## APPENDICES

Appendix A - Ventura County VMT Reduction Strategies

# 1 EXECUTIVE SUMMARY

## 1.1 INTRODUCTION

The City of Irvine (City) is preparing the 2045 Focused General Plan Update (GPU) that will serve as the long-range vision of the City for the next 20 to 25 years. The City as the lead agency has determined that the project will require the preparation of a Program Environmental Impact Report (Program EIR) in compliance with the California Environmental Quality Act (CEQA; California Public Resources Code, Section 21000 et seq.), and Title 14 of the California Code of Regulations (CCR).

In compliance with CEQA, a Vehicle Miles Traveled (VMT) analysis has been completed for this project. This VMT report assesses the impact of the proposed additional residential and non-residential land uses along with a proposed new transportation improvement in the GPU on the transportation system, in accordance with the City's Traffic Study Guidelines. The report provides information concerning the methodology, analysis, findings, and recommendation resulting from the VMT analysis. The VMT analysis evaluates five land use alternatives and one transportation alternative:

1. Existing General Plan
2. Proposed Project (Conservative Alternative)
3. Reduced Project Alternative
4. Cumulative Plus Proposed Project (Conservative Alternative)
5. Cumulative Plus Reduced Project Alternative
6. Proposed Project (Conservative Alternative) Without Ada extension (Transportation Alternative)
7. Reduced Project Alternative Without Ada extension (Transportation Alternative)

## 1.2 PROJECT DESCRIPTION

**Residential Land Uses:** Consistent with the 2021-2029 Housing Element, the project would update the General Plan land use element to support the City's Regional Housing Needs Assessment (RHNA) of 23,610 units. To ensure consistency with State housing statutes, including no-net loss and affirmatively furthering fair housing requirements, the 2021-2029 Housing Element identified adequate sites to accommodate 55,395 new residential units in addition to the 2,261 unbuilt units already in the General Plan. The Proposed Project (Conservative Alternative) simply adds these 55,395 new units to the Existing General Plan and assumes all other future development in the Existing General Plan would also take place.

However, the City's Existing General Plan has a significant amount of unbuilt non-residential square footage available throughout the planning areas (PAs) identified in the 2021-2029 Housing Element site inventory that would be available for the potential conversion to residential uses. Given the recent history in the City of converting future approved office and warehouse approvals to residential development, the Proposed Project (Conservative Alternative) represents a maximum development scenario which may not be achievable in practice. A Reduced Project Alternative was therefore developed with the assumption that a portion of future unbuilt non-residential square footage is converted to housing, thereby reducing the total number of dwelling units. Therefore, because of the conversion of non-residential uses to residential uses, the City would add 40,378 new units in addition to the 2,261 unbuilt units in the Existing General Plan for a total of 42,639 units.

**Non-residential land uses:** In addition to the RHNA residential development, the project includes additional non-residential park uses in the Irvine Great Park (Great Park). Buildout of the Great Park Framework Plan non-residential park uses is included in all project alternatives. Only Phase 1 of the Great Park Framework Plan is included in the Existing General Plan. The Existing General Plan represents the No Project Alternative pursuant to CEQA Guidelines Section 15126.6.

**Transportation Improvements:** A transportation improvement is part of the project and included in all project alternatives except the Existing General Plan. The extension of the street named Ada (Ada Extension) from its current

terminus in the parking lot of the Irvine Station south of the Southern California Railroad Authority (SCRRA) railroad tracks is proposed to extend north under the railroad tracks to meet the future Marine Way extension north of the railroad tracks. The Ada roadway extension between the Irvine Station and Marine Way provides multi-modal connectivity to support the residential uses.

**Cumulative Projects:** For the Cumulative Plus Proposed Project (Conservative Alternative) and Cumulative Plus Reduced Project Alternative, a portion of each neighboring city's RHNA housing inventory was added to the Irvine Transportation Analysis Model (ITAM) based on the known geographic location of future development. These units have been included because they are located within ITAM Traffic Analysis Zones (TAZs) physically near Irvine city limits in which land use input data could be added. In addition to the RHNA housing inventory from neighboring cities, some additional projects within the City of Irvine have been added to the Cumulative Plus Proposed Project Alternative and Cumulative Plus Reduced Project Alternative because these pending projects are currently in various stages of approval.

### 1.3 METHODOLOGY

The City's approach to calculating VMT "attributable to the project" is consistent with Section 15064.3 of the CEQA Guidelines. In this approach, ITAM is run with the project land uses, and VMT statistics are calculated using trip tables and travel distance "skims" for a project TAZ to calculate the project VMT rate. The project VMT rate is then compared to the VMT threshold rate based on existing conditions at the time when the updated traffic study guidelines were approved. ITAM also calculates the associated population and employment of a project through its land use to socioeconomic data conversion module. VMT, population and employment for any given project can be calculated. To determine whether a project has a significant VMT impact, the project VMT metric is compared with the adopted threshold for that metric as shown below.

There is no guidance in the City's Traffic Study Guidelines for the treatment of area-wide or Citywide buildout plans. Therefore, metrics and thresholds of significance for citywide land-use plans were developed for the General Plan Update effort based on the VMT per service population. The adopted methodology in the Traffic Study Guidelines identifies thresholds of significance for residential and non-residential projects based on a 15% reduction of existing countywide average VMT per population or employment. Similarly, the threshold of significance applied for the Citywide plan is based on a 15% reduction of existing countywide average VMT per service population of which service population is the sum of the countywide population and employment. This methodology is consistent with methodologies used in other jurisdictions.

## 1.4 RESULTS

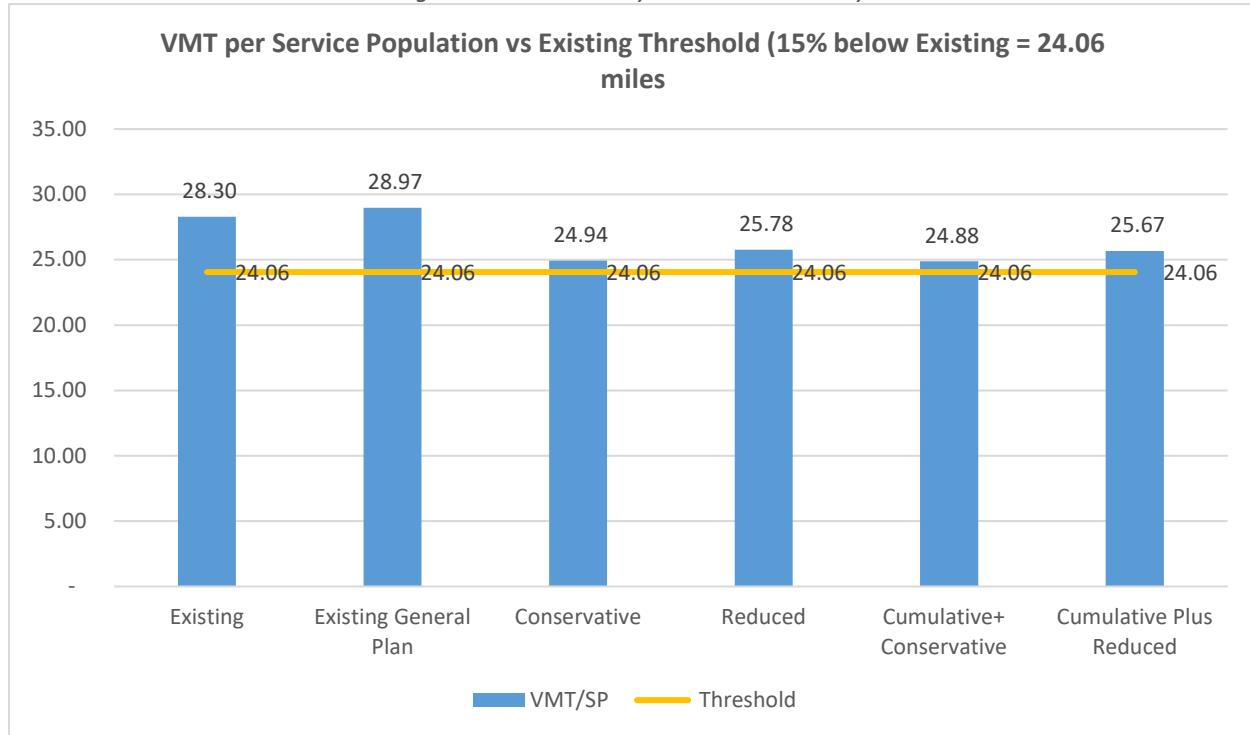

**Table 1-1 and Figure 1-1** shows that all the project alternatives result in significant impact. All alternatives exceed the VMT per service population significance threshold (i.e., 24.06 miles).

*Table 1-1 – VMT Analysis Results Summary*

Project Description	Total VMT (miles)	Total Population	Total Employees	Service Population	VMT per Service Population	Miles Above Existing threshold	% Above VMT threshold (24.06 miles)	% VMT reduction needed to meet threshold
Existing General Plan	20,437,228	368,261	337,102	705,363	28.97	<b>4.98</b>	20.4%	17.0%
Proposed Project (Conservative) Alternative	21,337,558	517,654	337,910	855,564	24.94	<b>0.88</b>	3.7%	3.5%
Reduced Project Alternative	21,008,186	477,019	337,910	814,929	25.78	<b>1.72</b>	7.2%	6.7%
Cumulative Plus Proposed Project (Conservative) Alternative	21,516,666	526,535	338,391	864,926	24.88	<b>0.82</b>	3.4%	3.3%
Cumulative Plus Reduced Project Alternative	21,157,974	485,900	338,391	824,291	25.67	<b>1.62</b>	6.7%	6.3%

Figure 1-2 – VMT Analysis Results Summary

- The Existing General Plan would result in a 20.4% increase in VMT per service population compared to the threshold and requires a 17% reduction in VMT/service population to meet the significance threshold.
- Both the Proposed and Reduced Project Alternatives represent a notable reduction in VMT per service population compared to the existing on-the-ground development and the General Plan. The Proposed Project Alternative requires a 3.5 % reduction in VMT to meet the significance threshold and the Reduced Project Alternative requires a 6.7 % reduction to meet the significance threshold.
- The Cumulative conditions result in a marginally lower VMT per service population compared to the Non-Cumulative alternatives. The cumulative conditions require 3.3% reduction under the Proposed Project Alternative and 6.3% under the Reduced Project Alternative.
- The impacts in both Cumulative and Non-Cumulative for both Proposed and Reduced Project Alternatives could potentially be mitigated by using a combination of onsite design and Transportation Demand Management ( TDM ) measures such as car-pool, van-pool programs, which could result in up to a 7.5 % reduction in VMT impact in areas of the City where a TDM program is existing or may be introduced.
- While there are potential mechanisms to have a programmatic approach to CEQA transportation mitigation based on VMT metrics, it is likely a new, managed mitigation program would need to be enacted by the City which would be subject to several statutory constraints. Most California cities are opting to continue project-level mitigation approaches where the project applicant is directed to develop mitigation with direction from City staff in their role as the CEQA lead agency.
- The extension of Ada under the SCRAA train tracks from the existing terminus at Irvine Station south of the railroad tracks to Marine Way north of the tracks could potentially be screened out from VMT analysis because the extension improves pedestrian and bicycle connectivity by reducing travel distances between the train station and future residential development north of the train tracks. Improved multi-modal access to the train station will also encourage the use of rail trips instead of car trips. Therefore, there is no

significant impact associated with this improvement. This is consistent with expectations when providing a new connection that shortens trip distances.

## 2 INTRODUCTION

As previously noted, the City is preparing the 2045 Focused GPU that will serve as the long-range vision of the City for the next 20 to 25 years. The City as the lead agency has determined that the project will require the preparation of a Program EIR in compliance with CEQA; California Public Resources Code, Section 21000 et seq., and Title 14 of CCR.

In compliance with CEQA, a VMT analysis has been completed for this project. This VMT report assesses the impact of the proposed additional residential and non-residential land uses associated with the GPU on the transportation system, in accordance with the City's Traffic Study Guidelines. The report provides information concerning the methodology, analysis, findings, and recommendation resulting from the VMT analysis. The VMT analysis evaluates five land use alternatives and one transportation alternative:

1. Existing General Plan/No Project Alternative
2. Proposed Project (Conservative Alternative)
3. Reduced Project Alternative
4. Cumulative Plus Proposed Project (Conservative Alternative)
5. Cumulative Plus Reduced Project Alternative
6. Proposed Project Alternative Without Ada Extension (Transportation Alternative)
7. Reduced Project Alternative Without Ada Extension (Transportation Alternative)

### 2.1 PROJECT DESCRIPTION

**Residential Development:** Consistent with the 2021-2029 Housing Element, the project would update the General Plan land use element to support the City's Regional Housing Needs Assessment (RHNA) of 23,610 units. To ensure consistency with State housing statutes, including no-net loss and affirmatively furthering fair housing requirements, the 2021-2029 Housing Element identified adequate sites to accommodate 57,656 new residential uses (55,395 new residential units plus 2,261 unbuilt units already in the General Plan). The Proposed Project (Conservative Alternative) simply adds these 55,395 new units to the Existing General Plan and assumes all other future development in the Existing General Plan would also take place.

However, the City's Existing General Plan has a significant amount of unbuilt non-residential square footage available throughout the planning areas (PAs) identified in the 2021-2029 Housing Element site inventory that would be available for the potential conversion to residential uses. Given the recent history in the City of converting future approved office and warehouse approvals to residential development, the Proposed Project (Conservative Alternative) represents a maximum development scenario which may not occur due to a range of factors.

A more realistic Reduced Project Alternative was therefore developed with the assumption that a portion of future unbuilt non-residential square footage would be converted to housing, thereby reducing the total number of dwelling units. Therefore, because of the conversion of non-residential uses to residential uses, the City would add 42,639 units (or 40,378 new residential units plus 2,261 unbuilt units already in the General Plan) under the Reduced Project Alternative. The Reduced Alternative has 15,017 fewer units compared to the maximal Conservative Project Alternative.

Specifically, to accommodate the City's RHNA requirement for new residential units, the project would implement the 2021-2029 Housing Element through the introduction of additional residential and/or mixed-use development throughout the City using overlay zones and/or master plans to allow greater flexibility for property owners and developers. The overlays would promote higher density residential and mixed-use in three focus areas, targeted retail centers, conversion of hotel/motel, and on religious and school sites. It is anticipated that most of the future residential growth would occur in three focus areas that are most suited for new growth and development as they are located near existing job centers and are along major travel corridors with access to existing and future public transit opportunities as shown in **Figure 2-1**.

- Focus Area 1 is the Irvine Business Complex (PA 36 and PA 19);
- Focus Area 2 is the Spectrum area (PAs 13, 31, 32, 33, and a portion of PA 12); and
- Focus Area 3 is the Great Park Neighborhoods (PA 51)

There are also new housing units planned outside the focus areas. In the Conservative Alternative 8,536 of the 55,395 units are located outside the focus areas while in the Reduced Alternative 4,071 of the 40,378 units are located outside the Focus areas.

Figure 2-1: Focus Areas for General Plan Update – New Residential Development

### City of Irvine General Plan

#### Focus Areas for General Plan Update New Residential Development

- Focus Area 1 - PA 36 and 19
- Focus Area 2 - PA 12, 13, 31, 32, and 33
- Focus Area 3 - PA 51

**Non-Residential Land Uses:** In addition to the RHNA residential uses, the project includes additional non-residential park uses within the Irvine Great Park (Great Park). Buildout of the Great Park Framework Plan non-residential park uses are included in all project alternatives except the Existing General Plan. The Existing General Plan is provided to illustrate the differences between the current and proposed General Plan and is intended to be used for informational purposes only.

**Transportation Improvements:** A transportation improvement is part of the project and included in all project alternatives except the existing General Plan. The extension of Ada from its current terminus in the parking lot of the Irvine Station south of the SCRRA railroad tracks is proposed to extend north under the railroad tracks to meet the future Marine Way extension north of the railroad tracks. The Ada roadway extension between the Irvine train station and Marine Way provides multi-modal connectivity to support the residential uses.

## 2.2 STUDY ALTERNATIVES

The VMT traffic study includes the evaluation of five project land use alternatives, including the Existing General Plan, and a single transportation alternative.

In accordance with the City's Traffic Study Guidelines, the alternatives were compared against a significance threshold that was based on a 15% reduction of existing on-the-ground conditions (2023), consistent with the release date of the Notice of Preparation (NOP) for the project. The five alternatives are:

1. **Existing General Plan/No Project** – This scenario represents the currently approved Buildout land uses including Great Park Framework Phase 1. Future development includes unbuilt dwelling units and non-residential uses. However, pursuant to CEQA Guidelines Section 15126.6, the City's analysis of proposed alternatives will also include a "no project" alternative.
2. **Proposed Project (Conservative Alternative)** – This alternative evaluates the Existing General Plan plus 55,395 RHNA housing units within the adopted Housing Site Inventory sites. Buildout of the Great Park Framework Plan non-residential park uses and the extension of Ada from the Irvine Metrolink/Amtrak Station to Marine Way are also included in this alternative.
3. **Reduced Project Alternative** – This alternative evaluates the Existing General Plan plus 40,378 RHNA housing units within the adopted housing site inventory sites. Buildout of the Great Park Framework Plan non-residential park uses and the extension of Ada from the Irvine Station to Marine Way are also included in the Reduced Project Alternative.
4. **Cumulative Plus Conservative Project Alternative** – This alternative evaluates the Proposed Project (Conservative Alternative) plus additional cumulative projects that are assumed to be built in the background conditions in both the City of Irvine and in surrounding jurisdictions. Cumulative projects include known future residential development in adjacent Cities.
5. **Cumulative Plus Reduced Project Alternative** – This alternative evaluates the Reduced Project Alternative plus additional cumulative projects that are assumed to be built in the in the background conditions in both the City of Irvine and in surrounding jurisdictions. Cumulative projects include known future residential development in adjacent Cities.

In addition to these five land-use alternatives, a VMT impact analysis was prepared for two transportation alternatives that proposes the extension of Ada from the existing terminus at the Irvine Station south of the SCRRA railroad tracks under the railroad to Marine Way north of the railroad tracks. To conservatively test the Ada extension in isolation, the City's Transportation Guidelines require a link-based VMT analysis comparing VMT with and without the proposed transportation improvements. Therefore, two additional alternatives were evaluated without Ada to assess the change in VMT associated with the Ada extension.

6. **Proposed Project (Conservative) Alternative without Ada Connection to Marine Way (Transportation Alternative)**
7. **Reduced Project Alternative Without Ada Connection to Marine Way (Transportation Alternative)**

**Table 2-1** lists the residential project description for the Proposed and Reduced Project Alternatives by TAZ in the ITAM. **Table 2-2** summarizes the number of units by Planning Area. There are 55,395 residential units in the Proposed Project Alternative and 40,378 residential units in the Reduced Project Alternative. **Figure 2-2** shows the location and quantity shown in a bar graph of the residential units for both Conservative and Reduced Project Alternatives. **Figure 2-3** shows the residential units for the Proposed Project Alternative only and **Figure 2-4** shows the residential units for the Reduced Project Alternative only.

**Cumulative Projects:** For the Cumulative Plus Proposed Project (Conservative Alternative) and Cumulative Plus Reduced Project Alternative, a portion of each neighboring city’s RHNA housing inventory has been added to ITAM based on the known geographic location of future development. These units have been included because they are located within ITAM TAZs physically near Irvine city limits in which land use input data can be added. In addition to the RHNA housing inventory from neighboring cities, some additional projects within the City of Irvine have been added to the Cumulative Plus Proposed Project (Conservative Alternative) and Cumulative Plus Reduced Project Alternative since these projects are currently in various stages of approval. These projects include:

- Bill Barber Gymnasium;
- Civic Center Office Expansion;
- Gateway Residential
- Heritage Park Expansion;
- PA 25 GPA/ZC;
- PA 39 GPA/ZC; and
- PA 40 Residential;

**Table 2-4** lists the projects added to the Cumulative Plus Conservative Project Alternative and Cumulative Plus Reduced Project Alternative.

*Table 2-4 – Assumed Cumulative Projects*

Project/City	TAZ	Unit	Description	Approximate Quantities
Bill Barber Gymnasium	199	TSF	Health Club	90
Civic Center Office Expansion	199	TSF	Office Mix (IBC)	70
Gateway Residential	76	DU	Multi-Family (IBC)	1,200

Santa Ana		DU	Condominiums	1,100
Tustin		DU	Condominiums	4,031
<b>Residential Units</b>				
<b>14,993</b>				

The two Cumulative alternatives include a roadway network change that removes the Jeffrey Road extension from SR-241 to Santiago Canyon Road. This removed roadway has been identified as a candidate for removal from OCTA's Master Plan of Arterial Highways.

### 2.3 VMT STUDY AREA

The VMT study area measures the daily VMT from each of the TAZs within the City boundary and includes the full length of each trip generated in ITAM to and from each TAZ within Irvine. The ITAM area encompasses the northern five counties of the Southern California Associated Governments (SCAG) area, namely the Counties of Orange, Los Angeles, Riverside, San Bernardino, and Ventura.

## 3 EXISTING CONDITIONS

This section presents an overview of the existing land use. Additional relevant data sources such as 2020 Circulation Phasing Report and Active Transportation Plan were reviewed.

### 3.1 EXISTING LAND USE

Existing (Year 2023) land uses in the City were obtained from ITAM and aggregated and tabulated by different land use categories. **Table 3-1** shows the existing land uses within the City and **Table 3-2** shows a comparison between existing land uses and the Current General Plan.

*Table 3-1 – Existing Land Use*

Land Use Category	Unit	Amount
Agriculture/Open Space	Acre	5,264
Auto	TSF	571
Childcare Center	TSF	155
Church/Synagogue	TSF	1,129
College/University	TSF	560
Commercial	TSF	5,945
Community Facility	TSF	834

<b>Total Net Difference - Non-Residential TSF</b>				<b>30,714</b>

Note: DU = Dwelling Units, TSF = Thousand Square Feet

## 3.2 EXISTING ROADWAY NETWORK STATISTICS

Using the ITAM model, lane miles for each arterial highway facility type within the City were calculated. Lane miles are used to measure the total length and lane count of a given highway or roadway. The following lists the roadway facility types within the ITAM roadway network:

- |   |  |
|---|--|
| 1 – Freeway: Limited access, divided, grade separated highway | 6 – Commuter: Two lane undivided arterial highway  |
| 2 – Major: Six (or more) lane divided arterial highway        | 7 – Expressway: Four (or more) lane divided with operational enhancements, possibly limited access |
| 3 – Primary: Four lane divided arterial highway               | 8 – HOV Facility   |
| 4 – Secondary: Four lane undivided arterial highway           | 9 – Freeway Ramp   |
| 5 – Commuter: Two lane divided arterial highway               | 10 – Toll Facility   |

Table 3-3 shows the lane miles for each ITAM facility type.

*Table 3-3 – City of Irvine Lane Miles*

Facility Type #	Facility Type	Lane Miles
1	Freeway	170
2	Major Arterial	366
3	Primary Arterial	284
4	Secondary Arterial	125
5	Commuter Divided	38
6	Commuter Undivided	136
7	Expressway	14
8	HOV	44
9	Freeway Ramp	72
10	Toll Road Lanes	124
<b>Total</b>		<b>1,373</b>

## 4 VMT ANALYSIS METHODOLOGY

CEQA analysis for determining potential significant transportation impacts from vehicle traffic transitioned from an automobile delay or capacity measure to a VMT metric in July 2020, as required by Senate Bill (SB) 743. SB 743 directed agencies to develop new guidelines that provide a transportation performance metric that can help promote the reduction of greenhouse gas emissions, the development of multimodal networks, and diversity of land uses. **VMT is an area-wide performance measure** which helps compare the overall performance of a project or project alternatives and is also used as a metric to ultimately assess the transportation environmental impacts of a project.

VMT analysis shifts the focus towards impacts caused by the distance traveled by vehicles rather than the localized congestion created by vehicles (i.e., intersection-level delay). In essence, utilizing VMT means measuring the impact that motorists have on a network, as opposed to level of service (LOS), which assesses the impact of a project on motorists. In April 2018, the Office of Planning and Research (OPR) issued a Technical Advisory on Evaluating Transportation Impacts in CEQA, to provide CEQA practitioners with assistance and recommendations in applying the new SB 743 guidance. The City updated their traffic study guidelines in June 2020 (further updated in March 2023) to include VMT as the CEQA performance metric.

The City of Irvine maintains an in-house traffic model, ITAM, which is currently used to forecast traffic volumes and calculate Level of Service (LOS) and impacts associated with new development. The traffic model is based on and is certified consistent with the regional Orange County Transportation Analysis Model (OCTAM). The City of Irvine has developed a VMT calculation tool that appends to the traffic model.

The City's approach to calculating VMT "attributable to the project" is consistent with Section 15064.3 of the CEQA Guidelines. In this approach, ITAM is run with the project land uses, and VMT statistics are calculated using trip tables and travel distance "skims" for a project TAZ to calculate the project VMT rate. The project VMT rate is then compared to the VMT threshold rate based on existing conditions at the time when the updated traffic study guidelines were approved. The number of trips for each Origin-Destination pair are multiplied by the distance of that trip for each travel purpose and time period using congested travel times. ITAM also calculates the associated population and employment of a project through its land use to socioeconomic data conversion module. VMT, population, and employment for any given project can be calculated. To determine whether a project has a significant VMT impact, the project VMT metric is compared against the adopted threshold for that metric as shown below:

- **Residential projects:** The residential methodology captures VMT associated with the project and the population resulting from the project. This calculated VMT per capita is compared to the residential VMT threshold. Each residential project should consider if it is appropriate to account for other VMT contributing groups (i.e., residential projects with affordability component).
- **Non-residential projects:** The non-residential methodology captures all non-residential VMT (commute and other non-residential) associated with the project and the number of employees resulting from the project. Non-residential uses include offices, medical offices, hotels, and other land uses. Each non-residential project should consider if it is appropriate to account for VMT-contributing groups in addition to VMT-contributing employees. For example, a medical office may have a VMT-contributing group that considers project-specific estimated number of patients per day in the project VMT rate calculation. Based on extensive testing of this methodology and its application in the City of Irvine, this methodology meets the intent of SB 743. This calculated VMT per employee is compared to the non-residential VMT threshold.
- **Mixed use projects:** For mixed use projects, both the residential VMT per capita and non-residential VMT per employee are calculated. Each type of VMT is then compared to its corresponding threshold. This is consistent with OPR's Technical Advisory P17 *"Lead agencies can evaluate each component of a mixed-use project independently and apply the significance threshold for each project type included (e.g., residential and retail)."*

The City's Traffic Study Guidelines indicate that the City's goal and associated significance threshold criteria is for new projects to generate 15% less VMT per capita (or per employee) compared to existing conditions, which is consistent with OPR's Technical Advisory recommendations.

While the City’s Traffic Study Guidelines provide VMT metrics for individual projects, there is no specific guidance for the treatment of area-wide or Citywide buildout plans such as the General Plan Update. Both the Current General Plan and the project alternatives contain significant changes to both residential and non-residential land uses from current on-the-ground conditions. The resulting VMT impacts of the plans are the result of the complex interaction of the future residential and non-residential development with the existing residential and non-residential development that is not adequately represented by separate residential VMT per capita or non-residential VMT per employee metrics. Instead, a more appropriate metric is **total** (residential plus non-residential) VMT per service population (the sum of population and employment). This methodology is consistent with analysis of citywide plans in other jurisdictions. Therefore, the project alternative will be assumed to have a less than significant impact if its VMT per service population is 15% below the VMT per service population in existing conditions.

**Table 4-1** identifies the existing residential VMT per resident, the non-residential VMT per employee, as well as the VMT per service population with their respective significance thresholds using the City’s VMT traffic model. The residential VMT significance threshold is based on the countywide population VMT divided by the countywide population. The non-residential VMT significance threshold is based on the countywide commute and other (i.e., customer and client) VMT trips divided by the number of countywide employees. The VMT per service population threshold is based on the total countywide VMT divided by the summation of the total countywide population and countywide employees.

*Table 4-1 – VMT Rate Threshold Goals for Projects within the City of Irvine*

VMT Metric	Existing	Threshold Goal (15 % reduction)
VMT per resident	17.50	14.88
VMT per employee	48.66	41.36
VMT per service population	28.30	24.06

For the City of Irvine GPU project, if the project VMT rate exceeds the significance threshold for VMT per service population (24.06), then the project is anticipated to create a significant VMT impact.

# 5 VMT RESULTS

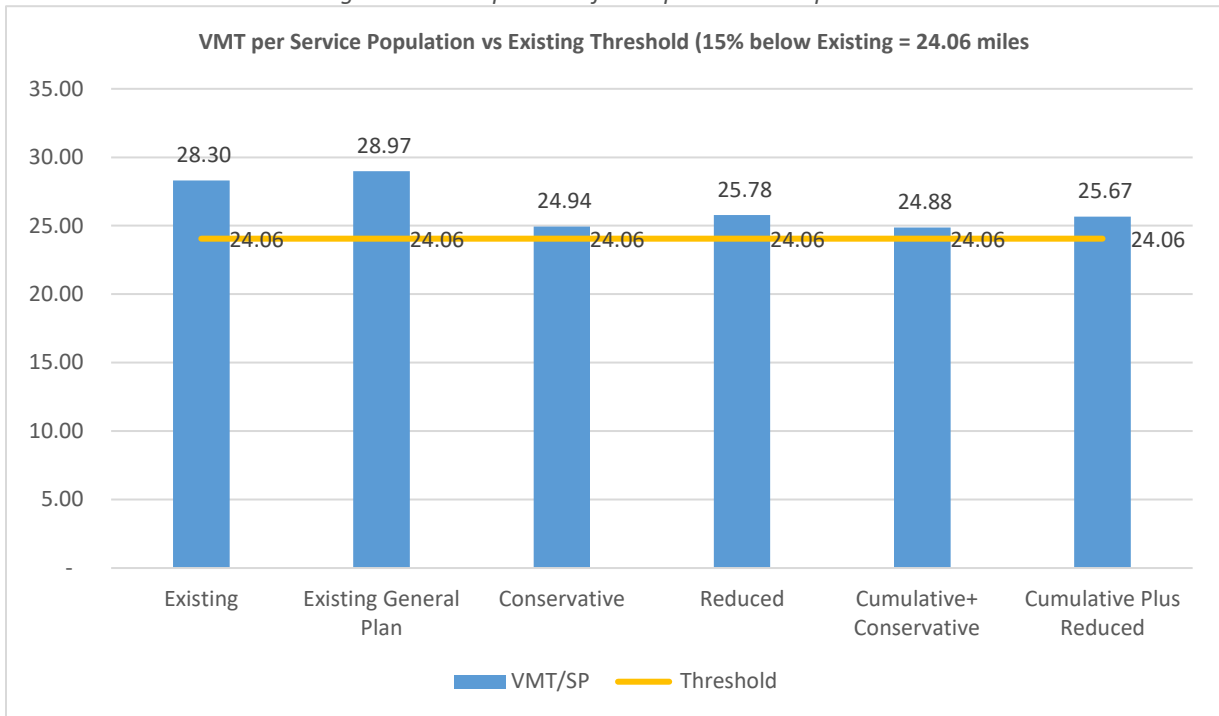

## 5.1 PROJECT ALTERNATIVES VMT

**Table 5-1** summarizes the VMT per service population results associated with all five project alternatives compared to the threshold of 85% (i.e. 15% below) of existing conditions which is 24.06 miles. **Figure 5-1** shows the results graphically. All five project alternatives exceed the City’s VMT per service population threshold by varying degrees.

