Environmental Impact Report (DSEIR).

Interior

- Provide a "windows closed" condition, requiring a means of mechanical ventilation (e.g., air conditioning) for all units.
- Provide standard and upgraded dual-glazed windows with a minimum Sound Transmission Coefficient rating of 26. Specific window recommendations shall be made once final architectural plans are available and detailed interior noise reduction calculations can be calculated based on actual building assembly details.

- N-2** Prior to authorization to use, occupy and/or operate any multi-family residential unit, the project applicant or its successor shall submit evidence to the satisfaction of the Director of Community Development that occupancy disclosure notices for residential units with balconies that do not meet the City's exterior noise standard of 65 dBA CNEL will be provided to all future tenants pursuant to the City's Noise Ordinance.

The SSEIR identified the following measures as existing PPPs that apply to the proposed Project and will help reduce or avoid potential noise impacts:

Of the PPPs listed below, applicable measures will be incorporated into the proposed Project upon project implementation.

4. *Discussion of Checklist and Mitigation Measures*

- PPP 8-1** Title 6 (Public Works), Division 8 (Pollution), Chapter 2 (Noise) of the Irvine Municipal Code, also known as the City's Noise Ordinance, outlines the regulations necessary to control unnecessary, excessive and annoying noise in the City. The provisions of this chapter are applicable to nontransportation-related stationary noise sources. It outlines the noise level measurement criteria; establishes the noise zones and the maximum permitted exterior and interior noise standards in each zone; and discloses special noise provisions for construction, truck delivery and maintenance activities. For example, as outlined in Section 6-8-205 of the Noise Ordinance, no construction shall be permitted outside of the hours of 7:00 a.m. to 7:00 p.m. Monday through Friday and 9:00 a.m. to 6:00 p.m. Saturdays, unless a temporary waiver is granted by the Chief Building Official or authorized representative. Trucks, vehicles, and equipment that are making, or are involved with, material deliveries, loading, or transfer of materials, equipment service, maintenance of any devices or appurtenances for or within any construction project in the City shall not be operated or driven on City streets outside of these hours or on Sundays and federal holidays unless a temporary waiver is granted by the City. Any waiver granted shall take impact upon the community into consideration. No construction activity will be permitted outside of these hours except in emergencies including maintenance work on the City rights-of-way that might be required.
- PPP 8-2** Prior to the issuance of building permits for each structure or tenant improvement, other than a parking structure, the applicant shall submit a final acoustical report prepared to the satisfaction of the Director of Community Development. The report shall demonstrate that the development will be sound attenuated against present and projected noise levels including stationary, roadway, aircraft, helicopter, and railroad noise to meet City interior and exterior noise standards. The final acoustical report shall include all information required by the City's Acoustical Report Information Sheet (Form 42-48). The report shall be accompanied by a list identifying the sheet(s) of the building plans that include required sound attenuation measures (Standard Condition 3.5).
- PPP 8-3** Title 5 (Planning), Division 10 (Grading Code and Encroachment Regulations), Chapter 1 (Grading Code), Section 5-10-127.G (Import and Export of Earth Materials) of the City Municipal Code, states that if a grading project includes the movement of earth material to or from the site in an amount considered substantial by the Chief Building Official, the permittee is required to submit the proposed haul route for review and approval by the Chief Building Official. Special conditions of the grading permit may be imposed that require alternate routes or other measures in consideration of the possible impact on the adjacent community environment or effect on the public right-of-way itself.

The Second Supplemental Environmental Impact Report (SSEIR) also identified the following measure as PDF that apply to the proposed Project and will help reduce or avoid potential noise impacts. The following PDF, as applicable, will be incorporated into the proposed Project upon project implementation.

- PDF 8-1 Construction Noise:** Prior to issuance of grading permits, the project applicant or its successor shall incorporate the following measures as a note on the grading plan cover sheet to ensure that the greatest distance between noise sources and sensitive receptors during construction activities has been achieved, and that construction noise has been

4. Discussions of Checklist and Mitigation Measures

reduced.

- During construction activities, all construction equipment, fixed or mobile, shall be equipped with properly operating and maintained mufflers, consistent with manufacturers' standards. All stationary construction equipment shall be placed so that emitted noise is directed away from the noise-sensitive receptors nearest the proposed Project site boundaries.
- Equipment shall be staged in areas that will create the greatest distance between construction-related noise sources and the noise-sensitive receptors nearest the proposed Project site during all project construction.
- All construction-related activities shall be restricted to the construction hours outlined in the City's Noise Ordinance (Municipal Code Section 6-8-205).
- Haul truck and other construction-related trucks traveling to and from the proposed Project site shall be restricted to the same hours specified for the operation of construction equipment. To the extent feasible, haul routes shall not pass directly by sensitive land uses or residential dwellings.
- Where construction will occur adjacent to any developed/occupied noise-sensitive uses, a construction-related noise mitigation plan shall be submitted the Director of Community Development for review and approval prior to the issuance of grading permits. The plan must depict the location of construction equipment and how the noise from this equipment will be mitigated during construction of the 2012 Modified Project, through the use of such methods as: (1) temporary noise attenuation fences; (2) preferential location of equipment; and (3) use of current technology and noise-suppression equipment.
- Construction of planned sound walls that have been incorporated into the project design shall be installed prior to construction of the building foundation; or temporary sound blankets (fences typically composed of poly-vinyl-chloride-coated outer shells with absorbent inner insulation) shall be placed along the boundary of the proposed Project site facing the nearest noise-sensitive receptors during construction activities.

4.12 POPULATION AND HOUSING

4.12.1 Environmental Setting

The OCGP FEIR examined demographics in the context of the existing and projected population of the Orange County region and the City. Population and housing information was developed based on the 2000 United States Bureau of Census population, household, and employment census information. The most recent Census was conducted in 2010 (2010 Census) and this data is used, when available, for analysis in this section. The areas surrounding the former base and the Orange County subregion are considered jobs-rich and housing-poor. The SCAG seeks to encourage housing growth over job growth in the Orange County subregion.

4. Discussion of Checklist and Mitigation Measures

The OCGP FEIR reported that the ratio of jobs to housing in the area has environmental implications related to transportation and air quality. Thus, a major focus of the regional planning efforts has been to improve the ratio of jobs to housing in all affected subregions in order to reduce the vehicular trips, costly infrastructure improvements, and resultant air emissions.

4.12.2 Impacts Identified in the OCGP FEIR

As noted above, the area surrounding the former MCAS El Toro and the Orange County subregion are considered jobs-rich and housing-poor. SCAG seeks to improve the jobs-to-housing ratio in the Orange County subregion. The OCGP FEIR reported that regional projections are dynamic and, as a compilation of local land use projections, reflect changing community views on the location and the types of growth desired. The Orange County Council of Governments adopted the Orange County Projections 2010 report (OCP-2010), which provides projections of anticipated growth for Orange County in terms of population, housing and employment based on detailed information about growth trends, development and local land use provided by Orange County jurisdictions and public agencies; infrastructure, utility and service providers; and the private sector. OCP-2010 accounts for projects in progress, including the 1,269 density bonus units. According to the OCP-2010, forecast growth rates for population, dwelling units, and employment in Irvine over the 2008–2035 period are all higher than the corresponding rates for the entire Orange County area, as shown in Table 4.12-1.

Table 4.12-1. OCP-2010 Projections for Orange County and the City of Irvine, 2008–2035

	2008	2010	2020	2035	Change, 2010-2035	
					Total	Percent
Orange County						
Population	3,123,058	3,182,061	3,430,505	3,582,266	400,205	12.6%
Dwelling Units	1,035,005	1,045,959	1,100,260	1,174,912	128,953	12.3%
Employment	1,624,061	1,510,928	1,646,437	1,799,477	288,549	19.1%
City of Irvine						
Population	210,761	223,024	271,340	309,977	86,953	39.0%
Dwelling Units	78,955	83,103	100,572	117,427	34,324	41.3%
Employment	223,480	203,831	236,641	286,492	82,661	40.6%

Source: OCGP DSEIR, Table 5.8-3, p. 5.8-3; Center for Demographic Research, Cal State Fullerton, "2010 Orange County Projections," released January 27, 2011.

According to OCP-2000, as of June 2000, Orange County had approximately 1.5 million jobs. According to OCP-2010, that number was projected to increase to approximately 1.51 million by 2010. OCP-2010 projects that jobs in Orange County will grow by 288,549 between 2010 and 2035, which amounts to an average of 11,542 jobs per year (i.e., a 19.1 percent increase in jobs over the 25-year period).

Although implementation of the Overlay Plan would not have exceeded the OCP-2010 employment projections, its impact on employment was considered significant because the Orange County subregion is anticipated to become increasingly jobs-rich over the next 20 years and the Overlay Plan-related employment would exacerbate the subregional jobs/housing imbalance. As discussed in the OCGP FEIR, the Overlay Plan was expected to result in:

- An increase of up to 9,000 residents

4. Discussions of Checklist and Mitigation Measures

- A provision of 3,625 dwelling units
- An approximate increase of 16,510 jobs
- An on-site jobs-housing ratio of 4.55

The increase in population would not substantially exceed projections contained for the site in OCP-2010. The increase in jobs, however, would contribute to worsening Orange County's jobs/housing ratio imbalance and is therefore considered a significant impact. The OCGP FEIR identified less than significant impacts for population and housing, and a significant and unavoidable impact for employment.

In 2008, the City granted 1,269 density bonus residential units to Heritage Fields pursuant to State law. Consequently, the Overlay Plan included a total of 4,894 residential units, and a total of 12,462 residents, based on estimates of persons per household in the City's General Plan. The Overlay Plan, including the 1,269 density bonus units, was included in the City's data for OCP-2010, which was then in turn used by SCAG to establish regional growth forecasts. Therefore, the population, housing and employment growth created by the Overlay Plan was consistent with OCP-2010 regional planning projections, and was consistent with anticipated forecasts forthcoming from SCAG. OCP-2010 estimates a jobs-housing balance of 2.45 in Irvine in 2010 and 2.44 in 2035, as shown in Table 4.12-2. The Overlay Plan would contribute to making the community more jobs-housing balanced over time.

Table 4.12-2. OCP-2010 Jobs to Housing Ratio for Orange County and the City of Irvine, 2008–2035

	2008	2010	2020	2035
Orange County				
Dwelling Units	1,035,005	1,045,959	1,100,260	1,174,912
Employment	1,624,061	1,510,928	1,646,437	1,799,477
Jobs-Housing Ratio	1.57	1.44	1.50	1.53
City of Irvine				
Dwelling Units	78,955	83,103	100,572	117,427
Employment	223,480	203,831	236,641	286,492
Jobs-Housing Ratio	2.83	2.45	2.35	2.44

Source: OCGP DSEIR, Table 5.8-7, p. 5.8-8; Center for Demographic Research, Cal State Fullerton. "2010 Orange County Projections," released January 27, 2011.

The 16,510 new jobs contemplated in the 2003 EIR would still be generated under the Overlay Plan. Therefore, the Overlay Plan, which includes 4,894 residential units, would have an on-site jobs-housing ratio of 3.37, which is substantially improved from the 4.55 ratio associated with the 3,625 units analyzed in the FEIR. However, since the 3.37 jobs-housing ratio is still greater than Irvine's existing jobs-housing ratio of 2.45, the Overlay Plan's significant impact to the jobs-housing balance remained.

Although OCP-2010 was originally approved in January 2011, publication was delayed until 2012 to incorporate 2010 Census population and housing data. The OCP-2010 Modified represents the growth projected in the approved 2010 projections, with the inclusion of the 2010 Census data. According to the OCP-2010, forecast growth rates for population, dwelling units, and employment in Irvine over the 2010–2035 period are all higher than the corresponding rates for the entire Orange County area, as shown in Table 4.12-3.

4. Discussion of Checklist and Mitigation Measures

Table 4.12-3. OCP-2010 Projections for Orange County and the City of Irvine, 2010–2035

	2010	2020	2035	Change, 2010–2035	
				Total	Percent
Orange County					
Population	3,019,356	3,266,107	3,421,228	401,872	13.3%
Dwelling Units	1,050,330	1,105,238	1,180,929	130,599	12.4%
Employment	1,490,296	1,625,805	1,778,845	288,549	19.4%
City of Irvine					
Population	215,644	265,605	304,242	88,598	41.1%
Dwelling Units	84,189	103,303	120,158	35,969	42.7%
Employment	209,152	241,962	291,813	82,661	39.5%

Source: Center for Demographic Research, Cal State Fullerton. "2010 Orange County Projections Modified," released January 26, 2012.

According to OCP-2000, there were a total of 1.49 million jobs in Orange County in 2010 (as shown in Table 4.12-2). OCP-2010 projects that jobs in Orange County will grow by 288,549, between 2010 and 2035, which amounts to an average of 11,542 jobs per year (a 19.4 percent increase in jobs over the 25-year period).

OCP-2010 estimates a jobs-housing balance of 2.48 in Irvine in 2010 and 2.43 in 2035, as shown in Table 4.12-4. These are well above the industry standard for an ideal jobs-housing ratio in the range of 1.3 to 1.7. OCP-2010 projects that Irvine will outpace Orange County's housing and employment growth rates between 2010 and 2035.

Table 4.12-4. OCP-2010 Jobs to Housing Ratio for Orange County and the City of Irvine, 2010–2035

	2010	2020	2035
Orange County			
Dwelling Units	1,050,330	1,105,238	1,180,929
Employment	1,490,296	1,625,805	1,778,845
<i>Jobs-Housing Ratio</i>	1.42	1.47	1.51
City of Irvine			
Dwelling Units	84,189	103,303	120,158
Employment	209,152	241,962	291,813
<i>Jobs-Housing Ratio</i>	2.48	2.34	2.43

Source: Center for Demographic Research, Cal State Fullerton. "2010 Orange County Projections Modified," released January 26, 2012.

The 2012 Modified Project consisted of the reduction of 410,400 sf of non-residential intensity and a corresponding addition of 3,412 dwelling units, as well as 1,194 density bonus units for a total of 4,606 new dwelling units (9,500 total dwelling units). In terms of jobs-housing imbalance, the SSEIR concluded that the implementation the 2012 Modified Project would improve this condition by increasing the amount of housing opportunities. The additional housing proposed by the 2012 Modified Project would assist the City in achieving a healthier jobs-housing balance with the ratio of 1.85. Therefore, the jobs-housing impact was not considered a significant impact.

4. Discussions of Checklist and Mitigation Measures

4.12.3 Impacts Associated with the Expansion of the OCGP Community Ice Facility

The proposed Project would not alter the population or housing information contained in the OCGP FEIR. The three ice sheet Community Ice Facility evaluated in Addendum No. 8 would have employed approximately 80 full time equivalent employees. While the proposed Project would employ approximately 120 full time equivalent employees, the proposed Project would not create new jobs because there would be no net increase in developed square footage within the OCGP Master Plan. Therefore, the proposed Project would not change the ratio of jobs to housing beyond that already analyzed in the OCGP FEIR, SSEIR, and Addenda. The Project's impacts would be the same as those identified in the OCGP FEIR, less than significant for population and housing, and significant and unavoidable for employment.

4.12.4 Findings

Major FEIR Revisions Not Required. Based on the foregoing analysis and information, there is no evidence that the Proposed project would require a major change to the certified OCGP FEIR. The proposed modification to the OCGP Master Plan and the WSPDP, which does not include any major change to park development areas identified in the approved OCGP Master Plan, will not result in any new significant environmental impact nor will there be a substantial increase in the severity of impacts from that described in the certified OCGP FEIR.

No Substantial Change in Circumstances Requiring Major FEIR Revisions. There is no information in the record or otherwise available that indicates that there are substantial changes in circumstances pertaining to population and housing that would require major changes to the certified OCGP FEIR.

No New Information of Substantial Importance Showing Greater Significant Effects Than Previous FEIR. All available relevant information has been analyzed, and there is no new information of substantial importance that was unknown and could not have been known with the exercise of reasonable diligence at the time the OCGP FEIR was approved, augmented, and/or updated, indicating that the proposed Project will have one or more significant effects not discussed in the OCGP FEIR or result in a substantial increase in the severity of previously identified effects.

No New Information of Substantial Importance Showing Ability to Reduce Significant Effects in Previous FEIR. All available relevant information has been analyzed, and there is no new information of substantial importance that was unknown and could not have been known with the exercise of reasonable diligence at the time the OCGP FEIR was approved, augmented, and/or updated, indicating that (1) mitigation measures or alternatives previously found not to be feasible would in fact be feasible, and would substantially reduce one or more significant effects of the proposed Project, but the project proponent declines to adopt the mitigation measures or alternatives; or (2) mitigation measures or alternatives that are considerably different from those analyzed in the previous EIR would substantially reduce one or more significant effects on the environment, but the project proponent declines to adopt the mitigation measures or alternatives. There are no alternatives to the proposed Project or additional mitigation measures that would substantially reduce one or more of the significant effects on population and housing identified in and considered by the OCGP FEIR.

4. *Discussion of Checklist and Mitigation Measures*

4.12.5 Mitigation from the OCGP FEIR and Applicability to the Expanded Community Ice Facility

The OCGP FEIR identified a significant impact associated with the jobs-housing ratio. The OCGP FEIR also stated that no mitigation is available to rectify conflicts between the numerical objectives of regional planning documents including the jobs-housing ratio. This finding remains applicable to the proposed Project.

The SSEIR identified the following measure as existing PPP that would help reduce or avoid potential population and housing impacts. The proposed Project is not a housing Project and, therefore, the following PPP is not applicable; the PPP would remain applicable to future housing projects within the OCGP Master Plan area.

PPP 9-1 Compliance with the City's Housing Element. Compliance with the City's Housing Element policies provides a strategic blueprint to ensure the siting of new very low, low, and moderate income housing units in future development projects under the 2012 Modified Project to help the City continue to meet its State fair share housing targets. The Housing Ordinance mandates that all projects with 50 or more housing units shall set-aside 15 percent of the total units for very low, low, and moderate income households.

4.13 PUBLIC SERVICES

Environmental Setting Law Enforcement

The Irvine Police Department (IPD) provides law enforcement services to the Project site. IPD is headquartered at the Irvine Civic Center Complex located at one Civic Center Plaza and has a satellite facility in the Irvine Spectrum Entertainment Complex. Primary response to the Project site would be patrol vehicles assigned geographically throughout the City. The ratio of police officers to population is 0.94 officers per 1,000 residents. At any given time, a minimum of 9 sworn officers are available to respond to calls for service anywhere in Irvine.

The James A. Musick Jail Facility is owned by the County of Orange and operated by the Orange County Sheriff's Department. The jail facility is located on a 105-acre parcel in PA 35 located northeast of the proposed Project site. The jail facility has permanently assigned staff personnel that guard the jail 24 hours a day. The staff includes deputies, special officers, and correctional service technicians. The jail facility is currently a minimum-security detention and corrections facility. Inmate housing and detention facilities are located in the northeast corner of the jail facility site. The remainder of the site is used for agriculture uses associated with inmate detention. The IPD also has a mutual aid agreement with the County Sheriff's Department and is available to assist the Sheriff with law enforcement at the Musick Jail Facility, if requested by the Sheriff.

Fire and Emergency Medical Services

The Orange County Fire Authority (OCFA) provides fire protection services to the city of Irvine, unincorporated Orange County, and 22 other jurisdictions. It maintains mutual aid agreements with all other cities in Orange County and with the State of California. Prior to annexation of the Project site, primary fire protection to PA 51 was provided by OCFA under contract to the county of Orange on an interim basis. Subsequent to the annexation of the property into the city of Irvine, OCFA has continued

4. Discussions of Checklist and Mitigation Measures

and will continue to provide fire protection service to the project area. OCFA has 71 fire stations, and 11 of these stations are in Irvine. Nearby OCFA fire stations outside of the City limits (i.e., Tustin and Lake Forest) may respond to calls in the City, if necessary. OCFA also has in place Secured Fire Protection Services Agreement with the Irvine Company, as part of the Northern Sphere Area that funds fire protection facilities and apparatus and would help provide adequate service to all areas surrounding the Project site.