*Table 5-1 – VMT Analysis Results Summary*

Project Description	Total VMT (miles)	Total Population	Total Employees	Service Population	VMT per Service Population	Miles Above Existing threshold	% Above VMT threshold	% VMT reduction needed to meet threshold
Existing General Plan	20,437,228	368,261	337,102	705,363	28.97	4.98	20.4%	17.0%
Proposed Project (Conservative) Alternative	21,337,558	517,654	337,910	855,564	24.94	0.88	3.7%	3.5%
Reduced Project Alternative	21,008,186	477,019	337,910	814,929	25.78	1.72	7.2%	6.7%
Cumulative Plus Proposed Project (Conservative) Alternative	21,516,666	526,535	338,391	864,926	24.88	0.82	3.4%	3.3%
Cumulative Plus Reduced Project Alternative	21,157,974	485,900	338,391	824,291	25.67	1.62	6.7%	6.3%

*Figure 5-1: Comparison of VMT per Service Population*

**Existing General Plan/No Project Alternative** has an average VMT per service population of 28.97, which is greater than the threshold of 24.06. Therefore, the Existing General Plan is considered to have a significant VMT impact under CEQA. This alternative would require a 17.0 % reduction in VMT impact to meet the significant threshold.

**Proposed Project (Conservative Alternative).** Results for the Proposed Project indicate that it would result in a VMT per service population of 24.94. Therefore, there would be a significant impact under CEQA that would require a 3.5% reduction in VMT impact to meet the significance threshold.

**Reduced Project Alternative.** Results for the Reduced Project Alternative indicate that this alternative would generate a VMT per service population of 25.78. Therefore, there would be a significant impact under CEQA that would require a 6.7% reduction in VMT impact to meet the significance threshold.

**Cumulative Plus Proposed Project (Conservative Alternative).** Results for the Cumulative Plus Proposed Project (Conservative Alternative) indicate that this alternative would generate a VMT per service population of 24.88. Therefore, there would be a significant impact under CEQA that would require a 3.3 % reduction in VMT impact to meet the significance threshold.

**Cumulative Plus Reduced Project Alternative.** Results for the Cumulative Plus Reduced Project Alternative indicate that this alternative would generate a VMT per service population of 25.67 . Therefore, there would be a significant impact under CEQA that would require a 6.3 % reduction in VMT impact to meet the significance threshold.

The two transportation alternatives are not analyzed for VMT per service population since their only purpose is to estimate the net VMT due to the new Ada connection. Ada is included in all four Project Alternatives.

## 5.2 DISCUSSION OF RESULTS

Increasing the number of residential units (and associated density) results in lower VMT per service population and therefore lesser VMT impact which may initially seem counterintuitive. However, the City is a major employment center and is “jobs heavy” with a high jobs-to-population ratio. The City has more jobs than can be sustained by the City’s own population. Many of the jobs are in relatively high-paying professions and employees are more likely and able to afford to make longer distance commutes from less dense residential areas within Irvine as well as residential areas outside the city.

While some of this long-distance travel may occur on freeways outside the city, a large proportion of the VMT will end up on city streets and intersections. The intention of the use of VMT metrics for CEQA is to move more towards regional effects to meet new types of environmental goals such as greenhouse gas effects on climate change rather than localized impacts that are based only on vehicle and driver delay. Shifting towards a more balanced jobs to population ratio can be expected to improve VMT metrics.

The jobs housing balance (more recently referred to as a “jobs-housing fit”) is discussed in an article on the Journal of the American Planning Associates, which indicates that from 2002 to 2015 the jobs housing balance was becoming more imbalanced in most Cities. One of the purposes of the VMT measure under CEQA is to address this balance to reduce commute distances.

*“Municipal government officials and policymakers are increasingly working to encourage a functional balance between housing and employment opportunities, particularly as cities face growing housing affordability crises that push residents to live further away from their jobs and lengthen their commute times. However, while this jobs-housing balance was a popular topic among researchers in the 1990s, it has received less research attention in recent years.*

*Evelyn Blumenberg and Hannah King revisit the issue in the Journal of the American Planning Association, “Jobs-Housing Balance Re-Re-Visited,” in which they test how the jobs-housing balance has shifted in California cities and which factors might be influencing this shift. The authors specifically test whether cities in California have become more or less “self-contained” over time, which they measure using an independence ratio that compares the number of internal work trips*

*in a city (in which the individual works and live within that same city) to external work trips (in which the individual works or lives in a different city).*

Independence Index

$$= \frac{\text{Internal Work Trips (work and live inside city)}}{\text{External Work Trips (work outside city + live outside city)}}$$

*The authors find that the majority of California's cities are becoming less self-contained, with the independence index dropping from 0.075 in 2002 to 0.063 in 2015. This finding extends to cities in the San Francisco Bay Area, where 22 of the 23 cities included became less self-contained from 2002 to 2015. This finding shows a reversal from Cervero's findings that used jobs-housing data from the 1980s, and which showed that Bay Area cities were actually becoming more self-contained at the time.*

*Ultimately, the authors make the case for a better alignment between housing, employment opportunities, and workers in order to lessen the trend of growing commute times."*

**Source:** <https://www.planning.org/blog/9220914/measuring-the-jobs-housing-balance-in-california/>

**Table 5-2** shows the jobs/housing balance for the City of Irvine compared to other jurisdictions in Orange County. The City of Irvine currently has roughly double the number of jobs per population as the rest of Orange County (1.01 vs 0.49). Adding new housing units will help offset this imbalance and provide shorter commutes therefore reducing VMT impacts.

*Table 5-2 – Orange County Jobs to Total Population Existing and Year 2045 (Source: OCTAM)*

City	Existing (2016) OCTAM			2045 OCTAM		
	Jobs	Population	Jobs/ Population Ratio	Jobs	Population	Jobs/ Population Ratio

Westminster	25,410	97,709	0.26	26,940	102,878	0.26
Yorba Linda	15,192	61,584	0.25	16,824	65,677	0.26
County	1,713,648	3,187,121	0.54	1,984,248	3,542,572	0.56
County excluding Irvine	1,446,655	2,922,781	0.49	1,652,245	3,224,462	0.51

**Figure 5-2** shows the total number of jobs in bar columns superimposed on top of the average jobs per population by City within Orange County. The jobs to population ratio within Irvine was 1.01 in 2016 conditions. Irvine also had the highest number of jobs in Orange County with 264,340. The next highest City is Anaheim with 184,336 jobs. Other cities with high jobs to population ratios include the Cities of Newport Beach, Brea, and La Palma.

**Figure 5-3** shows the forecast jobs housing ratios for 2045 using Orange County Projections data used by OCTA in the OCTAM model. This shows very similar results to the existing conditions data although the jobs-to-population ratio in Irvine becomes even more imbalanced, increasing from 1.01 to 1.04. This represents anticipated jobs and population based on the Existing General Plan.

Figure 5-2: Existing Jobs to Population Ratio and Total Employment (Source: OCTAM)

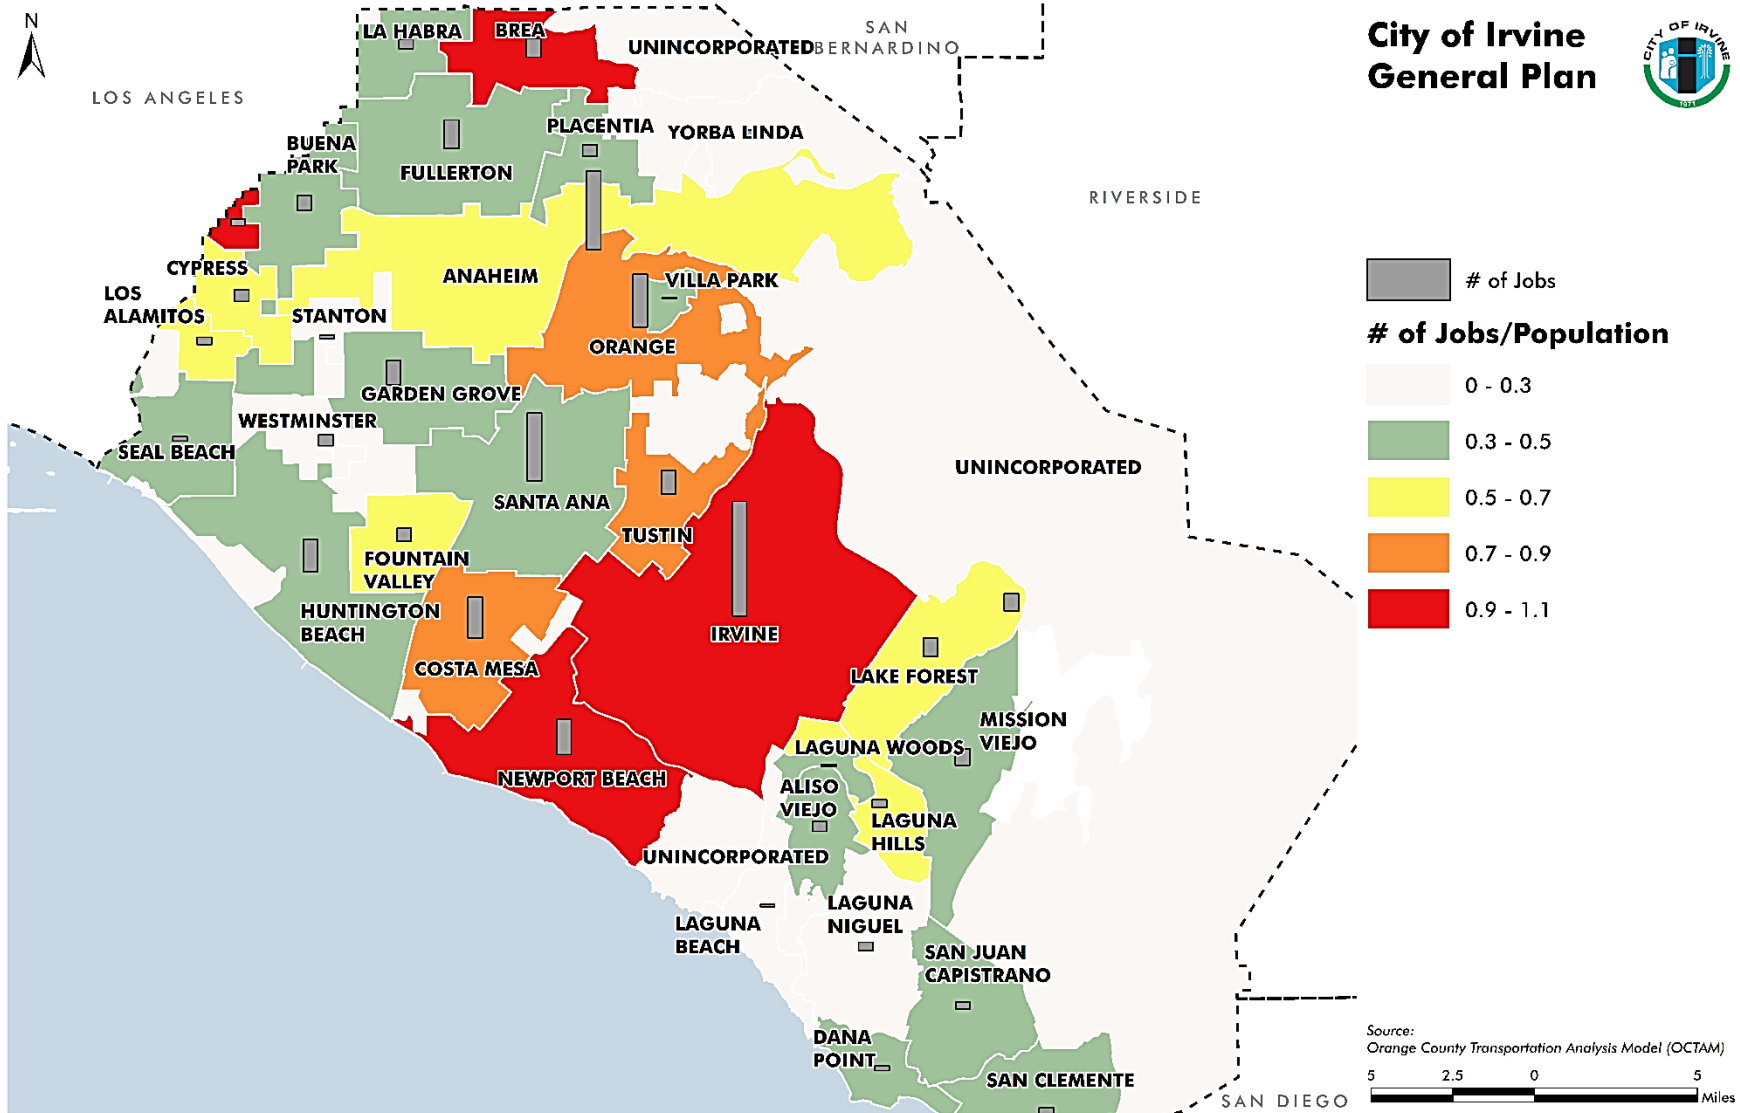

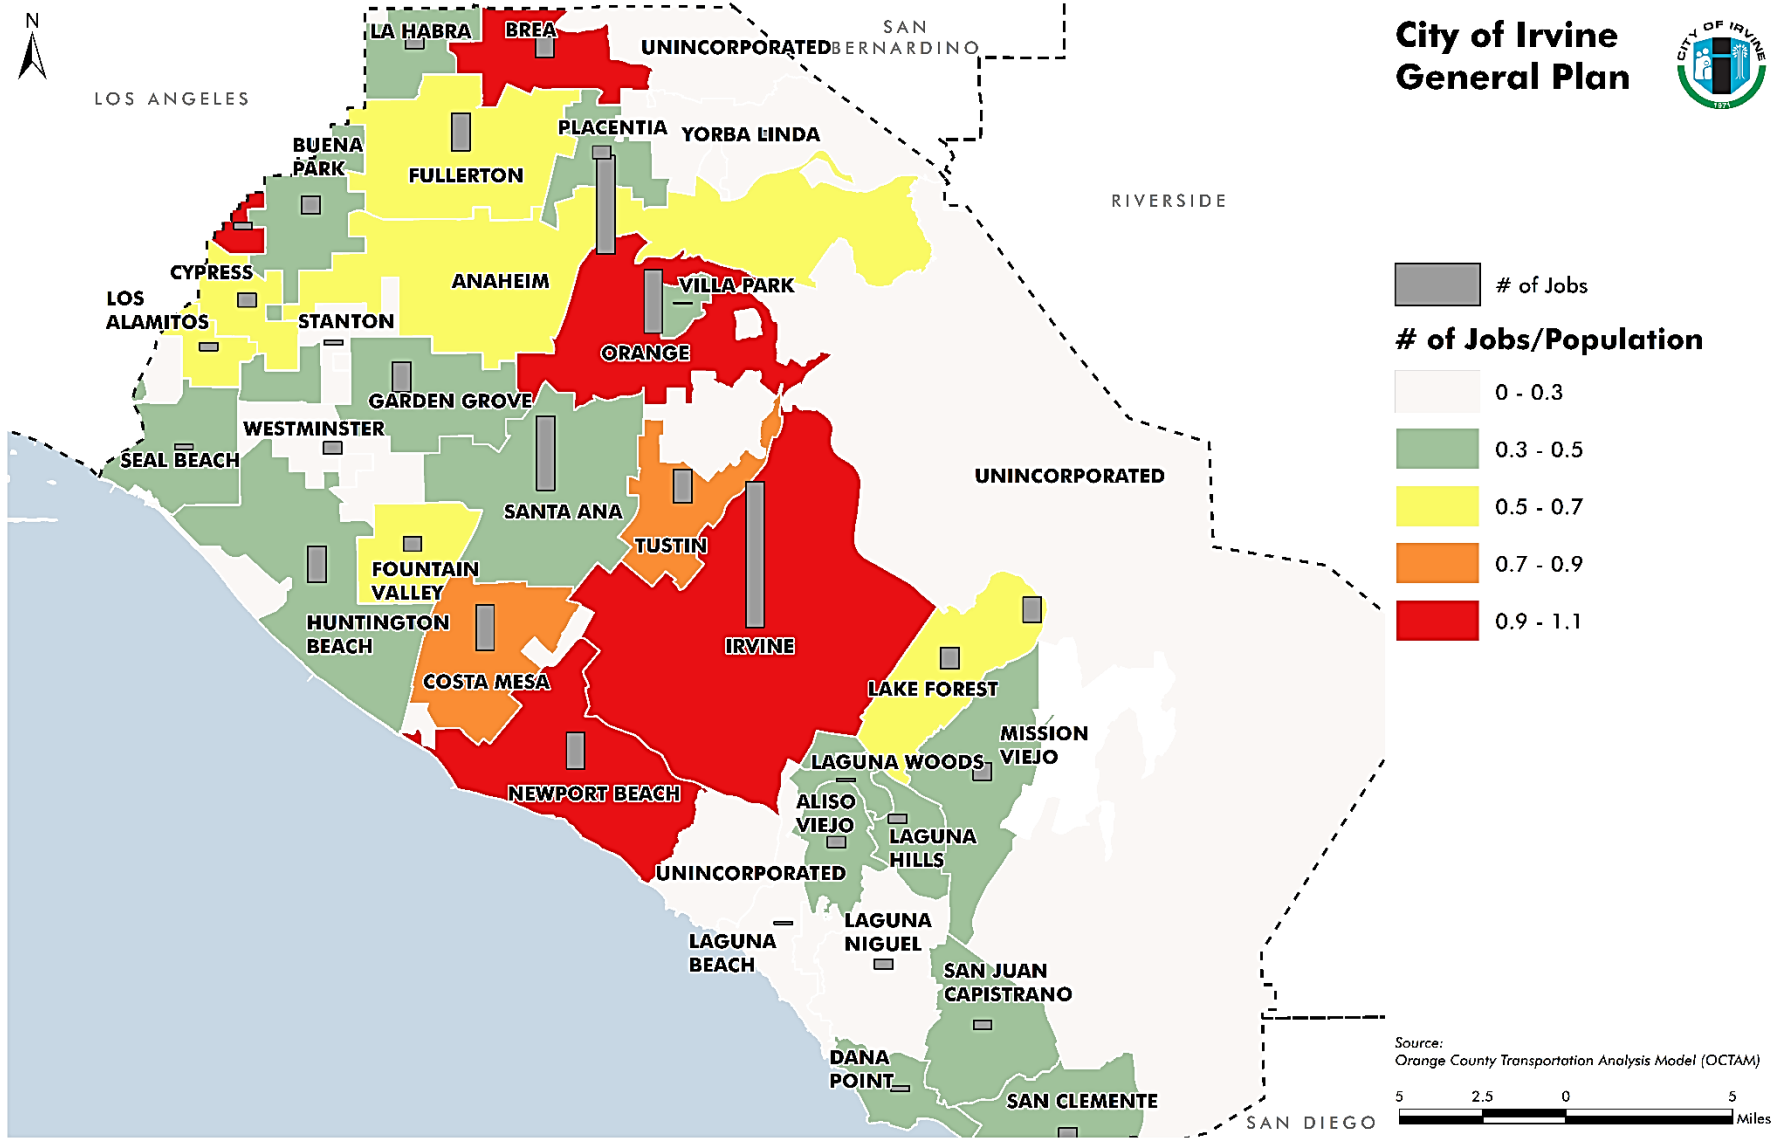

Figure 5-3 – Year 2045 Jobs to Population Ratio and Total Employment (Source: OCTAM)

Based on the VMT results and criteria, the Proposed Project Alternative results in a lower VMT per Service Population than the Reduced Project Alternative. **Table 5-3** represents the decrease in VMT per service population for each alternative compared to that of the Existing General Plan.

*Table 5-3 – Reduced Project VMT per Service Population vs Conservative*

Scenario	VMT per Service Population	Change from Current GP
Existing General Plan	28.97	
Conservative Project Alternative	24.94	-4.03
Reduced Project Alternative	25.78	-3.19
Conservative Plus Cumulative Project Alternative	24.88	-4.09
Reduced Plus Cumulative Project Alternative	25.67	-3.30

### 5.3 TRANSPORTATION ALTERNATIVE VMT

The Ada extension from the Irvine train station under the SCRRRA railroad tracks to Marine Way would provide a new two-lane collector street connection to the future residential development in the Great Park neighborhood and the Irvine Great Park and will improve access to/from the train station for vehicles, pedestrians and cyclists. There is currently no direct path for pedestrians and bicyclists to gain access to land uses on the north side of the railroad tracks from the train station south of the railroad tracks.

The City's Traffic Study Guidelines provide a series of screening criteria to determine whether a transportation improvement would likely result in less than significant VMT impacts and therefore would not require VMT analysis. Most of these screening criteria relate to safety or operational improvements of existing roadway facilities; however, Ada is not an existing roadway providing vehicle access across the railroad tracks. There is justification that screening criteria may be applicable for the Ada extension improvement because the new connection would provide a grade separated crossing to protect vehicles, bicycles and pedestrians crossing the railroad tracks, as well as provide for a separation between pedestrians and bicycles from vehicular traffic on Ada.

City of Irvine Screening Criteria - Through Lanes:

- **Addition of roadway capacity on local or collector streets provided that the project also substantially improves conditions for pedestrians, cyclists,** and, if applicable, transit (e.g., protected and separated Class IV bikeway as well as pedestrian refuges, bulb-outs, and elements that shorten pedestrian crossing distances)
- **Grade separation to separate vehicles from rail,** transit, pedestrian or bicycles, or to replace a lane in order to separate preferential vehicles (e.g. HOV, HOT, or trucks) from general vehicles.

Although justification exists that the Ada extension may be screened from VMT analysis, a VMT impact analysis was performed for informational purposes.

A transportation project VMT impact analysis must evaluate the net change in VMT with and without the transportation project under the build-out scenario. A project that results in no net percentage increase in the total VMT results in no significant impact and therefore, does not require mitigation. This impact analysis methodology for transportation projects is consistent with the methodology employed by the California Department of Transportation as outlined in its Transportation Analysis Under CEQA. A project that results in a net increase in VMT may be deemed significant and may require mitigation such as Intelligent Transportation Systems (ITS) that integrate advanced communications technologies into transportation infrastructure and vehicles to advance safety and mobility.

**Table 5-4** shows the computed link-based VMT from ITAM with and without Ada for the both the Proposed Project (Conservative) Alternative and the Reduced Project Alternative within a three-mile radius of the Ada extension. Three miles was considered a sufficient distance to capture a majority if not all diverted traffic. Overall, there is a 0.05% net reduction in total VMT in both scenarios when the Ada extension is implemented in the network. Therefore, based on

this net reduction in total VMT, there is no significant impact, and no mitigation is required in connection with the Ada extension. **Figure 5-4** shows the net daily traffic change (red increase, blue decrease) in volumes within the three-mile radius for the Proposed Project (Conservative) Alternative and **Figure 5-5** shows the Reduced Project Alternative.

Table 5-4 – Change in VMT With and Without Ada

Alternative	With ADA	Without ADA	Change	Percent Change
Proposed Project (Conservative)	5,807,694	5,810,612	(2,918)	-0.05%
Reduced Project	5,717,095	5,720,150	(3,055)	-0.05%

Figure 5-4 – Change in VMT With and Without Ada – Proposed Project (Conservative) Alternative

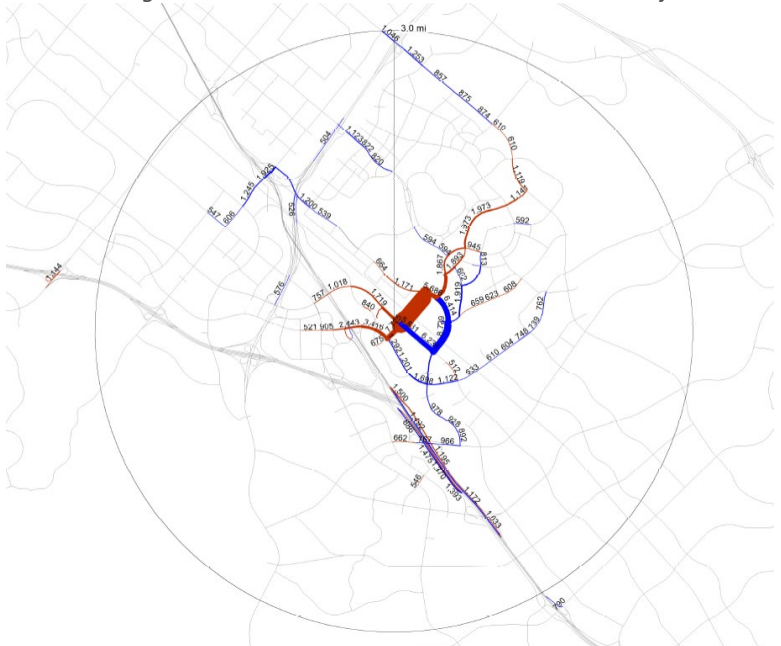

Figure 5-5 – Change in VMT With and Without Ada – Reduced Project Alternative

The net reduction in VMT is consistent with the expectation that a new transportation connection that provides connectivity between land uses on either side of a railroad track results in shortened journey distances, whereas if that connection did not exist, journey distances across the railroad tracks would be lengthier. This is noted in the Office of Planning and Research (OPR) Guidelines for SB 743 implementation (page 34):

*“A project which provides new connectivity across a barrier, such as a new bridge across a river, may provide a shortened path between existing origins and destinations, thereby shortening existing trips. .... this trip-shortening effect might be substantial enough to reduce the amount of vehicle travel resulting from the project .....or even lead a net reduction in vehicle travel overall.”*

## 6 MITIGATION MEASURES

When a project results in a significant VMT impact, the appropriate mitigation measures must be identified to reduce the VMT impact to a level that meets the City's adopted VMT threshold. All feasible mitigation measures must be incorporated into the project to substantially reduce the VMT impact even if the project cannot meet the adopted VMT threshold. If the project cannot meet the adopted VMT threshold rate after all feasible mitigations are incorporated, then a Statement of Overriding Considerations must be adopted along with preparation of an EIR in accordance with CEQA Guidelines.

### 6.1 AVAILABLE MITIGATION MEASURES

The City's Traffic Study Guidelines contain a 2-tier system for the VMT Mitigation Program:

**Tier I – On-Site Infrastructure:** An on-site connectivity reduction of 2.5 % VMT rate can be made due to on-site connectivity improvements as part of the project design to promote bicycle activity (i.e. bike facilities) and pedestrian walkability (i.e., connected sidewalks from building entrances to public streets. The 2.5 % reduction rate is based on the ranges provided in The California Air Pollution Control Officers Association (CAPCOA) Handbook for Analyzing Greenhouse Gas Emission Reductions (2021) [https://www.caleemod.com/documents/handbook/full\\_handbook.pdf](https://www.caleemod.com/documents/handbook/full_handbook.pdf) and other research *1 Handy, S. et al. (2014). Impacts of Pedestrian Strategies on Passenger Vehicle Use and Greenhouse Gas Emissions - Policy Brief and Technical Background Document. California Air Resources Board. Retrieved from: <https://arb.ca.gov/cc/sb375/policies/policies.htm>.*

**Tier II – On-Site Transportation Demand Management (TDM):** A reduction of up to 5% can be made if the project develops or is part of a Transportation Demand Management (TDM) program. This reduction is consistent with the CAPCOA Handbook and other research on trip reduction estimates and is supported by observed data from the annual Spectrumotion surveys submitted to the City *2 Boarnet, M. et al. (2014). Impacts of Employer-Based Trip Reduction Programs and Vanpools on Passenger Vehicle Use and Greenhouse Gas Emissions - Policy Brief and Technical Background Document. California Air Resources Board. Retrieved from: <https://arb.ca.gov/cc/sb375/policies/policies.htm>*

While TDM programs in the past have typically focused on employer sites, they can also be implemented to new residential developments with measures such as bike share or car share programs.

**Discussion of VMT Mitigation Fee Program:** The purpose of a VMT mitigation fee program is to fund a set of off-site VMT reduction strategies (meaning strategies that would improve VMT conditions on a broader scale than a single development site) if Tier II reduction strategies are either infeasible or there is an inability to fully mitigate a potential significant VMT impact. A CEQA transportation mitigation fee program would include projects that could demonstrably reduce non-single occupancy vehicle mobility. These projects could either be existing projects from other fee programs or new improvement projects. Since the purpose of this program would be to streamline CEQA requirements, CEQA requires substantial evidence be provided to support findings with particular emphasis should be placed on feasible strategies for which there is a substantive body of evidence about their effects.

There are challenges involved in the implementation of a VMT Mitigation Fee Program including concerns regarding overall costs and the cost-effectiveness of VMT reduction measures, consistency with CEQA, and Mitigation Fee regulations such as nexus and additionally concerns about the economic impact of the fee on future development. These issues are compounded by the fact that several development projects would not need VMT mitigation.

The use of a Mitigation Fee Act (AB 1600 Requirements), Government Code § 66000- 66025-compliant program for use in the mitigation of CEQA significant impacts under the transportation resource area is something that has been explored by several jurisdictions; however, few jurisdictions have moved forward with such programs due to the technical infeasibility of such a mechanism for CEQA mitigation. The title of "Mitigation Fee Act" is not in reference to a CEQA mitigation of a significant environmental impact. The Mitigation Fee Act is intended to allow local agencies to impose a fee as a condition of approval of a development project at is imposed to provide for an improvement to be constructed

to serve the development project, or a fee for public improvements. Mitigation fees are developed by assessing an overall area deficiency and then using the cost of the improvements needed to address the deficiency, resulting in a fee per new unit of development.

CEQA mitigations have additional requirements beyond identification of a physical deficiency. CEQA mitigation's feasibility is determined through not only the type of improvement but its nexus, timeframe, effectiveness, and implementation—generally these requirements fall on the CEQA lead agency. Furthermore, mitigations must provide additional resources that otherwise would not have been provided or providing the additional resources substantially earlier than they otherwise would have been available. This “additionality” requirement means CEQA mitigation funds cannot replace other funds that could be available for a mitigation. In general, for CEQA transportation mitigations, both project applicants and CEQA lead agencies prefer to use infrastructure projects as mitigation where the project is considered mitigated once complete.

These additional requirements and practices result in difficulties in crafting and managing a program that satisfies both Mitigation Fee Act and CEQA mitigation requirements. For a programmatic environmental impact report, it is possible to determine a level of VMT that would need to be mitigated and attach that value to a fee-based mitigation program to be run by the City. This program would need to be closely monitored and managed to ensure mitigations were applied and effective and the program met ongoing legal requirements. In **Hamilton and High, LLC v. City of Palo Alto**, the California Court of Appeal ordered the City to refund nearly a million dollars of unspent “in-lieu parking fees” to the developer of a mixed use project because the City failed to meet the periodic reporting requirements of the Mitigation Fee Act.

Any mitigation that would be outside of the direct implementation of the City (e.g. Metrolink service improvements) may be considered infeasible due to the inability of the City to guarantee the implementation of the mitigation—and payment of mitigation funds to support ongoing projects may have issues with CEQA additionality requirements. This would leave the City with only City infrastructure or programmatic improvements which have not previously had identified funding as off-site mitigation options.

There is also the potential for yet-to-be identified projects which could reduce VMT to be included in a managed program—this is considered a mitigation bank / in-lieu fee option which would require a managed and monitored program run by the City. This model is used for natural habitat restoration. Caltrans and its local/regional partners who sponsor projects on the state highway system regularly pay in-lieu fees to mitigate impacts to biological resources at off-site locations with comparable habitat values. These in lieu fees are often paid to separate agencies or third parties such as a non-profit conservancies that ultimately carry out the biological mitigation activity as separate stand-alone projects. It is important to note that the technical and regulatory protocols regarding the nexus between biological impacts and mitigations is complex and wide-ranging—VMT-specific methodologies and protocols would be required to demonstrate the nexus between VMT impacts and mitigations to ensure the adequacy of mitigation under CEQA as revised by SB 743 and There would need to be a comparable mechanism in place to collect these funds and pass them through to a party that would carry out those strategies in order to demonstrate that their implementation is reasonably assured.

Examples of potential mitigation measures to include in such a program would be transit service funding for a set period or major infrastructure projects such as pedestrian bridges over major arterials. **Table 6-1** shows potential off-site mitigation measures and their potential maximum effect on VMT applied to a subset of project trips. A fuller list of potential VMT mitigation measures is included in **Appendix A** which is extracted from the Ventura County CEQA Vehicle Miles Travelled Adaptive Mitigation Program 2023 [Ventura County Vehicle Miles Traveled Adaptive Mitigation Program - Ventura County Transportation Commission \(goventura.org\)](#)

Table 6-1 – Potential Off site VMT mitigation measures (CAPCOA)

Category	Type	Strategy	Maximum	Affected Group
Land Use	Location	Improve Street Connectivity	30%	Community
Neighborhood Design	Infrastructure	Provide Pedestrian Network Improvement	6.4%	Community
Neighborhood Design	Infrastructure	Construct or Improve Bike Boulevard	0.2%	Corridor
Neighborhood Design	TDM	Implement Conventional Carshare Program	0.15%	Community
Neighborhood Design	TDM	Implement Pedal (Non-Electric) Bikeshare Program	0.03%	Community
All Categories	Infrastructure	Require Contributions to Infrastructure Projects	varies	Community
Cleaner Vehicles and Fuels	TDM	Use Cleaner-Fuel Vehicles	100%	Vehicle replacement
Neighborhood Design	Infrastructure	Provide Traffic Calming Measures	1%	Corridor
Neighborhood Design	Infrastructure	Construct or Improve Bike Facility	0.8%	Corridor
Neighborhood Design	Infrastructure	Dedicated Land for Bike Trails	0.8%	Corridor
Neighborhood Design	Infrastructure	Expand Bikeway Network	0.5%	Community
Neighborhood Design	Infrastructure	Create Urban Non-Motorized Zones	0.2%	Community
Neighborhood Design	TDM	Implement Electric Carshare Program	0.18%	Community
Neighborhood Design	TDM	Implement Electric Bikeshare Program	0.03%	Community
Neighborhood Design	TDM	Implement Scooter-share Program	0.03%	Community
Parking Management	Infrastructure	Implement Market Price Public Parking (On-Street)	30%	Community
Road Pricing	Infrastructure	Implement Area or Cordon Pricing	22%	Community
Parking Management	Infrastructure	Install Park-and-Ride Lots	0.5%	Community
Parking Management	Infrastructure	Require Residential Area Parking Permits	0.36%	Community
Transit	Infrastructure	Increase Transit Service Frequency/Speed	11.30%	Corridor
Transit	Infrastructure	Extend Transit Network Coverage or Hours	4.6%	Corridor
Transit	Infrastructure	Provide Local Shuttles	2.5%	Community
Transit	Infrastructure	Implement Transit-Supportive Roadway Treatments	0.6%	Corridor
Transit	Infrastructure	Provide Bike Parking Near Transit	0.09%	Community
Transit	TDM	Microtransit NEV (neighborhood electric vehicles)	12.7%	Corridor
Transit	TDM	Reduce Transit Fares	1.2%	Community
Trip Reduction Programs	Infrastructure	Implement School Bus Program	63%	Students
Trip Reduction Programs	TDM	Implement School Pool Program	15.8%	Students
Trip Reduction Programs	TDM	Provide Community-Based Travel Planning	2.3%	Community

Potential alternatives to developing a Citywide VMT Mitigation Fee program are use of a regional VMT programs or a VMT mitigation bank administered by agencies such as SCAG or OCTA or development of a fair share mitigation cost applicants could apply towards off-site VMT reducing projects such as active transportation or affordable housing.

Currently there are no regional VMT mitigation programs in Orange County and there are increasing concerns about the legality of such programs due to the challenges of demonstrating a nexus from the fee to VMT improvements for an individual jurisdiction. An additional concern could be that development projects in Irvine could be mitigating impacts with transportation projects located outside of the City that would not necessarily benefit Irvine residents.

In summary, while there are potential mechanisms to have a programmatic approach to CEQA transportation mitigation based on VMT metrics, it is likely a new, managed mitigation program would need to be enacted by the City which would be subject to several statutory constraints. Most California cities are opting to continue project-level mitigation approaches where the project applicant is directed to develop mitigation with direction from City staff in their role as the CEQA lead agency.

## 6.2 POTENTIAL MITIGATION MEASURES

The Conservative Project Alternative requires a 3.5% reduction in VMT to meet the City's VMT threshold while the Reduced Project Alternative requires a 6.7% reduction in VMT to meet the threshold.

Therefore, both the Conservative and Reduced Project Alternatives could meet the VMT threshold with the implementation of a combination of on-site infrastructure improvements (2.5%) and on-site TDM programs (5%), which could provide an overall 7.5% reduction in VMT in certain areas of the City where a TDM program exists or could be introduced as part of a development agreement.

While mitigation measures do not necessarily apply to the Cumulative scenarios (since several projects are outside the City), the fact that the VMT per service population is lower in the Cumulative scenarios compared to the Non-Cumulative scenarios implies that Cumulative impacts would also be mitigated by the same measures needed to mitigate the Non-Cumulative scenarios.

Both options would involve identifying projects with potential VMT reduction improvements. For example, this could be done through projects identified in the City's Active Transportation Plan, or proposed new transit circulator routes, or estimating the VMT reductions and costing the capital and recurring costs of the program to determine a fee per VMT reduced. Other aspects that would need to be considered include:

- **Legal Foundation:** Does the program meet statutory requirements established under CEQA and other relevant state laws?
- **Agency Oversight & Funding:** Which entity would manage the program and how would the program administration be funded?
- **Geography & Scale:** Could the program be applied at multiple geographic scales? How would the location of VMT impacts relate to the location of mitigations?
- **Applicability:** To what types of projects would the program apply, and what types of mitigations would it support? Would the program promote equitable outcomes for members of underserved communities?
- **Data Analysis & Monitoring:** Would the program establish a standardized approach to evaluating VMT impacts and reductions, and have clearly defined methods for ongoing data collection and monitoring?
- **Program Risk Management:** Is the program clear and easy to understand, and does it result in predictable and affordable results?

## 7 CONCLUSIONS

- The Irvine General Plan Update will update the General Plan land use element to support the City's RHNA. For CEQA compliance, a VMT analysis has been completed for this project. The project includes five land-use alternatives and a single transportation alternative.
- Since there is no guidance in the City's Traffic Study Guidelines for the treatment of area-wide or Citywide plans, metrics and thresholds of significance for citywide land-use plans. Therefore, a threshold of significance was developed based on the VMT per service population, which is calculated by dividing the countywide total VMT by the sum of the total countywide population and countywide employment.
- The Current General Plan would result in a significant increase in VMT per service population compared to service population threshold, requiring a 17% reduction to meet the City's VMT per service population significance threshold.
- Both the Conservative and Reduced Project Alternatives represent a notable reduction in VMT per service population compared to the existing on-the-ground development and the Current General Plan. However, since the VMT threshold is 15% below existing conditions, there are still significant impacts with VMT per service population being higher than the acceptable threshold in both the Conservative and Reduced Project Alternatives. The Conservative Project Alternative requires a 3.5% reduction in VMT to meet the City's VMT threshold and the Reduced Project Alternative requires a 6.7% reduction to meet the City's VMT threshold.
- The Cumulative conditions result in a marginally lower VMT per service population compared to the Non-Cumulative alternatives.
- The impacts in both Cumulative and Non-Cumulative for both Conservative and Reduced Project Alternatives could potentially be mitigated in certain geographical areas of the City by using a combination of on-site connectivity design and TDM measures, that would result in up to a 7.5 % reduction in VMT.
- While there are potential mechanisms to have a programmatic approach to CEQA transportation mitigation based on VMT metrics, it is likely a new, managed mitigation program would need to be enacted by the City which would be subject to several statutory constraints. Most California cities are opting to continue project-level mitigation approaches where the project applicant is directed to develop mitigation with direction from City staff in their role as the CEQA lead agency.
- The extension of Ada from the Irvine Train Station to Marine Way would result in a minor reduction in VMT and improve pedestrian and bicycle connectivity thereby reducing travel distances between the train station and the future development north of the train tracks. Improved access to the train station will also encourage the use of rail trips instead of car trips. While this improvement could potentially be screened out from VMT analysis, a VMT analysis was performed the results of which indicate that there was a net reduction in VMT with the proposed Ada extension. Therefore, VMT impacts under this scenario would be less than significant and there is no significant impact associated with this improvement. This is consistent with expectations when providing a new roadway connection that shortens trip distances.

## **1. INTRODUCTION**

### **1.1 PROJECT DESCRIPTION**

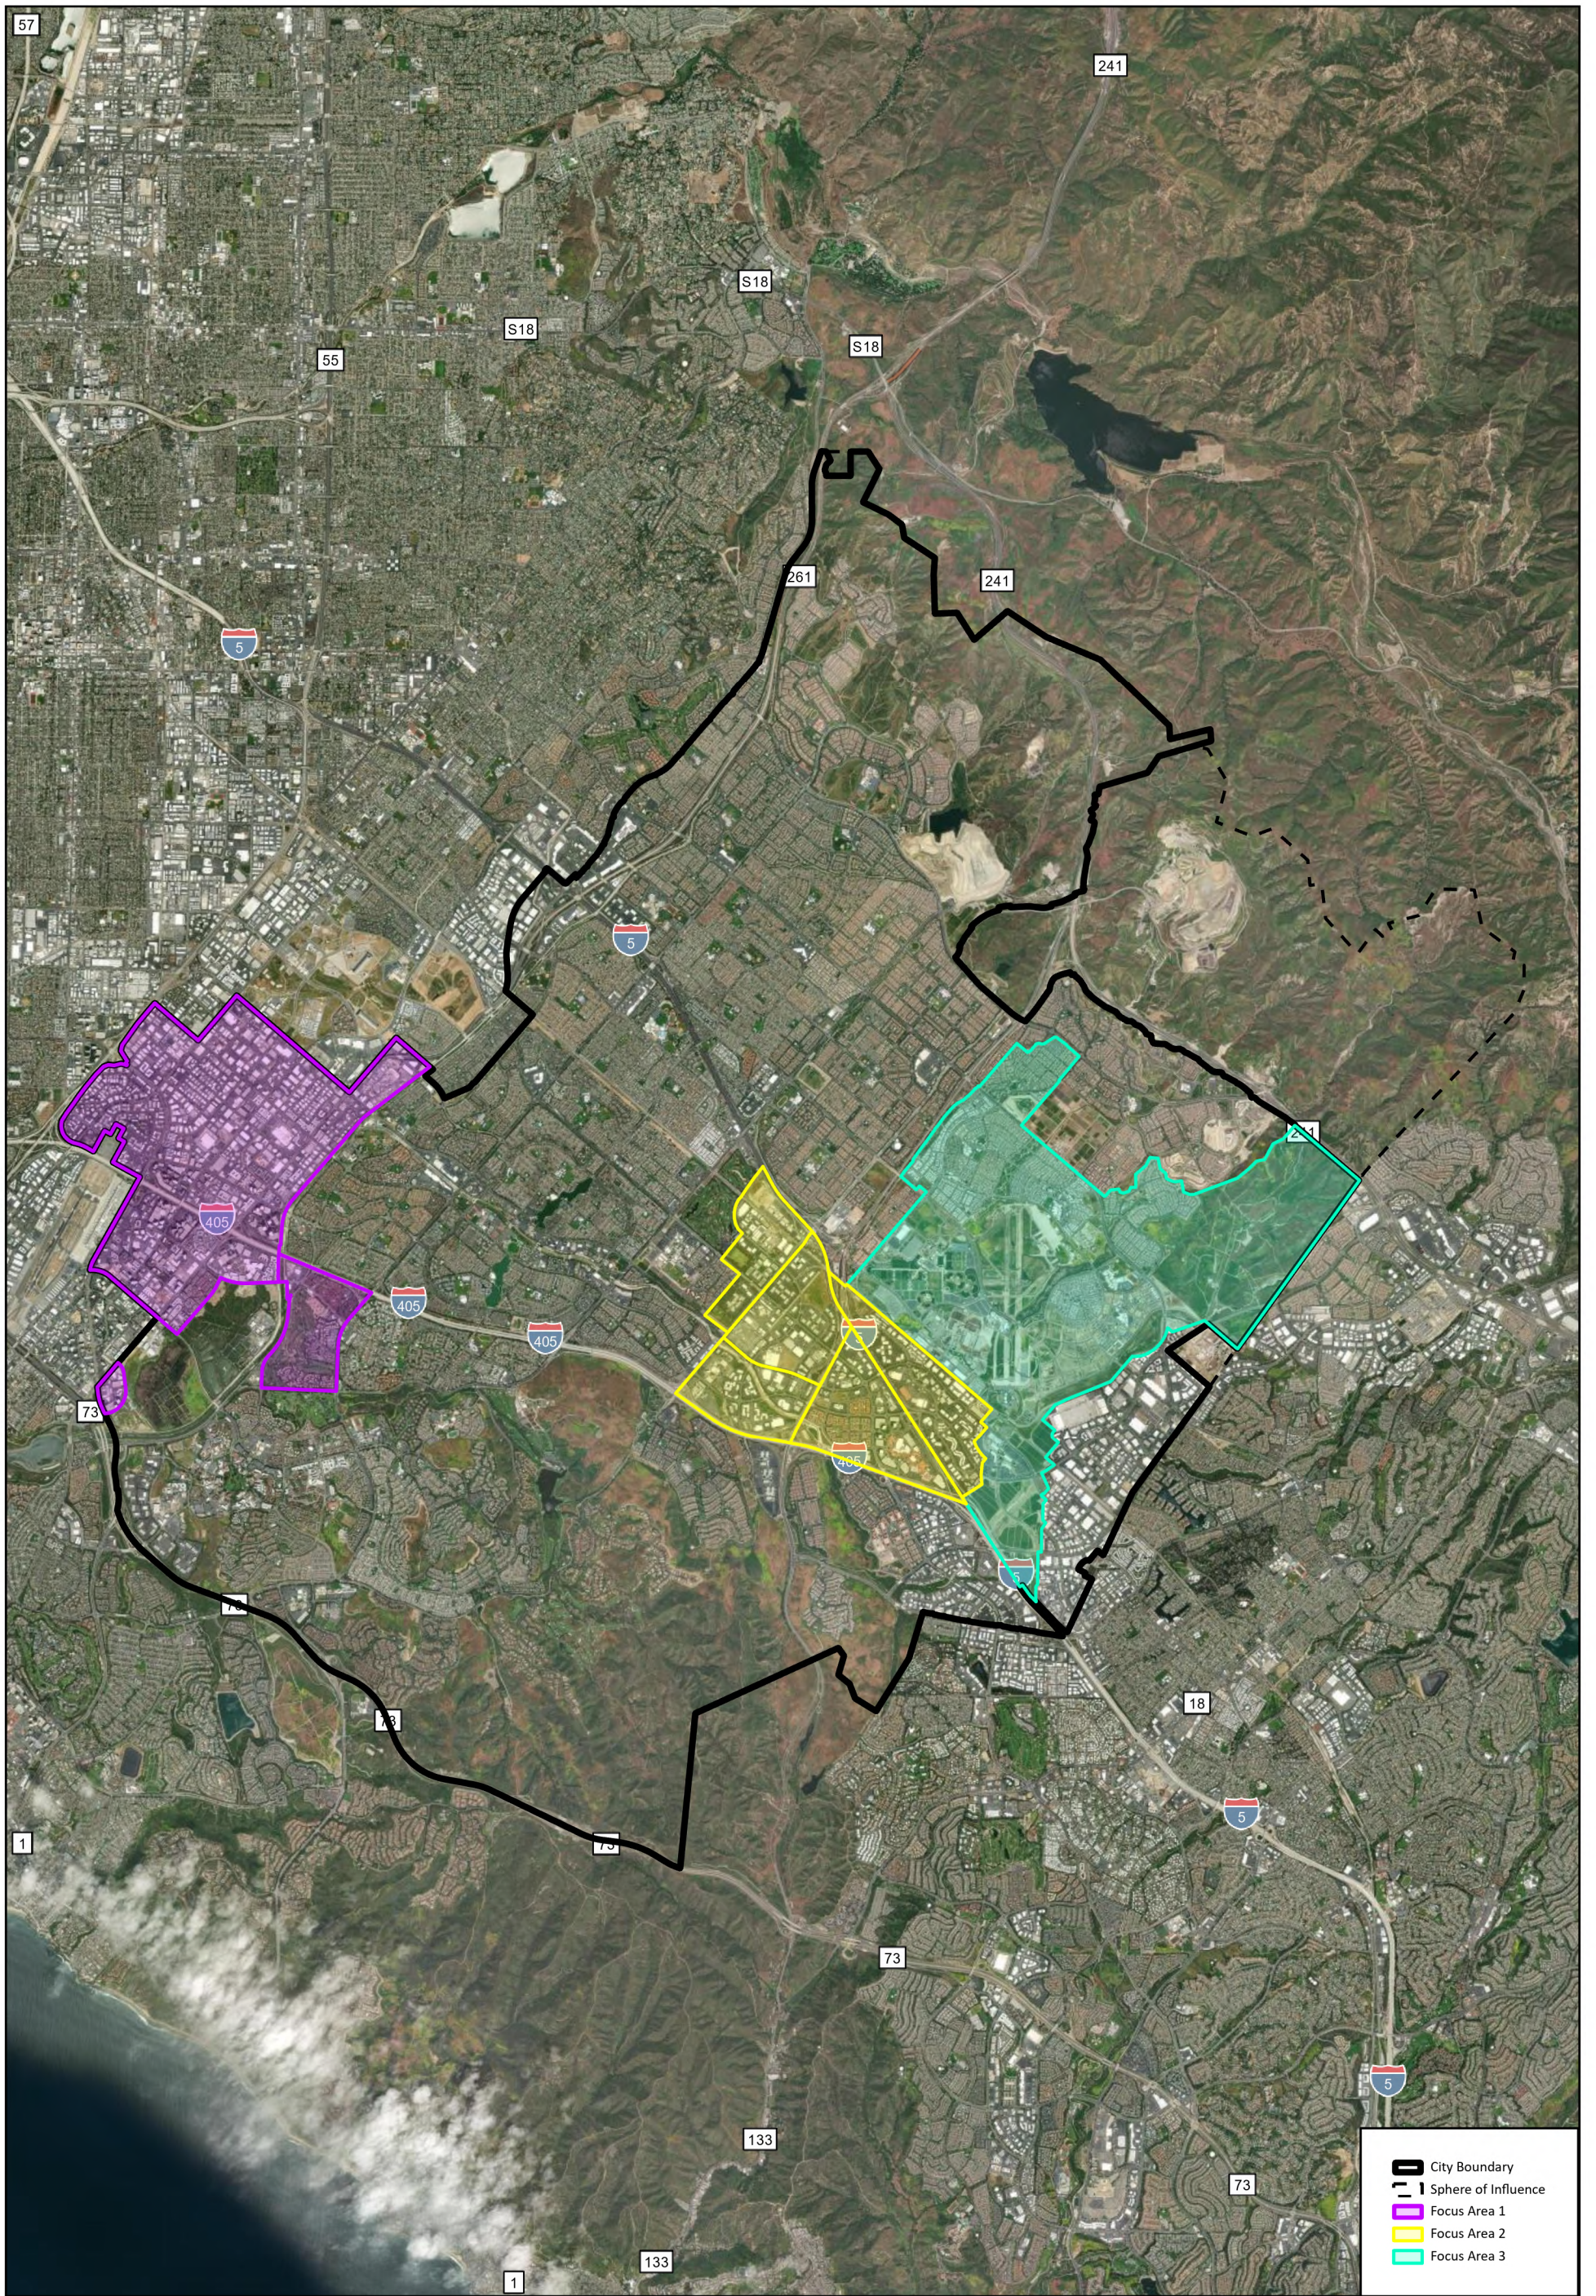

The City of Irvine (“City”) is currently undergoing a General Plan Update (GPU), which is intended to shape development and redevelopment in the City over the next 30-plus years. A General Plan is the principal long-range policy and planning document for guiding California cities and counties’ physical development, conservation, and enhancement of. As part of the GPU and the California Environmental Quality Act (CEQA), infrastructure such as drainage, sewer, water systems, and water quality that support the existing and proposed land uses will be evaluated at a programmatic city-wide level in connection with the proposed land use changes and focus areas.

### **1.2 SCOPE OF WORK**

This infrastructure assessment report describes the primary wet utility infrastructure systems that support the City of Irvine and its sphere of influence (SOI), including water, sewer, storm drainage systems, and water quality programs. As part of the California Environmental Quality Act (CEQA) process associated with GPUs, infrastructure, and utilities that support the existing and proposed land uses will be analyzed at a level consistent with the GPU city-wide program-level planning of an Environmental Impact Report (“EIR”). This report will evaluate the existing conditions of the infrastructure systems that serve the City and SOI (“Irvine GPU”). Under the proposed GPU, the proposed buildout and land use changes will alter demands on existing infrastructure and utilities. The analysis within this report will review, identify, and summarize the effects of the proposed conditions on the existing infrastructure within the water, sewer, storm drainage, and water quality systems. Any significant deficiencies will be identified, along with the tools available to address them, including any major Capital Improvements Plans (CIP) to remedy existing or prospective deficiencies within the City GPU.

See Figure 1 for an aerial extent of the Irvine GPU area.

City Boundary  
 Sphere of Influence  
 Focus Area 1  
 Focus Area 2  
 Focus Area 3

**City of Irvine GPU Aerial Extent**

**Figure 1**

2/29/2024

### **1.3 LAND USE DESCRIPTION**

The City of Irvine's Zoning Ordinance<sup>1</sup> defines the land uses throughout the City. The Ordinance establishes regulations to protect public health, safety, and welfare while ensuring alignment with the City's GPU. The ordinance assigns specific land use intensities to planning areas (PAs), promotes compatibility between natural and built environments, incorporates State-mandated development procedures, and maintains existing regulations that align with the GPU. Infrastructure improvements follow building intensity standards, develop new zoning criteria as needed for GPU consistency, and emphasize urban design to enhance the City's development. Additionally, the ordinance encourages innovative solutions within the City and its SOI.

#### **PLANNING AREAS (PA)**

The City is divided into distinct neighborhoods called Planning Areas (PAs) and each PA has a distinct set of land uses and zoning descriptions within the City's GPU. PAs facilitate coordinated development by requiring zoning in accordance with the City's general development standards and land use regulations. See Figure 2 for a visual of the PAs throughout the City.

#### **LAND USE ELEMENT AND HOUSING ELEMENT**

The City's Land Use Element defines local policies for land development, and aligns with the zoning regulations for various residential, commercial, industrial, etc. designations. One of the GPUs primary goals is to update the Land Use Element to align with the 2021-2029 Housing Element<sup>2</sup>, a crucial component of the City's planning framework. The Housing Element analyzes present and future housing needs and establishes goals, policies, and programs for housing preservation, improvement, and development.

In accordance with California Government Code 65583(a), the Housing Element assesses housing needs, including an inventory of resources and constraints. Data from the Southern California Association of Governments (SCAG) and the Housing and Community Development (HCD) informs the City's Housing Element, which in the most recent 2021-2029 Housing element assigned the City a Regional Housing Needs Assessments (RHNA) of up to 23,610 dwelling units.

To comply with state housing statutes, including no-net loss and affirmatively furthering fair housing requirements, the 2021-2029 Housing Element also identified that the City has capacity for up to 57,656 new residential units through a sites inventory. However, the City's current GPU includes a significant amount of unbuilt non-residential square footage (SF) within the PAs. This surplus of non-residential space could potentially be converted to residential dwelling units (DUs).

---

<sup>1</sup> City of Irvine, Zoning Ordinance – Division 1 General Provisions and Definitions. Accessed March 2024. Found here: [https://library.municode.com/ca/irvine/codes/zoning?nodeId=ZOOR\\_DIVIGEPRDE](https://library.municode.com/ca/irvine/codes/zoning?nodeId=ZOOR_DIVIGEPRDE)

<sup>2</sup> City of Irvine, 2021-2029 Housing Element. May 6, 2022. Found here: <https://legacy.cityofirvine.org/civica/filebank/blobdload.asp?BlobID=34118>

Considering this potential conversion, a Reduced Project Alternative, also known as the Preferred Project, would require 15,019 fewer units compared to the Conservative Alternative, which captures all 57,656 new residential units. Instead, the Reduced Project Alternative would add 42,637 new DUs to the general plan to meet RHNA requirements and other development goals. Both approaches involve introducing additional residential and mixed-use development throughout the City using overlay zones and master plans, which offers greater flexibility for developers.

The residential overlays would encourage higher density residential (average 50 DUs/Acre) and mixed-use development in three focus areas. These areas are well-suited for growth, because of their proximity to existing job centers and major travel corridors with access to public transit options. Within this report’s assessment of impacts to wet utilities and infrastructure, the Conservative Alternative/Proposed Project, with the most planned residential growth and units, will be the core focus as it has the potential to have the most impacts in comparison to the less intensive Reduced Project Alternative. See the descriptions of PAs and zoning designation within the three focus areas described below.

- Focus Area 1 – Greater Irvine Business Complex Area: PAs 19 and 36
- Focus Area 2 – Greater Spectrum Area: PAs 12, 13<sup>3</sup>, 31, 32, and 33
- Focus Area 3 - Great Park Neighborhood Transit Village: PA 51

Existing land uses and their zoning descriptions are provided below Table 1.