Parks and Recreation

The private neighborhood park serving Pavilion Park (first phased residential development for the Great Park Neighborhoods) and the newly constructed Beacon Park in Development District 1-North are open and serving residents. A portion of the WSPDP Phase I is currently operating with recreation facilities that are open to the public. In addition, many public facilities are located within five miles of the OCGP including neighborhood and community parks, recreational trails, and open space.

There are approximately 506 acres of neighborhood and community parks and recreational trails in the City of Irvine's public park system, including one aquatic complex containing three competition size pools. Irvine presently has 18 community parks, 37 public neighborhood parks, and 200 private neighborhood parks. William R. Mason Regional Park, a County of Orange facility, and numerous private parks and recreation facilities are also available throughout Irvine that provide additional recreational opportunities for the City's residents.

The City of Irvine, through its Conservation and Open Space Element has established an open space program comprehensively aggregating open space, adjoining other regional open space, and promoting conservation and passive recreational opportunities (e.g. Bommer Canyon, Shady Canyon and Limestone Canyon).

School Services

PA 51 is within the school service boundaries of the Irvine Unified School District (IUSD) and the Saddleback Valley Unified School District (SVUSD). Prior to the closure of the base, an IUSD elementary school (El Toro Marine Elementary School at 8171 Southeast Trabuco Road) with a 650- student capacity was operating on the former base property. There are currently 40 schools in IUSD, including 23 elementary schools, 6 middle schools, 7 high schools, and 3 alternative education schools. There are currently 36 schools in SVUSD, including 24 elementary schools, 5 intermediate schools, 7 high schools, 1 continuation high school, 1 independent study high school, and 1 special education school.

Library Services

The Orange County Public Library (OCPL) provides library services to municipalities and unincorporated parts of Orange County through 33 library branches located throughout the OCPL service area. Irvine is served by three OCPL branches, the Heritage Park Regional Library at 14361 Yale Avenue, the University Park Library at 4512 Sandburg Way, and the Katie Wheeler Library at 13109 Old Myford Road.

4. Discussion of Checklist and Mitigation Measures

In addition, there are three colleges and universities, each with academic libraries, in Irvine. Residents can use these academic libraries to supplement the public library branches, as each academic library allows nonstudents to purchase a library card that provides borrowing privileges.

4.13.1 Impacts Identified in the OCGP FEIR

Law Enforcement

The OCGP FEIR discussed the law enforcement needs of PA 51 and stated that following annexation, the Irvine Police Department would provide law enforcement for the entire project area. The OCGP FEIR also analyzed the number of police officers, police supervisors and support staff, as well as the number of vehicles, equipment, and services. The OCGP FEIR stated that police protection for the park area would be funded through the use of a special park assessment. As stated in the OCGP FEIR, the general impacts associated with construction and operation of public facilities were analyzed in the OCGP FEIR as part of the planned land uses which also included the construction of a new Police substation. The OCGP FEIR concluded that the police facilities were adequate to handle the personnel and equipment that were employed and utilized by the department.

Additional police personnel and associated equipment would be provided through the continued implementation of the City's Strategic Business Plan and annual budget review process. Pursuant to the Amended and Restated Development Agreement (ARDA), Heritage Field has provided 5.5-acre site in District 1 North to the City for civic uses. It is anticipated that the City will be funding and constructing a new IPD substation at this location. During the development review and permitting process, the IPD would review and approve any new development plans to ensure that adequate facilities and personnel are provided to allow the IPD to serve the needs of all of Irvine residents. All standard conditions and guidelines would be applied during the normal review process, including the PPPs outlined in Section 4.13.4. Implementation of the PPPs would reduce potential impacts associated with police protection to less than significant.

Fire and Emergency Medical Services

Subsequent to annexation of the property, PA 51 would continue to be served by OCFA. The OCGP FEIR stated that it was likely that additional fire services infrastructure would be required to support the proposed project. OCFA had not provided the detailed calculations of the extent of new services. The OCGP FEIR stated that the final determination of fire station needs and locations would be made at a future date when more information is known about risk, layout, and types of occupancy. The specific environmental impact of constructing the new fire facilities to serve the project could not be determined at the General Plan level of analysis as specific site plans and locations had not been prepared. However, the general impacts associated with the construction and operation of public facilities were addressed within the OCGP FEIR. A temporary fire station is currently located a short distance from the planned ceremonial entrance to the OCGP along Trabuco Road.

Table 5.10-1 of the SSEIR (see Table 4.13-1 below) includes the stations that would provide initial response and the next level of response to calls for emergency services from the project site and surrounding area. All portions of the project site are within 4 minutes (2 miles) of an existing fire station.

4. Discussions of Checklist and Mitigation Measures

Table 4.13-1. OCFA Responding Stations (Table 5.10-2 of the SSEIR)

Station Number	Station Location	Equipment and Personnel
Initial Responding Stations to Project Site		
Fire Station 20	7020 Trabuco Road	1 Paramedic Engine/1 Water Tender/12 Personnel
Fire Station 27	12400 Portola Springs Road	1 Paramedic Engine/9 Personnel
Fire Station 38	26 Parker	1 Engine/1 Medic Van/15 Personnel
Fire Station 51 ¹	18 Cushing Division Chief Headquarters	1 Paramedic Engine/14 Personnel (including Division II Chief and Administrative Captain)
Next Level of Responding Stations to Project Site		
Fire Station 26	4861 Walnut Avenue	1 Engine/1 Medic Van/1 Patrol/15 Personnel/Reserve Firefighters
Fire Station 55	4955 Portola Parkway	1 Paramedic Assessment Unit (PAU) Engine/9 Personnel
Fire Station 47	47 Fossil Road	1 Paramedic Assessment Unit (PAU) Engine/9 Personnel
Fire Station 22	24001 Paseo de Valencia, City of Laguna Woods	2 Paramedic Engines/1 Truck/1 Battalion/39 Personnel
Fire Station 19	23022 El Toro Road, City of Lake Forest	1 Paramedic Engine/1 Squad/12 personnel/Reserve Firefighters

Source: SSEIR 2012

¹ Fire Station 51 is the initial responding station for PA 51.

PA = Planning Area

In addition to the fire stations listed above, OCFA has in place a Secured Fire Protection Services Agreement with the Irvine Company as part of the Northern Sphere Area that funds fire protection facilities and apparatus and would help provide adequate service to all areas surrounding and within the proposed Project site. Overall, compliance with the Mitigation Measures HH-3 and HH-4, PPP 10-1 through 10-10, and PDF 10-1 would ensure a less than significant impact on fire protection and emergency services.

Parks and Recreation

As discussed in detail in OCGP FEIR, the parkland acreage under the project would greatly exceed the existing City standards, and would provide a regional open space amenity for the benefit of Orange County. The OCGP FEIR calculated a total of 45.1 acres of parkland required for the Great Park Neighborhoods development. A portion of that acreage would be in neighborhood parks.

The community park requirement for the future Great Park Neighborhoods development has been addressed through the Development Agreement between the City and Heritage Fields (recorded on July 12, 2005) and reflected in the ARDA (December 2010). Based on the SSEIR, the requirement for dedication of community parkland has been met via past dedication of 165 acres of parkland and payment of fees to the City as set forth in the ARDA. Conveyance of the OCGP to the City satisfied any requirement imposed on the developer for the dedication or development of community parks as required by the City's General Plan and Municipal Ordinance. The neighborhood park requirements for the future Great Park Neighborhoods development would be met within the Great Park Neighborhoods development, outside the OCGP. Details of specific park locations, ownership, sizes, and improvements would be presented to the Community Services Commission and Planning Commission as a part of the Park Plan for the new residential developments. Since the OCGP Master Plan does not create a demand for parks and recreation but is itself a park and recreation amenity, no new impacts on parks and recreation are anticipated. This is consistent with the findings of the OCGP FEIR.

4. *Discussion of Checklist and Mitigation Measures*

School Services

The OCGP FEIR discussed in detail the proposed project, the related student generation, and the required school facilities. Based on an initial analysis, IUSD estimated the need for one 13-acre K-8 site as well as funding for expansion and modernization of existing middle and high school facilities by project buildout.

According to the SSEIR, per the Heritage Fields Mitigation Agreement with IUSD, two K-8 schools, each with a maximum capacity of 1,000 students, and a new high school (High School No. 5) with a maximum capacity of 2,600 students are planned for construction. Based on the current projections and the provisions contained within the Heritage Field Mitigation Agreement with IUSD, IUSD would be able to provide adequate school services and facilities. As for SVUSD, with payment of the SB 50 Fees, no significant impacts to the SVUSD would occur.

Library Services

Impacts to library services are determined only by the development of residential land uses. To meet the demand of library services, the City completed a Library Needs Assessment Study in October 2006 to evaluate the State of library services and identify options for enhanced library services within the City. The study determined that new facilities are needed, especially in light of anticipated population growth.

The 2007 Library Alternatives Study prepared by the City present six potential sites for new libraries, and identifies library facility options, including construction of a new branch library and/or a new main library, totaling 39,000 square feet, at the Great Park. The study further recommended inclusion of new library facilities in the Citywide Capital Improvement Program and Public Facilities Master Plan that would allow the City Council to assess development of new library facilities. However, there are no capital funds designated for expansion of the OCPL system.

Since a portion of property taxes are specifically allocated for capital improvement and operating costs for the OCPL system, new residents of the Irvine (including the project) would be required to make a financial contribution to expand and/or construct new library facilities. Development of the project would also be required to comply with PPP 10-10. In addition, residents of Irvine, including future residents of the City have access to any branch of OCPL library system, including those within neighboring cities (e.g., Tustin, Lake Forest, and Costa Mesa) and also those within academic libraries and resources of the colleges and universities within the City. Therefore, significant impacts related to library services are not anticipated.

4.13.2 Impacts Associated with the Expanded Community Ice Facility

Although the proposed Project would increase the square footage and spectator seating in the community ice rink, the proposed Project would not result in new uses not previously anticipated in the OCGP Master Plan and there would be a corresponding decrease in the square footage of another use within the OCGP Master Plan area. The proposed addition of building square feet for the Community Ice Facility site would be deducted from other approved uses so that the maximum building square footage allocated for the overall uses within the OCGP will not be exceeded. Therefore, the increase in size and seating would not substantively alter the provision of public services or create additional demand on existing levels of service when compared to what was anticipated in the FEIR and Addenda.

4. Discussions of Checklist and Mitigation Measures

Law Enforcement

The proposed Project would not result in new uses not previously anticipated in the OCGP Master Plan. The increase in spectator seating may result in an increase in calls for service, however, all standard conditions and guidelines would be applied during the normal review process, including the PPPs outlined in Section 4.13.5. As such, impacts associated with police protection would be less than significant and substantially similar to the impacts disclosed in the FEIR.

Fire and Emergency Medical Services

The proposed Project would not result in new uses not previously anticipated in the OCGP Master Plan. The increase in spectator seating may result in an increase in calls for service, however, all standard conditions and guidelines would be applied during the normal review process, including the PPPs outlined in Section 4.13.5. As such, impacts associated with fire and emergency medical services would be less than significant and substantially similar to the impacts disclosed in the FEIR.

Parks and Recreation

Since the OCGP Master Plan does not create a demand for parks and recreation but is itself a park and recreation amenity, no new impacts on parks and recreation are anticipated. Likewise, the Community Ice Facility and the proposed expansion of the Community Ice Facility would be recreation amenities for the City and the County of Orange. The proposed Project would not directly generate additional residents and any incidental use of parks within the City would be minimal. Impacts on existing parks would be less than significant. This is consistent with the findings of the OCGP FEIR.

School Services

The proposed Project would not directly generate additional students for IUSD or SVUSD. The proposed Project would be required to pay applicable school facility fees. Impacts on existing parks would be less than significant. With payment of applicable fees (refer to PPP 10-9 in Section 4.15.5), no significant impacts to IUSD or SVUSD would occur. Therefore, the demand and potential impact on school services remains consistent with the analysis contained in the OCGP FEIR.

Library Services

Impacts to library services are determined only by the development of residential land uses. The proposed Project would not directly generate additional residents. The proposed Project would be required to comply with PPP 10-10 provided in Section 4.16.5. Therefore, the demand and potential impact on library services remains consistent with the analysis contained in the OCGP FEIR.

4.13.3 Findings

Major FEIR Revisions Not Required. Based on the foregoing analysis and information, there is no evidence that the Proposed project would require a major change to the certified OCGP FEIR. The proposed modification to the OCGP Master Plan, which does not include any major change to park development areas identified in the approved OCGP Master Plan, would not result in any new significant

4. Discussion of Checklist and Mitigation Measures

environmental impact nor would there be a substantial increase in the severity of impacts from that described in the certified OCGP FEIR.

No Substantial Change in Circumstances Requiring Major FEIR Revisions. There is no information in the record or otherwise available that indicates that there are substantial changes in circumstances pertaining to public services that would require major changes to the certified OCGP FEIR.

No New Information of Substantial Importance Showing Greater Significant Effects Than Previous FEIR. All available relevant information has been analyzed, and there is no new information of substantial importance which was unknown and could not have been known with the exercise of reasonable diligence at the time the OCGP FEIR was approved, augmented, and/or updated, indicating that the proposed Project would have one or more significant effects not discussed in the OCGP FEIR or result in a substantial increase in the severity of previously identified effects.

No New Information of Substantial Importance Showing Ability to Reduce Significant Effects in Previous FEIR. All available relevant information has been analyzed, and there is no new information of substantial importance, which was unknown and could not have been known with the exercise or reasonable diligence at the time the OCGP FEIR was approved, augmented, and/or updated and addenda were approved, indicating that: (1) mitigation measures or alternatives previously found not to be feasible would in fact be feasible, and would substantially reduce one or more significant effects of the proposed Project, but the project proponent declines to adopt the mitigation measures or alternatives; or (2) mitigation measures or alternatives that are considerably different from those analyzed in the OCGP FEIR would substantially reduce one or more significant effects on the environment, but the project proponent declines to adopt the mitigation measures or alternatives. There are no alternatives to the proposed Project or additional mitigation measures that would substantially reduce one or more of the significant public services-related effects identified in and considered by the OCGP FEIR.

4.13.4 Mitigation from the OCGP FEIR and Applicability to the Expanded Community Ice Facility

The OCGP FEIR determined the mitigation measures identified in other sections of the OCGP FEIR (Sections 5.1-5.13) address the impacts associated with the construction and operation of public facilities. These measures would be applicable to any new construction and operation of facilities for police, fire protection, park and recreation, and education services.

In addition, the SSEIR identified the following measures as existing PPPs that apply to the proposed Project and would help reduce or avoid potential public services impacts:

Of the PPPs listed below, applicable measures will be incorporated into the proposed Project upon project implementation.

PPP 10-1 Every project applicant shall comply with all applicable Orange County Fire Authority codes, ordinances, and standard conditions regarding fire prevention and suppression measures relating to water improvement plans, fire hydrants, automatic fire extinguishing systems, fire access, access gates, combustible construction, water availability, and fire sprinkler systems.

4. Discussions of Checklist and Mitigation Measures

- PPP 10-2** Prior to the approval of the first certificate of occupancy the applicant shall arrange for and have passed an inspection, to be performed by the Police Department and OCFA, to ensure compliance with the Emergency Access Plan requirements. The inspector shall verify test acceptance and locations of all Knox boxes and key switches as depicted on the approved plan (Standard Condition 4.9).
- PPP 10-3** Prior to the issuance of the first building permit, the applicant shall submit and have approved by the Chief of Police an Emergency Access Plan, which identifies and locates all Knox Boxes, Knox key switches, and Click2Enter radio access control receivers. Said plan shall be incorporated into the plan set approved for building permits (Standard Condition 3.17).
- PPP 10-4** Prior to the issuance of the first building permit, the applicant shall have executed a Secured Fire Protection Agreement with the OCFA (Standard Condition A.15).
- PPP 10-5** The project applicant shall comply with all applicable requirements of the City Uniform Security Code (Municipal Code Title 5, Division 9, Chapter 5).
- PPP 10-6** Prior to issuance of the first building permit, a Construction Site Security Plan, per the City Uniform Security Code, Section 5-9-521, shall be approved by the Chief of Police. Said plan shall be incorporated into the plan set approved for building permits (Standard Condition 3.20).
- PPP 10-7** Prior to approval of the first certificate of occupancy, the project applicant shall demonstrate to the City's Police Department that an Opticom traffic light control system has been installed at all signalized intersections servicing or adjacent to the proposed Project site (Condition of Approval).
- PPP 10-8** The project applicant shall implement the concepts of Crime Prevention Through Environmental Design in the design and layout of individual development projects within the proposed Project site to reduce criminal opportunity and calls for police service. Implementation of these concepts shall be verified by the City's Police Department during the development review process (Condition of Approval).
- PPP 10-9** Pursuant to California Government Code Section 65995, the individual applicant shall pay developer fees to the appropriate school districts at the time building permits are issued; payment of the adopted fees would provide full and complete mitigation of school impacts. Alternatively, the applicant may enter into a school finance agreement with the school district(s) to address mitigation to school impacts in lieu of payment of developer fees. The agreement shall establish financing mechanisms for funding facilities to serve the students from the project. If the applicant and the affected school district(s) do not reach a mutually satisfying agreement, then project impact would be subject to development fees.
- PPP 10-10** In the event that a city-wide library impact fee is adopted and in force, the developer shall pay this fee prior to issuance of building permits for new development. Since a 39,000 sf library facility is approved for development within Existing PA 51, this would satisfy payment of a library impact fee, if adopted by the City at a future date.

4. Discussion of Checklist and Mitigation Measures

The SSEIR also identified the following measure as a PDF that applies to the proposed Project and would help reduce or avoid potential public services impacts. The following PDF, as applicable, will be incorporated into the proposed Project upon project implementation:

PDF 10-1 A key consideration in the final planting program for the Relocated Wildlife Corridor Feature will be to ensure that the planting plan does not create a fire hazard for adjacent development. The Wildlife Corridor (WLC) has been designed with native grasslands and southern cactus scrub within 150 feet of future development. Maintenance of vegetation within the WLC is not anticipated, but is allowed as needed for fire control. Final approval of the planting schemes and palettes will require approval from OCFA and assurance that the WLC will not create a fire hazard for the adjacent development or require mitigation by the adjacent development.

4.14 RECREATION

Issues related to Recreation are discussed above under Section 4.13, *Public Services*.

4.15 TRANSPORTATION AND TRAFFIC

4.15.1 Environmental Setting

The OCGP FEIR described the traffic and circulation conditions of a study area that encompassed 145 existing intersections (2007) and an additional 11 future intersections (Post 2025) in the City, and portions of seven adjacent jurisdictions including the Cities of Lake Forest, Mission Viejo, Laguna Hills, Laguna Woods, Aliso Viejo, Laguna Beach, and unincorporated areas of Orange County.

The OCGP FEIR used the City Traffic Performance Criteria, which establishes LOS A to D as the peak-hour minimum acceptable service level. In its adoption of the Overlay Plan, the City General Plan Policy B-1(C), which allowed for the consideration of LOS E as acceptable for application to intersections in PAs 13, 31, 32, 34, 35 and 39, was changed to include the effects of future development in PA 51, including former PA 30, on the intersections in those PAs.

The City's performance criteria also includes a standard of 0.02 or greater for existing deficiencies, roadway volume to capacity (V/C) ratio or the intersection capacity utilization (ICU) or an increase from acceptable to unacceptable LOS, to identify significant project impacts and associated need for improvements at both roadways and intersections.

4.15.2 Impacts Identified in the OCGP FEIR

The OCGP FEIR assessed the traffic impacts of two development scenarios for the overall OCGP project, the Base Plan and the Overlay Plan. The OCGP FEIR concluded that the adopted Overlay Plan would cause an increase in traffic which would be substantial in relation to the existing traffic load and capacity of the street system in the year 2007, year 2025, and post-2025 scenarios.

The OCGP FEIR concluded that the adopted Overlay Plan would exceed, either individually or cumulatively, a LOS standard established by the county congestion management agency for designated roads or highways in the 2007 and 2025 scenarios.