**Table 1 Focus Areas Existing Zoning Designations**

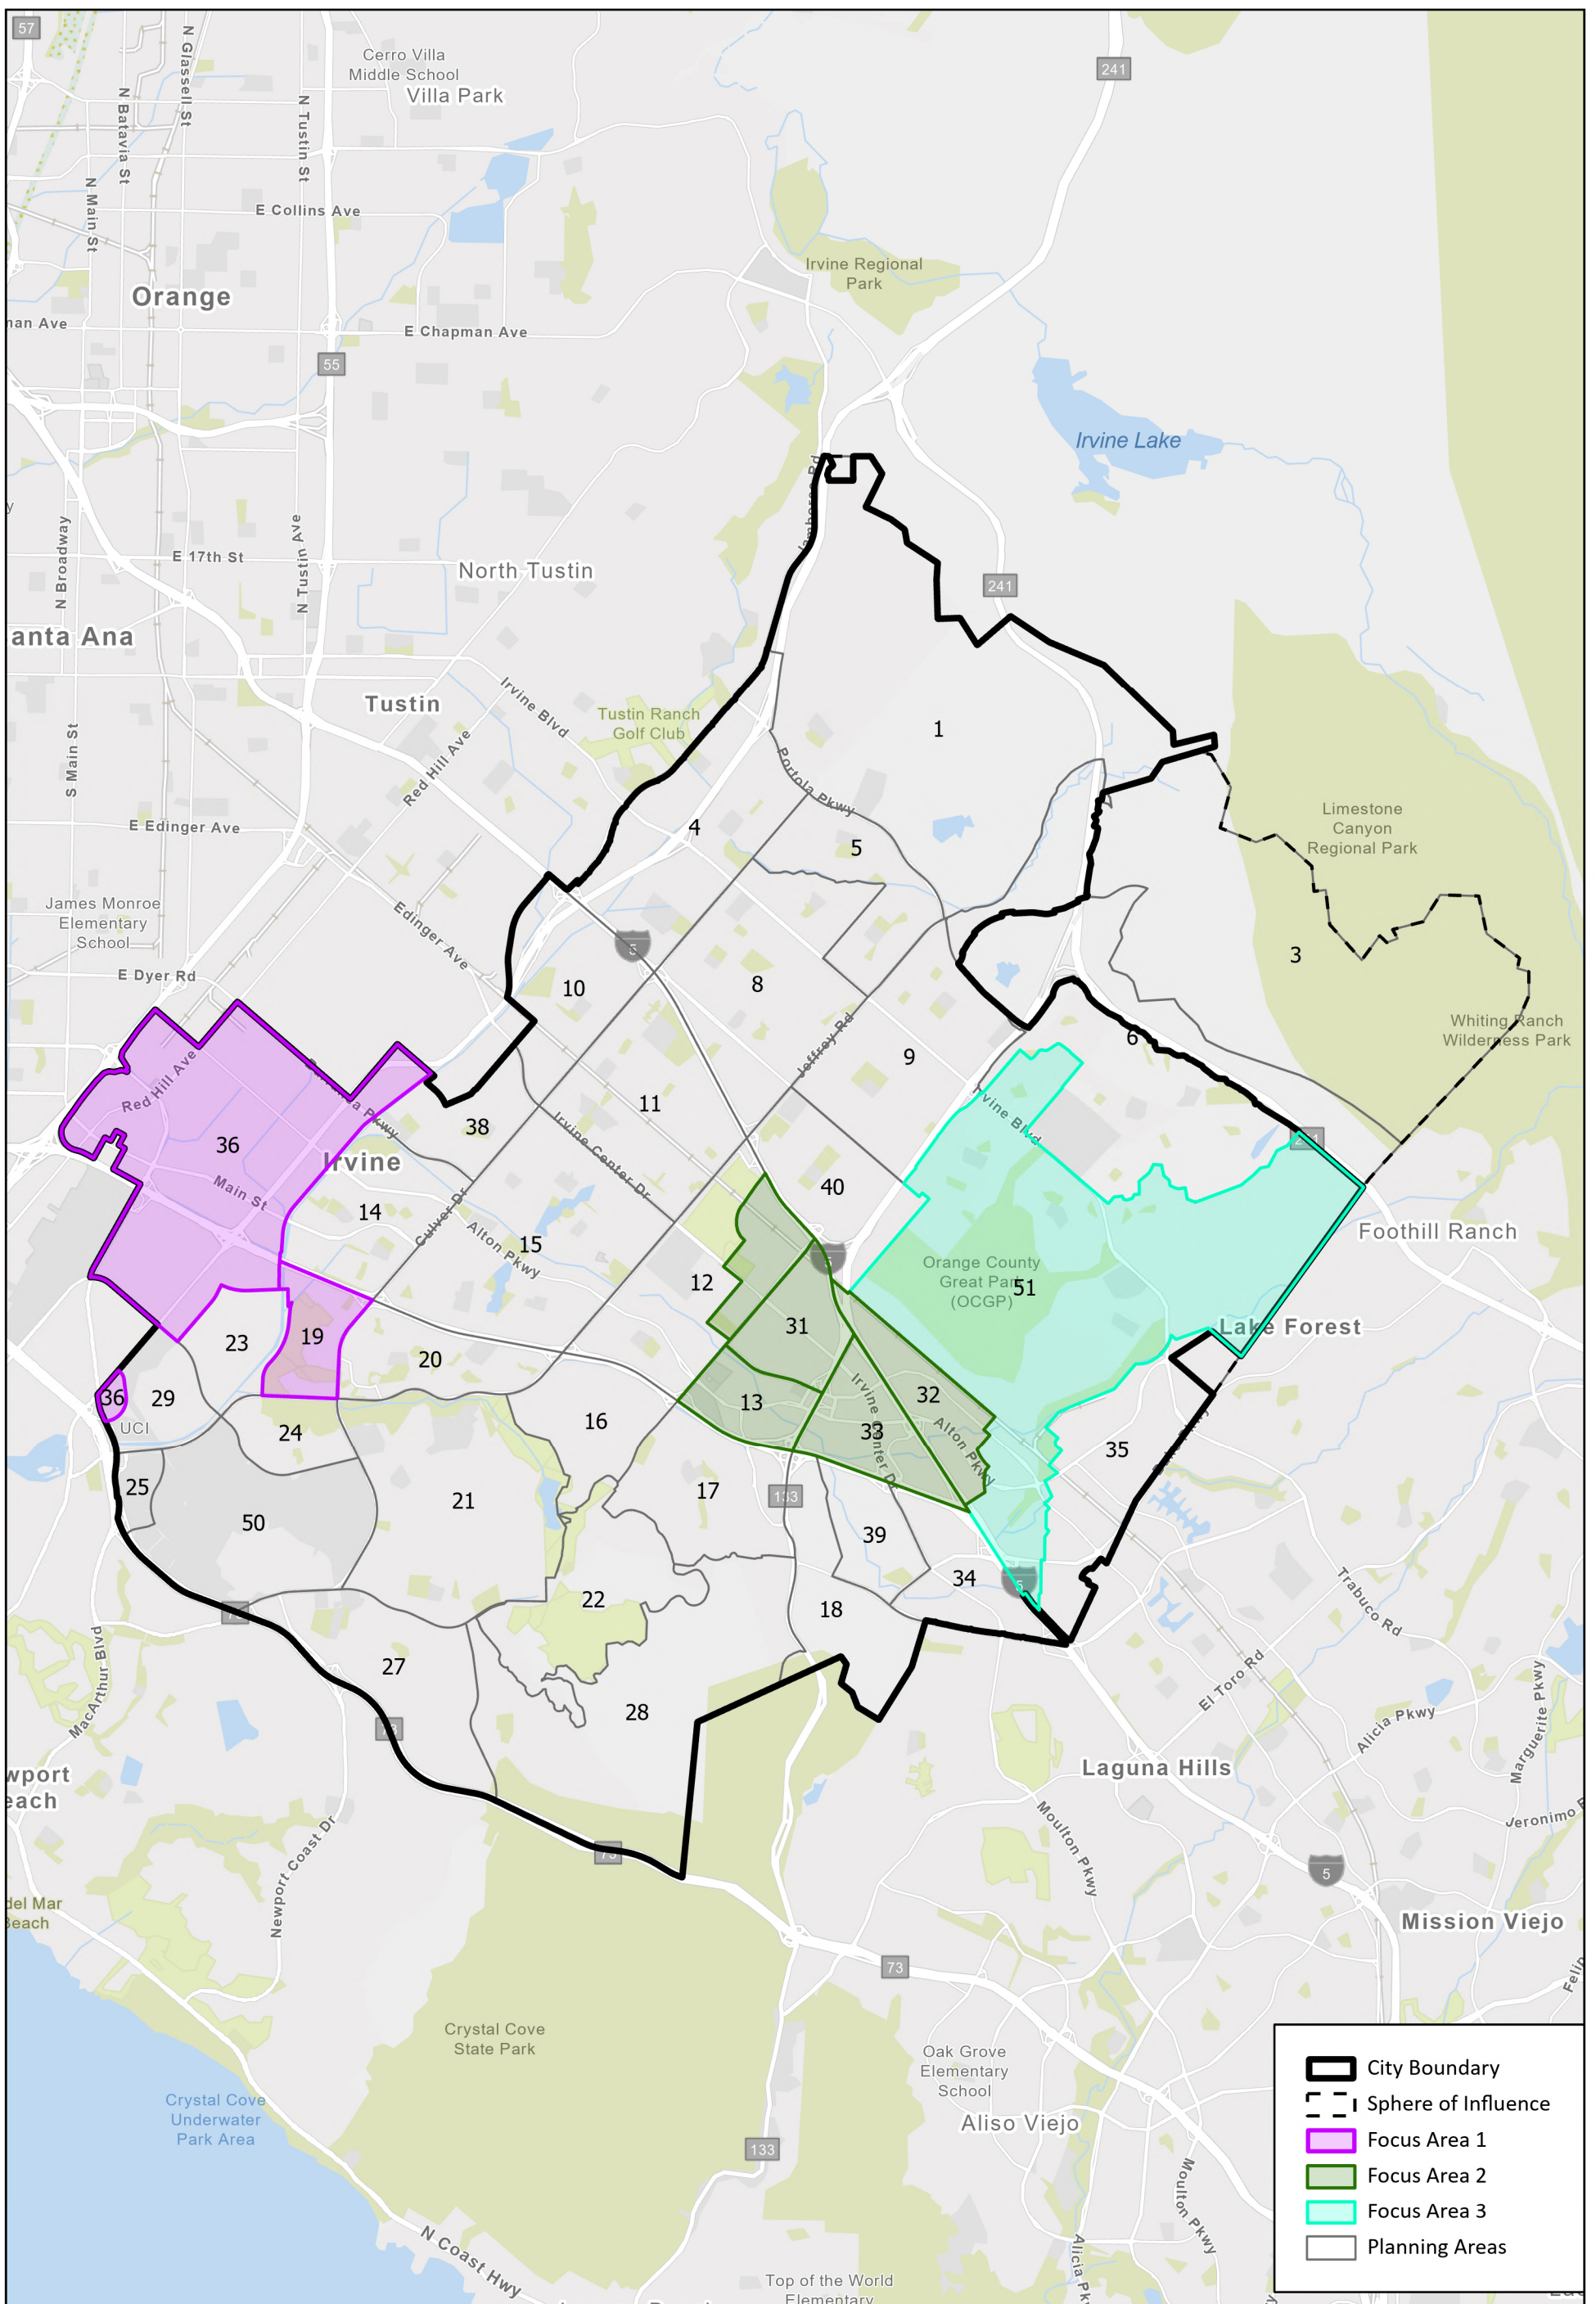

Zoning Designation(s)	Acres within Focus Area	
<b>Focus Area 1 – Greater Irvine Business Complex Area</b>		
Commercial Recreation	34.91	1%
IBC Industrial	92.47	4%
IBC Multi-Use	2,022.39	78%
Irvine Business Complex Mixed-Use	55.31	2%
Irvine Business Complex Residential	102.73	4%
Medium-High Density Residential	71.20	3%
Medium Density Residential	62.61	2%
Neighborhood Commercial	5.00	0%
Recreation	147.14	6%
Water Bodies	2.74	0%
<b>TOTAL ACRES</b>	<b>2,596.49</b>	<b>100%</b>
Zoning Designation(s)	Acres within Focus Area	
<b>Focus Area 2 – Greater Spectrum Area</b>		
Community Commercial	122.46	7%

<sup>3</sup> Note that Planning Area 13 is included within this focus area, but no additional units are proposed or contemplated as part of the project. As such, the analysis with respect to water and wastewater throughout this report does not address Planning Area 13.

Development Reserve	32.03	2%
General Industrial	438.79	27%
Institutional	13.73	1%
Irvine Center Garden Commercial	137.93	8%
Irvine Center Regional Commercial	54.91	3%
Irvine Center Retail/Office Commercial	32.02	2%
Irvine Center Urban Commercial	136.77	8%
Medical and Science	570.41	35%
Preservation	5.88	0%
Recreation	101.49	6%
<b>TOTAL ACRES</b>	<b>1,646.41</b>	<b>100%</b>
<b>Zoning Designation(s)</b>	<b>Acres% within Focus Area</b>	
<b>Focus Area 3 – Great Park Neighborhood Transit Village</b>		
Exclusive Agriculture	117.73	3%
General Industrial	1.25	0%
Institutional	136.54	3%
Multi-Use	1.08	0%
Orange County Great Park	925.93	21%
Preservation	1,166.71	27%
Trails and Transit Oriented Development	1,971.60	46%
<b>TOTAL ACRES</b>	<b>4,320.84</b>	<b>100%</b>

As shown above in Table 1 the City's three focus areas of growth are currently zoned to consist of a range of residential, commercial, industrial, and mixed uses. Most important to note is that each focus area consists largely of one zoning designation with Focus Area 1 being IBC Multi-Use, Focus Area 2 General Industrial & Medical and Science, and Focus Area 3 Trails and Transit Oriented Development. These zoning designations are important to note as they will drive the City's existing land use demands for water and sewer and provide a basis of comparison in determining the effects of the GPU and Housing Elements proposed zoning changes to high density residential for these areas.

Refer to Figure 3 to see a visual of the zoning designations within the proposed Focus Areas of growth.

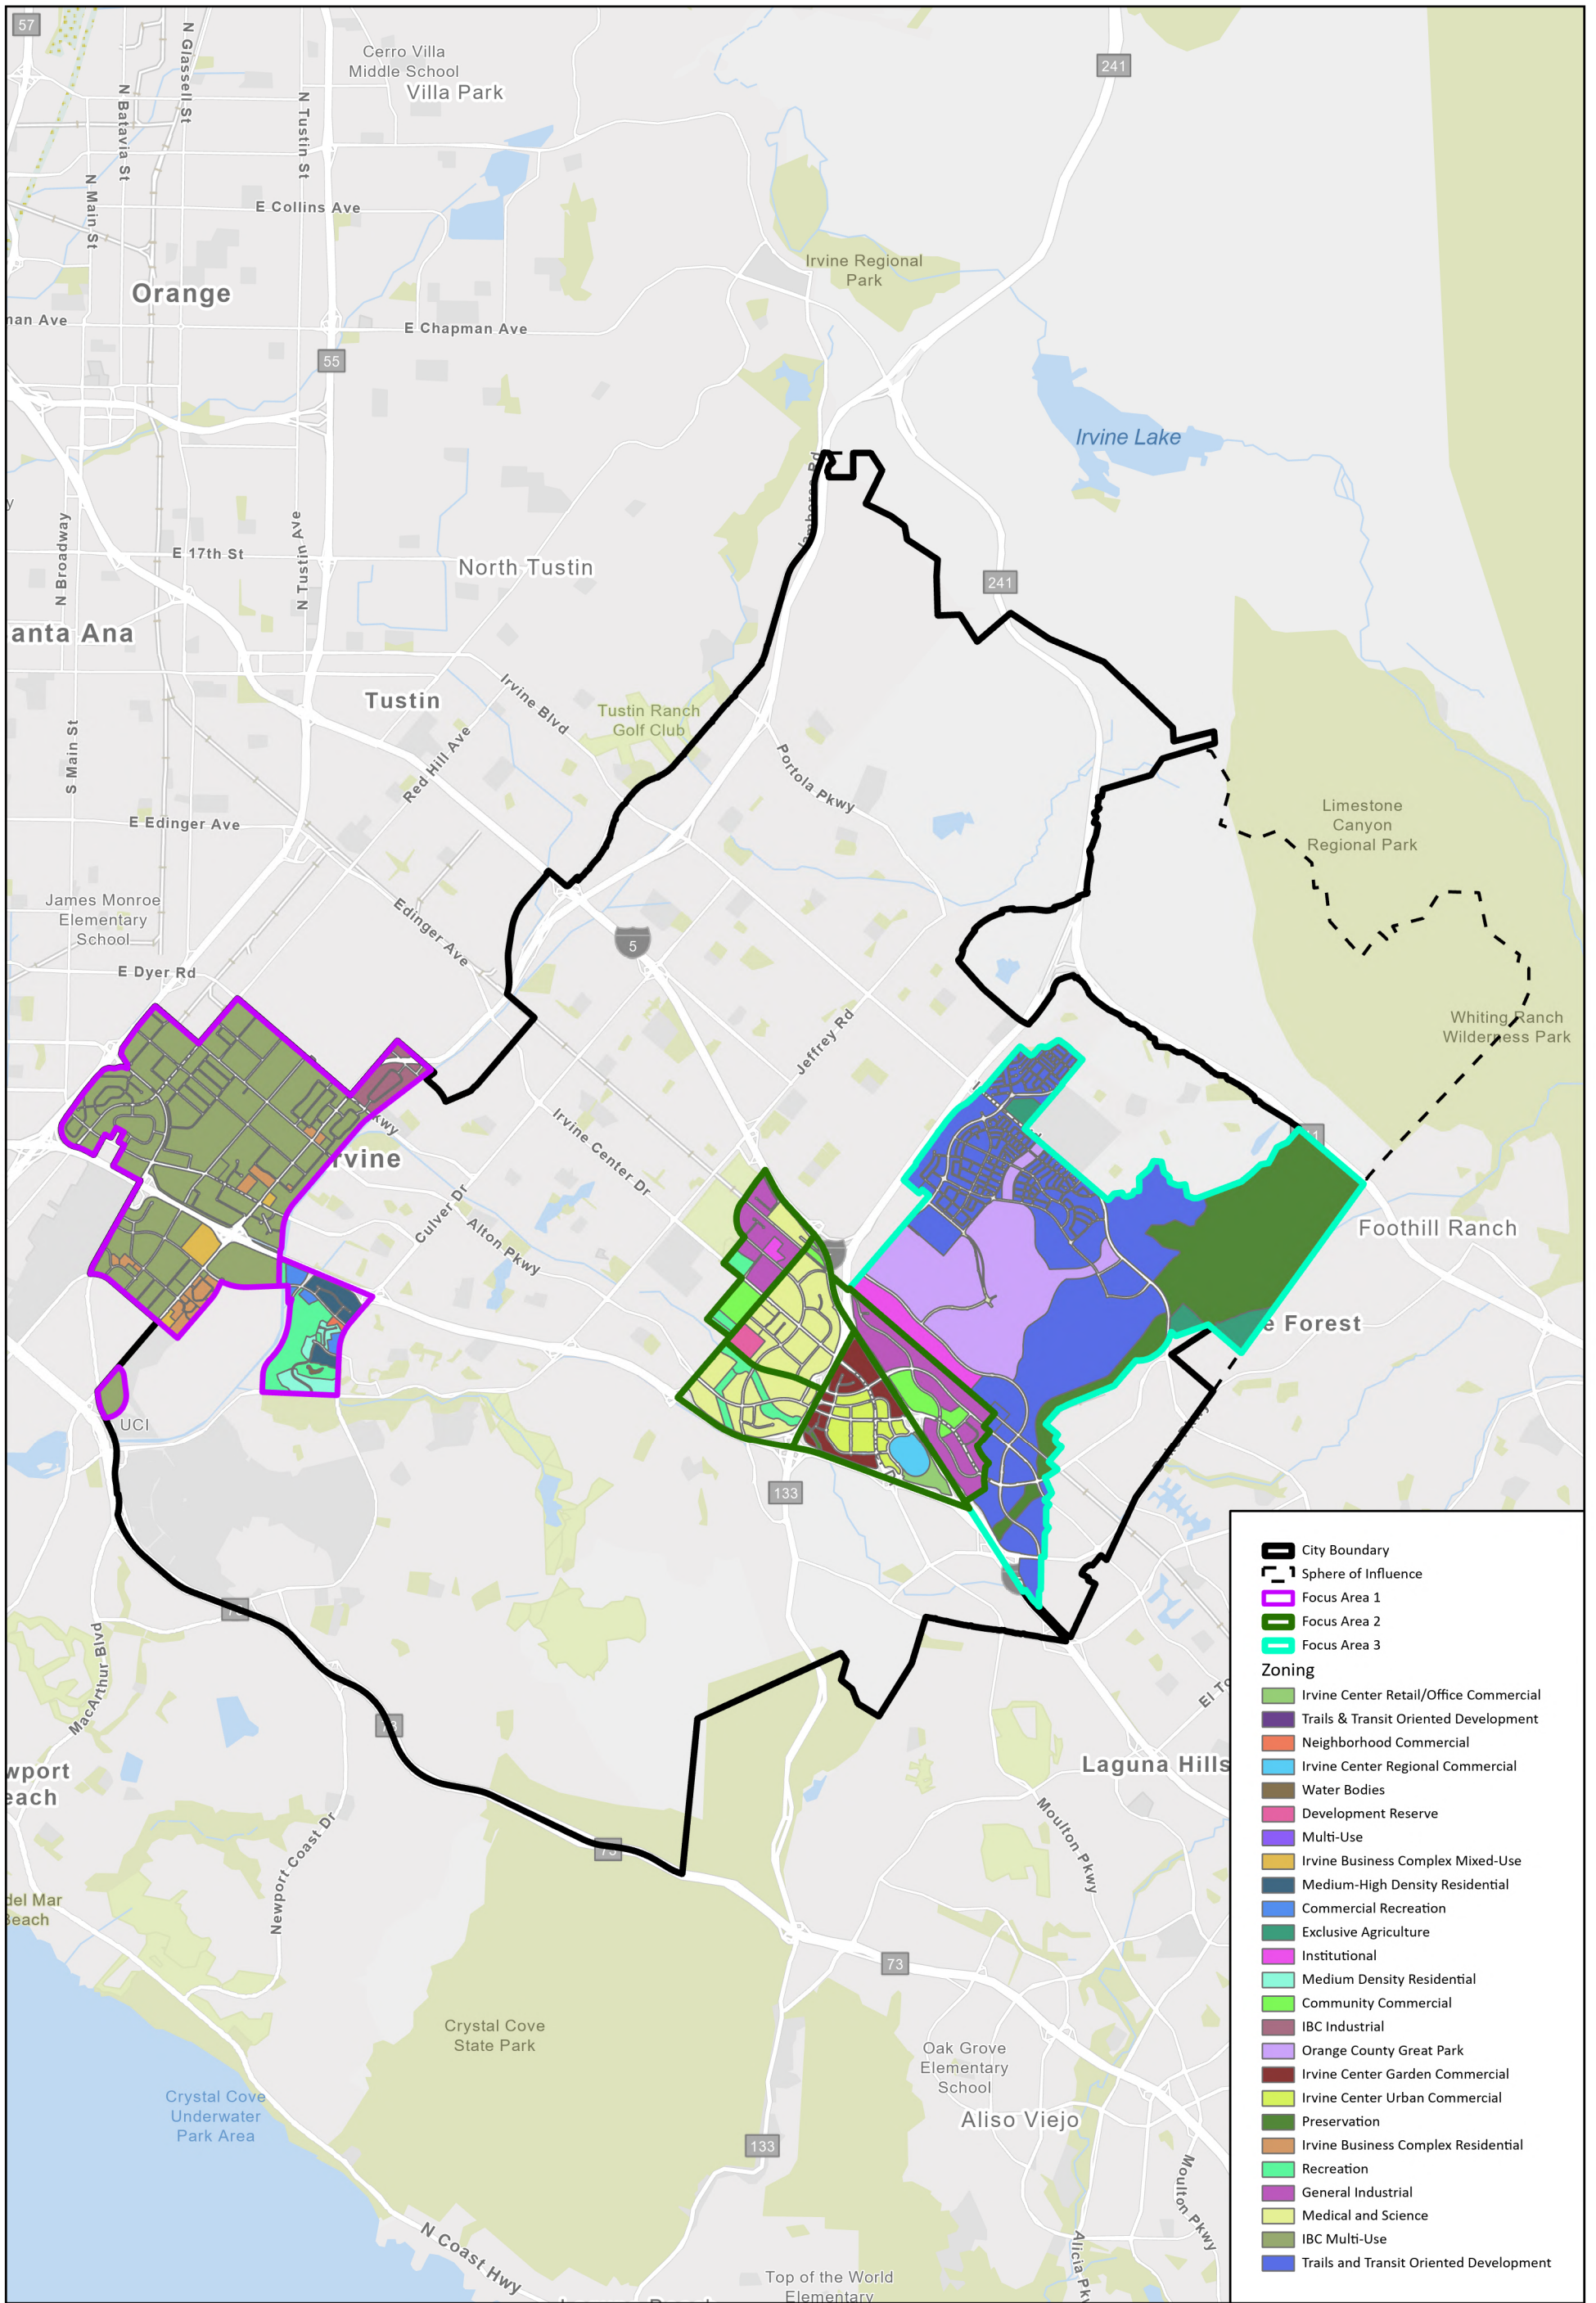

**City of Irvine Planning Areas**

**Figure 2**

2/29/2024

**City of Irvine Existing Zoning within the Focus Areas**

**Figure 3**

2/29/2024

As discussed above, the City’s Conservative Alternative Plan/Proposed Project expects to increase residential land use zoning throughout the City to allow up to 57,656 DUs under the Conservative Alternative housing plan. A majority, 81% of the residential land use increases will occur in the three focus areas and the remaining units 19% are allotted throughout the City’s PAs. These units are expected to be higher density multifamily residential dwelling units with an average density of 50 DUs/Acre. See Table 2 below to understand which PAs and Focus Areas are expected to be zoned for more residential DUs.

**Table 2 Proposed Buildout Plan**

Planning Area(s)	Conservative Alternative Dwelling Units (DUs)	
<b>Focus Area 1 - Greater Irvine Business Complex Area</b>		
19 (Rancho San Joaquin)	2,202	DUs
36 (Irvine Business Complex)	12,798	DUs
<b>Focus Area 2 – Greater Spectrum Area</b>

<b>TOTAL</b>	<b>57,656</b>	<b>DUs</b>
<i>DU = Dwelling Unit</i>		
Source: City of Irvine, Project Description and Final Buildout. Received 18 January 2024.		

This report will review the baseline conditions of the water, sewer, storm drainage system, and existing water quality regulations and analyze the potential impact of the proposed Conservative Alternative Plan on the existing infrastructure systems. For CEQA purposes the focus of these assessments will be concentrated on the three focus areas that will undergo the most intensive residential growth. The remaining units will

be spread out among ten different PA's throughout the City and the change in land use throughout the City is not significant enough to impact the existing sewer, water and storm drain systems. Analysis will utilize GIS tools, data, and communication with City staff and local providers.

## **2. WATER**

### **2.1 WATER SYSTEM ENVIRONMENTAL SETTING & INFRASTRUCTURE**

#### **IRVINE RANCH WATER DISTRICT (IRWD)**

The City's existing potable water system is fully encompassed within the Irvine Ranch Water Districts (IRWD) potable and non-potable water service area. IRWD also services portions of the surrounding cities of Tustin, Santa Ana, Orange, Costa Mesa, Lake Forest, Newport Beach, and unincorporated areas of the County of Orange. Altogether the service area is approximately 181 square miles with the City of Irvine and its SOI accounting for approximately 41% (74 square miles) of IRWDs service area.

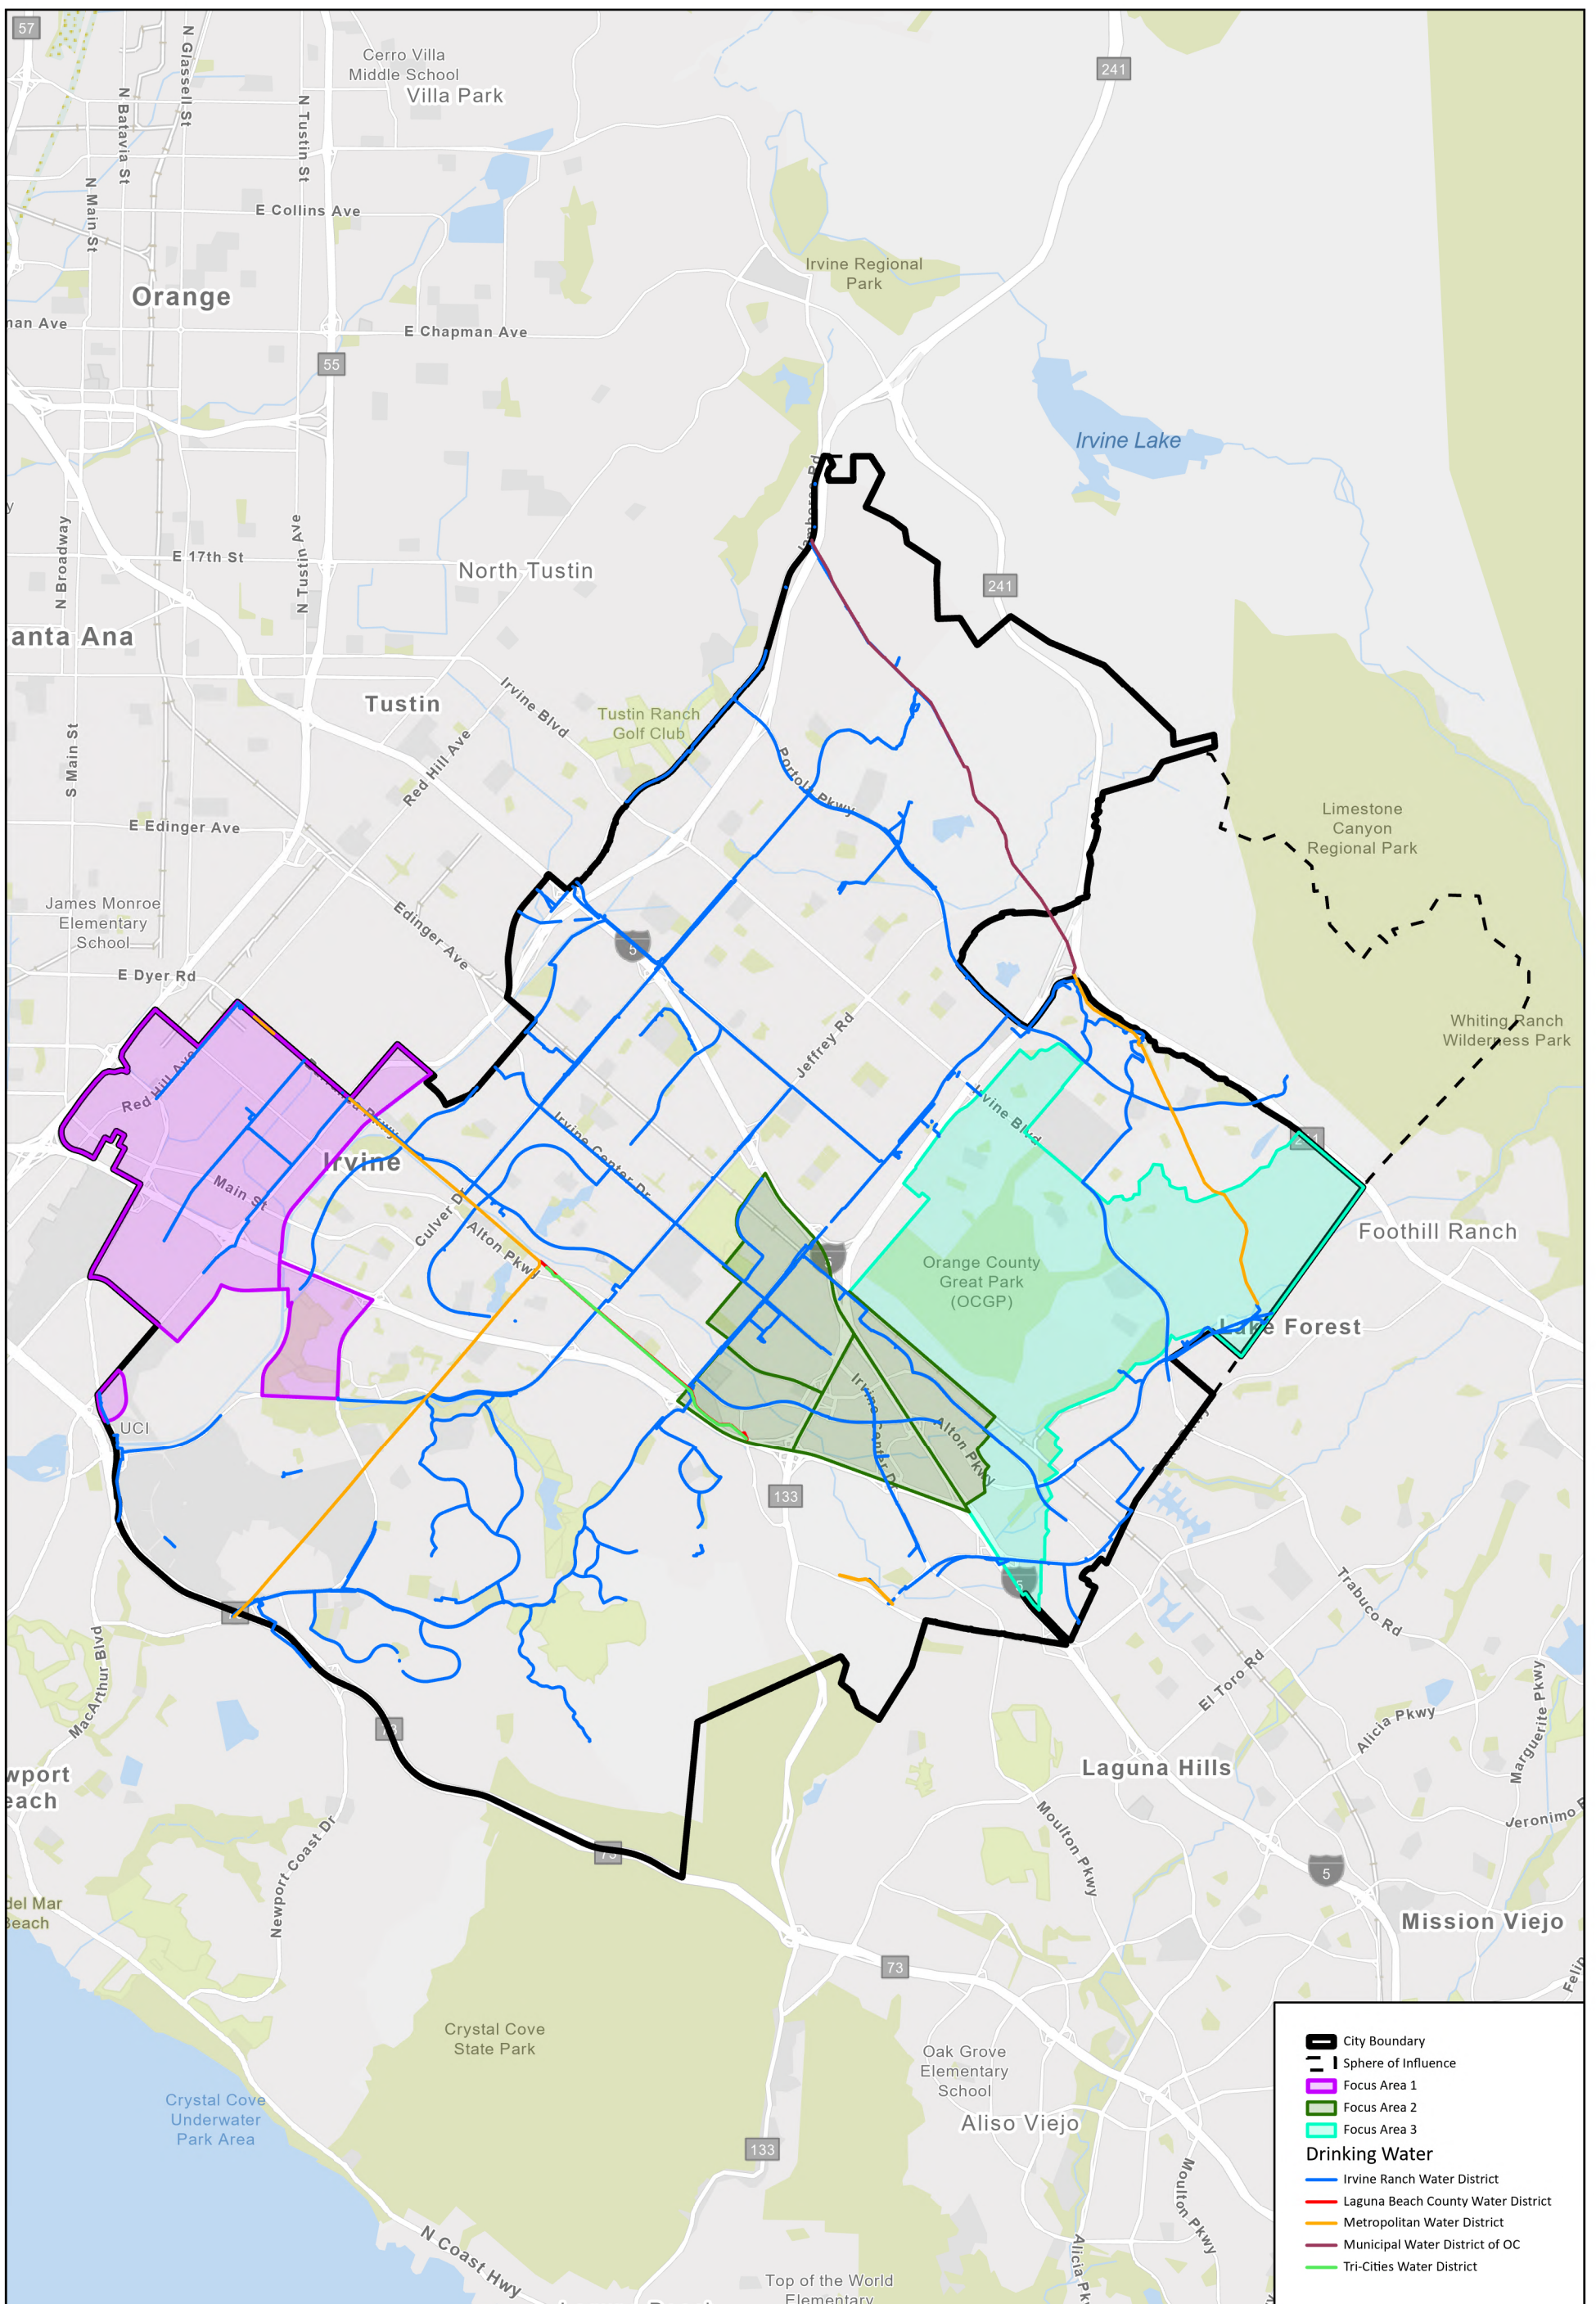

Because IRWD serves about one fifth of Orange County and it has facilities worth over \$1 billion that include more than 1,500 miles of drinking water pipelines, more than 900 miles of sewer pipes, 53 reservoirs and two large water recycling facilities. Distribution pipelines within the City range in diameter between 1" and 72" and have a total length of approximately 78 miles. Most of the water pipes throughout the City are 8" pipes and most of the pipelines were constructed in the 1970's through the 2000's. Refer to Figure 4 to see the District's service area and facilities.

#### **MUNICIPAL WATER DISTRICT OF ORANGE COUNTY (MWDOC)**

IRWD's imported water supplies come from the Metropolitan Water District of Southern California (Metropolitan) and is purchased through the Municipal Water District of Orange County (MWDOC). MWDOC is a wholesale water supplier and resource planning agency that serves all of Orange County through 27 retail water agencies (except for the cities of Anaheim, Fullerton, and Santa Ana). Local water supplies meet more than half of Orange County's total water demand. To meet the remaining demand, MWDOC purchases imported water- from the Colorado River and from the State Water Project in the north- through the Metropolitan Water District of Southern California, and distributes this water to its 27 member agencies, including IRWD. These member agencies are made up of both city water departments and water districts that provide retail water services to the public.

#### **ORANGE COUNTY WATER DISTRICT (OCWD)**

The Orange County Water District (OCWD) serves as the groundwater manager for the main Basin and sub-basins within its jurisdiction. OCWD oversees the groundwater management plan, updating it periodically to ensure effective water management practices. The Basin acts as an underground reservoir, with OCWD managing storage capacity to mitigate drought impacts. IRWD relies heavily on local groundwater sources, with approximately 50% of its overall supply coming from groundwater wells within the Orange County Groundwater Basin and its sub-basins, including Irvine and Lake Forest. IRWD operates groundwater-producing facilities within these areas, holding an adjudicated right to utilize groundwater from the Basin. OCWD's responsibilities extend to protecting water rights, managing replenishment efforts, and overseeing groundwater conditions within the Basin. Groundwater conditions are influenced by various factors, including natural hydrologic processes and artificial recharge methods. Despite challenges, the Basin remains a significant source of water supply for IRWD and other stakeholders within the region.

**Existing Water System Facilities Within the City of Irvine**

**Figure 4**

3/13/2024

## 2.2 EXISTING WATER DEMANDS

### REGIONAL

Water demands throughout the District are driven by existing populations and projected growth linked to the Southern California Associations of Governments (SCAG) projections. SCAG utilizes a detailed modeling framework covering multiple Southern California counties including Orange County and the City. The population, household, and employment projections used by the District to forecast service area population and service connections tie back to the SCAG census tract land use and growth projections. See Table 3 for the District’s estimated water demands for 2020 and projected demands for 2025 to 2040.

**Table 3 IRWD Actual and Projected Water Demands**

Land Use Type	Actual (2020) and Projected Water Demands (2025-2040) (AFY)				
	2020	2025	2030	2035	2040
Single Family	6,885	26,866	30,188	33,510	36,832
Multi-Family	24,955	12,515	14,062	15,609	17,157
Commercial	7,320	9,701	10,900	12,099	13,299
Industrial	5,024	4,465	5,018	5,570	6,122
Institutional/ Gov.	1,454	5,028	5,650	6,272	6,893
Landscape	6,176	1,705	1,915	2,126	2,337
Agricultural Irrigation	1,177	3,225	2,391	1,556	722
Other Potable/ Non-Potable	334	0	0	0	0
Losses	3,049	3,573	3,936	4,298	4,661
<b>TOTAL</b>	<b>56,374</b>	<b>67,078</b>	<b>74,060</b>	<b>81,040</b>	<b>88,023</b>

*AFY = Acre-Feet Per Year*

Source: Irvine Ranch Water District, UWMP "Table 4-1 and 4-2". Found here: [https://wuedata.water.ca.gov/public/uwmp\\_attachments/2761173844/2020%5FUrban%5Fwater%5Fmanagement%5Fplan%5FIRWD%5Fadopted%5FJune2021.pdf](https://wuedata.water.ca.gov/public/uwmp_attachments/2761173844/2020%5FUrban%5Fwater%5Fmanagement%5Fplan%5FIRWD%5Fadopted%5FJune2021.pdf)

As shown in the table above IRWD delivered 56,374 acre-feet (AF) of potable and non-potable water with residential demands (multifamily and single family) accounting for 56% or over half of water demands throughout the service area 2020IRWD projects that by 2040 its service area will demand up to 88,023 AFY, which is an increase of 31,649 AF. This significant growth is captured by IRWDs estimates that there will be significant increases in single family residential uses, commercial uses, and institutional/Government land use. During 2020 IRWD reports that the largest water use came from 44% multi-family residential units, 13% commercial, and 12% single family residential units.

### LOCAL

The water demands generated within the City and its three Focus Areas are representative of a portion of all IRWD’s customer water use and water demand

forecasting. All connections throughout IRWDs service area are metered and IRWD employs water use factors which assigns water demands to various land use types and then aggregates these demands. The water use factors are based on average water use and incorporate the effect of IRWD's tiered-rate conservation pricing (budget-based rates)<sup>4</sup>. For further details on the existing land use evaluation for water demands within the Focus Areas see Table 4 below and Appendix A for notes on how these calculations were derived.

---

<sup>4</sup> Irvine Ranch Water District, 2019, Water Resources Master Plan, Table 3-1

**Table 4 Existing Land Use Evaluation for Water Demands**

Planning Area	Proposed Residential (DUs)	Density/ Acre	Acres of Residential Development	City of Irvine Land Use Category	Estimated Existing Water Demand							
					IRWD Land Use Category	IRWD Water Use Factor Converted to (GPD/Acre)			Existing Water Demand (GPD)		Existing Water Demand (AFY)	
<b>Focus Area 1 – Greater Irvine Business Complex Area</b>												
19 (Rancho San Joaquin)	2,202 DUs	50 DUs/Acre	44 Acres	IBC Multi-Use	Light Industrial	70 GPD/KSF	43,560 SF/Acre	3,049 GPD/Acre	134,287 GPD		150 AFY	
36 (Irvine Business Complex)	12,798 DUs		256 Acres						780,473 GPD		874 AFY	
<b>Focus Area 2 – Greater Spectrum Area</b>												
12 (Oak Creek)	4,907 DUs	50 DUs/Acre	98 Acres	General Industrial & Medical and Science	Industrial - Light & Regional Commercial	70 GPD/KSF	43,560 SF/Acre	4,574 GPD/Acre	448,873 GPD		503 AFY	
31 (Irvine Spectrum 6)	2,934 DUs		59 Acres						268,391 GPD		301 AFY	
32 (Irvine Spectrum 3)	17,817 DUs		356 Acres						1,629,828 GPD		1,826 AFY	
33 (Irvine Spectrum Center)	949 DUs		19 Acres						86,811 GPD		97 AFY	
<b>Focus Area 3 – Great Park Neighborhood Transit Village</b>												
51 (Great Park)	5252 DUs	50 DUs/Acre	105 Acres	Trails and Transit Oriented Development	Regional Commercial	140 GPD/KSF	43,560 SF/Acre	6,098 GPD/Acre	640,576 GPD		718 AFY	
<b>TOTAL 46,859 DUs 937 Acres</b>					<b>ESTIMATED EXISTING WATER DEMAND 3,989,238 GPD 4,469 AFY</b>							
<i>AFY = Acre-Foot Per Year, DU = Dwelling Unit, KSF = thousand square feet, GPD = Gallons Per Day, SF = Square-Foot</i>												

As shown in the table above it is estimated that the existing land uses within the Focus Areas requires approximately 4,469 AFY or 3,989,238 GPD of water. To understand how these demands were generated please refer to the section below.

## **2.3 PROPOSED WATER DEMANDS**

### **METHODOLOGY**

In the process of developing existing and proposed water demands it was noted that the locations of the potential residential units were not readily available to provide a comparison in water use from the existing land uses to the proposed residential conversions. Without being able to specifically compare an existing condition location and associated water demand with a proposed residential location and associated water demand, a practical approach was taken. Namely, the primary focus of the City's Housing Element and the Conservative Alternative Plan/Proposed Project is intensified residential growth with an average of up to 50 DUs / Acre. This residential density was applied within the Focus Areas to determine an estimated acreage of residential development within each area.

After determining the acres of residential development, existing water demands were created by identifying the predominant existing land uses and zoning designations within each Focus Area. As noted in Table 1 each focus area consists largely of one zoning designation with Focus Area 1 being IBC Multi-Use, Focus Area 2 General Industrial & Medical and Science, and Focus Area 3 Trails and Transit Oriented Development. These primary zoning designations within each Focus Area were then matched to IRWD's water use factors, expressed in gallons per day per thousand square foot (gpd/ksf). These factors were then converted to acreages to establish a water use factor in gallons per day per acre (gpd/acre). This factor was then applied to each Focus Area's respective acreage of residential development to evaluate existing water demands in the area.

While this approach simplifies the calculation process and provides a reasonable estimate of existing water demands, it should be noted that it may not capture the full complexity of existing land use patterns and water use. Different land use categories such as commercial, industrial, or open space, may have varying water use profiles when compared to residential areas. However, due to the lack of detailed data on existing land uses, this approach is necessary to proceed with the analysis and determine the impacts on water and water infrastructure from an existing to proposed condition. By applying the average density of dwellings units per acre to the existing land use area, it allows for a consistent basis of comparison between existing and proposed water demands. It also provides a practical way to assess the potential impacts of proposed zoning changes on water demands within the City's Focus Areas of growth.

Similar to the existing land use evaluation methodology, the proposed water demand estimates also utilize the acreages of residential development to generate a proposed demand within the Focus Areas. To generate a water use, factor the average density of 50 DUs/ Acre was matched to IRWDs water use factor for high rise density units in Irvine. IRWD categorizes high rise density land uses as any development with a density of 40.0 DUs/Acre or more. Water demands associated with these high-rise density developments are shown to be 125 GPD/DU and this water factor was then converted to GPD/ Acre by applying the Housing Elements projected average density of 50 DUs/

Acre to it which results in a demand of 6,250 GPD/ Acre. Refer to Table 5 for the estimated demands generated from each Focus Areas of the residential development.

**Table 5 Proposed Land Use Evaluation for Water Demands**

Planning Area	Proposed Residential (DUs)		Density/Acre		Acres of Residential Development		City of Irvine Land Use Category	Estimated Proposed Water Demands										
								IRWD Land Use Category	IRWD Water Use Factor Converted to (GPD/Acre)				Proposed Water Demand (GPD)		Proposed Water Demand (AFY)			
<b>Focus Area 1 – Greater Irvine Business Complex Area</b>																		
19 (Rancho San Joaquin)	2,202	DUs	50	DUs/Acre	44	Acres	IBC Multi-Use	High Rise Density - Irvine	125	GPD/DU	50	DU/Acre	6,250	GPD/Acre	275,250	GPD	308	AFY
36 (Irvine Business Complex)	12,798	DUs			256	Acres			125	GPD/DU	50	DU/Acre	6,250	GPD/Acre	1,599,750	GPD	1,792	AFY
<b>Focus Area 2 – Greater Spectrum Area</b>																		
12 (Oak Creek)	4,907	DUs			98	Acres	General Industrial & Medical and Science	High Rise Density - Irvine							613,375	GPD	687	AFY
31 (Irvine Spectrum 6)	2,934	DUs	50	DUs/Acre	59	Acres			125	GPD/DU	50	DU/Acre	6,250	GPD/Acre	366,750	GPD	411	AFY
32 (Irvine Spectrum 3)	17,817	DUs			356	Acres			125	GPD/DU	50	DU/Acre	6,250	GPD/Acre	2,227,125	GPD	2,495	AFY
33 (Irvine Spectrum Center)	949	DUs			19	Acres									118,625	GPD	133	AFY
<b>Focus Area 3 – Great Park Neighborhood Transit Village</b>																		
51 (Great Park)	5252	DUs	50	DUs/Acre	105	Acres	Trails and Transit Oriented Development	High Rise Density - Irvine	125	GPD/DU	50	DU/Acre	6,250	GPD/Acre	656,500	GPD	735	AFY
<b>TOTAL</b>	<b>46,859</b>	<b>DUs</b>			<b>937</b>	<b>Acres</b>	<b>ESTIMATED PROPOSED WATER DEMAND</b>						<b>5,857,375</b>	<b>GPD</b>	<b>6,561</b>	<b>AFY</b>		
<i>AFY = Acre-Feet Per Year, DU = Dwelling Unit, KSF = thousand square feet, GPD = Gallons Per Day, SF = Square-Feet</i>																		

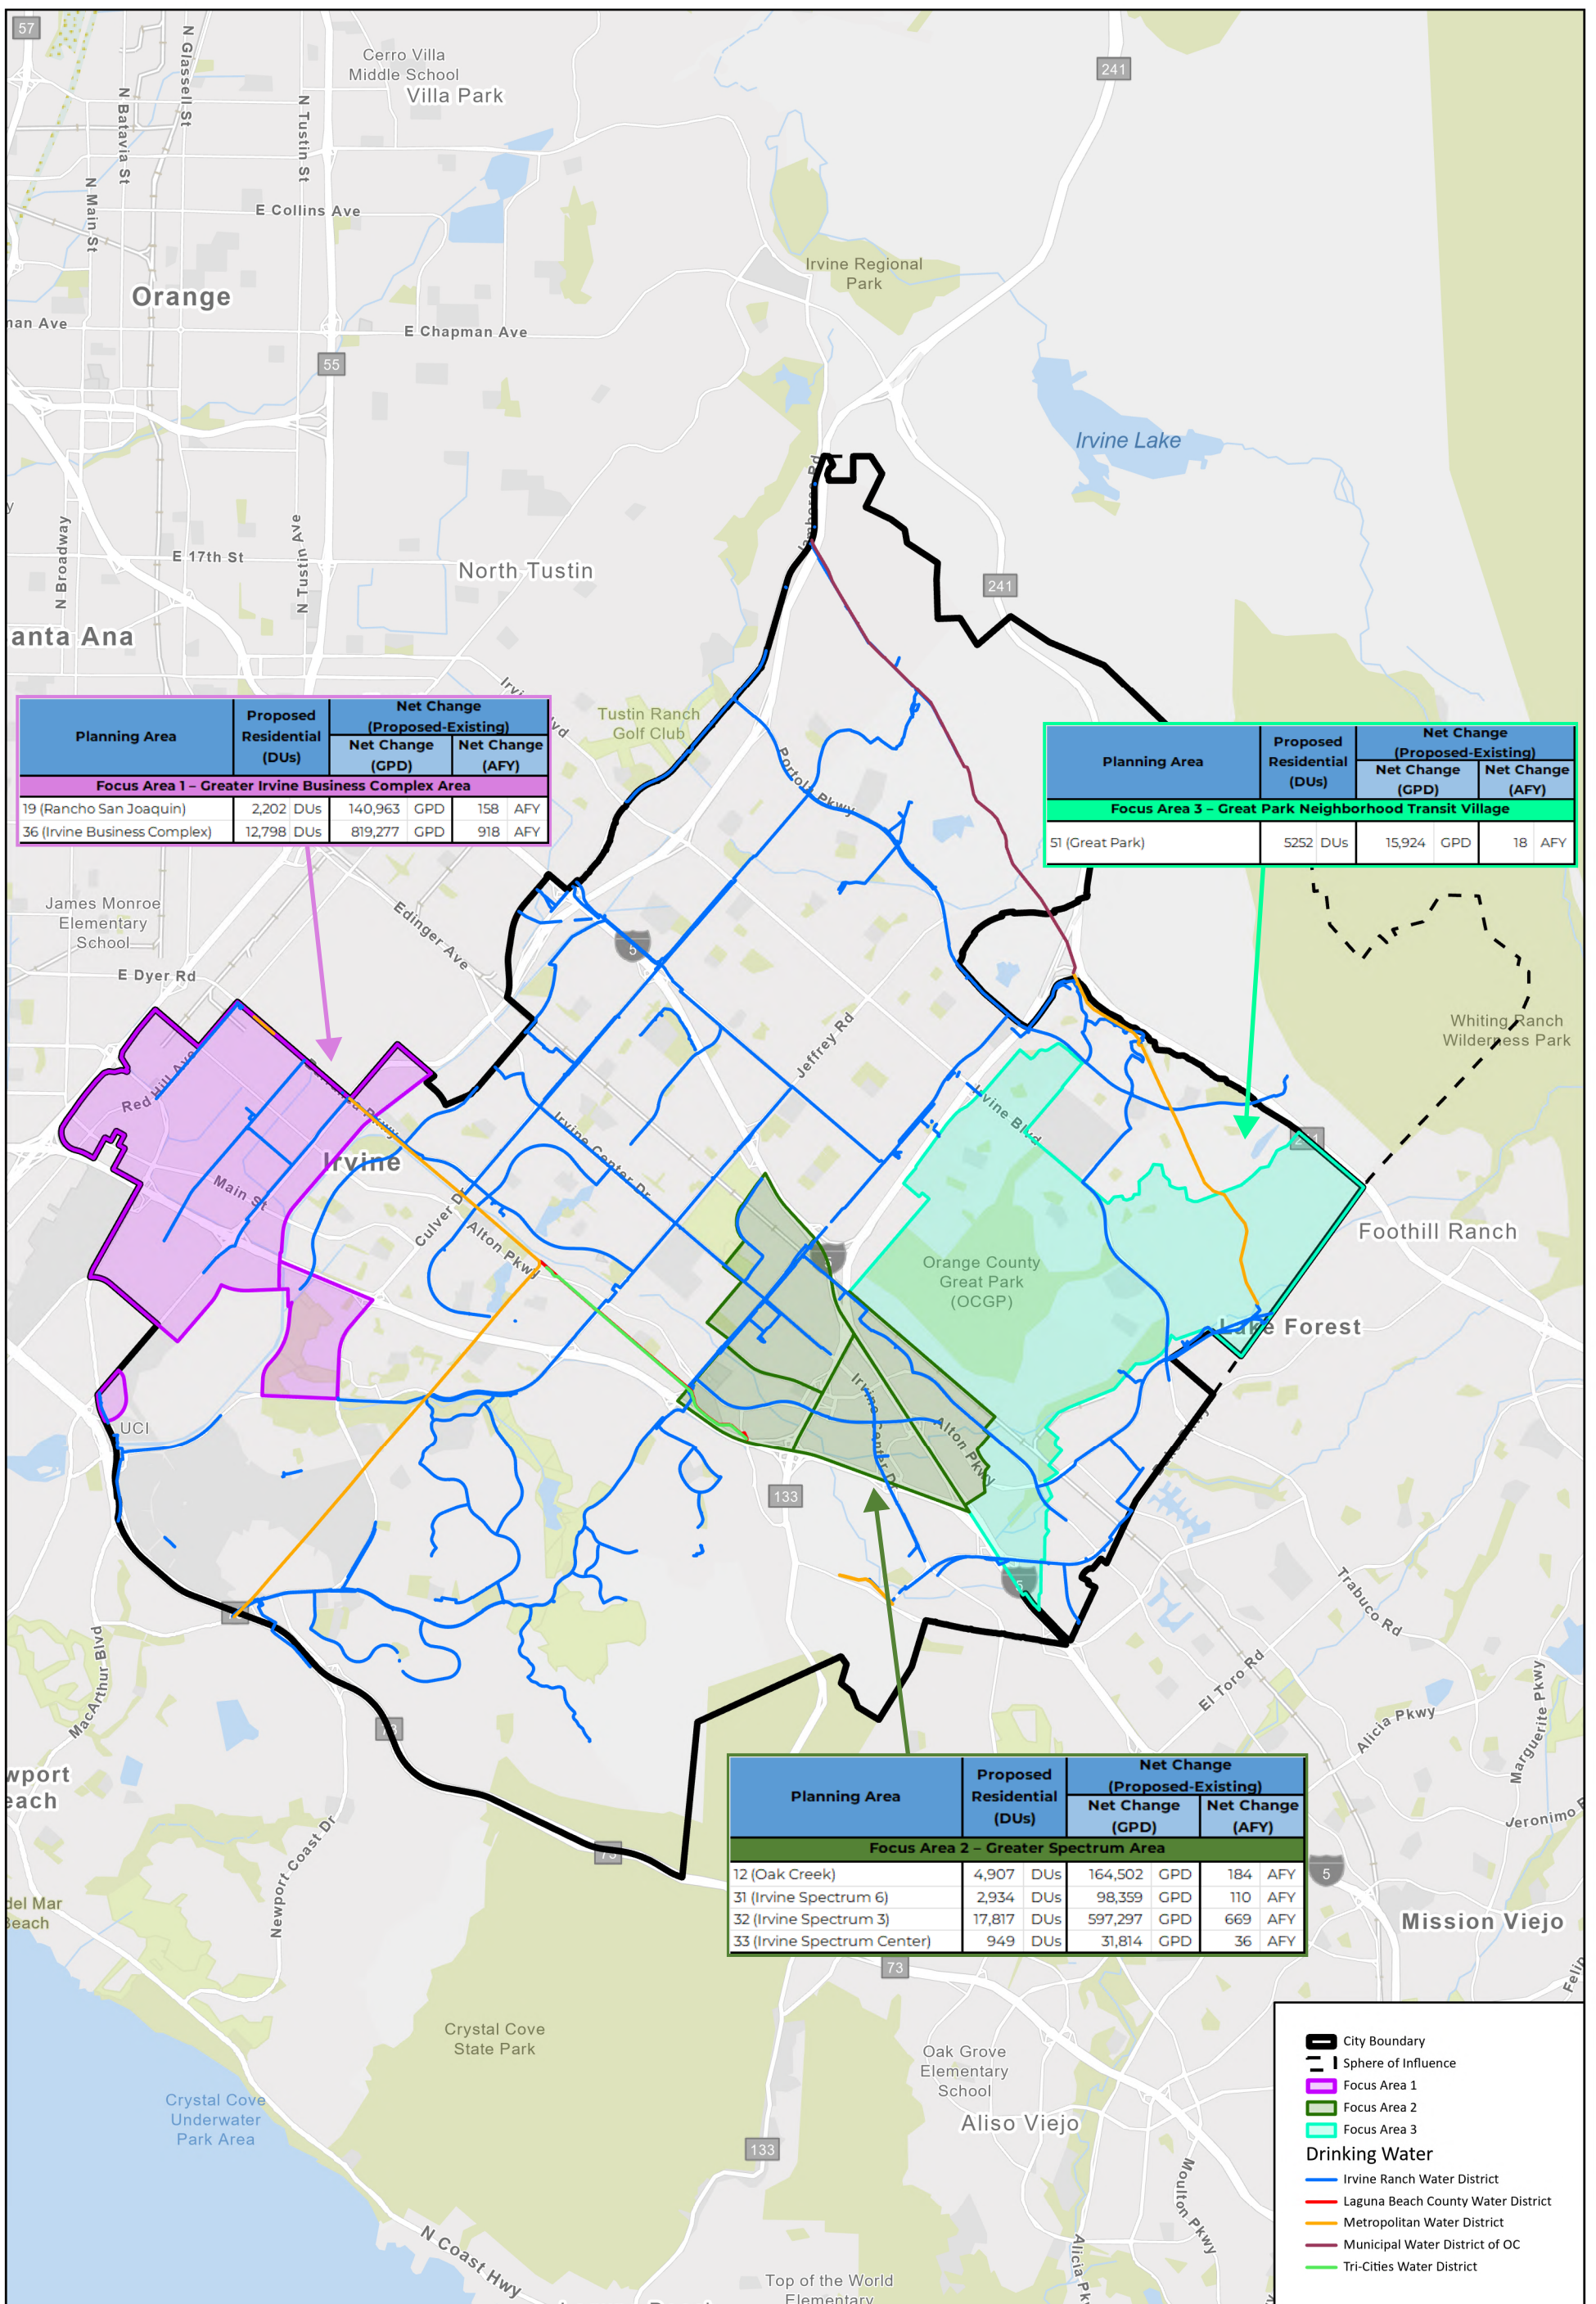

As shown above in Table 5 under the proposed Conservative Alternative/Proposed Project land use plan, the GPU will potentially increase the number of residential units by 57,656 DUs or 46,859 DUs (81% of all units) within the Focus Areas. This increase in units has the potential to generate demands up to 6,561 AFY or 5,857,375 GPD within the three Focus Areas. See Appendix A for a table of the water demand calculations and IRWDs water use factors.

The difference between the water demands calculated in Tables 4 and 5 are representative of the net change in demands for the areas of residential development. See Table 6 below for more details.

**Table 6 Net Change (Existing to Proposed) Land Use Evaluation for Water Demands**

Planning Area	Proposed Residential (DUs)	Net Change (Proposed-Existing)					
		Net Change (GPD)		Net Change (AFY)			
<b>Focus Area 1 – Greater Irvine Business Complex Area</b>							
19 (Rancho San Joaquin)	2,202 DUs	140,963	GPD	158	AFY		
36 (Irvine Business Complex)	12,798 DUs	819,277	GPD	918	AFY		
<b>Focus Area 2 – Greater Spectrum Area</b>							
12 (Oak Creek)	4,907 DUs	164,502	GPD	184	AFY		
31 (Irvine Spectrum 6)	2,934 DUs	98,359	GPD	110	AFY		
32 (Irvine Spectrum 3)	17,817 DUs	597,297	GPD	669	AFY		
33 (Irvine Spectrum Center)	949 DUs	31,814	GPD	36	AFY		
<b>Focus Area 3 – Great Park Neighborhood Transit Village</b>							
51 (Great Park)	5252 DUs	15,924	GPD	18	AFY		
<b>TOTAL</b>		<b>46,859</b>	<b>DUs</b>	<b>1,868,137</b>	<b>GPD</b>	<b>2,093</b>	<b>AFY</b>

As shown above, it is projected that these land use changes within the Focus Areas will produce an estimated water demand increase of 2,093 AFY (1,868,137 GPD). See Figure 5 for a summary of the GPU's proposed water demands and Appendix A to review details regarding the methodology of the existing, proposed, and net change water demand calculations.

**City of Irvine Proposed Water Demands**

**Figure 5**

2/29/2024

## 2.4 WATER SUPPLY

IRWD's water supply system includes local groundwater and surface water supplies (56% of total), recycled water (28% of total), and imported water from the Municipal Water District of Orange County (MWDOC) (16% of total). MWDOC is a wholesale importer and member agency of the Metropolitan Water District (MWD) and is entitled to receive water from the available sources of MWD including Colorado River and Northern California surface water. IRWD also has contracts with Kern County to store up to 126,000 AF of groundwater storage and extract up to 28,750 AF per year during dry years<sup>5</sup>. These water resources are described in more detail below.

### LOCAL GROUNDWATER

The City and its SOI is located within the Coastal Plain of Orange County groundwater basin also known as Basin 8-1. Under the Sustainable Groundwater Management Act (SGMA), the Basin 8-1 is classified as a medium priority basin, due to heavy reliance on the Basin's groundwater as a source of water supply<sup>6</sup>. The IRWD's local surface water supplies are the drainage tributary areas to the Irvine Lake and Harding Canyon Reservoir. On average, about 4,000 AFY are captured for IRWD's demands. Water supplies available from the Harding Canyon are often limited due to dry-weather conditions. Recycled water meets about 33% of IRWD's (non-potable; agricultural irrigation, landscape, golf course, commercial, and industrial uses) water demands. In 2020, approximately 24,626 AF of wastewater was recycled within the service area from the Michelson Water Recycling Plant (MWRP) and Los Alisos Water Recycling Plant (LAWRP) (Table 6-3, UWMP, 2020). In the case there isn't sufficient supplies of treated wastewater for use from the MWRP and LAWRP, supplemental untreated imported water can be used.

There are minimal stormwater recovery systems. IRWD captures dry weather runoff via Peter's Canyon Channel Water Capture and Reuse project (three intersections in the channel are used to capture and send dry-weather runoff to Orange County Sanitation District (OCSD) for treatment and eventual recharge into groundwater sources). There are currently no commitments for purchase of desalination water by IRWD.