4. Discussions of Checklist and Mitigation Measures

The OCGP FEIR utilized trip thresholds (also known as trip caps) for each of the planning areas within the OCGP area. The trip cap is based on socioeconomic data average daily trip generation for the approved OCGP plan (the Overlay Plan area), which includes the Heritage Fields development. The traffic impacts of the 2006 GPA/ZC project were analyzed in Addendum No. 2 by distributing project-related traffic over existing and future traffic conditions. The three future conditions (year 2010, year 2025 and post-2025) were based on the circulation system plus fully funded intersection improvements that were planned to be in place in each future time frame and the land use and development growth that is projected in each future time frame. In each case, project impacts were identified by comparing traffic conditions with and without the 2006 GPA/ZC project.

The circulation system performance criteria applied in the analysis were the criteria approved in the 2003 North Irvine Transportation Mitigation (NITM) Program Nexus Study. The performance criteria were also consistent with the criteria adopted by the jurisdictions that are within the project study area. The criteria include components for arterial roadways, intersections, freeway/tollway ramps, and freeway/tollway mainline segments.

The results of the year 2010, year 2025 and post-2025 analysis indicated that the proposed 2006 GPA/ZC project was not forecast to significantly impact any roadway segment based on the second level of analysis (the City's peak hour link capacity analysis methodology), intersection, freeway/tollway ramp, or any freeway/tollway mainline segment.

Subsequently, as addressed in Addendum No. 3, a Traffic Study for the Master Subdivision Map was prepared by Austin-Foust Associates, Inc. to address the transportation impacts for the "project," i.e. backbone infrastructure with no new land use development in an interim year timeframe consistent with the TTM scope of work of the North Irvine Transportation Mitigation (NITM) Program Ordinance. The Traffic Study analyzed the impacts of the Master Subdivision Map (MSM) application based on Year 2010 traffic conditions in the traffic analysis study area.

An Internal Circulation Analysis for the Master Subdivision Map in the Overlay Plan area was prepared by Austin-Foust Associates, Inc. to analyze the access and internal circulation for the Heritage Fields project. The project traffic loaded directly onto the surrounding arterial system at several locations.

The intersections were analyzed using ICU values to determine LOS. The results of this analysis showed that all intersections operate at an acceptable LOS under Post-2025 buildout conditions. The intersections were then analyzed for signalization needs. Traffic signal warrants based on peak-hour volumes (as adopted by the Federal Highway Administration and Caltrans) were used to determine the need for signalization. Based on the application of the warrants, it was determined that traffic signals should be installed at all of the analyzed intersections except for the intersections of C Street and D Street at Marine Way.

Recommended on-site traffic-control measures included stop signs, traffic signals, and roundabouts. Left-turn pocket lengths for project access intersections with exclusive left-turn lanes were estimated using the County of Orange Environmental Management Agency (EMA) Highway Design Manual. The estimated left-turn storage length requirements for the analyzed intersections were based on peak hour volumes. Right-turn lanes were proposed to be provided for select project access locations on site where additional intersection capacity is needed.

4. Discussion of Checklist and Mitigation Measures

Addendum No. 4 analyzed the impacts of the proposed OCGP Master Plan. Since the proposed land uses within the OCGP Master Plan were consistent with those analyzed in the OCGP FEIR and the updated traffic study for the Revised Overlay Plan, no additional traffic analysis was found to be necessary, and no new significant impacts related to traffic were anticipated.

Addendum No. 5 analyzed the impacts associated with realignment of the Marine Way/Bake Parkway intersection and concluded that the project would not produce or substantially worsen significant impacts identified in the OCGP FEIR. Consistent with the conclusions in the OCGP FEIR, traffic and circulation impacts associated with the project would be less than significant, as the future development would implement all applicable laws and regulations to reduce impacts on traffic and circulation.

Addendum No. 7 analyzed potential impacts associated with the removal of certain NITM Improvements from the OCGP FEIR that were determined to no longer be necessary. Based on the findings of the NITM Five-Year Review Traffic Study, it was determined that previously proposed traffic mitigation strategies were not required for seven intersections and one ramp since they operate at an acceptable LOS under all interim year and build-out conditions. In addition, improvements above and beyond the baseline conditions for these locations were not warranted based on forecast future traffic activity.

The SEIR analyzed the potential impacts of the 2nd Amended VTTM 17008, Amended TTM 17283, TTM 17202, TTM 17364, TTM 17366 and TTM 17368 within the Heritage Fields site located in PA 51, including former PA 30, in the City of Irvine. The purpose of the comprehensive and tract map-level NITM traffic studies was to identify the location, timing and prioritization of applicable NITM improvements and any necessary project-related improvements that address potential impacts caused by project traffic.

The results of the analyses indicated the need for the following NITM improvements:

- Alton & Technology (2030): Westbound Technology restripe to include 2.5 left turn lanes, 1.5 through lanes, and a defacto right turn lane.
- El Toro & Jeronimo (2030): Add second southbound El Toro left turn lane.
- Alicia & Muirlands (2015): Add second southbound Alicia left turn lane.
- I-5 Southbound off-ramp to Sand Canyon (Post-2030): Add a second drop lane from the I-5 to the off-ramp.
- I-5 Southbound off-ramp to Alton (Post-2030): Add a second auxiliary lane from the I-5 to the off-ramp.
- I-5 Southbound off-ramp to El Toro (2030): Add a second drop lane from the I-5 to the off-ramp.

Additional improvements needed to address traffic impacts caused by the project include:

- Jeffrey & Roosevelt (2030): Restripe eastbound Roosevelt approach to provide a shared through/right turn lane.
- Bake & Portola (Post-2030): Restripe the northbound Bake approach to provide a shared through/left lane (which currently exists as a through lane) and modify the traffic signal for a north/south split phase signal operation. Alternatively, restripe the northbound approach to provide dual left turn lanes

4. Discussions of Checklist and Mitigation Measures

in combination with a single through lane and single right turn lane, and modify signal operation to include northbound right turn overlap.

- Lake Forest & Portola (2030, fair-share): Conversion of the northbound Lake Forest approach from de-facto right-turn to dedicated right-turn, and modification of the traffic signal to include right turn overlap phase.

As part of Addendum No. 8, two traffic studies were prepared by LSA for the OCGP Western Sector Development Plan Phase 1 located in PA 51 in the City of Irvine. The results of the August 2011 parking and traffic generation analysis indicated that 2,804 parking spaces would be necessary to accommodate the park visitors on a weekday, and 3,842 spaces would be required on a weekend. The conceptual Great Park design included regular day-to-day parking for 5,505 vehicles. This supply of parking would be more than sufficient to accommodate the parking demand for the entire park at any given time on a typical weekday or weekend. The analysis also concluded that the maximum daily trip generation of the park modification would be 13,537 trips on a typical weekday. This is below the 19,083 weekday trips calculated in the OCGP FEIR, and therefore no changes to the impact analysis would occur.

According to the traffic data used to prepare Addendum No. 8, full build-out of the OCGP Master Plan would result in a total of 19,030 weekday trips, which is below the FEIR maximum; however, the FEIR traffic analysis was not based on weekend conditions. The weekend trip analysis was conducted for the parking demand calculations and was not included in the original OCGP FEIR.

As presented in the August 2011 traffic study, the WSPDP Project would generate approximately 4,635 daily trips, which was significantly below the 19,083 daily trips approved as part of the OCGP FEIR. The AM peak hour is forecast at 184 and the PM peak hour at 659.

The project would not produce new or substantially increase the severity of significant impacts previously identified in the OCGP FEIR. Consistent with the conclusions in the OCGP FEIR, traffic and circulation impacts associated with the project would be less than significant as the future development would implement all applicable laws and regulations to reduce impacts on traffic and circulation.

The 2011 SEIR concluded that with the 2011 Approved Project all intersections and roadway/freeway/tollway/ramp segments would operate at acceptable levels of service with the existing or planned improvements. However, it stated that since the primary responsibility for approving and/or completing certain improvements outside of the City of Irvine limits lie with agencies other than the City (i.e., City of Lake Forest, Laguna Woods, Mission Viejo, County of Orange, and Caltrans), there is the potential that significant impacts may not be fully mitigated if such improvements are not completed for reasons beyond the City's control. Should that occur, impacts relating to traffic generated by the 2011 Approved Project would remain significant.

Addendum No. 9 addressed the potential for environmental impacts associated with the modifications to the 688-acre OCGP Improvement Area, which included both the Unilateral Program Changes allowed in the ALA II and other staff-recommended changes to the OCGP Improvement Area 1. The proposed modifications to the OCGP Improvement Area were within the Bosque and Sports Park Districts of the 688-acre OCGP Improvement Area. Additionally, two design features of the Project that would be incorporated upon project implementation and included dual 250-foot -long eastbound left-turn pockets at Marine Way and Great Park Boulevard West (562) (Great Park Street 1) and a 250-foot -long westbound

4. Discussion of Checklist and Mitigation Measures

right -turn lane at the Marine Way right -in/right -out driveway (669), located west of Great Park Boulevard (West) (Great Park Street 1).

A Traffic Study for the 688-acre Park Development Plan was prepared to analyze the potential traffic impacts of the Project in general accordance with the North Irvine Transportation Mitigation (NITM) Program per City Council Resolution 03-61 and applicable sections of the City's Traffic Study Guidelines (updated August 24, 2004) and the City of Irvine Transportation Guidelines (TG) dated July 31, 1993. The analysis identified potential impacts of the proposed Project in the Project area based on Existing (2012) and Future Year (2017) traffic conditions using the Irvine Transportation Analysis Model (ITAM 12.3). The Traffic Study found that the proposed Project, reducing the number of sports courts, expanding passive recreational area, relocating some of the Improvement Area components to optimize visibility, access and efficiency, and assessing adequacy of parking plan, would not introduce new uses that would impact traffic, circulation and access within the proposed Project area. Therefore, the traffic related impacts of the proposed Modifications to the OCGP Improvement Area would be less than significant.

4.15.3 Impacts Associated with the Expanded Community Ice Facility

In January 2016, LSA prepared a Traffic Impact Analysis (TIA) for the proposed expansion of the OCGP Community Ice Facility. The TIA analyzed traffic generated from the proposed sheet of ice, consistent with the previously approved traffic study for the WSPDP. As shown in Table 4.15-1, the proposed expansion to four sheets of ice is forecast to generate approximately 960 ADT, including 32 a.m. peak-hour trips (16 inbound and 16 outbound) and 128 p.m. peak-hour trips (80 inbound and 48 outbound). This represents the addition of 240 ADT, 8 a.m. peak-hour trips (4 more inbound and 4 more outbound), and 32 p.m. peak-hour trips (20 more inbound and 12 more outbound) compared to the current Master Plan.

Table 4.15-1. Project Trip Generation

Land Use	Size (TSF)	Unit	ADT	A.M. Peak Hour			P.M. Peak Hour		
				In	Out	Total	In	Out	Total
Ice Rink Trip Rates	1	Sheet	240	4	4	8	20	12	32
Proposed Expansion									
Trip Generation ¹	4	Sheets	960	16	16	32	80	48	128
Approved Trip Generation									
Trip Generation ¹	3	Sheets	720	12	12	24	60	36	96
Net Trip Generation (1 sheet of ice)			240	4	4	8	20	12	32

¹ Western Sector Park Development Plan Phase 1 Traffic Analysis (LSA Associates, Inc., August 2011).

ADT = average daily trips

TSF = thousand square feet

Building square footage was not used in the TIA because any proposed addition of building square feet on the Community Ice Facility site compared to current approvals would be deducted from other uses so that the maximum building square footage or trip budget allocated for the overall uses within the OCGP will not be exceeded.

The TIA focused on the daily, a.m. peak-hour, and p.m. peak-hour LOS at 11 intersections and on 11 roadway segments. Project impacts were determined based on analysis of the following scenarios:

4. Discussions of Checklist and Mitigation Measures

- 2017 Baseline Approved (three sheets of ice); and
- 2017 Baseline Approved Plus Project (four sheets of ice).

2017 Baseline Approved

Table 4.15-2 presents a summary of the intersection LOS for the 2017 Baseline Approved conditions (including three sheets of ice). As this table indicates, all study area intersections are forecast to operate at satisfactory LOS (defined as LOS D or better).

Table 4.15-2. 2017 Baseline Approved Intersection LOS Summary

Intersection		A.M. Peak Hour		P.M. Peak Hour	
		ICU/Delay	LOS	ICU/Delay	LOS
1	Ridge Valley Street/Trabuco Road (ITAM Int. 559)	0.41	A	0.55	A
2	Ridge Valley Street/Champion Way (ITAM Int. 623)	0.13	A	0.14	A
3	Ridge Valley Street/LV Street (ITAM Int. 575)	0.14	A	0.14	A
4	Ridge Valley Street/Project RIRO Driveway (ITAM Int. 493) HCM	8.40	A	8.60	A
5	Ridge Valley Street/8 th Street (ITAM Int. 655)	0.30	A	0.18	A
6	Ridge Valley Street/C Street (ITAM Int. 576)	0.19	A	0.16	A
7	Ridge Valley Street/Marine Way (ITAM Int. 560)	0.36	A	0.35	A
8	G Street/LV Street (ITAM Int. 654) HCM	9.00	A	9.40	A
9	G Street/Full-Access Project Driveway (ITAM Int. 496) HCM	0.00	A	0.00	A
10	G Street/8 th Street (Roundabout) (ITAM Int. 497) HCM	3.80	A	3.90	A
11	C Street/LV Street (Roundabout) (ITAM Int. 498) HCM	4.00	A	4.40	A

Delay is reported in seconds per vehicle using the HCM 2010 unsignalized intersection methodology.

HCM = Highway Capacity Manual

ICU = Intersection Capacity Utilization

Int. = Intersection

ITAM = Irvine Transportation Analysis Model

LOS = level of service

RIRO = right-turn in/right-turn out

Table 4.15-3 presents the daily traffic volumes and volume-to-capacity (v/c) ratios for 2017 Baseline Approved conditions. As this table indicates, all study area roadway segments are forecast to operate at satisfactory LOS (defined as LOS D or better).

Table 4.15-3. 2017 Baseline Approved Daily Traffic Volumes and V/C Ratios

Roadway	Segment	Capacity	ADT	V/C	LOS
Ridge Valley Street	Trabuco Road to Champion Way (B Street) (ITAM 2013)	32,000	5,300	0.17	A
	Champion Way to LV Street (ITAM 2013)	32,000	5,300	0.17	A
	LV Street to Project RIRO Driveway (ITAM 4096)	32,000	1,700	0.05	A
	Project RIRO Driveway to 8 th Street (ITAM 4155)	32,000	1,700	0.05	A
	8 th Street to C Street (ITAM 4099)	32,000	4,800	0.15	A
	C Street to Marine Way (ITAM 2016)	32,000	5,400	0.17	A
G Street	LV Street to Full-Access Project Driveway (ITAM 4165)	13,000	300	0.02	A
	Full-Access Project Driveway to 8 th Street (ITAM 4166)	13,000	100	0.01	A
LV Street	Ridge Valley Street (O St) to G Street (ITAM 4097)	13,000	600	0.05	A
	G Street to C Street (ITAM 4164)	13,000	400	0.03	A
8 th Street	Ridge Valley Street (O Street) to G Street (ITAM 4169)	13,000	1,300	0.10	A

ADT = average daily trips

ITAM = Irvine Transportation Analysis Model

LOS = level of service

RIRO = right-turn in/right-turn out

V/C = volume-to-capacity

4. Discussion of Checklist and Mitigation Measures

Based on the results of the LOS analysis, the study area intersections and roadway segments are forecast to operate at acceptable LOS with the added sheet of ice in 2017. No project impacts have been identified on the study area intersections or roadway segments.

Project design features were also analyzed based on the design guidelines in the City's Transportation Guidelines (TGs) and TDPs. No impacts to vehicular access were identified. The proposed access points would meet the City's design guidelines.

2017 Baseline Approved Plus Project

Table 4.15-4 presents the summary of the 2017 Baseline Approved Plus Project intersection LOS. As this table indicates, all study area intersections are forecast to operate at satisfactory LOS (defined as LOS D or better). Therefore, the project (addition of one sheet of ice) can be implemented in a 2017 Baseline Approved condition with no peak-hour intersection impacts.

Table 4.15-4. 2017 Baseline Approved Plus Project Intersection LOS Summary

Intersection		A.M. Peak Hour		P.M. Peak Hour	
		ICU/Delay	LOS	ICU/Delay	LOS
1	Ridge Valley Street/Trabuco Road (ITAM Int. 559)	0.41	A	0.54	A
2	Ridge Valley Street/Champion Way (ITAM Int. 623)	0.12	A	0.13	A
3	Ridge Valley Street/LV Street (ITAM Int. 575)	0.13	A	0.14	A
4	Ridge Valley Street/Project RIRO Driveway (ITAM Int. 493) HCM	8.40	A	8.60	A
5	Ridge Valley Street/8 th Street (ITAM Int. 655)	0.28	A	0.19	A
6	Ridge Valley Street/C Street (ITAM Int. 576)	0.20	A	0.16	A
7	Ridge Valley Street/Marine Way (ITAM Int. 560)	0.37	A	0.35	A
8	G Street/LV Street (ITAM Int. 654) HCM	9.40	A	9.80	A
9	G Street/Full-Access Project Driveway (ITAM Int. 496) HCM	8.50	A	8.80	A
10	G Street/8 th Street (Roundabout) (ITAM Int. 497) HCM	3.90	A	3.80	A
11	C Street/LV Street (Roundabout) (ITAM Int. 498) HCM	4.00	A	4.40	A

¹ Delay is reported in seconds per vehicle using the HCM 2010 unsignalized intersection methodology.

HCM = Highway Capacity Manual

LOS = level of service

ICU = intersection capacity utilization

RIRO = right-turn in/right-turn out

ITAM = Irvine Transportation Analysis Model

Int. = Intersection

Table 4.15-5 lists the daily traffic volumes and v/c ratios for the 2017 Baseline Approved Plus Project scenario. As this table indicates, all study area roadway segments are forecast to operate at satisfactory LOS (defined as LOS E or better). Therefore, no significant project impacts are created on roadway segments with implementation of the project.

Special Issues.

The Project proposes special events up to 12 times per year. Special events are defined as those events that are anticipated to exceed the ice facility's on-site parking supply. Per an agreement with the City, the project will provide a minimum of 665 parking spaces on site. A Traffic Management Plan (TMP) will be required and coordinated with City staff and Public Safety for these special events. The specific issues addressed in this special event permit will include traffic management, traffic control and signage plans, parking management, and queuing analyses among others and are therefore not detailed in this analysis.

An access analysis, consistent with the City's Transportation Guidelines (TGs) and Transportation Design

4. Discussions of Checklist and Mitigation Measures

Procedures (TDPs), was conducted for the proposed project. Based on this analysis, the recommended requirements for TG-1, TG-8, TG-10, TG-11, TG-15, and TDP-17 have been met or shall be met through subsequent phases of the process via a detailed site design plan.

Table 4.15-5. 2017 Baseline Approved Plus Project Daily Traffic Volumes and V/C Ratios

Roadway	Segment	Capacity	ADT	V/C	LOS
Ridge Valley Street	Trabuco Road to Champion Way (B Street) (ITAM 2013)	32,000	5,400	0.17	A
	Champion Way to LV Street (ITAM 2013)	32,000	5,400	0.17	A
	LV Street to Project RIRO Driveway (ITAM 4096)	32,000	1,200	0.04	A
	Project RIRO Driveway to 8 th Street (ITAM 4155)	32,000	1,200	0.04	A
	8 th Street to C Street (ITAM 4099)	32,000	4,500	0.14	A
	C Street to Marine Way (ITAM 2016)	32,000	5,800	0.18	A
G Street	LV Street to Full-Access Project Driveway (ITAM 4165)	13,000	1,100	0.08	A
	Full-Access Project Driveway to 8 th Street (ITAM 4166)	13,000	900	0.07	A
LV Street	Ridge Valley Street (O Street) to G Street (ITAM 4097)	13,000	600	0.05	A
	G Street to C Street (ITAM 4164)	13,000	400	0.03	A
8 th Street	Ridge Valley Street (O Street) to G Street (ITAM 4169)	13,000	1,500	0.12	A

ADT = average daily trips

RIRO = right-turn in/right-turn out

ITAM = Irvine Transportation Analysis Model

V/C = volume-to capacity ratio

LOS = level of service

Potential Impacts and/or Recommendations

Based on the results of the TIA, the proposed Project can be implemented without significant impacts to the surrounding roadway system in the 2017 horizon. The addition of Project traffic to study area intersections and roadway segments does not result in City thresholds for performance being exceeded and is not considered significant; therefore, mitigation is not required. Special events (held up to 12 times per year) that exceed the parking capacity on site would require a special permit from the City. As part of this, a TMP would be required and coordinated with City staff and Public Safety for these special events. The specific issues addressed in this special event permit would include traffic management, traffic control and signage plans, parking management, and queuing analyses among others and are therefore not detailed in the traffic analysis. Further, an access analysis consistent with the City's TGs and TDPs was conducted for the proposed Project. Based on this analysis, the recommended requirements for TG-1, TG-8, TG-10, TG-11, TG-15, and TDP-17 have been met or shall be met through subsequent phases of the process via a detailed site design plan.

4.15.4 Findings

Major FEIR Revisions Not Required. Based on the foregoing analysis and information, there is no evidence that the Proposed project would require a major change to the certified OCGP FEIR. The proposed modification to the OCGP Master Plan and the WSPDP, which does not include any major change to park development areas identified in the approved OCGP Master Plan, would not result in any new significant environmental impact nor would there be a substantial increase in the severity of impacts from that described in the certified OCGP FEIR.

No Substantial Change in Circumstances Requiring Major FEIR Revisions. There is no information in the record or otherwise available that indicates that there are substantial changes in circumstances pertaining to transportation/traffic that would require major changes to the certified OCGP FEIR.

4. Discussion of Checklist and Mitigation Measures

No New Information of Substantial Importance Showing Greater Significant Effects Than Previous FEIR. This environmental evaluation has analyzed all available relevant information and has determined that there is no new information of substantial importance which was unknown and could not have been known with the exercise of reasonable diligence at the time the OCGP FEIR was approved, augmented, and/or updated, indicating that the Project would have one or more significant effects not discussed in the previous FEIR or result in a substantial increase in the severity of previously identified effects.

No New Information of Substantial Importance Showing Ability to Reduce Significant Effects in Previous FEIR. All available relevant information has been analyzed, and there is no new information of substantial importance which was unknown and could not have been known with the exercise of reasonable diligence at the time the OCGP FEIR was approved, augmented, and/or updated, indicating that (1) mitigation measures or alternatives previously found not to be feasible would in fact be feasible, and would substantially reduce one or more significant effects of the proposed Project, but the project proponent declines to adopt the mitigation measures or alternatives; or (2) mitigation measures or alternatives that are considerably different from those analyzed in the previous FEIR would substantially reduce one or more significant effects on the environment, but the proposed project proponent declines to adopt the mitigation measures or alternatives. There are no alternatives to the proposed Project or additional mitigation measures that would substantially reduce one or more of the significant transportation/traffic-related effects identified in and considered by the OCGP FEIR.

4.15.5 Mitigation from the OCGP FEIR and Applicability to the Expanded Community Ice Facility

The OCGP FEIR identified Mitigation Measures TRAN1 through TRAN8 which, if fulfilled prior to specified development approvals, would eliminate or substantially reduce the traffic and circulation effects of development under the adopted Master Plan. The SEIR proposed that several mitigation measures from the certified OCGP FEIR be deleted (because they have been completed or they are no longer necessary in light of the NITM Program and new mitigation measures being proposed for Modified Project-specific impacts identified in the Traffic Study for the Modified Project). Mitigation Measure TRAN 1 would be carried forward for this project; however, it was modified by the City and approved as shown with 2nd AVTTM 17008 (PC Resolution 11-3109). References to PA 30 were proposed to be removed since the 2012 Modified Project's proposed GPA/ZC consolidated PAs 30 and 51 into one PA to be designated Combined PA 51.

Of the Mitigation Measures listed below, applicable measures will be incorporated into the proposed Project upon project implementation.

TRAN1 Prior to the approval of any final map of a subsequent subdivision map (other than a financing and conveyance map) for any land use, excluding single family land uses (single family land use includes single family detached and single family attached projects), parks, schools, daycare, and religious institutions, that allocates building intensity within Combined PA 51, the landowner or subsequent project applicant shall either (i) apply for annexation of any areas within the final map to the Irvine Spectrum Transportation Management Association (TMA) (Spectrumotion) in accordance with Article X of the recorded Declaration of Covenants, Conditions and Restrictions (CC&Rs) for the Irvine Spectrum TMA, including any supplementary or amended CC&Rs, to reduce traffic, air quality and noise impacts or (ii)

4. Discussions of Checklist and Mitigation Measures

develop and implement a similar transportation management plan containing the elements and meeting the criteria described below as approved by the Director of Public Works. The transportation management plan shall be implemented via payment of assessment dues to an organization similar to Spectrumotion for all land uses, with the exceptions noted above. While affordable housing units will be included, their assessment fees will be covered by other remaining adjacent land uses. The implementation (payment of assessment dues) for either option described above shall occur prior to issuance of building permit(s):

Transportation Management Plan (TMP)

The development and implementation of a Transportation Management Plan is an identified mitigation measure to manage transportation access for Combined PA 51. This document summarizes the key elements of the TMP.

A. Introduction

The purpose of this document is to provide an outline for a comprehensive TMP for the Combined PA 51 (Great Park TMP). This report is not intended to provide the specific details of the plan, but rather to highlight the key components and provide direction for subsequent detailed planning and implementation activities. When preparation of the TMP is undertaken, all of the agency and stakeholders will be invited to provide input.

The applicant may elect to annex Combined PA 51 into the Irvine Spectrum Transportation Management Association (Spectrumotion). Spectrumotion is a private, nonprofit Transportation Management Association (TMA) formed to reduce traffic congestion in Irvine Spectrum. Spectrumotion promotes, markets, and subsidizes alternatives to solo-commuting and assists the business community in complying with trip reduction related requirements. Membership is mandatory to property owners with deed restrictions requiring participation in the TMA. Membership dues provide the funding for the Association and its programs, which offer a variety of employer and commuter services focused on reducing vehicular trip generation.

In the event that applicant elects not to annex into Spectrumotion, a TMP similar to that provided by Spectrumotion will be developed and implemented. This document sets forth the components of the TMP should it be necessary.

B. Transportation Management Plan Framework

The key elements of the Great Park TMP are set forth below:

New Hire Orientation: Inform newly hired employees of commuting services available to them.

Public Transportation Pass Sales: Provide a central location for purchase of passes to available transit services (e.g., OCTA buses, Metrolink, and Amtrak).

Vanpool and Carpool Formation Assistance: Perform all of the administrative work necessary to establish van pools and car pools.

4. *Discussion of Checklist and Mitigation Measures*

Onsite Promotions: Hold rideshare promotions at work sites and assist in employer assistance promotions.

Telecommuting/Alternative Work Schedule Consulting: Assist employers in developing and implementing a telecommuting or alternative work schedule program.

Personalized Commute Consulting: Provide a personalized commute profile to any commuter, which includes carpool match list containing the names of other commuters in the North Irvine Sphere that live and work near each other.

Website: Maintain a website with all of their program information available.

Rideshare Promotions: Conduct high visibility rideshare promotions as a means to advertise its services.

Subsidies: To the extent financially feasible, offer subsidies to assist in the formation of vanpools, the formation of carpools, and to encourage the trying of transit services.

Public Agency Coordination: Work closely with various public and quasi-public agencies to improve bus and commuter rail service to the Spectrum and North Irvine Sphere areas.

C. Transportation Management Plan Implementation

As part of the TMP, a process will be established to monitor its effectiveness in reducing peak hour trip generation in the Combined PA 51. Provision shall be made for the Plan to be modified as appropriate to enhance its effectiveness.

TRAN2 Following adoption of a land use plan and circulation plan for the OCGP property and before the issuance of any building permits within the base property, the City shall request a cooperative study with OCTA and other affected jurisdictions to amend the Orange County Master Plan of Arterial Highways. Marine Way, Trabuco Road from the SR-133 toll way to "O" Street (formerly College Road), and Ridge Valley (formerly Y Street) should be included on the Orange County Master Plan of Arterial Highways.

TRAN3 Prior to issuance of the first building permit for dwelling units or nonresidential square footage, a Fee Reallocation Study shall be completed to recalculate the NITM Fees, reflecting any fair share allocation modifications. The landowner or subsequent property owner shall submit the Fee Reallocation Study under a separate cover to be approved by the Director of Public Works in consultation with the NITM Advisory Committee.

TRAN4 Prior to approval of the last final map for the Modified Project (or any portion thereof in the event that the final map is approved in multiple phases), the landowner or subsequent property owner shall pay the costs of the following mitigation in an amount to be mutually agreed upon between the landowner or subsequent property owner and the City and reflective of the costs of the mitigation at the time of payment:

- 286 Jeffrey Road and Roosevelt: Restripe the eastbound approach to provide a

4. Discussions of Checklist and Mitigation Measures

shared through/right-turn lane.

- 361 Bake Parkway and Portola Parkway: Restripe the northbound approach to provide a share through/left lane (which currently exists as a through lane) and modify the traffic signal for a north/south split phase signal operation. Alternatively, restripe the northbound approach to provide dual left-turn lanes in combination with a single through lane and single right-turn lane, and modify signal operation to include northbound right-turn overlap phase.
- 374 Lake Forest Drive and Portola Parkway (Pending Projects analysis impact): Convert the existing northbound approach from de-facto right-turn to a dedicated right-turn, and modify the existing traffic signal operation to include right-turn overlap phase.

The following additional mitigation measures were proposed in the SSEIR:

TRAN5 (For specific Project-related non-NITM improvements): In conjunction with the submittal of any tentative tract maps/tentative parcel maps (TTM/TPM) for the Project within Combined PA 51, the landowner or subsequent project applicant shall prepare, subject to review and approval of the City, the required TTM/TPM level traffic study per City Resolution No. 03-61. This Traffic Study will verify whether the intersection locations listed below, which have been identified as impacted in this SSEIR, are projected to be impacted by the subject project of the Interim Year Analysis. For those intersections impacted by subject project of the TTM/TPM Traffic Study, the TTM/TPM will be conditioned to construct the necessary improvements that have been identified in the TTM/TPM Traffic Study. For those intersections listed below, which are not projected to be impacted by the subject project of the TTM/TPM Traffic Study, and prior to approval of the last final map for the 2012 Modified Project (or any portion thereof in the event that the final map is approved in multiple phases), the land owner or subsequent property owner shall construct, pay fair share of the costs or enter into an agreement with the City to establish the mechanism in which the funds generated by the fair share mitigations shall be provided and utilized by Caltrans, City of Lake Forest, City of Tustin and/or City of Irvine toward implementing the improvements.

- 16. Newport Avenue and Irvine Boulevard – Modification of signal to provide a northbound right-turn overlap phase. (2030, Option 2) Improvement no longer needed if Pending projects are approved.
- 54. Browning Avenue and Irvine Boulevard – Application of ATMS, subject to approval by City of Tustin. (2030, Options 1 and 2)
- 221. Culver Drive and Bryan Avenue – Addition of a westbound defacto right-turn lane. (2030, Option 2) Improvement no longer needed if Pending projects are approved.
- 286. Jeffrey Road and Roosevelt – Conversion of the eastbound shared through/right lane into a through lane and addition of a second right-turn lane.

4. Discussion of Checklist and Mitigation Measures

(Post-2030, Options 1 and 2)

- 290. Jeffrey Road and Barranca Parkway – Application of PA9C-identified ATMS. (2030, Options 1 and 2)
- 291. Jeffrey Road and Alton Parkway – Provision of an eastbound standard right-turn lane with right- turn overlap resulting in an ultimate eastbound lane configuration of 2 left-turn lanes, 2 through lanes, and 1 right-turn lane. (Post-2030, Options 1 and 2)
- 303. Sand Canyon Avenue and I-5 northbound ramp/Marine Way – Conversion of the northbound defacto right-turn lane to a standard right-turn lane with right-turn overlap signal operation. (2030, Options 1 and 2)
- 306. Sand Canyon Avenue and Oak Canyon – Fair Share contribution toward conversion of the westbound shared through/right lane to a single through lane and conversion of the westbound right-turn lane into a free-right turn lane, as identified in the PA40/12 GPA/ZC. (2030, Options 1 and 2) Improvement no longer needed if Pending projects are approved.
- 321. Laguna Canyon Road and Old Laguna Canyon – Application of ATMS, subject to approval by the Director of Public Works. Alternate improvement is the addition of a fourth northbound through lane. (Post-2030, Options 1 and 2) Improvement no longer needed if Pending projects are approved.
- 366. Bake Roadway and Rockfield Boulevard – Fully funded Lake Forest Transportation Mitigation (LFTM) improvement: Conversion of a westbound through lane to a third left-turn lane. (2030, Options 1 and 2)

TRAN6 (For specific Project-related NITM improvements): The NITM Program provides a funding mechanism for the coordinated and phased installation of required traffic and transportation improvements established in connection with land use entitlements for City PAs 1, 5, 6, 8, 9, 40, and 51. As established by City Ordinance No. 03-20, Combined PA 51 is included in this program and, as such, is required to pay its fair share towards the List of NITM Improvements included within the established NITM Program. The following Project-impacted locations are included in the NITM List of Improvements and thus, payment of NITM fees will mitigate the Combined PA 51 project's fair share responsibility toward these improvements:

- 228. Culver Drive and Barranca Parkway – Conversion of the westbound defacto right-turn lane to a through lane. (2030, Options 1 and 2)
- 424. Los Alisos Boulevard and Rockfield Boulevard – Addition of a southbound right-turn lane. (2030, Option 1)
- I-5 Northbound Off-ramp to Jamboree Road – Addition of a second drop lane from the I-5 to the Jamboree Road off-ramp. (2030, Option 1)

4. Discussions of Checklist and Mitigation Measures

TRAN7 (If pending projects are approved, **Project-related non-NITM improvements**): In the event that all of the pending (not approved) projects analyzed are approved and in conjunction with the submittal of any TTM/TPM for the Project within Combined PA 51, the landowner or subsequent project applicant shall prepare, subject to review and approval of the City, the required TTM/TPM level Traffic Study per City Resolution No. 03-61. This Traffic Study will verify whether the intersection locations listed below, which have been identified as impacted in this SSEIR, are projected to be impacted by the subject project of the Interim Year Analysis. For those intersections impacted by subject project of the TTM/TPM Traffic Study, the TTM/TPM will be conditioned to construct the necessary improvements that have been identified in the TTM/TPM Traffic Study. For those intersections listed below, which are not projected to be impacted by the subject project of the TTM/TPM Traffic Study, and prior to approval of the last final map for the 2012 Modified Project (or any portion thereof in the event that the final map is approved in multiple phases), the land owner or subsequent property owner shall construct, pay fair share of the costs or enter into an agreement with the City to establish the mechanism in which the funds generated by the fair share mitigations shall be provided and utilized by Caltrans, City of Lake Forest, City of Tustin, and/or City of Irvine toward implementing the improvements.

- 54. Browning Avenue and Irvine Boulevard – Application of ATMS, subject to approval by City of Tustin. (2030, Options 1 and 2)
- 286. Jeffrey Road and Roosevelt – Conversion of the eastbound shared through/right lane into a through lane and addition of a second right-turn lane. (Post-2030, Options 1 and 2)
- 290. Jeffrey Road and Barranca Parkway – Application of PA9C-identified ATMS.
- 291. Jeffrey Road and Alton Parkway – Provision of an eastbound standard right-turn lane with right- turn overlap resulting in an ultimate eastbound lane configuration of two left-turn lanes, two through lanes, and one right-turn lane. (2030 & Post-2030, Options 1, Post-2030, Option 2)
- 303. Sand Canyon Avenue and I-5 northbound ramp/Marine Way – Conversion of the northbound defacto right-turn lane to a standard right-turn lane with right-turn overlap signal operation. (2030, Options 1 and 2)
- 366. Bake Parkway and Rockfield Boulevard – Fully funded LFTM improvement: Conversion of a westbound through lane to a third left-turn lane. (2030, Options 1 and 2)
- 417. El Toro Road and Portola Parkway – Fully funded LFTM improvement: Addition of a southbound right-turn overlap phase. (2030, Options 1 and 2)

TRAN8 (If pending projects are approved, for specific Project-related NITM improvements): The NITM Program provides a funding mechanism for the coordinated and phased installation of required traffic and transportation improvements established in connection with land use

4. Discussion of Checklist and Mitigation Measures

entitlements for City PAs 1, 5, 6, 8, 9, 40, and 51. As established by City Ordinance No. 03-20, Combined PA 51 is included in this program and, as such, is required to pay its fair share towards the List of NITM Improvements included within the established NITM Program. In the event that all of the pending (not approved) projects analyzed are approved, the following Project-impacted locations are included in the NITM List of Improvements and thus, payment of NITM fees will mitigate the Combined PA 51 project's fair share responsibility toward these improvements:

- 228. Culver Drive and Barranca Parkway – Conversion of the westbound defacto right-turn lane to a through lane. (2030, Options 1 and 2)
- I-5 northbound Off-ramp to Jamboree Road – Addition of a second drop lane from the I-5 to the Jamboree off-ramp. (2030 & Post-2030, Option 1 and 2)

TRAN9 (Caltrans Fair Share): Prior to approval of the last final map for the 2012 Modified Project (or any portion thereof in the event that the final map is approved in multiple phases), the land owner or subsequent property owner shall make a good-faith effort to enter into a fair share agreement with Caltrans and the City to establish its fair share allocation towards the future implementation of the following freeway facility improvements. It may not be possible for the City to successfully negotiate the agreement. Fair share contribution shall be calculated using the same methodology for determining fair share contributions as included in the NITM Program. The Agreement shall establish the mechanism in which the funds generated by the Project's fair share mitigations shall be provided and utilized by Caltrans and/or the City toward implementing the following improvements:

- I-5 Northbound, north of Culver Drive – Directional capacity enhancement equivalent to a single general-purpose lane. (2030, Options 1 and 2)
- I-5 Northbound, north of Jeffrey – Directional capacity enhancement equivalent to a single general-purpose lane. (2030, Options 1 and 2) Improvement no longer needed if Pending projects are approved.
- I-405 Northbound, north of Jeffrey Road – Directional capacity enhancement equivalent to a single general-purpose lane. (2030 and Post-2030, Options 1 and 2) Improvement no longer needed if Pending projects are approved.

TRAN10 (If pending projects are approved, Caltrans Fair Share): In the event that all of the pending (not approved) projects analyzed are approved, and prior to approval of the last final map for the 2012 Modified Project (or any portion thereof in the event that the final map is approved in multiple phases), the land owner or subsequent property owner shall make a good-faith effort to enter into a fair share agreement with Caltrans and the City to establish its fair share allocation towards the future implementation of the following freeway facility improvements. It may not be possible for the City to successfully negotiate the agreement with Caltrans. Fair share contribution shall be calculated using the same methodology for determining fair share contributions as included in the NITM Program. The Agreement shall establish the mechanism in which the funds generated by the Project's fair share mitigations shall be provided and utilized by Caltrans and/or the City toward implementing the following improvements:

4. *Discussions of Checklist and Mitigation Measures*

- SR-133 northbound loop on-ramp at Barranca Parkway – Conversion of the high-occupancy vehicle (HOV) preferential lane to a second metered mixed-flow lane (2015, Option 2)
- I-5 Northbound, north of Culver Drive – Directional capacity enhancement equivalent to a single general-purpose lane. (2030, Options 1 and 2)

TRAN11 (Rockfield Boulevard Master Plan of Arterial Highways Amendment) The City shall submit a request to OCTA and other affected jurisdictions to amend the Orange County Master Plan of Arterial Highways to eliminate the extension of Rockfield Boulevard from the eastern project boundary to Marine Way.