### SUSTAINABLE GROUNDWATER MANAGEMENT ACT (SGMA)

The SGMA addresses the sustainable management of groundwater in California. This legislation is the result of severe water shortages in California, long-term issues with land subsidence, and overdrafting of groundwater aquifers. Department of Water Resources (DWR) identified the status of water basins by overdraft and priority levels (e.g., very low, low, medium, or high). While the Orange County Water District's (OCWD) water basin is not in overdraft, OCWD prepared a groundwater management plans<sup>7</sup> to further long-term groundwater sustainability. The plan describes basin hydrogeology, water supply monitoring, management and operation of recharge facilities,

---

<sup>5</sup> Irvine Ranch Water District, 2020 Urban Water Management Plan

<sup>6</sup> California Department of Water Resources, SGMA Basin Prioritization Board, Accessed March 2024. Found here: <https://gis.water.ca.gov/app/bp-dashboard/final/#>.

<sup>7</sup> Orange County Water District, 2015. Groundwater Management Plan. Found here: [https://www.ocwd.com/wp-content/uploads/groundwatermanagementplan2015update\\_20150624.pdf](https://www.ocwd.com/wp-content/uploads/groundwatermanagementplan2015update_20150624.pdf)

groundwater replenishment system, seawater intrusion and barrier management, and water quality protection.

### **IMPORTED WATER**

As previously noted, (MWDOC) is the wholesale water supplier that serves all of Orange County through 27 retail water agencies including IRWD. Local water supplies meet more than half of Orange County's total water demand. To meet the remaining demand, MWDOC purchases imported water- from the Colorado River and from the State Water Project in the north- through the Metropolitan Water District of Southern California and distributes this water to its 27 member agencies. IRWD utilizes imported water to meet its water needs. Supplies from the Colorado River and the State Water Project are treated at Metropolitan's Diemer Filtration Plant, which receives a blend of Colorado River water from Lake Matthews and this treated water is delivered to the City through pipelines owned by IRWD. IRWD also purchases untreated or non-potable imported water to meet certain agricultural and irrigation demands, as well as to supplement the recycled water system during peak months. This untreated water is supplied through the Baker Pipeline, which serves the Baker Water Treatment Plant. Additionally, IRWD receives untreated Colorado River water through the OC-33 turnout connection.

### **RECYCLED WATER**

Water recycling is an essential part of IRWD's water supply portfolio, as it reduces the demand for high-quality potable drinking water. IRWD's recycled water program began with the focus of providing tertiary treated Title 22 recycled water to serve agriculture. Today, new developments must install dual plumbing that allows recycled water to be used for landscaping, toilets, and other uses not requiring potable water. IRWD recycled water serves many state approved uses, including landscape irrigation, toilet flushing, cooling towers, industrial processes, composting, grading, and compaction.

IRWD maintains an extensive infrastructure system for recycled water. This includes a recycled water pipeline system that includes more than 500 miles of dual distribution pipelines. Water is recycled at the Michelson Water Recycling Plant (MWRP) and Los Alisos Water Recycling Plant (LAWRP). The MWRP has a permitted tertiary treatment capacity of 28 mgd and recycles 90 percent of the plant's sewage inflow. To support the over 5,400 recycled water users, IRWD has 15 reservoirs with a storage capacity of 4,536 acre-feet of recycled water.

### **WATER SUPPLY PROJECTIONS**

As of 2020, IRWDs potable and non-potable water supply system consisted of the sources and quantities listed below in Table 7.

**Table 7 IRWD Projected Water Supply**

Water Supply	Existing & Projected Water Supply (AFY)				
	2020	2025	2030	2035	2040
MWD – Potable Purchased or Imported Water	12,861	51,027	51,027	51,027	51,027
MWD – Non-Potable Purchased or Imported	1,168	17,347	17,347	17,347	17,347
Surface Water	6,600	3,048	3,048	3,048	3,048
Potable Groundwater	37,990	49,480	49,480	49,480	49,480
Non-Potable Groundwater	4,437	3,461	3,461	3,461	3,461
Future Potable Water - Groundwater	-	12,352	12,352	12,352	12,352
MWRP & LAWRP – Recycled Water	24,627	42,012	42,012	42,012	42,012
<b>TOTAL</b>	<b>87,683</b>	<b>178,727</b>	<b>178,727</b>	<b>178,727</b>	<b>178,727</b>

*AFY = Acre-Feet Per Year*

Source: Irvine Ranch Water District, UWMP "Table 6-8 and 6-9". Found here: [https://wuedata.water.ca.gov/public/uwmp\\_attachments/2761173844/2020%5FUrban%5Fwater%5Fmanagement%5Fplan%5FIRWD%5Fadopted%5FJune2021.pdf](https://wuedata.water.ca.gov/public/uwmp_attachments/2761173844/2020%5FUrban%5Fwater%5Fmanagement%5Fplan%5FIRWD%5Fadopted%5FJune2021.pdf)

As shown above the 2020 actual supply totals do not fully encompass the entirety of IRWD’s groundwater supply capabilities or its connected delivery capacity through Metropolitan and MWDOC. On the other hand, the planned supply resources for 2025 to 2040 are IRWDs projections for total supply capacities that will be available to IRWD. These planned resources are based on historical groundwater production, planned future supply projects, and data from Metropolitan and MWDOC’s 2020 UWMPs. The projections are also representative of data pulled from IRWDs Water Resources Master Plan (WRMP), which indicates reasonably available supplies from 2025 to 2040. Overall IRWD projects to have up to 178,727 AFY of water available from 2020 to 2040.

**URBAN WATER MANAGEMENT PLANS**

Through Urban Water Management Plan (UWMP) reporting, IRWD uses population growth, climate scenarios, water supplies, water conservation, large development projects and approved specific plans and other factors to estimate future water demand and evaluate the ability to meet this demand through various water supply sources over a 20-year projection. This document is required by the California Water Code and based on the Water Resources Master Plan (WRMP), with certain elements required by the water code. It is updated every five years, and the latest revision was prepared in 2020.

**Land Use and Water Resources Planning** – IRWD considers future development projects and schedules to determine current and future supply and infrastructure. The planning information for these development projects are either contained in Sub Area Master Plans (SAMPs) or sites are acknowledged by IRWD as potential development areas. IRWDs current 2020 UWMP accounts for various specific and general plan

growth, namely up to 24,107 residential dwelling units and 18 million commercial and industrial square feet throughout its service area. Several of these areas encompass portions of the City's PAs and the GPUs three focus areas.

Although the estimated 24,000 units that IRWD has noted in the 2020 UWMP does not encompass the extensive 56,756 plus units zoned for development in the City's GPU the UWMPs estimates IRWD consistently evaluates potential development areas. Thus, as the GPU progresses development areas will be evaluated for appropriate facility planning as IRWD is made aware of their development schedules.

**WATER SUPPLY EVALUATION**

Taking the difference between the projected demands shown in Table 3 and projected available supply in Table 7 it is evident that IRWD will have a surplus of water available to its service area. See Table 8 below for a summary of the difference between IRWDs projected supply and demand totals.

**Table 8 IRWD Projected Water Supply and Demand Comparison**

	Existing & Projected Water Supply (AFY)				
	2020	2025	2030	2035	2040
Supply Totals	87,683	178,727	178,727	178,727	178,727
Demand Totals	56,374	67,078	74,060	81,040	88,023
<b>DIFFERENCE (AFY)</b>	<b>31,309</b>	<b>111,649</b>	<b>104,667</b>	<b>97,687</b>	<b>90,704</b>
<i>AFY = Acre-Feet Per Year</i>					
Source: Irvine Ranch Water District, UWMP "Table 4-1, 4-2, 6-8, and 6-9". Found here: <a href="https://wuedata.water.ca.gov/public/uwmp_attachments/2761173844/2020%5FUrban%5Fwater%5Fmanagement%5Fplan%5FIRWD%5Fadopted%5Fjune2021.pdf">https://wuedata.water.ca.gov/public/uwmp_attachments/2761173844/2020%5FUrban%5Fwater%5Fmanagement%5Fplan%5FIRWD%5Fadopted%5Fjune2021.pdf</a>					

As shown in the table above IRWD anticipates that it will have a surplus of water supply ranging from 31,909 AF to 111,649 AF when comparing the difference of IRWDs water supply and demand totals. Surplus water is available to all IRWDs service areas, including the City.

In determining the environmental impacts of the City's GPU through a CEQA lens, the projected demands from the addition of the Focus Areas 46,859 residential DUs fall well within IRWDs total water supply projections. In total the Focus Areas account for 81% of the GPUs Conservative Alternative land use plan which calls for up to 57,656 residential DUs. IRWDs robust water supply projections indicate that they are more than capable of accommodating the projected demand increase of 2,093 AFY because of the proposed zoning within the Focus Areas and the entire allotment of residential DU's based on the large supply availability Looking ahead, IRWD is prepared to incorporate these land use changes into the next 2025 UWMP thus ensuring that evolving development aligns with available water resources. Furthermore, water supply assessments (WSAs) will play a pivotal role in managing larger projects from a water supply perspective. These WSAs that are subject to approval by IRWD will serve as a crucial water resource planning tool, that allows the District to track water supply and demands, and thus ensuring water supply reliability as large projects are developed.

The City and IRWD will continue to collaborate on various planning documents, such as the City's GPU, to prepare for future developments, zoning updates, and necessary infrastructure and supply improvements.

## **2.5 WATER CAPACITY ASSESSMENT**

In addition to assuring that there is ample water supplies available to its service area through the UWMP, IRWD utilize several other resources such as a Water Resources Master Plan (WRMP), WSAs, Improvement Districts, and Capital Improvement Plans (CIPs) to monitor, improve, and repair local and regional water infrastructure and supplies.

### **WATER RESOURCES MASTER PLAN (WRMP)**

To effectively manage such a large water system, IRWD developed a comprehensive planning document titled Water Resources Master Plan (WRMP) that identifies existing and future planned water supply sources and demands. The most recent update occurred in 2019. The data within the WRMP is used for hydraulic modeling, the groundwater work plan, assessments of available water supply for specific development projects as required by CWC Section 10910, sub-area master plans and basin pumping projections. As part of the WRMP, the IRWD Capital Program identifies short term and long-term projects needed to maintain future demands while accounting for replacement and maintenance for existing facilities. In addition to the Capital Program, the Financial Plan includes infrastructure repair and replacement funds and identifies how to pay and manage the long-term funding requirements.

### **WATER SUPPLY ASSESSMENTS/ VERIFICATIONS (WSA)**

Since 2002, when the California State Legislature passed SB 610 (Costa) and SB 221 (Kuehl), mandating official water supply assessments and verifications, IRWD has consistently made proactive planning efforts. WSAs play a critical role in closely linking land use planning with water supply reliability. Governed by SB 610, these assessments determine water supply adequacy for a 20-year projection, encompassing existing and planned future uses like agriculture and manufacturing. They are obligatory for projects proposing commercial development exceeding 250,000 square feet or retail centers exceeding 500,000 square feet. Additionally, under SB 221, before a city or county approves of residential subdivisions with 500 or more units, IRWD must provide written verification of sufficient water supply. This verification is prepared before final subdivision map adoption and ensures adequate water supply availability before construction commences<sup>8</sup>.

### **POTABLE WATER SYSTEM IMPROVEMENT DISTRICTS**

IRWD manages water system improvements, maintenance, water connection fees and other aspects of the system through Potable Water System Improvement Districts. There are approximately eight Improvement Districts related to potable water and as maintenance needs or upgrades are required per District, the costs are spread out

---

<sup>8</sup> Irvine Ranch Water District, Water Supply Assessments. Accessed March 2024. Found here: <https://www.irwd.com/doing-business/water-supply-assessments>

among the users within those Districts. If a development project will result in an impact beyond one District area, the Developer will be responsible for paying fees to support the improvements in all affected District areas. The costs of new capital facilities are shared equally between connection fees paid by developers and property taxes paid by property owners. The specific fees and taxes may differ between the Districts dependent upon the existing and future capacity of the water system and the maintenance requirements in each District<sup>9</sup>.

### **2.5.1 WATER CAPITAL IMPROVEMENT PLANS**

Stakeholders involved in managing water capital improvement projects employ various strategies to ensure effective oversight and maintenance of the water system. As part of the oversight and maintenance of the City's water system, IRWD and OCWD both prepare Capital Improvement Project budgets tailored to their specific objectives. IRWD focuses on infrastructure repairs and new facilities to enhance water delivery across its service area, while OCWD emphasizes basin production and water quality improvement. See Table 9 below for a description of some ongoing and planned CIPs.

**Table 9 Water System Capital Improvement Plans**

Project Name	CIP Fiscal Year	Project Summary
IRWD – Recycled Water Financial Incentives <sup>1</sup>	On-Going	IRWD grants or loan funds to pay for on-site improvements for recycled water use. Is expected to increase recycled water use by 200 AF.
IRWD - Dual Plumbed Buildings <sup>1</sup>	On-Going	Work with customers to dual plumb new and existing commercial buildings.
IRWD - Conversion Projects <sup>1</sup>	On-Going	Where possible establish new infrastructure for recycled water supplies. Is expected to increase recycled water use by 1,000 AF
IRWD - Syphon Reservoir Improvement Project <sup>1</sup>	On-Going	Increase recycled water storage capacity by 4,500 AF at the Syphon Reservoir.
IRWD - Central Orange County Water Supply and Water Quality Improvement Project <sup>1</sup>	FY 22-23	Utilize existing flood control basins for groundwater recharge and water quality improvement to increase water supply.
North/Central Orange County Irrigation Efficiency, Runoff Reduction, and Pollution Prevention Program <sup>2</sup>	FY 22-23	Rebate program promotes water-efficient landscaping and irrigation upgrades.
Making Conservation an Orange County Way of Life <sup>2</sup>	FY 22-23	Project includes changing 14 acres of grass, smart controllers, and indoor water-saving measures.
OCPW - Irvine Regional Park - Irrigation Pump House Transformer & Feeder Wiring- Replacement <sup>3</sup>	FY 21-28	The project consists of removal of the old automatic booster pump controls, development, and installation of new automatic controls.

As shown above IRWD and OCWD are continually exploring water reliability CIPs to secure the Districts infrastructure reliability and future water supply.

**2.6 PROPOSED LAND USE AND CEQA THRESHOLD ANALYSIS**

The following question regarding Utilities and Service Systems are identified in the CEQA Checklist related to water.

Would the Project:

- A. Require or result in the relocation or construction of new or expanded water, wastewater treatment or storm water drainage, electric power, natural gas, or telecommunications facilities, the construction or relocation of which could cause significant environmental effects?

Should the answer to this prove to be a potentially significant impact, mitigation measures would be required to reduce those impacts to a less-than-significant threshold. The following impact assessments are based on the significance criteria established earlier in the section.

***Impact A: Require or result in the relocation or construction of new or expanded water, wastewater treatment or storm water drainage, electric power, natural gas, or telecommunications facilities, the construction or relocation of which could cause significant environmental effects?***

**Impact Analysis:** Implementation of proposed land uses within the Focus Areas will have the potential for water demands to increase in the range of 1.87 MGD or 2,093 AFY over existing conditions. Implementation of projects consistent with the land use will require the construction of new water infrastructure where existing water lines are not sufficient to accommodate the increased supply demands. These determinations will be made on a project-by-project basis including site specific fire flow tests and hydraulic pressure analyses. The proposed improvements may include upsizing water lines on-site and off-site and additions of boosters in low pressure areas. In those conditions, where hydraulic or capacity impacts affect other service areas within the Improvement District, the developer is responsible for paying for the impacts through their connection fees. In addition, the 2025 UWMPs will be required to incorporate the proposed land use changes into their water demand and supply projections out to 2050.

The construction of the on-site and off-site water lines and associated improvements will primarily include trenching for the pipelines. All construction will be performed in accordance with the Construction General Permit and all associated requirements. Any work that may affect services to the existing water lines will be coordinated with the City and IRWD. When considering impacts resulting from the installation of any required water infrastructure, all impacts are of a relatively short-term duration and would cease to occur once the installation is complete. Therefore, Project impacts on water associated with construction activities would be less than significant.

### 3. SEWER

#### 3.1 SEWER SYSTEM ENVIRONMENTAL SETTING & INFRASTRUCTURE

##### IRVINE RANCH WATER DISTRICT (IRWD)

IRWD owns and operates a complex sewer collection system that stretches 963 miles to serve its current and future customers. The sewer system and drainage are defined by the physical geography of the San Diego Creek and Peters Canyon Wash/Channel. IRWD is bounded on the northeast by the Santa Ana Mountains and on the south by the San Joaquin Hills. As a result of these dominant drainage features, IRWD's sewer system flows generally from northeast to southwest. The majority of the IRWD sewer system serves the City of Irvine although there are some additional service areas that fall outside the City including portions of Lake Forest, Newport Beach, Costa Mesa, and Orange.

As of 2018<sup>10</sup> there are twenty-three sewage lift stations and twelve are considered major facilities. IRWD operates and maintains 1,100 miles of sanitary sewer mains and 12 miles of force mains spanning 181 square miles (84,000 acres) of service area in Orange County. The wastewater collection system serves the City of Irvine, Lake Forest, parts of Tustin, Newport Beach, Foothill Ranch, Costa Mesa, and unincorporated areas of Orange County. There is a small amount of wastewater generated in Newport Beach and the City that is collected by trunk sewers owned, operated, and maintained by the IRWD, then discharged into sewers owned and maintained by the Orange County Sanitation District (OCSD). The system also includes nineteen siphons which are used to convey wastewater flows under man-made and natural obstructions, and seven diversion structures to divert or split the upstream flows into two separate downstream pipelines. The collection is comprised of primarily vitrified clay pipe (VCP) and polyvinyl chloride (PVC) sewer mains that range from 4 to 60 inches in addition to 32 trunk lines that are the most critical components of the sewer collection system. The ultimate destination of wastewater collected in IRWD's system include the Michelson Water Reclamation Plant (WRP), the Los Alisos WRP or treatment plants.

***Michelson Water Reclamation Plant (WRP)*** - The Michelson Water Recycling Plant (MWRP) serves as a pivotal component of IRWDs wastewater treatment infrastructure. Established in 1967, MWRP initially catered to agricultural users, delivering about 2 million gallons per day (MGD) of tertiary-treated recycled water. Over the years, MWRP has undergone substantial expansions to keep pace with the growing demands of IRWD's service area. By 2008, its capacity had expanded to 18 mgd, supplying recycled water for various non-potable uses. Recently, in response to increasing demand, the plant's capacity was further expanded to 28 mgd, with projections indicating a need for 32.6 mgd at final build-out<sup>11</sup>.

<sup>10</sup> Irvine Ranch Water District, Sewer System Management Plan, June 2018. Found here:

[https://www.irwd.com/images/pdf/water-sewer/irwd\\_sewer\\_system\\_management\\_plan.pdf](https://www.irwd.com/images/pdf/water-sewer/irwd_sewer_system_management_plan.pdf)

<sup>11</sup> Irvine Ranch Water District, Michelson Water Recycling Plant. Accessed March 2024. Found here:

<https://www.irwd.com/construction/michelson-water-recycling-plant>

***Los Alisos Water Reclamation Plant (WRP)*** - The Los Alisos Water Recycling Plant (LAWRP) stands as another critical component of IRWD's wastewater treatment infrastructure, serving the City of Lake Forest and surrounding areas. Operating since 1964, LAWPR has witnessed several upgrades to incorporate advancements in recycling technology, enhancing efficiency and cost-effectiveness. Recent upgrades in 2007 introduced a new disinfection facility, pumping station, sodium hypochlorite building, and pipeline enhancements, elevating the plant's recycled water production capacity to 7.5 mgd. LAWPR's treatment process involves multiple steps, including preliminary treatment, biological treatment in five ponds, coagulation, flocculation, clarification, filtration, and sodium hypochlorite disinfection. These treatment measures ensure the production of tertiary recycled water is suitable for various non-potable uses, such as irrigation for parks, golf courses, and residential yards, as well as industrial applications and manufacturing processes<sup>12</sup>.

### **ORANGE COUNTY SANITATION DISTRICT, DISTRICT NO. 5 (OCSD)**

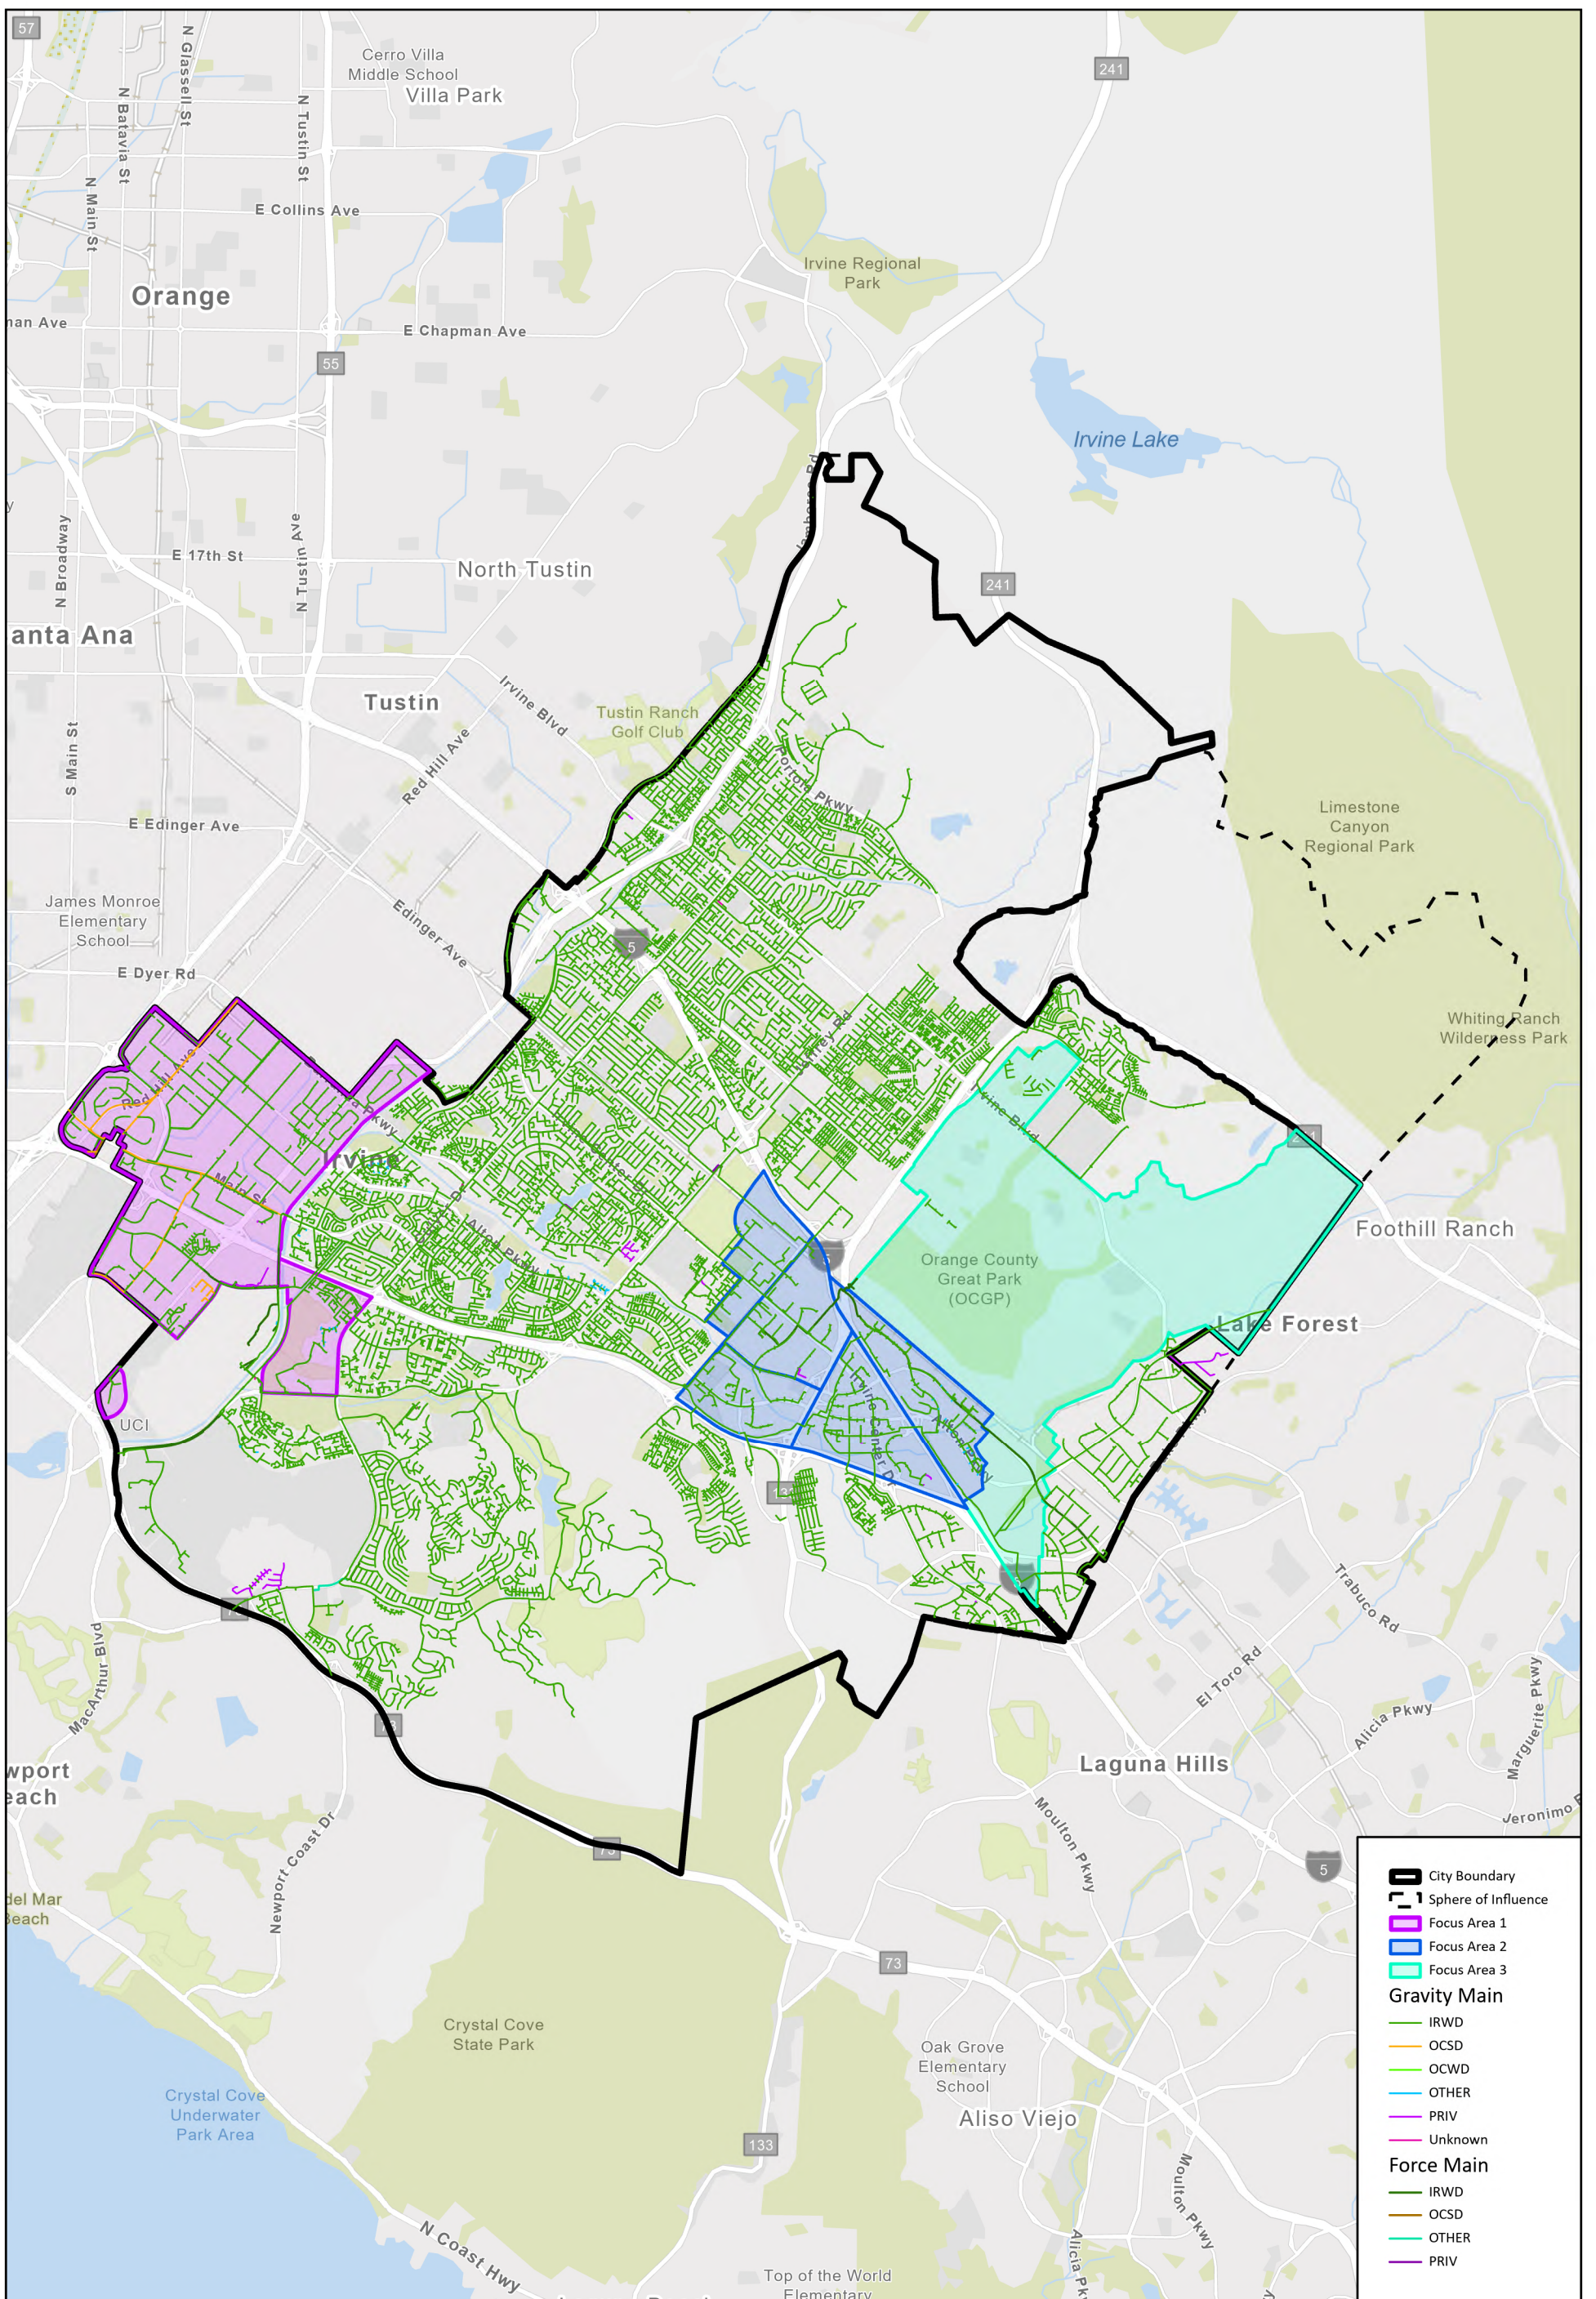

Orange County Sanitation District (OCSD) plays a crucial role in the sewage collection, treatment, and disposal processes within IRWD's service area. While IRWD collects and treats most of the sewage generated within its service area, a small percentage is handled by OCSD. OCSD operates treatment facilities that treat sewage to high-quality standards, meeting the water quality requirements for recycled water use. IRWD collaborates with OCSD to ensure backup sewage treatment capacity and disposal as needed, maintaining a connection for further treatment and eventual ocean discharge. Additionally, IRWD diverts some sewage to OCSD for treatment. This partnership with OCSD ensures efficient sewage management and supports IRWD's efforts to meet water quality standards and address wastewater treatment needs within its service area. See Figure 6 for a map of existing sewer infrastructure within the City.