TRAN12 (If Rockfield Boulevard Master Plan of Arterial Highways Amendment is not approved by OCTA) In the event that the Rockfield Boulevard Master Plan of Arterial Highways change does not occur and the Rockfield Boulevard connection to Marine Way is ultimately constructed, and in addition to previously identified Post-2030 Option 1 improvements, the land owner or subsequent property owner shall enter into a fair share agreement with the City to establish its fair share allocation towards the future implementation of the conversion of the HOV preferential lane at the SR-133 northbound loop on-ramp at Barranca Parkway to a second metered mixed-flow lane. The fair share contribution shall be calculated using the same methodology for determining fair share contributions as included in the NITM Program. For Option 2, the mitigations as indicated in TRAN5 through TRAN10 remain unchanged in the event that the Rockfield MPAH change does not occur and the Rockfield connection to Marine Way is ultimately constructed.

Additionally, the SSEIR identified the following PDF to help reduce or avoid potential traffic impacts. The following PDF, as applicable, will be incorporated into the proposed Project upon project implementation:

PDF 12-1 The 2012 Modified Project's optional conversion of nonresidential square footage to residential units, if implemented, will be subject to a traffic analysis to assess traffic impacts, if any, due to the specific changes in land use and will include a reduction in allowable Multi- Use intensity in terms of equivalent traffic generation (excluding DB units) based on AM peak, PM peak, and ADT. Conversions to other nonresidential uses within the Multi-Use category, if implemented, will also be subject to a traffic analysis to assess traffic impacts, if any, and shall be reflected in terms of equivalent traffic generation based on AM peak, PM peak, and ADT.

4.16 UTILITIES AND SERVICE SYSTEMS

4.16.1 Environmental Setting Potable Water

The Irvine Ranch Water District (IRWD) is the purveyor of potable and nonpotable water service to the project site. IRWD is a multiservice agency that provides potable and nonpotable water supply and wastewater collection, treatment, and disposal services to an area covering 84,610 acres (132 square miles). PA 51 is within Zone 3 North, Zone 4, and Zone 5 of the IRWD water system. The existing on-site distribution system includes a network of distribution system pipelines, six reservoirs, and two pump stations. The original water system for the former MCAS El Toro property was designed and built as a stand-alone system. Currently, IRWD supplies potable water through four metered connections that

4. Discussion of Checklist and Mitigation Measures

connect to the IRWD Zone 3 North and Zone 4 water system. The on-site existing distribution system consists of a network of distribution system pipelines, six reservoirs, and two pump stations.

Recycled Water

The IRWD is the jurisdictional agency responsible for water service for the project area. Recycled water is currently supplied to PA 51 via a 12-inch IRWD Zone B pipeline that connects to an 8-inch pipeline in the southwest corner of the project area. PA 51 lies within three separate IRWD recycled water system pressure zones, including Zone B East Irvine, Zone C East Irvine, and Zone D AMP East.

Sewer

The IRWD is the jurisdictional agency responsible for sewer service for the project area. Wastewater treatment is provided by IRWD's Michelson Wastewater Reclamation Plant (MWRP) that has a capacity of 28 million gallons per day (mgd). PA 51 is served by a two-branched system with flow from the northeast to the southwest, mainly by gravity. The system includes a series of pipes ranging from 6- to 15-inches in diameter. The sewer discharge exits PA 51 at the southwest boundary of the project site, flows through the system, and discharges through the San Diego Creek Interceptor on the north side of the I-405.

Solid Waste

OC Waste & Recycling (OCWR) is the regulating agency that operates the local Orange County landfills, including the Frank R. Bowerman Landfill, located in the City. Waste Management of Orange County is the private contract waste hauler for all residential developments in the City. Solid waste at the project site is collected by Waste Management, Inc., and is disposed of at the Frank R. Bowerman Landfill. The average daily rate of disposal for the Frank R. Bowerman landfill is 5,500 tons per day (tpd), with a maximum daily permitted capacity of 11,500 tpd. This landfill has capacity through year 2053.

Energy and Communications

SCE serves the project area via two primary substations, and the Southern California Gas Company (SCGC) provides natural gas to the project area. AT&T is the telephone service provider. Cox Communications provides cable video, data, and telephone service to south Orange County, including the City.

4.16.2 Impacts Identified in the OCGP FEIR

Potable Water

The OCGP FEIR projected the potable water demand to be less than 1.75 million gallons per day (MGD) calculated for the land uses proposed within the project. As stated in the OCGP FEIR, selected portions of the existing potable water facilities are assumed to remain in place and operational through project buildout. The OCGP FEIR stated that the existing system will be expanded and integrated into the IRWD system and thus provide a backbone service to all users on the project site. The OCGP FEIR assumed a potable water system that would follow the routing of existing and proposed roadways.

4. Discussions of Checklist and Mitigation Measures

The SSEIR concluded that even though the 2012 Modified Project would increase water consumption, the 2011 SAMP included a Sensitivity Analysis which considered development of up to 9,500 residential units. Subsequent demand projections for the 2012 Modified Project were not considered significant changes in comparison to the 2011 SAMP. Therefore, no significant changes to the planned on-site water infrastructure were considered necessary to serve the 2012 Modified Project, and it was further indicated that there was sufficient supply capacity to accommodate full buildout through 2032, upon completion of under development supplies.

Recycled Water

The OCGP FEIR stated that on January 27, 2003, the IRWD Board of Directors approved the assessment of water supply for the project. According to the findings of the assessment, the IRWD has determined that a sufficient non-potable water supply is available to serve the project. Since the proposed Modifications do not increase the intensity or change the mix of land uses, the total non-potable water supplies will meet the demand.

The OCGP FEIR stated that the implementation of the project would require the expansion of the recycled water transmission lines to serve the project. It was assumed that selected on-site facilities would remain in place and operational through buildout. The OCGP FEIR stated that the existing system will be expanded and integrated into the IRWD system and provide a backbone service to all users in the project site. The OCGP FEIR assumed a non-potable system that would follow the routing of existing and proposed roadways within the project.

The SSEIR concluded that the demand for recycled water decreased compared to previous projects due to the removal of the golf course. Therefore, no impact related to increased demand was anticipated, and it was further indicated that there was sufficient recycled water supply capacity to accommodate full buildout through 2032, upon completion of under development supplies.

Sewer

The OCGP FEIR stated that the IRWD will continue to provide sewer service to the project. The IRWD has indicated that it would have sufficient capacity to meet the future demand; however, additional wastewater treatment capacity may need to be purchased by project proponents as specific development projects come forward. The OCGP FEIR indicated that projected buildout demand for sewer services based on the land uses in the project were 0.89 MGD and that the project would require an increase of sewer transmission capacity to serve the project. The proposed sewer system would preserve selected, existing on-site facilities in place, remain operational through buildout and expand the system through extension of existing sewer lines. The OCGP FEIR stated that additional IRWD maintenance and equipment could be required to operate and maintain the proposed system.

The adopted Master Subdivision Map ensured that any projected use of the existing sewer system would be in conformance with all applicable regional and State requirements and the mitigation requirements of the OCGP FEIR and addenda. It included the alignment for the sewer lines throughout the project, which was an additional project design detail and did not change the project description.

The SSEIR indicated that IRWD has adequate wastewater treatment capacity for the 2012 Modified Project's estimate wastewater generation. Therefore, development of the project would not require

4. *Discussion of Checklist and Mitigation Measures*

construction of new or expanded wastewater treatment facilities.

Although the 2012 Modified Project would increase wastewater generation, the 2011 SAMP included a Sensitivity Analysis which considered development of up to 9,500 residential units. Subsequent demand projections for the 2012 Modified Project were not considered significant changes in comparison to the 2011 SAMP. Therefore, no significant changes to the planned on-site sewer infrastructure were considered necessary to serve the 2012 Modified Project.

Solid Waste

As stated in OCGP FEIR, demolition of existing runways, buildings, and structures within PA 51 will generate debris materials that would have to be disposed of at local landfills. Green waste would also be generated as a result of ongoing park and landscaping maintenance. In addition to the City requirement for recycling of construction and demolition material to reduce waste, solid waste reduction would also be achieved through compliance with AB 939, which requires that a minimum of 50 percent of the solid waste generated in cities in California be diverted from landfills. Further, SB 1374 requires that all cities implement measures that would divert 75 percent of all construction and demolition waste from landfills. While the OCGP FEIR identified a potential impact related to solid waste, it concluded that, with the recommended, City-adopted mitigation measures, the impact would be less than significant.

The SSEIR indicated that the 2012 Modified Project would increase the amount of solid waste generated and would increase the demand for solid waste services, there was adequate capacity at the Frank R. Bowerman Landfill to accommodate the 2012 Modified Project and cumulative development.

Energy and Communications

The Overlay Plan has proposed to install the new systems generally along a route that coincides with the existing and proposed roadway within the project. A portion of the routing, (specifically the portion along the loop road) is not included in the project and would require an adjustment to the routing system for the expansion of the dry utilities system. However, the expansion of the system would generally coincide with the existing and proposed roadways consistent with the OCGP FEIR. The OCGP FEIR further stated that the specific impacts of constructing new energy and communication transmission facilities could not be determined at the program level analysis, as site-specific plans for the installation of the energy and communication transmission backbone system have not been prepared. The general significant impacts associated with the construction and operation of public facilities, including the project's construction and operation of the transmission system, were addressed in the OCGP FEIR.

The SSEIR concluded that the no impacts related to energy and communications were anticipated and that the energy and communications providers indicated there was adequate capacity to serve the 2012 Modified Project as well as cumulative development in the area.

4.16.3 Impacts Associated with the Expanded Community Ice Facility

Although the proposed Project would increase the square footage and spectator seating in the community ice rink, it would not result in new uses not previously anticipated in the OCGP Master Plan and there would be a corresponding decrease in the square footage of another use within the OCGP. The proposed addition of building square feet for the Community Ice Facility site will be deducted from other approved

4. Discussions of Checklist and Mitigation Measures

uses so that the maximum building square footage allocated for the overall uses within the OCGP will not be exceeded. Therefore, the increase in size and seating would not substantively alter the provision of utilities or create additional demand on existing levels of service when compared to what was anticipated in the FEIR, and Addenda.

Potable Water

The proposed Project does not propose additional development intensity. As stated above, the proposed addition of building square feet for the Community Ice Facility site will be deducted from other approved uses so that the maximum building square footage allocated for the overall uses within the OCGP will not be exceeded. Therefore, the demand projection for potable water is consistent with the OCGP FEIR. No additional mitigation measures or change in any mitigation measure is required. Therefore, the proposed Project would not demand increased supplies or require construction of new water treatment facilities that would create an impact on the environment.

Recycled Water

The proposed Project not propose any additional development intensity, and the total non-potable water supplies would meet the project demand, as analyzed in the OCGP FEIR. As stated above, the proposed addition of building square feet for the Community Ice Facility site will be deducted from other approved uses so that the maximum building square footage allocated for the overall uses within the OCGP will not be exceeded. Therefore, the demand projection for recycled water is consistent with the OCGP FEIR. No additional mitigation measures or change in any mitigation measure is required. Therefore, the proposed Project would not demand increased supplies or require construction of new water treatment facilities that would create an impact on the environment.

Sewer

The proposed Project does not propose any additional development intensity. Therefore, demand projections and proposed system expansion requirements would remain the same and the demand projection for wastewater treatment would be consistent with the OCGP FEIR. No additional mitigation measures or change in any mitigation measure is required. Therefore, the proposed Project would not result in increased demand for wastewater treatment exceeding the requirements of the applicable RWQCB or require construction of new wastewater treatment facilities that would create an impact on the environment.

Solid Waste

As stated in OCGP FEIR, demolition of existing runways, buildings, and structures within PA 51 would generate debris materials that would have to be disposed of at local landfills. Green waste would also be generated as a result of ongoing park and landscape maintenance. The proposed Project would not change the land uses or intensity of the uses; therefore, no change in impact to solid waste is anticipated as a result of the modifications to the Improvement Area. Additionally, there is adequate capacity at the Frank R. Bowerman Landfill to accommodate the solid waste disposal demand of the proposed Project.

Energy and Communications

4. *Discussion of Checklist and Mitigation Measures*

The OCGP FEIR stated that the specific impacts of constructing new energy and communication transmission facilities could not be determined at the program level analysis, as site-specific plans for the installation of the energy and communication transmission backbone system have not been prepared. The analysis and conclusions in the OCGP FEIR do not change since the proposed Project does not introduce new land uses that would increase demand on energy and communications infrastructure. The general significant impacts, associated with the construction and operation of public facilities, were addressed in the OCGP FEIR.

4.16.4 Findings

Major FEIR Revisions Not Required. Based on the foregoing analysis and information, there is no evidence that the Proposed project would require a major change to the certified OCGP FEIR. The proposed modification to the OCGP Master Plan, which does not include any major change to park development areas identified in the approved OCGP Master Plan, would not result in any new significant environmental impact nor would there be a substantial increase in the severity of impacts from that described in the certified OCGP FEIR.

No Substantial Change in Circumstances Requiring Major FEIR Revisions. There is no information in the record or otherwise available that indicates that there are substantial changes in circumstances pertaining to utilities that would require major changes to the certified OCGP FEIR.

No New Information of Substantial Importance Showing Greater Significant Effects Than Previous FEIR. All available relevant information has been analyzed, and there is no new information of substantial importance, which was unknown and could not have been known with the exercise of reasonable diligence at the time the OCGP EIR was approved, augmented, and/or updated, indicating that the proposed Project will have one or more significant effects not discussed in the OCGP EIR or result in a substantial increase in the severity of previously identified effects.

No New Information of Substantial Importance Showing Ability to Reduce Significant Effects in Previous FEIR. All available relevant information has been analyzed, and there is no new information of substantial importance, which was unknown and could not have been known with the exercise or reasonable diligence at the time the OCGP FEIR was approved, augmented, and/or updated, indicating that (1) mitigation measures or alternatives previously found not to be feasible would in fact be feasible, and would substantially reduce one or more significant effects of the proposed Project, but the project proponent declines to adopt the mitigation measures or alternatives; or (2) mitigation measures or alternatives that are considerably different from those analyzed in the previous EIR would substantially reduce one or more significant effects on the environment, but the project proponent declines to adopt the mitigation measures or alternatives. There are no alternatives to the proposed Project or additional mitigation measures that would substantially reduce one or more of the significant effects identified in and considered by the OCGP FEIR.

4.16.5 Mitigation from the OCGP FEIR and Applicability to the Expanded Community Ice Facility

The OCGP FEIR determined the mitigation measures identified in other sections of the OCGP FEIR (5.1–5.13) address the impacts associated with the construction and operation of public facilities. These measures would be applicable to any new construction and operation of facilities for the following types of utilities to serve the project area:

4. Discussions of Checklist and Mitigation Measures

- Potable water
- Recycled water
- Wastewater
- Energy and communication transmission facilities

Mitigation Measures SW1 through SW5 apply to future demolition and new construction, and would be carried forward through permit approvals for subsequent development projects.

Of the Mitigation Measures listed below, applicable measures will be incorporated into the proposed Project upon project implementation.

SW1 It is anticipated that much of the solid waste resulting from the demolition, dismantling, or other deconstruction of the aged structures and property, including but not limited to buildings and runways, at MCAS El Toro is contaminated with lead-based paints, asbestos, or other materials that may render it unsuitable for recycling or reuse. At the sole cost and expense of the project applicant, in order to evaluate this condition and determine the feasibility of recycling of solid waste material from the MCAS El Toro site by ordinary means, a technical evaluation by a qualified environmental consultant must be conducted. The technical evaluation shall include sufficient sample testing of all types of solid waste materials to be generated by the project to analyze its composition. A copy of the full technical evaluation and its findings must be submitted to the City Community Development Department. The City must confirm the adequacy of the technical evaluation prior to authorizing the demolition, dismantling, or deconstruction project to proceed.

If it is determined by the technical evaluation that material is contaminated and prohibited from being recycled by ordinary means, a further evaluation must be conducted to identify and evaluate other feasible methods approved by State law to divert the material from landfills. This may include the delivery of the waste material to other appropriate non-disposal or transformation facilities, such as waste-to-energy (WTE) plants.

SW2 For that solid waste which is determined to be inappropriate for recycling (as that term is defined by California Public Resources Code Section 40180), the project applicant must submit a written plan to the City and implement such plan to ensure that 75 percent of the material, or the maximum amount feasible as determined by the technical evaluation, is diverted from the landfill through other methods that comply with State statutes and regulations.

SW3 For that solid waste which the technical study deems to be suitable for recycling, the project applicant must submit a written plan to the City and implement such plan to ensure that solid waste material generated by the demolition, dismantling, or deconstruction project, land use operations and maintenance is collected by a City-authorized solid waste hauler or recycling agent, and that a minimum of 75 percent of the solid waste from the project is diverted from landfills by recycling, as that term is defined by California Public Resources Code Section 40180 (recycling does not include transformation, as defined in Public Resources Code Section 40201).

4. Discussion of Checklist and Mitigation Measures

- SW4** To ensure ongoing compliance with these mitigation measures, the project applicant will be required to submit solid waste tonnage reports to the City on City-approved forms, accompanied by weight ticket receipts from State-certified disposal, nondisposal, or transformation facilities, on a quarterly basis to demonstrate that solid waste diversion has occurred in accordance with these required mitigation measures and in a manner that is consistent with, and not detrimental to, the efforts of the City to comply with AB 939.

To assure compliance with applicable statutes related to the disposal of solid waste, it is necessary for the City to require appropriate and effective mitigation measures to limit the disposal and ensure significant recycling of solid waste on-site.

- SW5** For green waste, the project applicant must submit a written plan to the City and implement such plan to ensure that the green waste material generated by landscape maintenance operations is collected by a City-authorized waste hauler or recycling agent, that the maximum feasible amount of that collected green waste is recycled, and that a minimum of 50 percent of the green waste from the project is diverted from landfills by recycling, as that term is defined by California Public Resources Code Section 40180.

The SSEIR identified the following measures as existing PPPs that apply to the proposed Project and will help reduce or avoid potential utilities and service system impacts:

Of the PPPs listed below, applicable measures will be incorporated into the proposed Project upon project implementation.

Water

- PPP 13-1 Requirement to Use Recycled Water:** IRWD will identify areas within the Subarea Master Plan that are capable of receiving service from the IRWD's recycled water system, and will determine the feasibility of providing recycled water service to these areas. IRWD will also review applications for new permits to determine the feasibility of providing recycled water service to these applicants. If recycled water service is determined by IRWD to be feasible, applicants for new water service shall be required to install on-site facilities to accommodate both potable water and recycled water service in accordance with IRWD's Rules and Regulations.
- PPP 13-2 Connection Fees:** The Project Applicant shall enter into agreement or agreements as necessary with IRWD to establish the appropriate financial fair share costs to be borne by the project proponent. Fair share costs may include, but are not limited to, those associated with the preparation of studies necessary to analyze the needs of the 2012 Modified Project and infrastructure expansion necessary to serve the 2012 Modified Project.
- PPP 13-3 Fire Flow Analysis:** In accordance with IRWD requirements, each tentative tract map in the 2012 Modified Project must provide a fire flow analysis. If the analysis identifies any deficiencies, the developer will be responsible for any water system improvements associated with the development project required to rectify the deficiencies and meet IRWD fire flow requirements.

4. Discussions of Checklist and Mitigation Measures

Wastewater

PPP 13-2 is applicable.

Solid Waste

- PPP 13-4** The City Construction and Demolition (C&D) Debris Recycling and Reuse ordinance requires that (1) all residential projects of more than one unit, (2) nonresidential developments on 5,000 sf or larger, and (3) nonresidential demolition/renovations with more than 10,000 sf of building recycle or reuse a minimum of 75 percent of concrete and asphalt and 50 percent of nonhazardous debris generated.
- PPP 13-5** The City adopted a Zero Waste program in 2007 to approach waste management. The City recovers approximately 66 percent of its waste for recycling and composting, which exceeds the State's AB 939 waste diversion goals. Furthermore, waste haulers establish rate schedules according to bin size and frequency of collection. Commercial customers that subscribe to smaller bins (e.g., 2 cubic-yard bins) are routinely charged less by haulers. This pricing structure encourages waste reduction and recycling, and tends to minimize hauler pickups.
- PPP 13-6** The Irvine Sustainable Community Initiative (Initiative Ordinance 10-11), adopted by the voters of the City as Initiative Measure S on November 2, 2010, and certified by the City Council on December 14, 2010, became effective December 24, 2010. The ordinance was adopted to ratify and implement policies in support of renewable energy and environmental programs for a sustainable community. It outlines the City's direction for continuing to develop and implement programs geared towards green building, renewable energy and sustainability. For example, the City would continue to develop and implement recycling, zero waste or other innovative on-site business programs to divert waste from landfills and also continue to develop and implement the use of native, California-friendly and drought-tolerant landscaping.
- PPP 13-7** Prior to the issuance of grading permits for a project that involves the demolition of an asphalt or concrete parking lot on site, the applicant shall submit a waste management plan demonstrating compliance with the requirements of Title 6, Division 7 of the City Municipal Code relating to recycling and diversion of demolition waste as applicable to said project. Over the course of demolition or construction, the applicant shall ensure compliance with all code requirements related to the use of City-authorized waste haulers (Standard Condition 2.24).
- PPP 13-8** Prior to the issuance of building permits for a project that involves new construction or that involves the demolition or renovation of existing buildings on site, the applicant shall comply with requirements of Title 6, Division 7 of the City Municipal Code relating to recycling and diversion of construction and demolition waste as applicable to said project. Over the course of demolition or construction, the applicant shall ensure compliance with all code requirements related to the use of City-authorized waste haulers (Standard Condition 3.7).

4. Discussion of Checklist and Mitigation Measures

Energy and Communications

PPP 4-3 California's Building and Energy Efficiency Standards (CCR Title 24): Prior to the issuance of a building permit for residential, commercial, or office structures in the proposed Project site, development plans for these structures shall be required to demonstrate that the project meets the Building and Energy Efficiency Standards in place at the time of building permit issuance. Commonly known as Title 24, these standards are updated periodically to allow consideration and possible incorporation of new energy efficiency technologies and methods. The 2008 standards are approximately 15 percent more energy efficient than the 2005 Building and Energy Efficiency Standards. The 2013 Building Energy Efficiency Standards are 25 percent more efficient than previous standards for residential construction and 30 percent more efficient for nonresidential construction. The 2013 Standards, which take effect on January 1, 2014, offer builders more efficient windows, insulation, lighting, ventilation systems and other features that reduce energy consumption in homes and businesses. Plans submitted for building permits shall include written notes demonstrating compliance with the energy standards and shall be reviewed and approved by the Public Utilities Department prior to issuance of building permits. Design strategies to meet this standard may include maximizing solar orientation for daylighting and passive heating/cooling, installing appropriate shading devices and landscaping, utilizing natural ventilation, and installing cool roofs. Other techniques include installing insulation (high R value) and radiant heat barriers, low-e window glazing, or double-paned windows.

PPP 4-4 Title 24 Code Cycles: Net-Zero Buildings (Residential and Nonresidential): The California Public Utilities Commission adopted its Long-Term Energy Efficiency Strategic Plan on September 18, 2008, presenting a roadmap for all new residential and commercial construction to achieve a zero-net energy standard. This Plan outlines the goal of reaching zero net energy in residential construction by 2020 and in commercial construction by 2030. Achieving this goal will require increased stringency in each code cycle of California's Energy Code (Title 24).

PPP 4-5 California Renewable Portfolio Standard: CARB's Renewable Portfolio Standard (RPS) is a foundational element of the State's emissions reduction plan. In 2002, SB 1078 established the California RPS program, requiring 20 percent renewable energy by 2017. In 2006, SB 107 advanced the 20 percent deadline to 2010, a goal which was expanded to 33 percent by 2020 in the 2005 Energy Action Plan II. On September 15, 2009, Gov. Arnold Schwarzenegger signed Executive Order S-21-09 directing CARB to adopt regulations increasing RPS to 33 percent by 2020. These mandates apply directly to investor-owned utilities, which in the case of the 2012 Modified Project is SCE.

The SSEIR also identified the following measures as existing PDFs that apply to the proposed Project and will help reduce or avoid potential utilities and service system impacts.

Of the PDFs listed below, applicable measures will be incorporated into the proposed Project upon project implementation.

Water

4. Discussions of Checklist and Mitigation Measures

PDF 4-3 Low-Flow Fixtures: The 2012 Modified Project incorporates low-flow water fixtures that will meet the requirements of the California Green Building Standards Code standards. Prior to issuance of building permit, the Applicant or its successor shall submit evidence to the satisfaction of the Director of Community Development that toilets, urinals, sinks, showers, and other water fixtures installed on-site are low-flow water fixtures that meet the California Green Building Standards Code standard.

PDF 4-4 Landscaping and Irrigation Systems: The 2012 Modified Project incorporates automated, high-efficiency landscaping irrigation systems on all master landscaped areas that reduce water use, such as evapotranspiration "smart" weather-based irrigation controllers, and bubbler irrigation; low-angle, low-flow spray heads; moisture sensors; and use of a California-friendly landscape palette. Prior to approval of landscape plans, the Applicant or its successor shall submit evidence to the satisfaction of the Director of Community Development that such landscaping irrigation systems will be installed so as to make the 2012 Modified Project consistent with the intent of the California Water Conservation in Landscaping Act of 2006 (AB 1881), including provisions to reduce the wasteful, uneconomic, inefficient, and unnecessary consumption of water.

PDF 4-5 Use of Recycled Water on All Master Landscaped Areas: Prior to approval of landscape plans, the Applicant or its successor shall submit evidence to the satisfaction of the Director of Community Development and IRWD that the 2012 Modified Project incorporates the use of recycled water in all master landscaped areas, including master landscaped commercial, multifamily, common, roadways, and park areas. Master landscapes will also incorporate weather-based controllers and efficient irrigation system designs to reduce overwatering, combined with the application of a California-friendly landscape palette.

Wastewater

PDF 4-3 is applicable.

4.17 DETERMINATION

Based on the information and analysis in this Initial Study/Addendum, and pursuant to Section 15162 of the State CEQA Guidelines, the City has determined that:

1. There are no substantial changes to the project that will require major revisions to the OCGP FEIR due to new, significant environmental effects or a substantial increase in the severity of impacts identified in the OCGP FEIR;
2. Substantial changes have not occurred in the circumstances under which the project is being undertaken that will require major revisions of the OCGP FEIR to disclose new, significant environmental effects or a substantial increase in the severity of the impacts identified in the OCGP FEIR; and
3. There is no new information of substantial importance not known at the time the OCGP FEIR was approved, augmented, and/or updated that shows any of the following:

4. Discussion of Checklist and Mitigation Measures

- a. The project will have any new significant effects not discussed in the OCGP FEIR;
- b. There are impacts that were determined to be significant in the OCGP FEIR that will be substantially increased;
- c. There are additional mitigation measures or alternatives to the project that would substantially reduce one or more of the significant effects identified in the OCGP FEIR; or
- d. There are additional mitigation measures or alternatives that were rejected by the project proponent that are considerably different from those analyzed in the OCGP FEIR that would substantially reduce any significant impact identified in that EIR.

Great Park Community Ice Facility - Previously Proposed Project

Orange County, Winter

1.0 Project Characteristics

1.1 Land Usage

Land Uses	Size	Metric	Lot Acreage	Floor Surface Area	Population
Parking Lot	655.00	Space	5.89	262,000.00	0
Arena	117.64	1000sqft	6.21	117,635.00	0

1.2 Other Project Characteristics

Urbanization	Urban	Wind Speed (m/s)	2.2	Precipitation Freq (Days)	30
Climate Zone	8			Operational Year	2017

Utility Company Southern California Edison

CO2 Intensity (lb/MW/hr)	630.89	CH4 Intensity (lb/MW/hr)	0.029	N2O Intensity (lb/MW/hr)	0.006
-----------------------------	--------	-----------------------------	-------	-----------------------------	-------

1.3 User Entered Comments & Non-Default Data

Project Characteristics -

Land Use - Project site acreage

Construction Phase - Estimated construction schedule

Grading - Project site acreage

Architectural Coating - Architectural coatings will consist mainly of primers, flats and nonflats with VOC content per SCAQMD Rule 1113.

Vehicle Trips - Based on traffic study

Vehicle Emission Factors - Fleet mix adjusted to recreational uses

Vehicle Emission Factors - Fleet mix adjusted to recreational uses

Vehicle Emission Factors - Fleet mix adjusted to recreational uses

Land Use Change -

Construction Off-road Equipment Mitigation -

EXECUTIVE SUMMARY

LSA Associates, Inc. (LSA) has prepared the following analysis to determine the traffic impacts resulting from the proposed modification to the approved Master Plan for the Orange County Great Park (OCGP) located at the former El Toro Marine Corps Air Station (MCAS El Toro) in the City of Irvine (City). The first phase of the OCGP, referred to as the Western Sector Park Development Plan (WSPDP) Phase 1, will include sports fields, supportive uses, and displays consistent with the approved Master Plan. A Traffic Impact Analysis (TIA) for the WSPDP was approved by the City in 2011 (LSA, August 2011).

A community ice rink facility (Area L) and western picnic area (Area E) are included in the description of uses approved for this area of the OCGP. This area is bounded by LV Street to the north, 8th Street to the south, G Street to the east (a new north/south roadway between the special event parking area and the project site, proposed as part of the project) and Ridge Valley Street to the west. As part of the approved TIA, the community ice facility included three sheets of ice, seating for up to 1,200 at one rink and 100 each for the other rinks (1,400 total seats), and special events up to 6 weekdays per year.

An expansion to the approved community ice facility portion of the Western Sector is proposed. The project proposes four sheets of ice (including three National Hockey League [NHL] size sheets and one Olympic-size sheet), seating for up to 2,500 at one rink and 500 each for the others (4,000 total seats), and special events up to 12 times per year. Special events are defined as those events that are anticipated to exceed the ice facility's on-site parking supply. Per an agreement with the City, the project will provide a minimum of 665 parking spaces on site. A Traffic Management Plan (TMP) will be required and coordinated with City staff and Public Safety for these special events.

The proposed ice sheets will drive facility usage, with additional square footage assigned to common area, circulation, and accessory uses that support the ice sheets. The seating will accommodate spectators for ice-related sporting events, such as hockey tournaments and figure skating competitions, within the four sheets proposed. The ice facility includes the following uses that would be an accessory to the sheets of ice (i.e., the primary services provided on site) and would not generate new traffic:

- Locker facilities
- Lobby, skating support, and retail spaces, including a pro shop, party rooms, and a restaurant
- Dedicated figure skating room
- Administrative space
- Mechanical/electrical space
- Training and team space

Access to the proposed community ice facility would be provided via a right-turn in/right-turn out (RIRO) only driveway on Ridge Valley Street and a full-access driveway on G Street, which is a new local roadway on the eastern boundary of the project site between LV Street to the north and 8th Street to the south.

This TIA was prepared in accordance with the applicable sections of the City's TIA Guidelines (adopted August 24, 2004), the City's Transportation Guidelines (TGs) (adopted July 1993), and the City's Transportation Development Guidelines (TDPs) (adopted February 2007), and in general accordance with the requirements of the North Irvine Transportation Mitigation (NITM) Program. A Scope of Work was approved by City staff on January 6, 2016, that outlines the study area and methodologies followed in this TIA (Appendix A).

This Executive Summary presents the findings of a traffic study carried out to determine the impacts of the proposed modifications of the community ice rink facility (Area L) and western picnic area (Area E) of the OCGP Western Sector Development Plan Phase 1 located in Planning Area 51 in the City of Irvine.

This study focuses on the daily, a.m. peak-hour, and p.m. peak-hour levels of service (LOS) at 11 intersections and on 11 roadway segments. Project impacts were determined based on analysis of the following scenarios:

- 2017 Baseline Approved; and
- 2017 Baseline Approved Plus Project.

City staff provided the forecast traffic volume data for each scenario consistent with the latest version of the Irvine Transportation Analysis Model (ITAM) (Model Number 12).

Summary of Findings

Based on the results of the LOS analysis, the study area intersections and roadway segments are forecast to operate at acceptable LOS with the added sheet of ice in 2017. No project impacts have been identified on the study area intersections or roadway segments.

Project design features were also analyzed based on the following design guidelines from the City's TGs and TDPs:

Transportation Guidelines:

- **TG-1:** Left-turn pocket length.
- **TG-8:** Distance between driveways and intersections.
- **TG-10:** Left-turn in/out access.
- **TG-11:** Right-turn lanes at uncontrolled driveways.
- **TG-15:** Driveway lengths.

Transportation Development Procedures:

- **TDP-17:** Roundabouts.

As a result, no impacts to vehicular access were identified. The proposed access points will meet the City's design guidelines.

INTRODUCTION

Project Site

The project site is bounded by LV Street to the north, 8th Street to the south, G Street to the east, and Ridge Valley Street to the west, as shown on Figure 1. This 14.06-acre site will be developed into an enclosed ice skating facility incorporating four sheets of ice, including three sized for regulation ice hockey and one sized for Olympic-style skating. Access to the proposed community ice facility would be provided via a RIRO-only driveway on Ridge Valley Street and a full-access driveway on G Street, which is a new local roadway on the eastern boundary of the project site that connects LV Street to the north and 8th Street to the south. It is located between Ridge Valley Street and Olympic Way (currently C Street). The street name of Olympic Way is used as a placeholder for reference purposes. The ultimate street name for this street is yet to be determined. Figure 2 illustrates a circulation plan of the community ice facility project.

The enclosed facility will include ancillary uses, support facilities, and seating for up to 2,500 spectators at one rink and 500 spectators at each of the other three rinks (4,000 total seats). The proposed expansion to the facility will support exhibitions, clinics, and leagues on the NHL-quality sheet, and figure skating and recreational uses on the Olympic sheet. A special event permit will be required prior to hosting a large event and will only be permitted up to 12 times per year. Special events are defined as those events that are anticipated to exceed the ice facility's on-site parking supply. A condition will be placed on the Park Design and/or Master Plan Modification indicating that additional traffic analysis may be required in the event that the number of large events per year is proposed to be increased. The facility operator shall be responsible for obtaining a special event permit with the City.

The proposed ice sheets will drive facility usage, with additional square footage assigned to common area, circulation, and accessory uses that support the ice sheets. The seating will accommodate spectators for ice-related sporting events, such as hockey tournaments and figure skating competitions, within the four sheets proposed. The ice facility includes the following uses that would be an accessory to the sheets of ice (i.e., the primary services provided on site) and would not generate new traffic:

- Locker facilities
- Lobby, skating support, and retail spaces, including a pro shop, party rooms, and a restaurant
- Dedicated figure skating room
- Administrative space
- Mechanical/electrical space
- Training and team space

The current approved Master Plan for the OCGP includes a community ice facility with three sheets of ice. As defined in the previous traffic study for the WSPDP, this generated 24 a.m. peak-hour trips, 96 p.m. peak-hour trips, and 720 average daily trips (ADT). The project's proposed expansion (i.e., one sheet of ice) will generate an additional 8 a.m. peak-hour trips, 32 p.m. peak-hour trips, and 240 ADT. Based on the City's TIA Guidelines, a project that generates less than 50 peak-hour trips would require a Limited Scope TIA, which includes a short-term horizon year analysis.

Great Park Community Ice Facility
Preliminary Circulation Plan

Encumbrance Map

This traffic study focuses on traffic generated from the proposed sheet of ice, consistent with the previously approved traffic study for the Western Sector. Building square footage is not used in this calculation. Any proposed addition of building square feet on site compared to the current approvals will be deducted from other uses so that the maximum building square footage or trip budget allocated for the overall uses within the OCGP will not be exceeded. The western picnic area will be replaced by the community ice facility and will not be relocated within the OCGP.

Study Area Boundary

As illustrated on previously referenced Figure 1, the study area as approved in the Scope of Work includes the following intersections within the area bounded by Trabuco Road on the north, Marine Way on the south, Olympic Way and C Street on the east, and Ridge Valley Street (formerly O Street) on the west:

1. Ridge Valley Street/Trabuco Road (ITAM Intersection [Int.] 559);
2. Ridge Valley Street/Champion Way (B Street) (ITAM Int. 623);
3. Ridge Valley Street/LV Street (ITAM Int. 575);
4. Ridge Valley Street/Project RIRO Driveway (ITAM Int. 493);
5. Ridge Valley Street/8th Street (ITAM Int. 655);
6. Ridge Valley Street/C Street (ITAM Int. 576);
7. Ridge Valley Street/Marine Way (ITAM Int. 560);
8. G Street/LV Street (ITAM Int. 654);
9. G Street/Full-Access Project Driveway (ITAM Int. 496);
10. G Street/8th Street (Roundabout) (ITAM Int. 497); and
11. Olympic Way/LV Street (Roundabout) (ITAM Int. 498).

The study area also includes the following roadway segments:

1. Ridge Valley Street between Trabuco Road and Champion Way (B Street);
2. Ridge Valley Street between Champion Way (B Street) and LV Street;
3. Ridge Valley Street between LV Street and Project RIRO Driveway;
4. Ridge Valley Street between Project RIRO Driveway and 8th Street;
5. Ridge Valley Street between 8th Street and C Street;
6. Ridge Valley Street between C Street and Marine Way;
7. G Street between LV Street and Full-Access Project Driveway;
8. G Street between Full-Access Project Driveway and 8th Street;
9. LV Street between Ridge Valley and G Street;

10. LV Street between G Street and Olympic Way;
11. 8th Street between Ridge Valley Street and G Street.

Figure 3 illustrates the future geometrics at each of the study area intersections.

Existing, General Plan, and Proposed Site Uses

In 1993, MCAS El Toro was listed by the Department of Defense in the Base Realignment and Closure Act for closure by 1999, with the site transferring to civilian use. The site of the OCGP consisted of buildings, military facilities, and runways that were left after closure. Current uses on site include the Balloon Park; Incredible Edible Farm; Picnic Meadow; Farmer's Market; Giving Grove; Festival Site; North Lawn; four soccer fields; Farm and Food Lab; Palm Court; Art Gallery; Hangar 244; Artist Studios; Walkable Timeline; Carousel; Visitor's Center Pavilion; Kid's Rock Playground; Great Park Operations Office; and Tierra Verde Industries.

The OCGP is owned, operated, maintained, and being developed by the City of Irvine. The City identifies the General Plan land use category for the site as "Orange County Great Park," and the Zoning District is classified as 1.9 Orange County Great Park.

The proposed uses for the site are consistent with Final Environmental Impact Report (FEIR) for the OCGP. An Addendum to the FEIR is being prepared to incorporate the additional sheet of ice and change to the roadway network (addition of G Street). The General Plan land use designations and related zoning district's permissible land uses include open space, parks, cultural facilities, golf courses, habitat preserves, wildlife corridors, agriculture, educational, institutional, and exposition centers. The proposed OCGP Master Plan Modification No. 3 for the Community Ice Facility is consistent with the City's General Plan and Zoning Ordinance.

PERFORMANCE CRITERIA

The intersection capacity utilization (ICU) methodology was used to determine the peak-hour operations at signalized intersections within the study area. The ICU methodology compares the volume-to-capacity (v/c) ratios of conflicting turn movements at an intersection, sums these critical conflicting v/c ratios for each intersection approach, and determines the overall ICU. The resulting ICU is expressed in terms of LOS, where LOS A represents free-flow activity and LOS F represents overcapacity operation. Parameters set by the City for ICU calculations, including lane capacity, right-turn treatment, and clearance interval, are included in the analysis.

According to the City's TIA Guidelines, LOS at an intersection or roadway is considered to be unsatisfactory when the ICU exceeds 0.90 (LOS D). Table A demonstrates the relationship of ICU to LOS.