***Plant No. 1*** – The Orange County Sanitation District (OCSD) operates several treatment facilities, including Plant No. 1, which treats wastewater from IRWD's Revenue Area 14 (RA 14) and other areas. Plant No. 1, 2021-2022 estimated average daily flows are 120 MGD, out of the treatment facilities treatment capacity of – MGD. OCSD's treatment facilities play a critical role in processing wastewater from various regions, ensuring compliance with regulatory standards, and protecting public health and the environment. While MWRP and LAWPR focus on producing recycled water, OCSD's facilities are integral to the broader wastewater treatment network, serving a larger geographical area and handling diverse types of wastewater flows. Together, these treatment plants and facilities contribute significantly to water management efforts in the region, promoting environmental sustainability, and resource conservation<sup>13</sup>.

**Existing Sewer System Facilities Within the City of Irvine**

**Figure 6**

3/13/2024

### 3.2 EXISTING SEWER FLOWS

#### REGIONAL

Wastewater in the City travels through IRWD’s collection system to the Michelson Water Reclamation Plant, where it is treated through the reclamation process for use in landscaping, agricultural irrigation, and other non-potable water uses. However, the Irvine Business Complex is serviced by the IRWD collection system and the majority of the IBC area (primarily western area) discharges into trunk sewers owned and maintained by the Orange County Sanitation District (OCSD). This area of the IBC falls within OCSD tributary zone No. 7. A smaller portion of the IBC (eastern area) is treated by the Michelson Water Reclamation Plant. See Table 10 for an estimate of the District’s indoor sewer generation for 2020.

**Table 10 IRWD Wastewater Collection 2020**

Wastewater Collection Agency	Volume Metered or Estimated?	Volume Collected (AF)	Receiving Agency	Treatment Plant	Located within IRWD Service Area?
IRWD <sup>1</sup>	Metered	22,575	IRWD	MWRP	Yes
IRWD	Metered	3,760	IRWD	LAWRP <sup>2</sup>	Yes
OCSD	Metered	7,568	OCSD	OCSD	Yes
IRWD	Estimated	112	SMWD	Chiquita Water Reclamation Plant	No
<b>TOTAL</b>		<b>34,015 AF</b>			
Source: Irvine Ranch Water District 2020 Urban Water Management Plan – Table 6-2 Retail: Wastewater Collected Within Service Area in 2020 1. Includes 1.09 MGD from outside service area 7 (SA-7). 2. Includes English Canyon flows (outside UWMP service area). 3. SMWD – Santa Margarita Water District					

As seen in the table above, the District estimates that in 2020 the volume of wastewater collected and treated by the IRWD, OCSD, and the Santa Margarita Water District (SMWD) was 34,015 AF. Overall, IRWDs system is very highly managed and is in relatively “young health” by sewer system standards. In addition, when specific plans or major projects are processed (over 400 residential units or equivalent mixed-use projects with similar sewer demands), IRWD requires subarea master plans that identify projected water and sewer demands, required sewer and water infrastructure, and conformance with the sewer collection system master plan. This process enables IRWD to manage the sewer and water systems in a comprehensive manner.

#### LOCAL

Under the proposed land use condition, the GPU will increase the number of residential units by 57,656 residential DUs. Based on IRWDs 2017 Sewer Collection System Master Plan (SCSMP), City specific sewer generation factors were utilized. For further details on

the existing land use evaluation for water demands within the Focus Areas see Table 11 below and Appendix B for notes on how these calculations were derived.

**Table 11 Existing Land Use Evaluation for Sewer Demands**

Planning Area	Proposed Residential (DUs)		Density/Acre		Acres of Residential Development		City of Irvine Land Use Category	Estimated Existing Sewer Flows										
								IRWD Land Use Category		IRWD Sewer Flow Factor Converted to (GPD/Acre)				Existing Sewer Flows (GPD)		Existing Sewer Flows (AFY)		
<b>Focus Area 1 – Greater Irvine Business Complex Area</b>																		
19 (Rancho San Joaquin)	2,202	DUs	50	DUs/Acre	44	Acres	IBC Multi-Use	Light Industrial	60	GPD/KSF	43,560	SF/Acre	2,614	GPD/Acre	115,103	GPD	129	AFY
36 (Irvine Business Complex)	12,798	DUs			256	Acres									668,977	GPD	749	AFY
<b>Focus Area 2 – Greater Spectrum Area</b>																		
12 (Oak Creek)	4,907	DUs	50	DUs/Acre	98	Acres	General Industrial & Medical and Science	Industrial - Light & Regional Commercial	60	GPD/KSF	43,560	SF/Acre	4,138	GPD/Acre	406,123	GPD	455	AFY
31 (Irvine Spectrum 6)	2,934	DUs			59	Acres									242,830	GPD	272	AFY
32 (Irvine Spectrum 3)	17,817	DUs			356	Acres		1,474,606	GPD	1,652	AFY							
33 (Irvine Spectrum Center)	949	DUs			19	Acres		78,543	GPD	88	AFY							
<b>Focus Area 3 – Great Park Neighborhood Transit Village</b>																		
51 (Great Park)	5,252	DUs	50	DUs/Acre	105	Acres	Trails and Transit Oriented Development	Regional Commercial	130	GPD/KSF	43,560	SF/Acre	5,663	GPD/Acre	594,821	GPD	666	AFY
<b>TOTAL</b>		<b>46,859</b>	<b>DUs</b>		<b>937</b>	<b>Acres</b>	<b>ESTIMATED EXISTING WATER DEMAND</b>								<b>3,581,002</b>	<b>GPD</b>	<b>4,011</b>	<b>AFY</b>
<i>AFY = Acre-Foot Per Year, DU = Dwelling Unit, KSF = thousand square feet, GPD = Gallons Per Day, SF = Square-Foot</i>																		

As shown in the table above it is anticipated that existing land uses within the Focus Areas generates approximately 4,011 AFY or 3,581,002 GPD in sewer flows. To understand how these sewer flows were generated please refer to the section below.

### **3.3 PROPOSED SEWER FLOWS**

#### **METHODOLOGY**

As mentioned in the water demand methodology, in the process of developing existing and proposed sewer flows it was noted that the locations of the potential residential units were not readily available to provide a comparison in sewer flows from the existing land uses to the proposed residential conversions. Without being able to specifically compare an existing condition location and sewer flows with a proposed residential location and sewer flows, a practical approach was taken. Namely, the primary focus of the City's Housing Element and the Conservative Alternative Plan is intensified residential growth with an average of up to 50 DUs / Acre. This residential density was applied within the Focus Areas to determine an estimated acreage of residential development within each area.

After determining the acres of residential development, existing sewer flows were created by identifying the predominant existing land uses and zoning designations within each Focus Area. As noted in Table 1 each focus area consists largely of one zoning designation with Focus Area 1 being IBC Multi-Use, Focus Area 2 General Industrial & Medical and Science, and Focus Area 3 Trails and Transit Oriented Development. These primary zoning designations within each Focus Area was then matched to IRWD's water use factors, expressed in (gpd/ksf). These factors were then converted to acreages to establish a sewer flow factor in gallons per day per acre (gpd/acre). This factor was then applied to each Focus Areas respective acres of residential development to evaluate existing sewer flows in the area.

While this approach simplifies the calculation process and provides a reasonable estimate of existing sewer flows, it should be noted that it may not capture the full complexity of existing land use patterns and sewer generation. Different land use categories such as commercial, industrial, or open space, may have varying sewer flow profiles when compared to residential areas. However, due to the lack of detailed data on existing land uses, this approach is necessary to proceed with the analysis and determine the impacts on sewer flows and sewer infrastructure from an existing to proposed condition. By applying the average density of dwellings units per acre to the existing land use area, it allows for a consistent basis of comparison between existing and proposed sewer flows. It provides a practical way to assess the potential impacts of proposed zoning changes on sewer flows within the City's Focus Areas of growth.

Similar to the existing land use evaluation methodology the proposed sewer flow calculations also utilizes the acreages of residential development to generate proposed flows within the Focus Areas. To generate a sewer flow factor the average density of 50 DUs/ Acre was matched to IRWDs sewer flow factor for high rise density units in Irvine. IRWD categorizes high rise density land uses as any development with a density of 40.0 DUs/Acre or more. Sewer flows associated with these high-rise density developments is 120 GPD/DU and this water factor was then converted to GPD/ Acres by applying the Housing Elements projected average density of 50 DUs/ Acre to it which results in a demand of 6,000 GPD/ Acre. Refer to Table 12 for the estimated sewer flows generated from each Focus Areas of the residential development.

**Table 12 Proposed Land Use Evaluation for Sewer Demands**

Planning Area	Proposed Residential (DUs)		Density/Acre	Acres of Residential Development		City of Irvine Land Use Category	Estimated Proposed Sewer Flows											
							IRWD Land Use Category		IRWD Sewer Flow Factor Converted to (GPD/Acre)				Proposed Sewer Flows (GPD)		Proposed Sewer Flows (AFY)			
<b>Focus Area 1 – Greater Irvine Business Complex Area</b>																		
19 (Rancho San Joaquin)	2,202	DUs	50	DUs/Acre	44	Acres	IBC Multi-Use	High Rise Density - Irvine	120	GPD/ DU	50	DU/ Acre	6,000	GPD/ Acre	264,240	GPD	296	AFY
36 (Irvine Business Complex)	12,798	DUs			256	Acres									1,535,760	GPD	1,720	AFY
<b>Focus Area 2 – Greater Spectrum Area</b>																		
12 (Oak Creek)	4,907	DUs	50	DUs/Acre	98	Acres	General Industrial & Medical and Science	High Rise Density - Irvine	120	GPD/ DU	50	DU/ Acre	6,000	GPD/ Acre	588,840	GPD	660	AFY
31 (Irvine Spectrum 6)	2,934	DUs			59	Acres									352,080	GPD	394	AFY
32 (Irvine Spectrum 3)	17,817	DUs			356	Acres									2,138,040	GPD	2,395	AFY
33 (Irvine Spectrum Center)	949	DUs			19	Acres									113,880	GPD	128	AFY
<b>Focus Area 3 – Great Park Neighborhood Transit Village</b>																		
51 (Great Park)	5,252	DUs	50	DUs/Acre	105	Acres	Trails and Transit Oriented Development	High Rise Density - Irvine	120	GPD/ DU	50	DU/ Acre	6,000	GPD/ Acre	630,240	GPD	706	AFY
<b>TOTAL</b>		<b>46,859</b>	<b>DUs</b>		<b>937</b>	<b>Acres</b>	<b>ESTIMATED PROPOSED WATER DEMAND</b>							<b>5,623,080</b>	<b>GPD</b>	<b>6,299</b>	<b>AFY</b>	
<i>AFY = Acre-Feet Per Year, DU = Dwelling Unit, KSF = thousand square feet, GPD = Gallons Per Day, SF = Square-Feet</i>																		

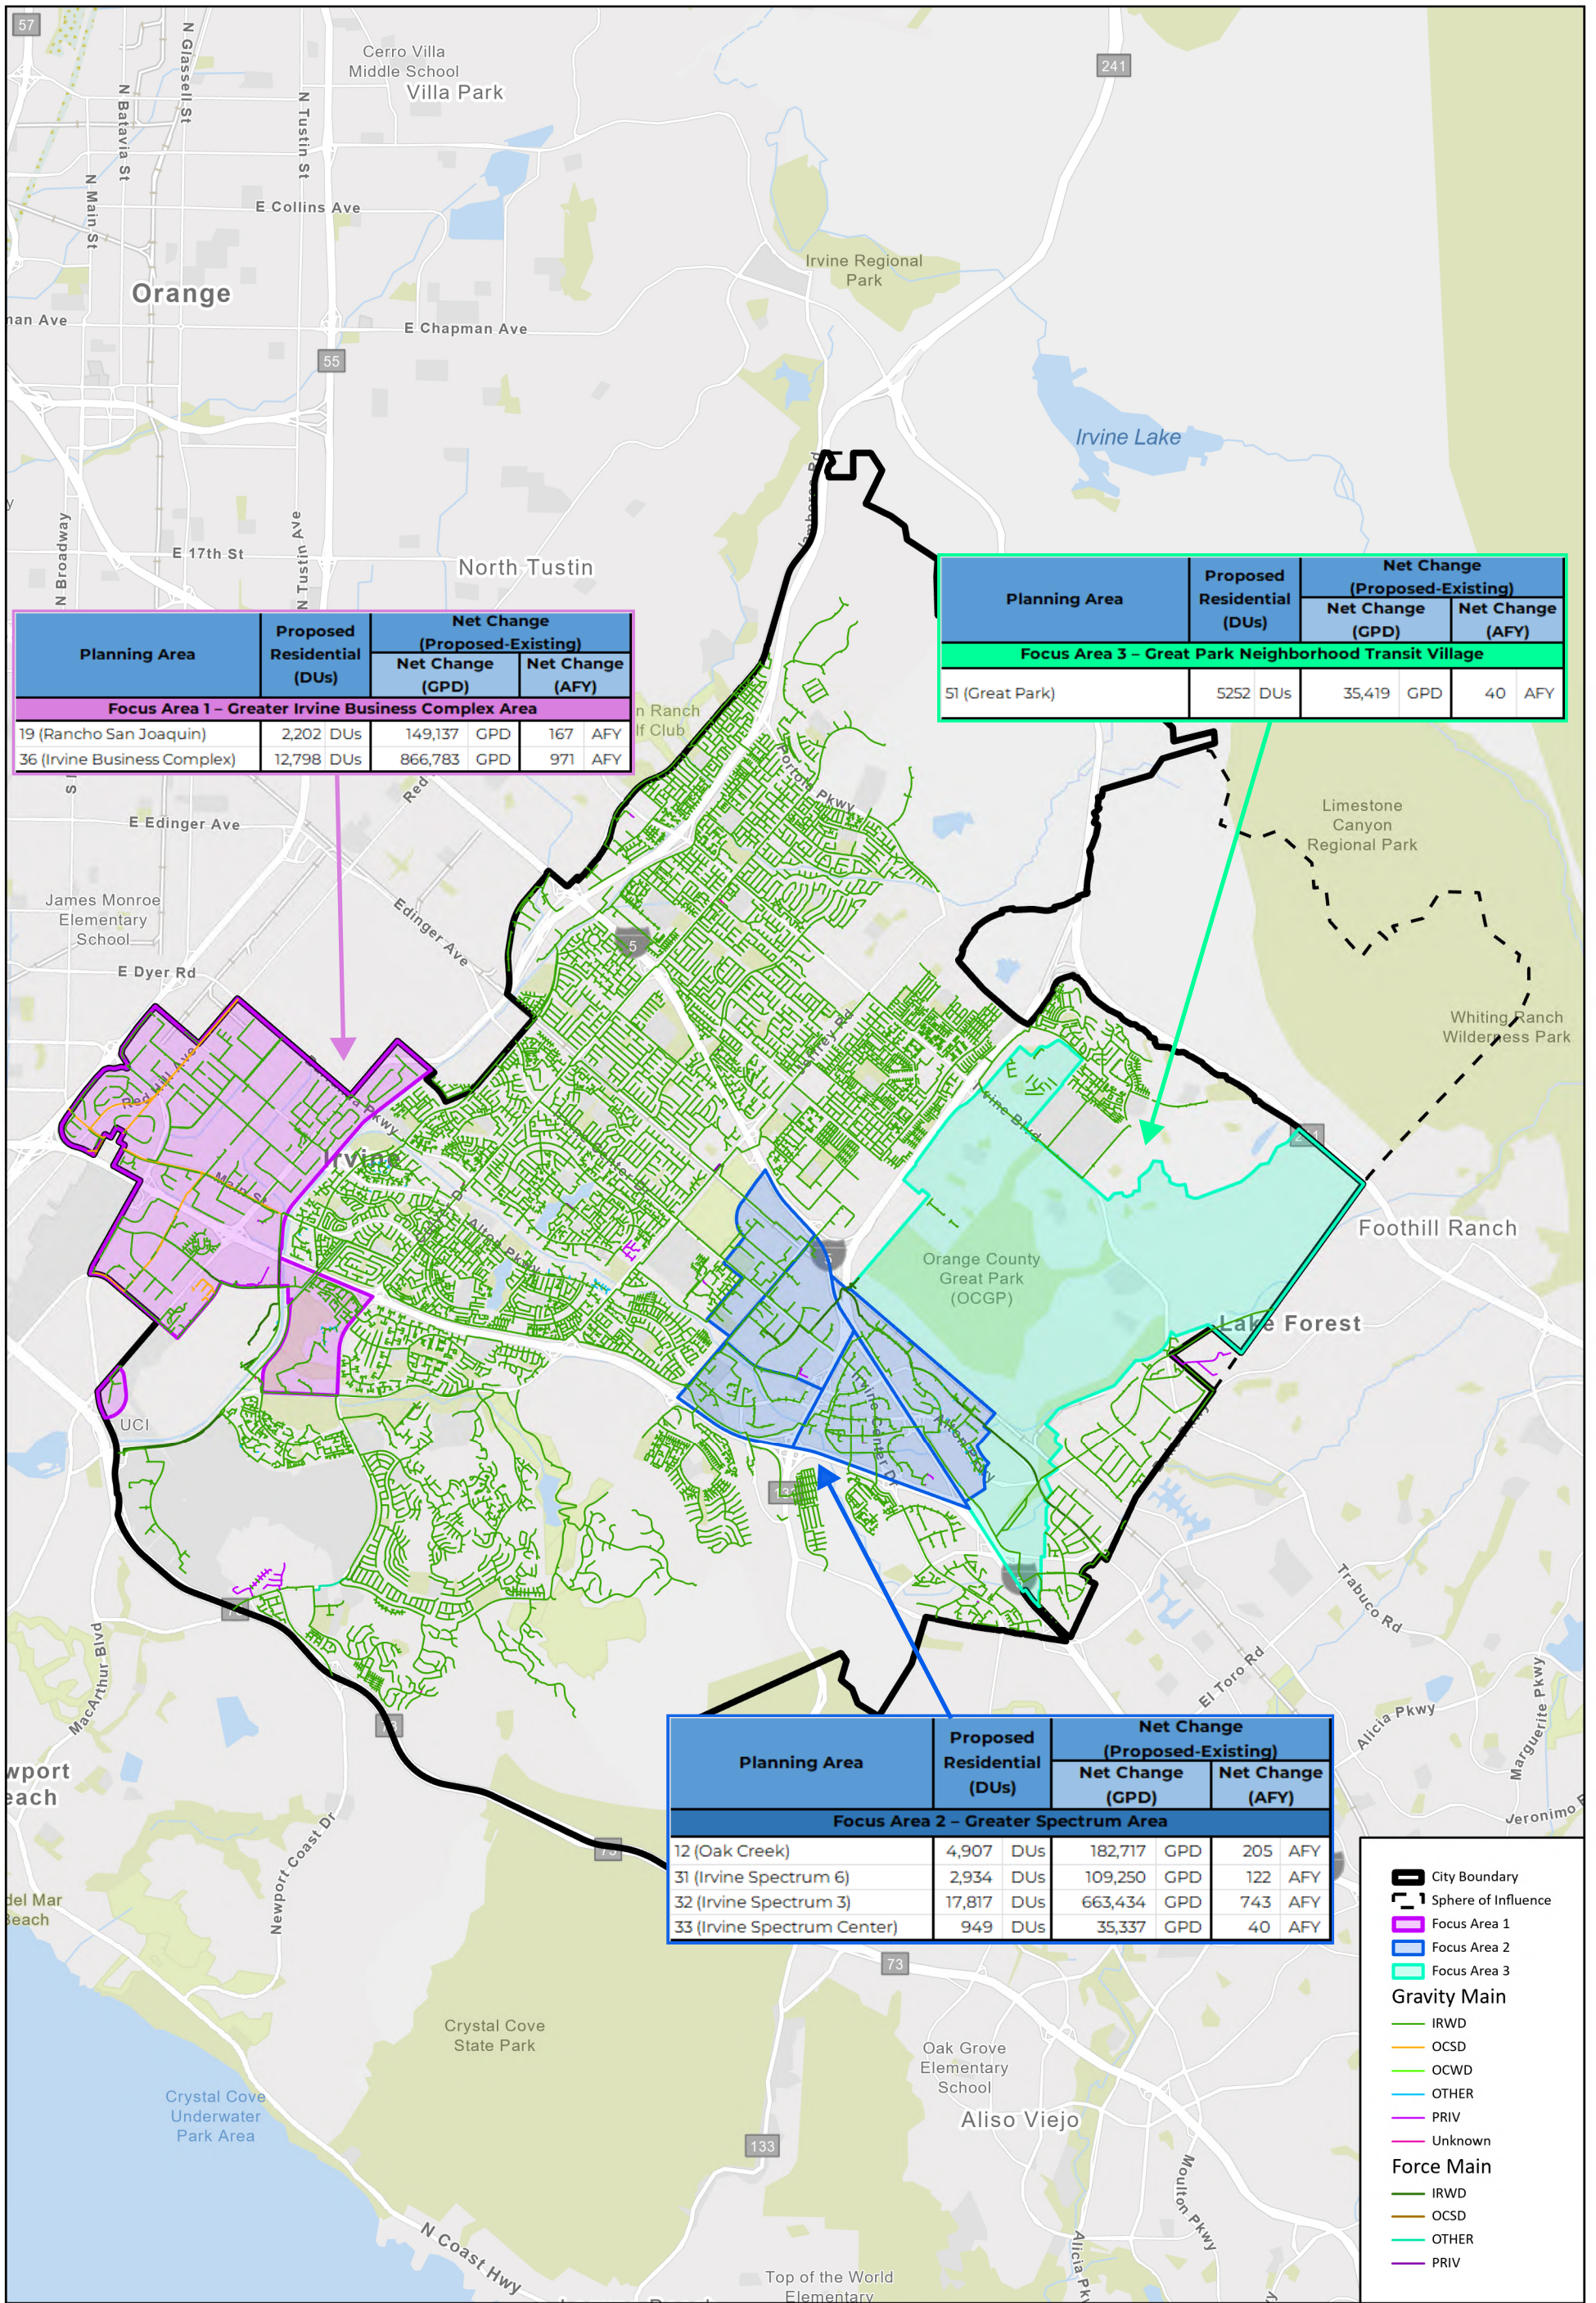

As shown above in Table 12 under the proposed Conservative Alternative land use plan/Proposed Project, the GPU will potentially increase the number of residential units by 57,656 DUs or 46,859 DUs (81% of all units) within the Focus Areas. This increase in units has the potential to generate sewer flows up to 6,299 AFY or 5,623,080 GPD within the three Focus Areas. See Appendix B for a table of the sewer flow calculations and IRWDs sewer flow factors.

The difference between the sewer flows calculated in Table 11 and Table 12 are representative of the net change in wastewater generation for the areas of residential development. See Table 13 below for more details.

**Table 13 Net Change (Existing to Proposed) Land Use Evaluation for Sewer Flows**

Planning Area	Proposed Residential (DUs)	Net Change (Proposed-Existing)	
		Net Change (GPD)	Net Change (AFY)
<b>Focus Area 1 – Greater Irvine Business Complex Area</b>			
19 (Rancho San Joaquin)	2,202 DUs	149,137 GPD	167 AFY
36 (Irvine Business Complex)	12,798 DUs	866,783 GPD	971 AFY
<b>Focus Area 2 – Greater Spectrum Area</b>			
12 (Oak Creek)	4,907 DUs	182,717 GPD	205 AFY
31 (Irvine Spectrum 6)	2,934 DUs	109,250 GPD	122 AFY
32 (Irvine Spectrum 3)	17,817 DUs	663,434 GPD	743 AFY
33 (Irvine Spectrum Center)	949 DUs	35,337 GPD	40 AFY
<b>Focus Area 3 – Great Park Neighborhood Transit Village</b>			
51 (Great Park)	5252 DUs	35,419 GPD	40 AFY
<b>TOTAL</b>	<b>46,859 DUs</b>	<b>2,042,078 GPD</b>	<b>2,287 AFY</b>

As shown above, it is projected that these land use changes within the Focus Areas will produce an estimated sewer flow increase of 2,287 AFY (2,042,078GPD). See Figure 7 for a summary of the GPUs proposed sewer flows and Appendix B to review details regarding the methodology of the existing, proposed, and net change sewer flow calculations.

**City of Irvine Proposed Sewer Flows**

**Figure 7**

2/29/2024

### **3.4 SEWER CAPACITY ASSESSMENT**

In addition to assuring that there are ample water supplies available to its service area through the SCSMP, IRWD utilize several other resources such as Sewer System Management Plan, Sub-Area Master Plans (SAMPs), Improvement Districts, and Capital Improvement Plans (CIPs) to monitor, improve, and repair local and regional sewer infrastructure.

#### **IRWD SEWER COLLECTION SYSTEM MASTER PLAN (SCSMP)**

To assure continuous high levels of customer service, a hydraulic model prepared for the Sewer Collection System Master Plan<sup>14</sup> was used to evaluate the hydraulic capacity required for the predicted 2010-2025 IRWD customer base. A capacity analysis was conducted across the piping system to determine the depth of flow as compared to the diameter of pipe (d/D).

The results highlighted 21 areas that exceeded current design criteria with 11 areas at a medium/high priority level. Recommendations were indicated to address the capacity deficiencies. It is noted that the largest, most severe and earliest occurring deficiencies should have the highest priority for action. The Capital Improvement Plan includes nine potential projects necessary to meet long term growth that is predicted to occur within the District.

#### **IRWD SEWER SYSTEM MANAGEMENT PLAN (SSMP)**

In addition, IRWD prepared an updated 2018 Sewer System Management Plan as part of the separate State Water Resources Control Board requirements. The SSMP identifies that since the development of the 2006 Sewer Collection System Master Plan, several of the high-priority deficiency projects have been implemented and several other projects have been put under a more detailed analysis. The SSMP serves as a separate guidance document that covers operations and maintenance, design and performance provisions, overflow emergency response plans, Fats Oils and Grease (FOG) Program, system evaluation and capacity assurance plan, monitoring, and measurement and program modifications. The periodic update of this document ensures the entire system is being operated and maintained and is continually being upgraded for future conditions<sup>15</sup>.

#### **SEWER SYSTEM DISTRICT IMPROVEMENT AREAS**

IRWD manages sewer system improvements, maintenance, sewer connection fees and other aspects of the system through Sewer System Improvement Districts. There are approximately eight Improvement Districts related to sewer generation and flows and as maintenance needs or upgrades are required per District, the costs are spread out among the users within those Districts. If a development project will result in an impact beyond one District area, the Developer will be responsible for paying fees to support

<sup>15</sup> Irvine Ranch Water District, Sewer System Management Plan. June 2018. Found here: [https://www.irwd.com/images/pdf/water-sewer/irwd\\_sewer\\_system\\_management\\_plan.pdf](https://www.irwd.com/images/pdf/water-sewer/irwd_sewer_system_management_plan.pdf)

the improvements in all affected District areas. The costs of new capital facilities are shared equally between connection fees paid by developers and property taxes paid by property owners. The specific fees and taxes may differ between the Districts dependent upon the existing and future capacity of the sewer system and the maintenance requirements in each District<sup>16</sup>.

### **SUB-AREA MASTER PLANS (SAMPS)**

Sub-Area Master Plans (SAMPs) serve as crucial studies conducted by IRWD to plan for sewer facilities in specific development areas or proposals. Typically initiated after developers present specific development plans, SAMPs refine general plan land uses and provide insights into phasing information. These plans include descriptions and mappings of proposed sewer systems, calculations of expected wastewater generation, and analyses of the new development's impact on existing sewer systems. Utilizing available SAMP reports and models, future system facilities are developed for hydraulic modeling. The SAMP hydraulic models, constructed with detailed tract map information, ensures that sewer flow loadings are appropriately applied. IRWD ensures that future gravity mains follow design criteria in the SAMP reports.

### **ORANGE COUNTY SANITATION DISTRICT MASTER PLAN UPDATE**

OCSD, in coordination with Woodard & Curran, prepared an update to its Master Plan in December 2019. The purpose of this Update Report was to evaluate collections system capacity throughout the OCSD service area. A new model was developed to replace the previous 2006 model, based on Center for Demographic Research (CDR) population and employment data and growth estimates. The updated capacity assessment was conducted between 2016 and 2017. The 2019 Master Plan update determined a series of trunk line segments that exhibited hydraulic deficiencies or potential hydraulic deficiencies under existing (2017) and buildout (2040) conditions. Hydraulic deficiencies were assessed for both peak dry-weather flow and peak wet-weather flow scenarios. Thus, OCSDs planning division maintains a 20-year CIP comprised of potential future projects. These projects are typically scoped to rehabilitate, upgrade, or replace most of the assets within a sub-area or facility.

#### **3.4.1 SEWER CAPITAL IMPROVEMENTS PLANS**

IRWD's SSMP plans for continuous high levels of customer service to accommodate future service demands. As part of this effort, hydraulic capacity models were used to determine the existing capacity and future capacity based on long-term growth projections. Although IRWD has not experienced any capacity-related sewer overflows, several specific capital improvement projects were identified to improve capacity to meet future needs. Since the 2006 study, four of the highest priority deficiency projects have been implemented; the other projects are deferred indefinitely. These remaining projects are being monitored with flow sensors at strategic locations, and IRWD is using real data (not modeled results) to evaluate capacity as compared to future growth in

---

<sup>16</sup> Irvine Ranch Water District, Rules And Regulations For Water, Sewer, Recycled Water, And Natural Treatment System Service. December 2019. Found here: [https://www.irwd.com/images/pdf/doing-business/engineering/2019/\\_\\_\\_Rules\\_and\\_Regs\\_APPROVED\\_20191216\\_FINAL.pdf](https://www.irwd.com/images/pdf/doing-business/engineering/2019/___Rules_and_Regs_APPROVED_20191216_FINAL.pdf)

these areas. See Table 14 below for a list of CIP projects that OCSD and IRWD are planning to implement throughout the City.