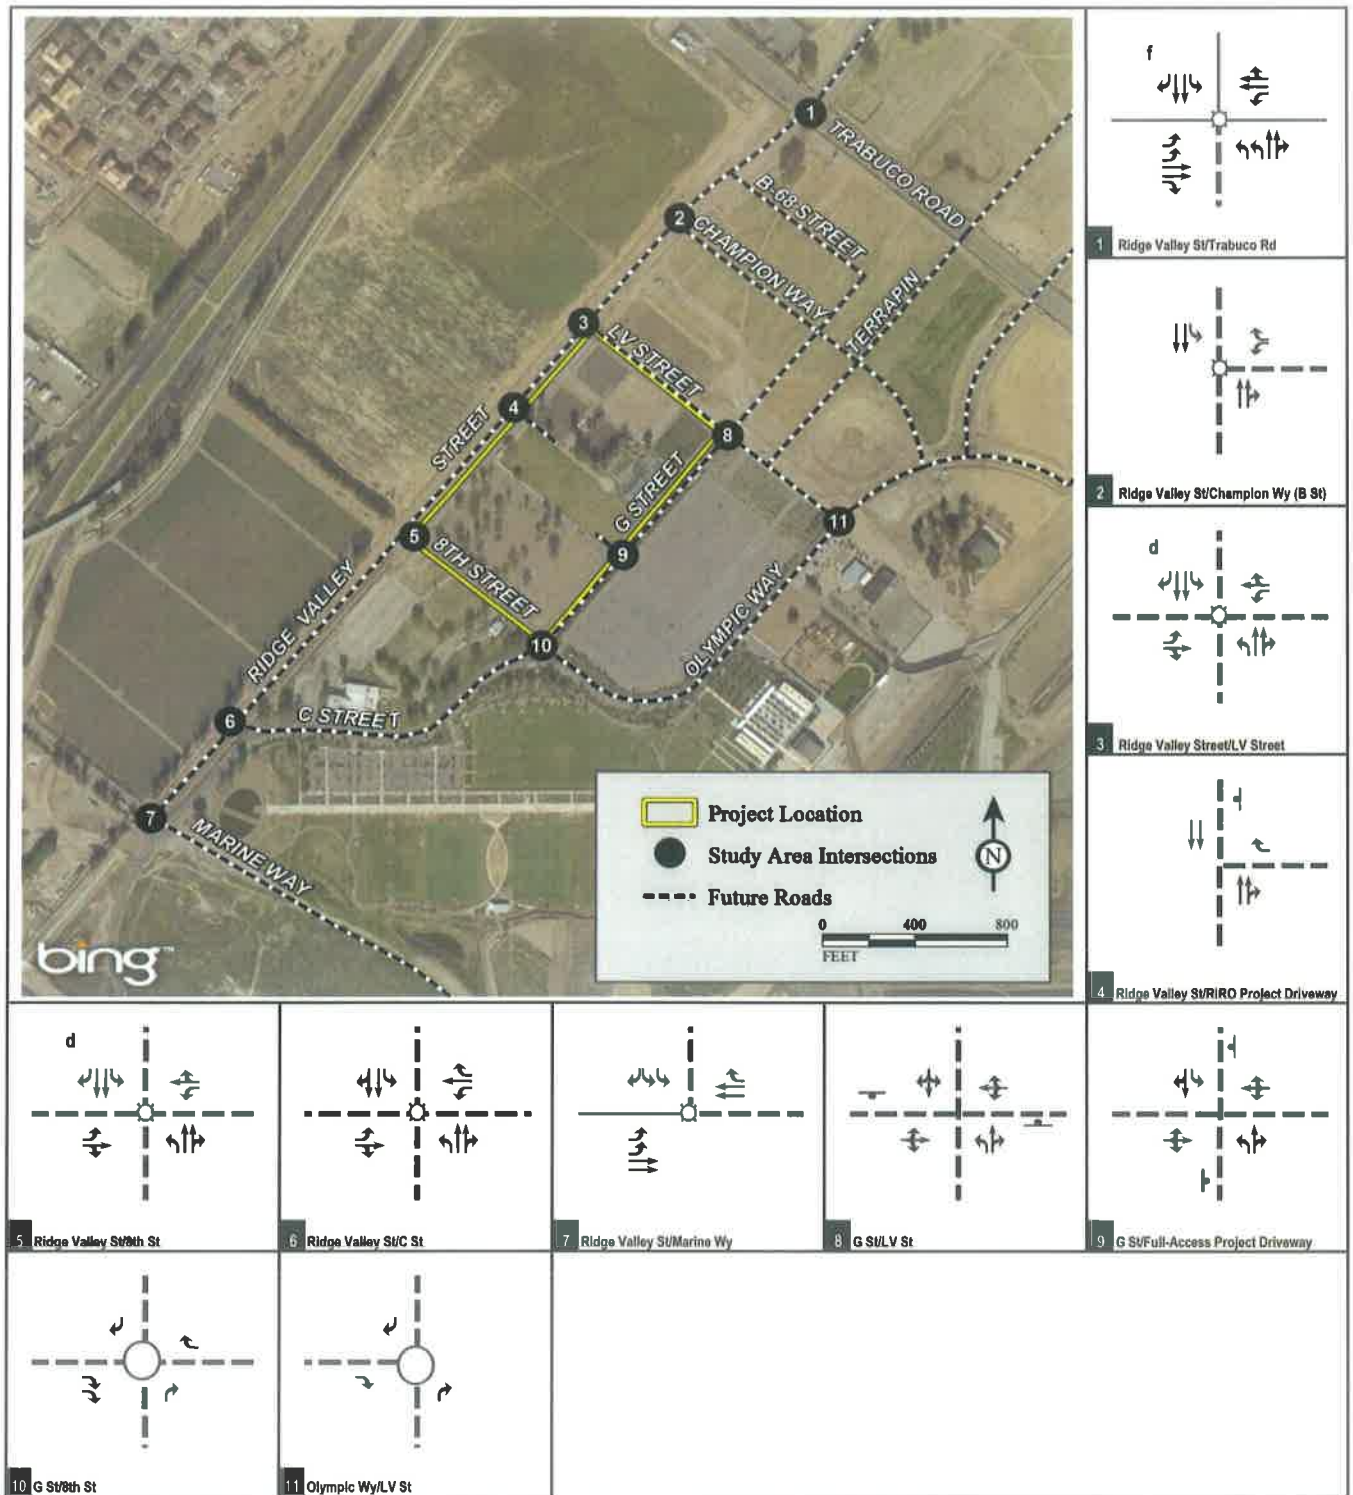

FIGURE 3

LSA

Legend
 □ Signal
 + Stop Sign
 ○ Roundabout

 d Defacto Right-Turn

Great Park Community Ice Facility

2017 Baseline Approved With Project
 Intersection Geometrics and Stop Control

Table A: Intersection Capacity Utilization and Volume-to-Capacity Ratio

Level of Service	ICU or V/C	Level of Service	ICU or V/C
A	0.00–0.60	D	0.81–0.90
B	0.61–0.70	E	0.91–1.00
C	0.71–0.80	F	> 1.00

ICU = intersection capacity utilization
V/C = volume-to-capacity ratio

A project impact occurs when the intersection in question exceeds the acceptable LOS or the impact of the development is greater than or equal to 0.02 in ICU or v/c, if already at an unacceptable LOS. Mitigation will be required back to 0.90 or the baseline, if the baseline is greater than 0.90.

The 2010 Highway Capacity Manual (HCM 2010) methodology was used to calculate intersection LOS at unsignalized study area intersections. The HCM 2010 unsignalized intersection methodology presents LOS in terms of total intersection delay and approach delay of the major and minor streets (in seconds per vehicle). Table B summarizes the relationship of delay and LOS at unsignalized intersections.

Table B: Delay and Level of Service at Unsignalized Intersections

Level of Service	Unsignalized Intersection Delay (seconds)	Level of Service	Unsignalized Intersection Delay (seconds)
A	≤10.0	D	>25.0 and ≤35.0
B	>10.0 and ≤15.0	E	>35.0 and ≤50.0
C	>15.0 and ≤25.0	F	>50.0

Roadway link v/c ratios were determined using the City's theoretical daily capacities as contained in the City's TIA Guidelines. Facility types were taken from the General Plan and the countywide Master Plan of Arterial Highways (MPAH). Table C illustrates theoretical daily capacities for roadways within the study area.

Table C: Theoretical Daily Capacities for Roadways in the Study Area

Facility Type	Number of Lanes	Theoretical Capacity
Major Highway	8 augmented	86,000
	8	72,000
	7 divided	63,000
	6 augmented	65,000
	6	54,000
Primary Highway	5 divided	43,000
	4 augmented	42,000
	4	32,000
Secondary Highway	4	28,000
Commuter	2	13,000

Ridge Valley Street is designated as a four-lane augmented commuter facility. Within the project study area, G Street, Olympic Way, C Street, and LV Street are designated as two-lane Local streets. A project impact occurs when the roadway link in question exceeds the acceptable LOS and the impact of the development is greater than or equal to 0.02 in ICU or v/c. Mitigation will be required back to 0.90 or the baseline, if the baseline is greater than 0.90.

Based on discussions with City staff, Signalized (and unsignalized) Intersection Design Research Aid (SIDRA) 6.0 software was used to determine roundabout intersection LOS at the intersections of G Street/8th Street and Olympic Way/LV Street. SIDRA is as an advanced lane-based microanalytical tool that measures roundabout capacity and delay for vehicles and pedestrians using HCM 2010 methodologies.

ANALYSIS METHODOLOGY/APPROACH

The future scenarios were analyzed based on the latest version of ITAM (Model Number 12). The future conditions described below are based on the funded roadway network and land use assumptions envisioned to be in place by the respective horizon year. There are two ITAM runs required for this traffic analysis. These model runs are examined with and without the proposed project conditions under approved development conditions. The “approved” condition includes each application for development currently approved by the City. City staff prepared the forecast data for this project. The scenarios examined for each condition are as follows:

- 2017 Baseline Approved; and
- 2017 Baseline Approved Plus Project.

Daily traffic volumes and v/c ratios are presented in the analysis for the study area roadway segments for each scenario. Traffic volumes and ICU calculations for the 2017 scenarios are referenced throughout this document and provided in Appendix B. The HCM LOS worksheets are provided in Appendix C.

FUTURE CONDITIONS

2017 Baseline Approved Traffic Volumes and LOS

Table D presents a summary of the intersection LOS for the 2017 Baseline Approved conditions (including three sheets of ice). As this table indicates, all study area intersections are forecast to operate at satisfactory LOS (defined as LOS D or better).

Table E presents the daily traffic volumes and v/c ratios for 2017 Baseline Approved conditions. As this table indicates, all study area roadway segments are forecast to operate at satisfactory LOS (defined as LOS D or better).

Table D: 2017 Baseline Approved Intersection LOS Summary

	Intersection	A.M. Peak Hour		P.M. Peak Hour	
		ICU/Delay	LOS	ICU/Delay	LOS
1	Ridge Valley Street/Trabuco Road (ITAM Int. 559)	0.41	A	0.55	A
2	Ridge Valley Street/Champion Way (ITAM Int. 623)	0.13	A	0.14	A
3	Ridge Valley Street/LV Street (ITAM Int. 575)	0.14	A	0.14	A
4	Ridge Valley Street/Project RIRO Driveway (ITAM Int. 493) HCM	8.40	A	8.60	A
5	Ridge Valley Street/8 th Street (ITAM Int. 655)	0.30	A	0.18	A
6	Ridge Valley Street/C Street (ITAM Int. 576)	0.19	A	0.16	A
7	Ridge Valley Street/Marine Way (ITAM Int. 560)	0.36	A	0.35	A
8	G Street/LV Street (ITAM Int. 654) HCM	9.00	A	9.40	A
9	G Street/Full-Access Project Driveway (ITAM Int. 496) HCM	0.00	A	0.00	A
10	G Street/8 th Street (Roundabout) (ITAM Int. 497) HCM	3.80	A	3.90	A
11	Olympic Way/LV Street (Roundabout) (ITAM Int. 498) HCM	4.00	A	4.40	A

Delay is reported in seconds per vehicle using the HCM 2010 unsignalized intersection methodology.

PROPOSED PROJECT IMPACTS

Trip Generation

Traffic volume forecasts were prepared using the latest version of ITAM (Model Number 12). Trip generation, distribution, and assignment are integrated into the methodology that the traffic model uses to forecast trips. The project trips assigned to study area intersections and roadway segments for 2017 are based on ITAM, which is the OCTA-sanctioned subarea model for the City. All modeling protocols (including trip generation, distribution, and assignment) are consistent with local, regional, and national guidance for such features.

All project trip generation is accounted for in ITAM, and the impacts of the project reflect the contribution of its trips to the local street system. All project traffic, as well as cumulative traffic and growth within the City and adjacent cities, is accounted for. ITAM is the only appropriate tool to evaluate discrete project-related circulation impacts for the City.

Table F presents the trip generation for the current Master Plan (three sheets of ice) and proposed Master Plan modification (four sheets of ice) using rates from the WSPDP Phase 1 Traffic Analysis (LSA, August 2011).

Table F: Project Trip Generation

Land Use	Size	Unit	ADT	A.M. Peak Hour			P.M. Peak Hour		
				In	Out	Total	In	Out	Total
Ice Rink Trip Rates	1	Sheet	240	4	4	8	20	12	32
Proposed Expansion									
Trip Generation ¹	4	Sheets	960	16	16	32	80	48	128
Approved Trip Generation									
Trip Generation ¹	3	Sheets	720	12	12	24	60	36	96
Net Trip Generation (1 sheet of ice)			240	4	4	8	20	12	32

¹ Western Sector Park Development Plan Phase 1 Traffic Analysis (LSA Associates, Inc., August 2011).

ADT = average daily trips

TSF = thousand square feet

As shown in Table F, the proposed expansion to four sheets of ice is forecast to generate approximately 960 ADT, including 32 a.m. peak-hour trips (16 inbound and 16 outbound) and 128 p.m. peak-hour trips (80 inbound and 48 outbound). This represents the addition of 240 ADT, 8 a.m. peak-hour trips (4 more inbound and 4 more outbound), and 32 p.m. peak-hour trips (20 more inbound and 12 more outbound) compared to the current Master Plan.

The traffic impacts in the 2017 Baseline Approved scenario analyze the proposed expansion project and the approved use. The access analysis, discussed later in the report, analyzes the total project trip generation at the project driveways.

Trip Distribution and Assignment

Directions of approach to and departure from the site were determined based on a select zone assignment from ITAM. The proposed community ice facility is located in Traffic Analysis Zone [TAZ] 950. Select zone plots for the 2017 Baseline Approved Plus Project volumes are provided in Appendix D (i.e., daily, a.m. peak hour, and p.m. peak hour). Figure 4 illustrates the project trip distribution and shows that approximately 48 percent of the inbound trips enter the site via Ridge Valley Street and 52 percent enter the site via G Street. Of the outbound trips, 58 percent exit onto Ridge Valley Street and 42 percent exit onto G Street.

FUTURE TRAFFIC WITH PROPOSED PROJECT

2017 Baseline Approved Plus Project Traffic Volumes and LOS

Table G presents the summary of the 2017 Baseline Approved Plus Project intersection LOS.

Table G: 2017 Baseline Approved Plus Project Intersection LOS Summary

	Intersection	A.M. Peak Hour		P.M. Peak Hour	
		ICU/Delay	LOS	ICU/Delay	LOS
1	Ridge Valley Street/Trabuco Road (ITAM Int. 559)	0.41	A	0.54	A
2	Ridge Valley Street/Champion Way (ITAM Int. 623)	0.12	A	0.13	A
3	Ridge Valley Street/LV Street (ITAM Int. 575)	0.13	A	0.14	A
4	Ridge Valley Street/Project RIRO Driveway (ITAM Int. 493) HCM	8.40	A	8.60	A
5	Ridge Valley Street/8 th Street (ITAM Int. 655)	0.28	A	0.19	A
6	Ridge Valley Street/C Street (ITAM Int. 576)	0.20	A	0.16	A
7	Ridge Valley Street/Marine Way (ITAM Int. 560)	0.37	A	0.35	A
8	G Street/LV Street (ITAM Int. 654) HCM	9.40	A	9.80	A
9	G Street/Full-Access Project Driveway (ITAM Int. 496) HCM	8.50	A	8.80	A
10	G Street/8 th Street (Roundabout) (ITAM Int. 497) HCM	3.90	A	3.80	A
11	Olympic Way/LV Street (Roundabout) (ITAM Int. 498) HCM	4.00	A	4.40	A

Delay is reported in seconds per vehicle using the HCM 2010 unsignalized intersection methodology.

HCM = Highway Capacity Manual

LOS = level of service

ICU = intersection capacity utilization

RIRO = right-turn in/right-turn out

ITAM = Irvine Transportation Analysis Model

As this table indicates, all study area intersections are forecast to operate at satisfactory LOS (defined as LOS D or better). Therefore, the project (addition of one sheet of ice) can be implemented in a 2017 Baseline Approved condition with no peak-hour intersection impacts.

Table H lists the daily traffic volumes and v/c ratios for the 2017 Baseline Approved Plus Project scenario. As this table indicates, all study area roadway segments are forecast to operate at satisfactory LOS (defined as LOS E or better). Therefore, no significant project impacts are created on roadway segments with implementation of the project.

SPECIAL ISSUES

Project Access and Internal Circulation

The approved WSPDP study included three sheets of ice within the OCGP site. The project proposes to expand the community ice facility to include one additional sheet of ice (total of four sheets) within Area L of the OCGP site. Access to the project site will be provided via a RIRO driveway on Ridge Valley Street and a full-access driveway on G Street.

Figure 5 illustrates driveway locations and project traffic volumes (including four sheets of ice on the project site). As shown on Figure 5, the project RIRO driveway on Ridge Valley Street anticipates 6 a.m. peak-hour vehicles and 37 p.m. peak-hour vehicles entering the project site, and 7 a.m. peak-hour vehicles and 34 p.m. peak-hour vehicles exiting the project site. The G Street full-access project driveway anticipates 10 a.m. peak-hour vehicles and 43 p.m. peak-hour vehicles entering the project

V/C = volume-to capacity ratio

site (primarily from the north), and 9 a.m. peak-hour vehicles and 14 p.m. peak-hour vehicles exiting the proposed ice facility. Dimensions to adjacent streets and intersections are also shown on Figure 5.

This analysis has been conducted consistent with the approved Scope of Work, TGs and TDPs. For TGs and TDPs that are traffic volume-dependent, evaluation of the proposed project driveway is provided in the 2017 Baseline Approved Plus Project condition, when the roadways and intersections are planned to be fully built out. Applicable design criteria for this project include TG-1 (turn lane pocket lengths), TG-8 (distance between driveways and intersections), TG-10 (left-turn in/out access), TG-11 (right-turn lane at uncontrolled driveways), TG-15 (driveway length), and TDP-17 (roundabouts).

The HCM 2010 unsignalized intersection methodology was used to calculate the LOS at the project driveways along Ridge Valley Street and G Street under 2017 Plus Project conditions. The project driveway LOS worksheets are provided in Appendix E. Table I summarizes the 2017 Baseline Approved Plus Project LOS at the project driveway and indicates that the driveways are forecast to operate at satisfactory LOS (LOS A during both peak hours).

Table I: 2017 Baseline Approved Plus Project Driveway LOS Summary

Intersection	Baseline Approved Plus Project			
	A.M. Peak Hour		P.M. Peak Hour	
	Delay	LOS	Delay	LOS
Ridge Valley Street/Project RIRO Driveway (ITAM Int. 493) HCM	8.40	A	8.60	A
G Street/Full-Access Project Driveway (ITAM Int. 496) HCM	8.50	A	8.80	A

HCM = Highway Capacity Manual

Int. = Intersection

ITAM = Irvine Transportation Analysis Model

LOS = level of service

RIRO = right-turn in/right-turn out

The project driveway is also analyzed based on the design criteria recommended in the City's TGs and TDPs. TGs and TDPs establish uniform policies and procedures for reviewing traffic design plans in the City. These guidelines were used to evaluate the roadway design features that may be impacted by the proposed project. A description and analysis of each applicable design criterion are provided below.

TG-1: Turn-Lane Pocket Lengths

The purpose of the turn pocket length is to allow the turning vehicle to exit the through movement and decelerate into the turn pocket without impacts to the through movement. The recommended acceptable design length for a turn pocket is 150 feet for Major, Primary, and Secondary highways with speeds greater than 45 miles per hour (i.e., Ridge Valley Street). For Commuter and Local streets (i.e., G Street, LV Street, and 8th Street), pocket lengths as short as 90 feet are permitted when volumes warrant.

An evaluation of the left-turn lane length at G Street/full-access project driveway (northbound left) has been provided. The 2017 Baseline Approved Plus Project volumes for this intersection are included in Appendix B.

G Street/Full-Access Project Driveway. According to the project circulation plan, the proposed northbound left-turn lane striped on G Street/full-access project driveway will have a storage capacity of approximately 162 feet. The 2017 Baseline Approved Plus Project left-turn demand at this location is 0 a.m. and 1 p.m. peak-hour vehicles. TG-1 states that the minimum turn pocket length on a local road (G Street) would be 90 feet. This minimum TG-1 requirement would satisfy forecast project volumes. Therefore, the northbound left-turn pocket meets TG-1 criteria.

TG-8: Distance between Driveways and Intersections

According to the criteria contained in TG-8, it is recommended that there be a minimum of 105 feet between a driveway and an intersection (or between two driveways) on Local streets (i.e., G Street) and 150 feet between a driveway and a Commuter street. The distance between driveways should be measured from the centerline of each driveway. The distance between an intersection and a driveway should be measured from the curb face of the street to the curb face of the driveway.

Based on the circulation plan (previously referenced on Figure 2), the proposed west-end project RIRO driveway (along Ridge Valley Street) will be located approximately 520 feet north of 8th Street (measured from the nearside curb face of the project driveway to the curb face of 8th Street) and 640 feet south of LV Street. The project driveway meets the minimum recommended distances per TG-8.

The east-end full-access project driveway will be located approximately 238 feet north of 8th Street (measured from the nearside curb face of the project driveway to the curb face of 8th Street) and approximately 302 feet south of a proposed driveway into the special event parking area (measured from centerline to centerline). The project driveway meets the minimum recommended distances per TG-8.

TG-10: Left-Turn In/Out Access

TG-10 provides guidelines to determine whether left-in-only or left-in/left-out access will be considered along Major, Primary, Secondary, and Commuter Streets. This guideline is based on the volume of vehicles entering and/or exiting a driveway in relationship to the conflicting volumes along the highway. Left-Turn Access Criteria in the City's TG presents a graph in which the left-turn volumes are compared to the conflicting volumes. Left-turn in/out access is considered acceptable when the point representing the left-turn volume and the conflicting volume lies below the line. Left-turn in/out access is not recommended when this point is above the line.

As illustrated on Figure 5 and the select zone plots included in Appendix D, fewer than 10 vehicles are forecast to make a left turns out of the project driveway onto G Street. According to TG-10 criteria, the threshold of acceptable conflicting (through and turn) volumes for 2 vehicles is approximately 1,085 vehicles. At the project driveway, the conflicting (through and turn) volumes along G Street are fewer than 1,085 vehicles. Therefore, the criteria for left-turn in/out access are satisfied for the project driveway.

TG-11: Right-Turn Lanes at Uncontrolled Driveways

TG-11 states that right-turn lanes on Commuter streets (i.e., Ridge Valley Street) and Local streets (i.e., G Street) are not required.

TG-15: Driveway Lengths

TG-15 provides guidance regarding a sufficient driveway length to allow vehicles "to enter the parking area without causing subsequent vehicles to back out on the City street system." The measurement of sufficient length is based on the distance from the back of the sidewalk or stop bar to the near curb line of the first intersecting parking stall or traffic control measure (i.e., internal drive aisle or pedestrian crosswalk). This TG is expressly used when evaluating access into parking lots. A summary of the TG-15 analysis is provided in Table J.

Table J: Summary of TG-15 (Driveway Length)

Driveway	Scenario	Peak-Hour Inbound Volume	Lane Length Required (feet)
Ridge Valley Street/Project RIRO Driveway (ITAM Int. 493)	2017 Baseline Approved Plus Project	37	50
G Street/Full-Access Project Driveway (ITAM Int. 496)	2017 Baseline Approved Plus Project	43	50

Int. = Intersection

ITAM = Irvine Transportation Analysis Model

RIRO = right-turn in/right-turn out

TG = Transportation Guidelines

The Ridge Valley Street/project RIRO driveway anticipates 6 a.m. peak-hour vehicles and 37 p.m. peak-hour vehicles will enter this driveway. Based on the recommended TG-15 criteria, a driveway length of 50 feet would accommodate the peak-hour inbound volume. The G Street/full-access project driveway anticipates 10 a.m. peak-hour vehicles and 43 p.m. peak-hour vehicles will enter this driveway. TG-15 recommends a driveway length of 50 feet for an inbound traffic volume of 43 vehicles. The detailed project site plan, once developed, should incorporate these recommended driveway lengths into the design of the project.

TDP-17: Roundabouts

TG-17 provides guidance regarding the recommended design, safety, capacity and vehicle approach speeds of a roundabout. It provides a description of the relationship between the central island diameter and the inscribed center circle diameter (ICD). Larger vehicles at small roundabouts with a 60-foot central island diameter require a minimum ICD of 120 feet to prevent overturning. Table K presents guidelines that should be followed when designing single- or double-lane roundabout.

Table K: TDP-17 Roundabout Criteria

Central Island Diameter (feet)		Minimum Inscribed Circle Diameter (feet)
13		92
20		94
26		98
33		101
39		105
46		109
52		113
59		118
Site Category	Typical Design Vehicle	Inscribed Circle Diameter Range
Mini-Roundabout	Single-Unit Truck	45–80 feet
Urban Compact	Single-Unit Truck/Bus	80–100 feet
Urban Single Lane	WB-50	100–130 feet
Urban Double Lane	WB-50	150–180 feet
Rural Single Lane	WB-67	115–130 feet
Rural Double Lane	WB-67	180–200 feet

Source: City of Irvine Transportation Design Procedures (February 2007) TDP-17 Criteria.

Note: Assumes 90-degree angles between entries and no more than four legs.

Two intersections were evaluated as potential modern roundabouts: G Street/8th Street and Olympic Way/LV Street. The intersection of G Street/8th Street, according to the circulation plan, is assumed to be a two-lane roundabout and Olympic Way/LV Street is assumed as a one-lane roundabout.

Based on the circulation plan, the intersection of G Street/8th Street will be designed with a 120-foot central island diameter and an ICD of 180 feet. According to the guidelines, an “Urban Double Lane” roundabout will be designed within an ICD range of 150–180 feet; therefore, the proposed G Street/8th Street roundabout meets the minimum criteria per TDP-17.

The single-lane Olympic Way/LV Street roundabout is planned to have a 110-foot central island diameter and an ICD of 130 feet. According to the WSPDP Phase 1, both roundabouts were designed with standard approach and exit widths, splitter islands, a central island, and inscribed circle distance. As a result, TDP-17 is met at both of the proposed roundabouts.

POTENTIAL IMPACTS AND/OR RECOMMENDATIONS

Based on the results of this analysis, the proposed project can be implemented without significant impacts to the surrounding roadway system in the 2017 horizon. The addition of project traffic to study area intersections and roadway segments does not result in City thresholds for performance being exceeded and is not considered significant; therefore, mitigation is not required.

Special events (up to 12 times per year) that exceed the parking capacity on site will require a special permit by the City. As part of this, a TMP will be required and coordinated with City staff and Public Safety for these special events. The specific issues addressed in this special event permit will include traffic management, traffic control and signage plans, parking management, and queuing analyses among others and are therefore not detailed in this analysis.

CONCLUSIONS

Based on the results of this analysis, the proposed project can be implemented without impacts to the surrounding roadway system. The evaluation of the study area intersection and roadway segment LOS with the expansion of one additional sheet of ice, for a total of four sheets of ice on site, shows that the proposed project will not create any significant adverse impacts.

An access analysis, consistent with the City's TGs and TDPs, was conducted for the proposed project. Based on this analysis, the recommended requirements for TG-1, TG-8, TG-10, TG-11, TG-15, and TDP-17 have been met or shall be met through subsequent phases of the process via a detailed site design plan.

APPENDIX A

APPROVED SCOPE OF WORK

SCOPE OF WORK GREAT PARK COMMUNITY ICE FACILITY LIMITED SCOPE TRAFFIC IMPACT ANALYSIS

The Orange County Great Park site is located north of Marine Way, east of future Ridge Valley Street, south of Irvine Boulevard and west of Alton Parkway in the City of Irvine, California. The first phase of the Great Park, referred to as the Western Sector Park Development Plan Phase 1, will include sports fields, supportive uses and displays consistent with the approved Master Plan. A traffic study (LSA Associates, Inc., August 2011) was approved by the City for the Western Sector Park Development Plan.

A community ice rink facility (Area L) and western picnic area (Area E) is included in the description of uses approved for this area of the Great Park. This area is bounded by LV Street to the north, 8th Street to the south, G Street to the east (a new north/south roadway between the special event parking area and the project site, proposed as part of the project) and Ridge Valley Street to the west. As part of the approved traffic study, the community ice facility included 3 sheets of ice, seating for up to 1,200 at one rink and 100 each for the others (1,400 total seats), and special events (more than 300 people) up to 6 weekdays per year.

An expansion to the approved community ice facility portion of the Western Sector is proposed. The project proposes 4 sheets of ice, seating for up to 2,500 at one rink and 500 each for the others (4,000 total seats), and special events up to 12 times per year. Special events are defined as those events which are anticipated to exceed the ice facility's on-site parking supply.

The facility includes the following uses which would be ancillary to the primary services provided on-site and as a result would not generate new traffic:

- Locker facilities
- Skating Support and Retail Spaces including a pro shop and a restaurant
- Administrative space
- Training and Team Space

It should be noted that the current Master Plan for the Great Park includes a community ice facility with 117,635 sf, which generates 24 a.m. peak hour, 93 p.m. peak hour and 720 ADT. The proposed square footage expansion of the ice rink facility will be deducted from other uses so that the maximum building sf or trip budget allocated for the overall uses within the Great Park will not be exceeded. The western picnic area is a 6.8 acre site that generates 93 ADT. This western picnic area will be replaced by the community ice facility and will not be relocated within the Great Park.

Approved by Kerwin Lau for Transportation

Specific access to the proposed community ice facility would be provided via a right turn in/out only driveway on Ridge Valley Street, and a full access driveway on G Street, which is a new local roadway on the eastern boundary of the project site between LV Street to the north and 8th Street to the south.

The purpose of this analysis is to determine potential traffic impacts on the adjacent circulation system resulting from the addition of one sheet of ice for typical operations. The analysis will assess the project impacts based on the City's latest ITAM model short range horizon year scenario. It should be noted that special events will occur on site that may maximize the seating capacity. However, these events are infrequent (up to 12 times per year) and will require a special permit from the City. A Traffic Management Plan (TMP) will be required and coordinated with City staff and Public Safety for these special events.

Per the City's Traffic Impact Analysis (TIA) Guidelines (adopted by the City Council on August 24, 2004), a project that generates less than 50 peak hour trips would require a Limited Scope TIA, which includes a short-term horizon year analysis. This Limited Scope TIA will be developed pursuant to the applicable sections of the City's TIA Guidelines, the City's Transportation Guidelines (TGs) (adopted July 1993), and in general accordance with the requirements of the North Irvine Transportation Mitigation (NITM) Program Traffic Study.

The traffic study will include the following key elements:

I. EXECUTIVE SUMMARY

This section will provide a short, clear, and concise description of the project and TIA findings. The proposed study recommendations and project mitigation measures will also be included in this section, if necessary. A discussion will be included to indicate that for purposes of the traffic analysis, the Great Park will not be fully built-out in the short range horizon.

II. INTRODUCTION

This section of the report will include a comprehensive description of the project and key elements of the TIA, including Western Sector Park Development Plan, general terrain features, and existing/proposed uses on site. The following elements are identified for the purpose of conducting the TIA.

A. Project Site

A project conceptual site plan has been attached to this scope of work and will be provided in the TIA. The project site is bounded by LV Street to the north, 8th Street to the south, G Street to the east and Ridge Valley Street to the west.

Approved by Kerwin Lau for Transportation

1/6/16

Access to the project site will be provided via provided via a right turn in/out (RIRO) only driveway on Ridge Valley Street and a full access driveway on G Street.

B. Study Area Boundary

The study area will include the following intersections:

1. Ridge Valley Street/Trabuco Road (ITAM Int. 559)
2. Ridge Valley Street/Champion Way (B Street)
3. Ridge Valley Street/LV Street (ITAM Int. 575)
4. Ridge Valley Street/Project RIRO driveway
5. Ridge Valley Street/8th Street (ITAM Int. 576)
6. Ridge Valley Street/C Street
7. Ridge Valley Street/Marine Way (ITAM Int. 560)
8. G Street/LV Street
9. G Street/Project Driveway
10. G Street/8th Street (Roundabout)
11. Olympic Way/LV Street (Roundabout)

Adjacent roadway links in the study area will be analyzed in the study. If significant project distribution is identified at the boundary of the initial study area, the analysis area will be expanded accordingly.

C. Existing, General Plan, and Proposed Site Uses

The approved Western Sector Park Development Plan Phase 1 land uses will be described and tabulated. The proposed community ice facility will be described and compared to the approved uses.

III. PERFORMANCE CRITERIA

The performance criteria to determine potential project impacts and associated improvements will be consistent with the City's criteria, as utilized in the NITM program analysis. Also, the most recently approved peak-hour link capacity methodology will be utilized for evaluating roadway capacity conditions and the need for improvements (if necessary).

The City's Transportation Guidelines (July 1993) will be used as the performance criteria to evaluate the access design features of the project site plan.

Approved by Kerwin Lau for Transportation 1/4/16

IV. EXISTING CONDITIONS

A. Existing Site Uses

Existing land uses in the vicinity of the project site will be identified.

B. Existing Roadways and Intersections

The characteristics of the site's surrounding roadway network will be documented to verify the existing and planned number of lanes, traffic signal locations, intersection configurations, and other visible factors that may have to be included in the analysis.

V. ANALYSIS METHODOLOGY/APPROACH

Study area intersections will be analyzed using the Intersection Capacity Utilization (ICU) methodology for signalized intersections and the Highway Capacity Manual (HCM) methodology for unsignalized intersections. Roundabouts will be analyzed using the appropriate software. The roadway segments between the intersections will also be analyzed in the report. Daily traffic volumes and v/c ratios will be presented in the analysis for these roadway segments. A peak-hour link analysis will be conducted for roadway segments operating at LOS F.

Consistent with the previous traffic study for the Western Sector Park Development Plan, the impacts will be based on the latest version of the Irvine Transportation Analysis Model (ITAM). The analysis will report the "No Project" (2017 Baseline) condition developed from the traffic model. The 2017 Baseline condition will represent the approved land uses on the project site (i.e., 3 sheets of ice) and approved roadway network (i.e., no G Street) consistent with the approved Master Plan.

Trip rates for the ice rink will be consistent with rates used in the approved Western Sector Park Development Plan traffic study. The trip generation characteristics for the expanded ice rink facility are the same as previously analyzed for the Western Section Park Development Plan. As such, for one additional sheet of ice, the proposed trip generation is 8 a.m. peak hour, 31 p.m. peak hour and 240 ADT. As described above, this trip generation (i.e., less than 50 peak hour trips) warrants a Limited Scope TIA including analysis of a short-term horizon year analysis.

The directions of approach to and departure from the site will be obtained based on an ITAM 2017 select zone assignment. A map indicating regional directions of trip distribution will be presented in the Limited Scope TIA.

The 2017 Baseline condition will be modified to include the addition of daily and peak hour traffic associated with one sheet of ice using the ITAM model. The 2017 "With Project" condition will also include the added roadway network of G Street between LV Street and 8th Street.

City staff will make all necessary land use and network changes for the baseline and "With Project" scenarios and will provide LSA with the model data (including intersection ICUs, roadway segment ADT volumes and a select zone assignment within the study area).

1/6/16

Approved by Kerwin Lau for Transportation

VI. PROPOSED PROJECT IMPACTS

Project impacts will be identified at study area intersections for the 2017 conditions, assuming improvements to the circulation system identified by the City. The resulting levels of service analysis (ICU and HCM) will be presented in the Limited Scope TIA to determine whether the project exceeds the standard level of service and improvements are required. Daily traffic volumes and v/c ratios will also be presented in the analysis for the study area roadway segments for each scenario. The City's peak-hour link analysis (per the adopted City TIA Guidelines) will be utilized for evaluating roadway capacity conditions and the need for mitigation measures (if necessary). The peak-hour link analysis will determine directional a.m. and p.m. peak-hour v/c ratios for each link which is projected to exceed LOS standards. The peak-hour capacity will be determined by multiplying the midblock number of lanes for each direction by a lane capacity of 1,600 vehicles per hour. Where the distance between controlled intersections is one or more miles, the midblock number of lanes shall be multiplied by a lane capacity of 2,000 vehicles per hour.

Special events (up to 12 times per year) that exceed the parking capacity on site will require a special permit by the City. A TMP will be required and coordinated with City staff and Public Safety for these special events. The specific issues addressed in this special event permit will include traffic control plans, parking management, and queuing analyses.

VII. SPECIAL ANALYSES/ISSUES

A. Access Analysis

An access analysis of the proposed project driveways on Ridge Valley Street and G Street will be performed based on typical operations of the ice facility. LSA will review project volume forecasts (associated with 4 sheets of ice) at the access locations and determine the adequacy of the interface with the arterial street system using the City's TGs. LSA will also determine access intersection turn-lane requirements for consistency with City standards.

The project peak-hour trips will be assigned in and out of the project access driveways. Trip distribution and driveway allocation will be determined using the distribution patterns from the most recent version of the ITAM. An exhibit will be provided that shows the "With Project" turning volumes at the access driveways to the project site. The exhibit will depict the project driveways, as well as any adjacent and opposing driveways. The exhibit will be drawn roughly to scale, with the distances between driveways and intersections dimensioned. The adjacent and opposing driveways to the project site will be included as part of the access analysis.

The internal circulation and access analysis will address specific design requirements of the City based on the proposed access plan and the project trip assignment. This analysis is to ensure that the project will meet or exceed the City's TG requirements (with the exception of roundabouts which will be evaluated per the Transportation Design Procedures (TDP-17). Specific design features to be evaluated include left turn pocket length (TG-1), distance between driveways and intersections (TG-8), left-turn in/out access (TG-10), right-turn lanes at uncontrolled driveways (TG-11), and driveway lengths (TG-15).

Approved by Kerwin Lau for Transportation

A summary of the proposed project and results of the analysis will be prepared. Based upon these results, recommendations will be presented for the design of the project access driveway and interface with adjacent streets. These recommendations will be consistent with the City's TGs.

VIII. POTENTIAL IMPACTS AND/OR RECOMMENDATIONS

Based on the results and in accordance with the adopted City TIA Guidelines, physical and/or operational improvements required in order to address any potential impacts will be identified in the traffic study. If NITM improvements are proposed to be constructed as part of the project, the analysis shall be performed to identify the Level of Service at the location of the NITM improvement both with and without the proposed NITM Improvement.

If the analysis identifies any impacts at a location where there are no proposed NITM improvements, then the applicant must implement the required improvements if the impact is caused by the project. However, if the project is adding to an existing deficiency at this location, then the applicant will be required to pay its fair share of the required improvements. The fair share responsibility shall be determined consistent with the procedures utilized to determine NITM fees.

IX. CONCLUSIONS

A summary of the results of the analysis and recommendations will be prepared.

X. REVISIONS TO ANALYSIS

Revisions to the TIA will be provided in response to the City's comments.

XI. SIGNATURE

The Limited Scope TIA will be prepared under the supervision of, and signed, stamped, and dated by, a registered traffic engineer or a registered professional civil engineer with appropriate engineering and/or planning credentials.

DELAY (CONTROL)

Average control delay per vehicle, or average pedestrian delay (seconds)

 Site: 10. G Street/8th Street (497)

Great Park Community Ice Facility - 2017 Approved AM Peak Hour Roundabout

All Movement Classes

	South	East	North	West	Intersection
LOS	A	A	A	A	A
	3.5	3.8	3.6	3.7	3.8

Colour code based on Level of Service

LOS A	LOS B	LOS C	LOS D	LOS E	LOS F	Continuous
-------	-------	-------	-------	-------	-------	------------

Level of Service Method: Delay & v/c (HCM 2010)
LOS F will result if v/c > 1 irrespective of movement delay value (does not apply for approaches and intersection)
Roundabout Level of Service Method: Same as Sign Control
HCM Delay Formula option is used. Control Delay does not include Geometric Delay since Exclude Geometric Delay option applies.