**Table 14 Sewer System Capital Improvement Plans**

Project Name	CIP Fiscal Year	Project Summary
OCSD – Costa Mesa and Irvine Gisler-Red Hill Interceptor and Baker Force Main Rehabilitation <sup>1</sup>	FY 23-25 In Construction	The project will make repairs to the inside of the pipeline to protect the pipe from corrosion, reducing the risk of a sewage spill and extending the pipeline's life. (Project No. 7-65).
OCSD – Costa Mesa and Irvine Sunflower and Red Hill Interceptor Repair <sup>1</sup>	FY 21-23 In Construction	Repair of the interceptor on sunflower and Red Hill to mitigate risks to wastewater collection, sewer spills, and water quality (Project No. 7-66)
IRWD – Michelson Force Main Rehabilitation Project <sup>2</sup>	FY 22-23 Design	This project will install CIP Pipe Lining on approximately 3,400 LF of force main sewer pipe.
IRWD – Newport Coast Lift Station Rehabilitation Project <sup>2</sup>	FY 22-23 Planning	This project rehabilitates CIP Pipe Lining on approximately 3,000 LF of force main sewer pipe and installs a new portion of epoxy-lined Ductile Iron Pipe that connects the rehabilitated force main to the lift station drywell
IRWD – Sewer Siphon Rehabilitation <sup>2</sup>	FY 22-23 Design	This project uses the results from the Criticality analysis and implements the identified rehabilitation.
IRWD – Sewer System Calcium Removal <sup>2</sup>	On-going	The routine sewer line cleaning and inspections identify areas for calcium removal, this project implements this maintenance task.
IRWD – Sewer Line Repairs <sup>2</sup>	On-going	This project is an on-going annual project put in place for, previously unidentified, sewer repairs.

As shown above, the IRWD and the OCSD are continually exploring sewer reliability CIPs in preparation for increased sewer generation and flows.

**3.5 PROPOSED CONDITION AND CEQA THRESHOLD ANALYSIS**

The following questions regarding Utilities and Service Systems are identified in the CEQA Checklist related to sewer.

**Would the Project:**

- A. Require or result in the relocation or construction of new or enhanced water, wastewater treatment or storm water drainage, electric power, natural gas, or telecommunications facilities, the construction or relocation of which could cause significant environmental effects?
- B. Result in a determination by the wastewater treatment provider which serves or may serve the project that it has adequate capacity to serve the project's projected demand in addition to the provider's existing commitments?

Should the answers to these environmental factors prove to be a potentially significant impact, mitigation measures would be required to reduce those impacts to a less-than-significant threshold.

***Impact A: Require or result in the relocation or construction of new or expanded water, wastewater treatment or storm water drainage, electric power, natural gas, or telecommunications facilities, the construction or relocation of which could cause significant environmental effects?***

**Impact Analysis:** Implementation of proposed land uses within the City's GPU will likely require construction of upgrades to new sewer infrastructure where existing sewer lines are not sufficient to accommodate the increased flows. The locations of these sewer improvements will be based on the project-specific locations. These determinations will be made on a project-by-project basis including site specific sewer flow monitoring and hydraulic sewer analysis. All project applicants are required to submit detailed information to IRWD regarding product type, size, number of units or square feet, projected demands (indoor and outdoor), and other project details so impacts on the existing sewer system can be managed properly. In those conditions, where hydraulic or capacity impacts affect other service areas or users within the Improvement District, the developer is responsible for paying for the impacts through their connection fees. When capital projects are identified for regional sewer improvements within the Improvement District, the costs are shared 50/50 between developer connection fees and existing users through property tax assessments.

The construction of the on-site and off-site sewer lines and associated improvements will primarily include trenching for the pipelines. All construction will be performed in accordance with the Construction General Permit and all associated requirements. Any work that may affect services to the existing sewer lines will be coordinated with the City and IRWD. IRWD also has Sewer Improvement Districts which allows the District to assess improvements per Improvement Area and collect fees accordingly. This process ensures that the fees collected are consistent with the improvements needed within the respective District being improved.

Furthermore, a Construction Management Plan or equivalent, which would ensure safe pedestrian access as well as emergency vehicle access and safe vehicle travel in general, will be implemented to reduce any temporary

pedestrian and traffic impacts occurring as a result of construction activities. Moreover, when considering impacts resulting from the installation of any required wastewater infrastructure, all impacts are of a relatively short-term duration and would cease to occur once the installation is complete. Therefore, Project impacts on wastewater associated with construction activities would be less than significant.

***Impact B: Result in a determination by the wastewater treatment provider which serves or may serve the project that it has adequate capacity to serve the project's projected demand in addition to the provider's existing commitments?***

**Impact Analysis:** The proposed development within the CPUs Focus Areas is expected to result in an increase in sewer flows by approximately 2.04 MGD. However, upon evaluation, this increase falls well within the remaining treatment capacity of the Michelson Water Recycling Plant (MWRP) at Irvine Ranch Water District (IRWD), which currently stands at 28 MGD. The capacity expansion of MWRP through projects like the Phase 2 Expansion in 2014, which added 7 MGD, has ensured that the plant can accommodate additional demand. The MWRP currently operates at an average of 25 MGD, recycling about 9 billion gallons of water annually. When combined with water from the Los Alisos Recycling Plant, the recycled-water operation collectively provides 28% of the water supplied to customers. Additionally, OCSD's Plant No. 1, with a treatment capacity of 320 MGD, remains capable of accommodating the projected increase in sewer flows<sup>17</sup>.

## **4. STORM DRAINAGE AND WATER QUALITY**

### **4.1 STORM DRAINAGE ENVIRONMENTAL SETTING & INFRASTRUCTURE**

#### **4.1.1 EXISTING DRAINAGE FACILITIES**

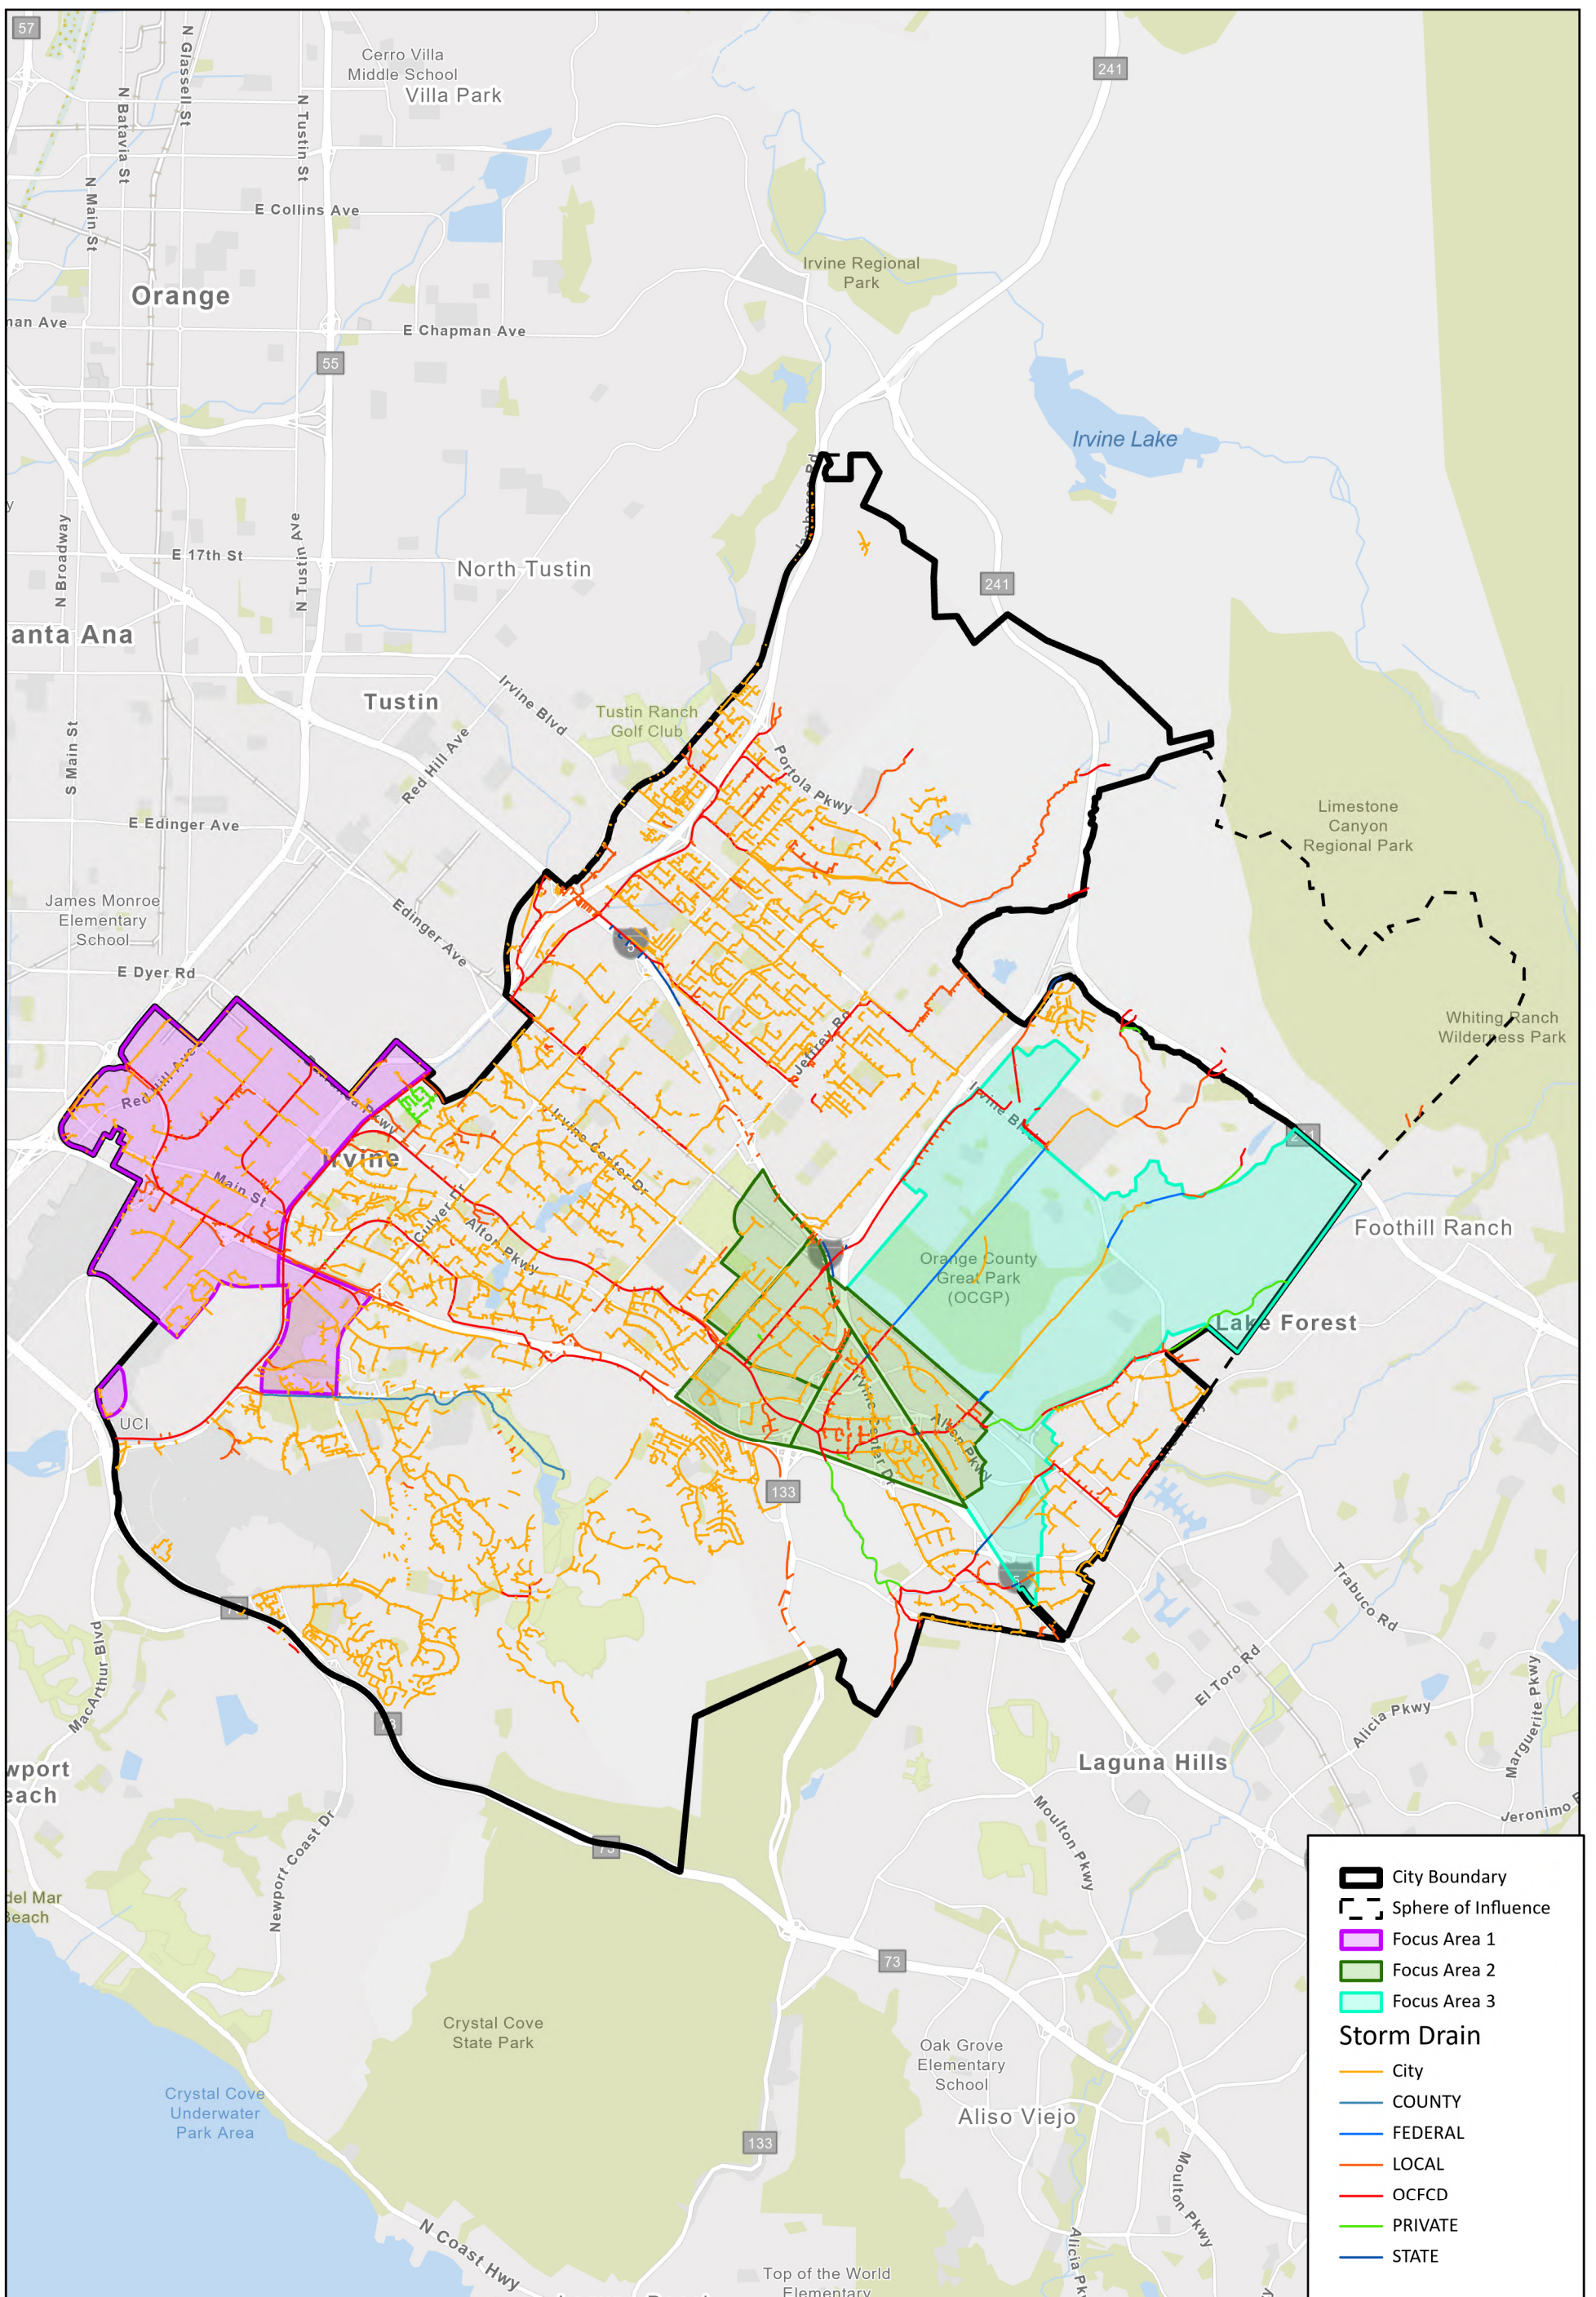

The local storm drain system within the City of Irvine is owned by the City of Irvine and maintained by the City's Public Works Department. The regional flood control system is owned and maintained by the Orange County Public Works Department (OCPW). Lines typically range in size from 18" - 60" with the local drainage system consisting of the smaller diameter pipes and the larger flood control facilities consisting of trapezoidal channels or riverine systems. Drainage facilities are typically either RCP pipe or box culverts to convey stormwater. Local storm drain facilities are typically designed to accommodate 10- to 25-year flow requirements and the regional County facilities are designed to accommodate from 10-year to up to 100-year storm events. The City conveys stormwater to the Orange County Flood Control District (OCFCD) regional conveyance facilities and has a detailed GIS based inventory of all drainage facilities including storm drainpipes, catch basins, BMPs/filters within catch basins, pump stations, settling basins and outfalls for both public and private properties. See Figure 8 below that shows the existing storm drain system throughout the City and Focus Areas. The City has an ongoing monitoring and maintenance procedure to ensure the overall system functions effectively. To prevent against significant flooding during storm events OCFCD and the City monitors and maintains stormwater pumping stations to ensure they are functioning efficiently.

In addition, the City currently requires individual drainage analyses for new developments and redevelopments to ensure conformity with the entire Citywide drainage system.<sup>18</sup> New developments and significant redevelopments must analyze the 10- to 25-year storm event for onsite areas and determine if there are any impacts to the public storm drain system. The City uses a hybrid approach of ensuring storm drain capacity is maintained and promotes the use of existing features (i.e., parks) and natural treatment systems (IRWD) to serve as detention systems, water quality treatment and infiltration wherever feasible.

See Figure 8 below for the existing storm drain system throughout the City.

---

<sup>18</sup> City of Irvine, CA, July 28, 2023. Municipal Code (Ord. No. 10-06, § 1, 7-13-10). **Figure 8**

2/29/2024

#### **4.1.2 WATERSHED SETTING**

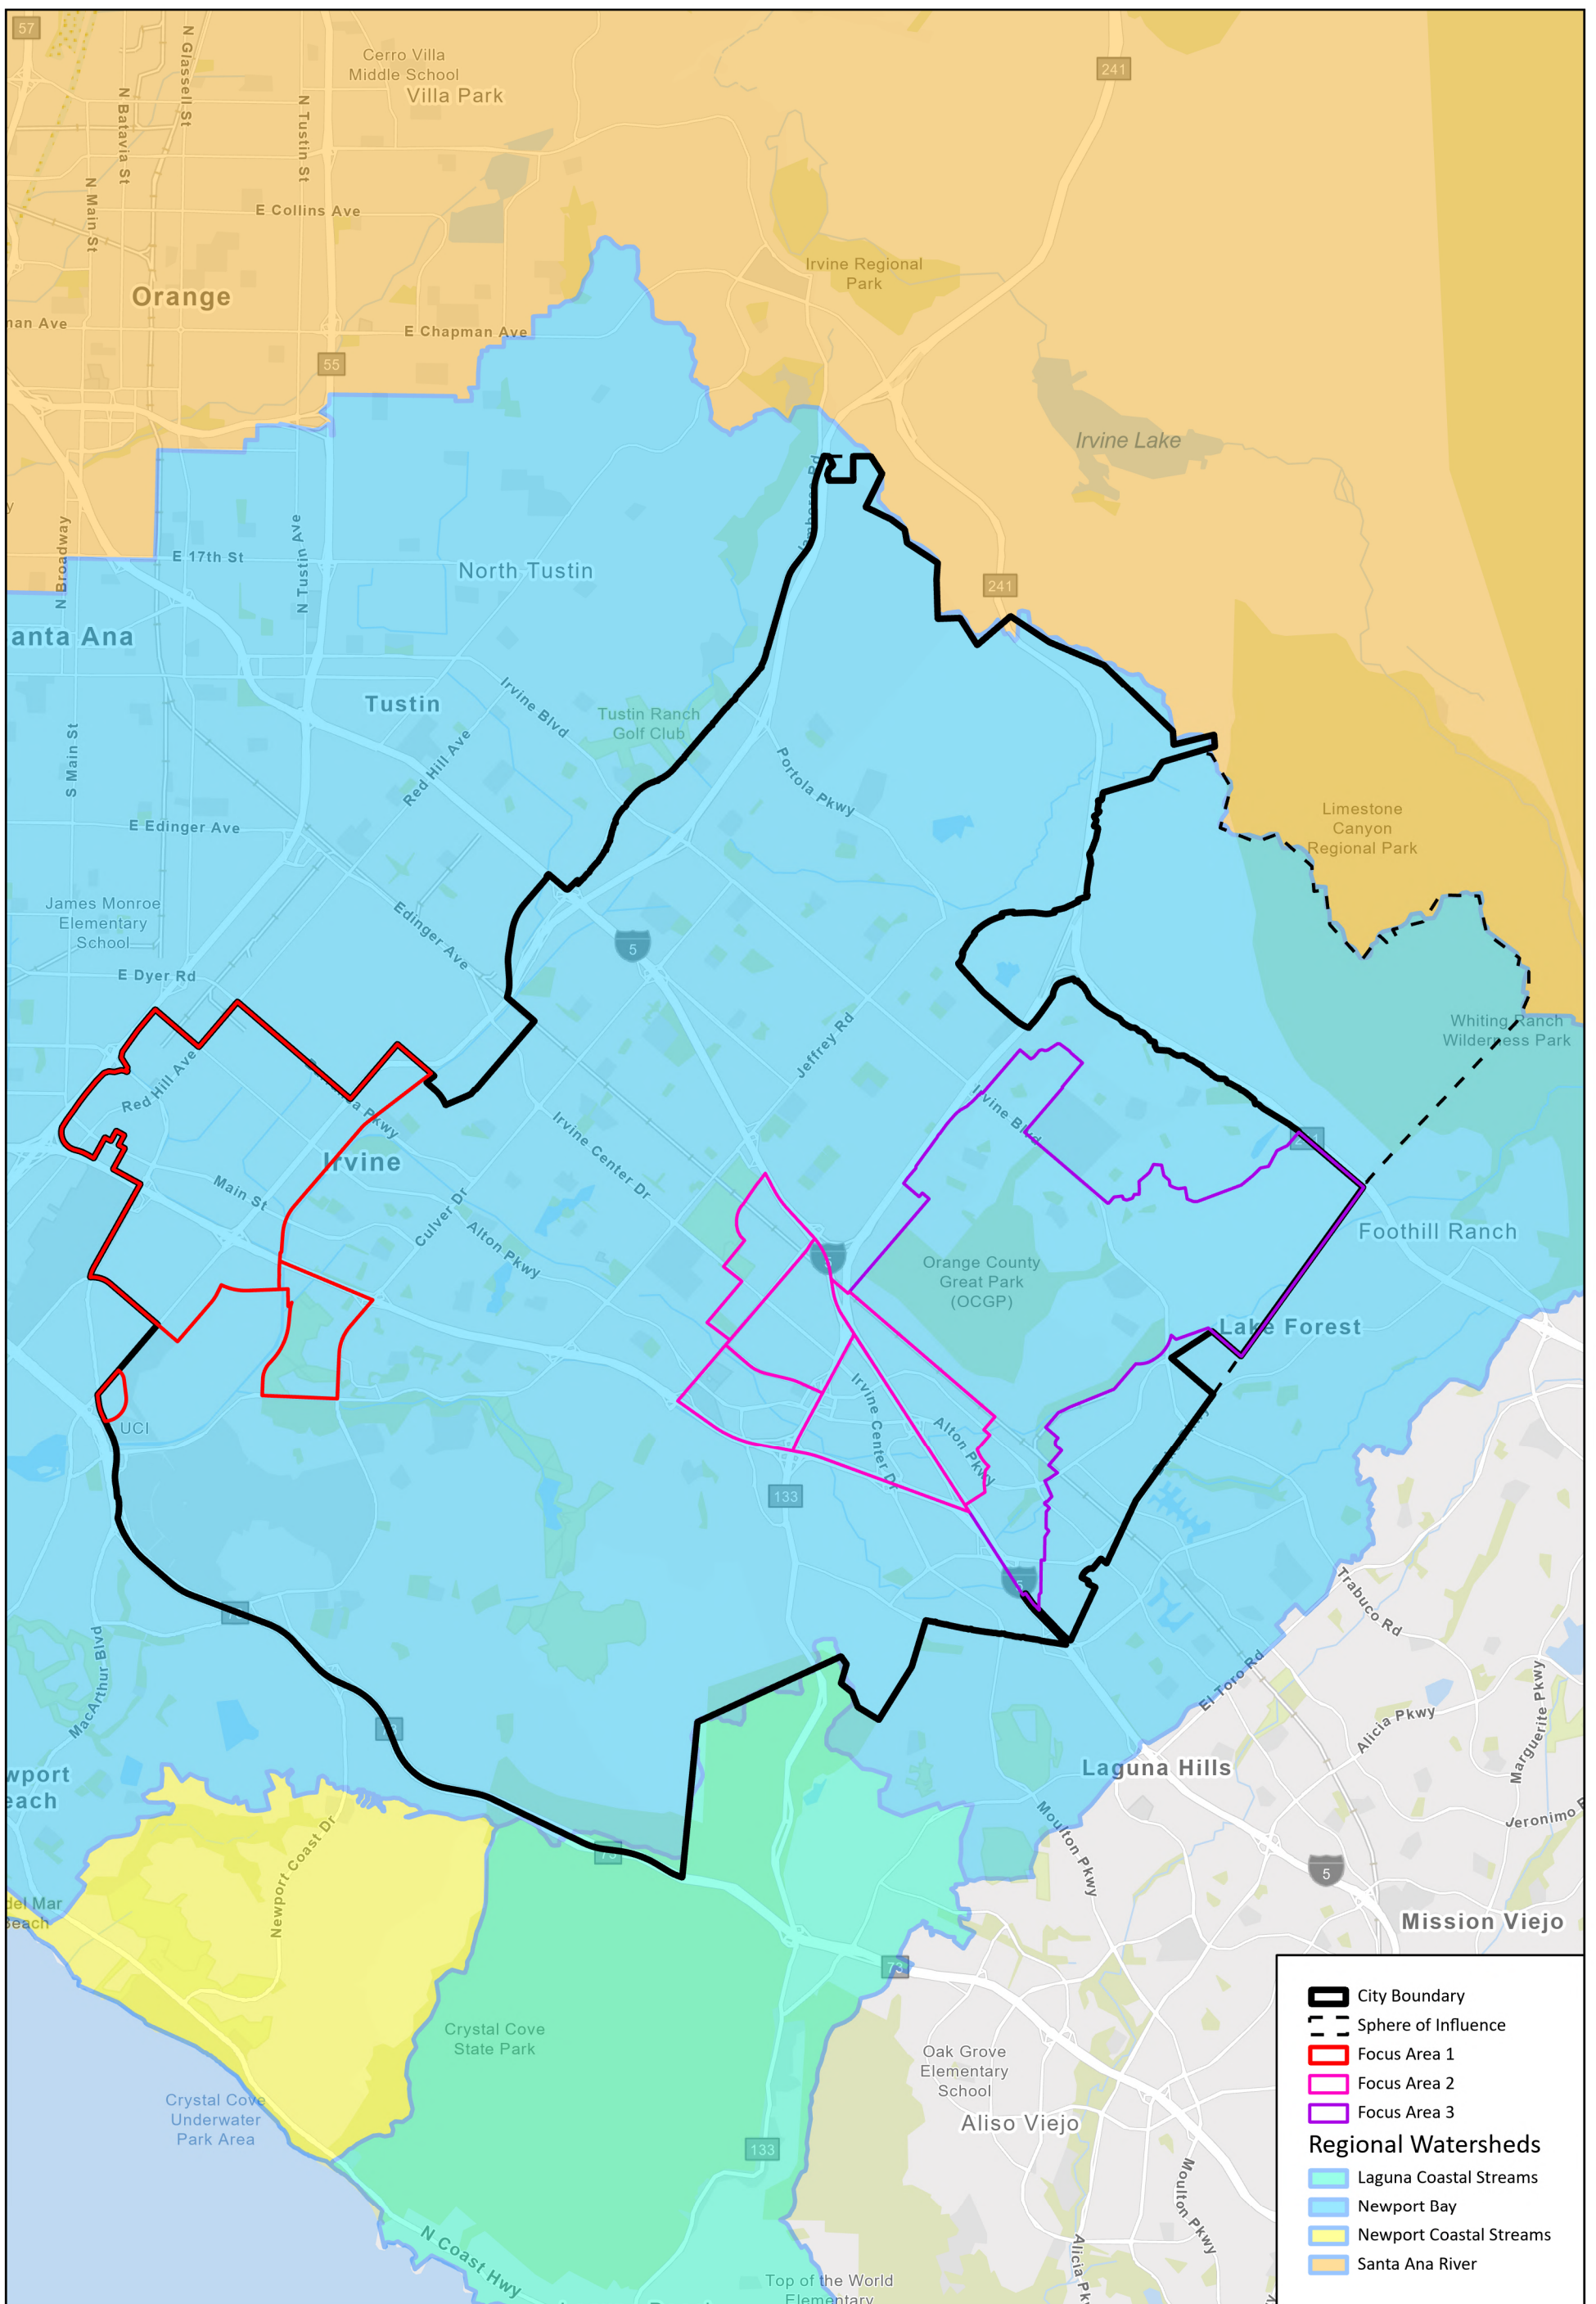

The City is located primarily within the 154-square mile Newport Bay Watershed. Newport Bay is located in the central portion of Orange County “OC”, California and is defined by the foothills of the Santa Ana Mountains to the east (Loma Ridge), and the San Joaquin Hills to the west and southwest. The Newport Bay Watershed is a part of the larger Orange County Watershed Management Areas, which consist of a split into a South, North, and Central Watershed Management Areas (WMA). The total area of the Newport Bay Watershed is approximately 154 square miles (98,500 acres) of the Central Orange County (COC) WMA. The watershed is comprised of channels that ultimately deliver stormwater to Newport Bay.

#### **WATERSHEDS**

As discussed previously, the City of Irvine is located in the Newport Bay Watershed. The primary tributaries are identified below.

- Newport Bay Watershed
  - Santa Ana Delhi Channel
  - Bonita Creek
  - Borrego Creek
  - Peters Canyon Wash
  - San Diego Creek Reach 1
  - Upper Newport Bay (Ecological Reserve)

See Figure 9 below for a map of the watersheds within and surrounding the City.

**City of Irvine Watersheds**

**Figure 9**

2/29/2024

## 4.2 EXISTING FLOOD PLAIN MAPPING

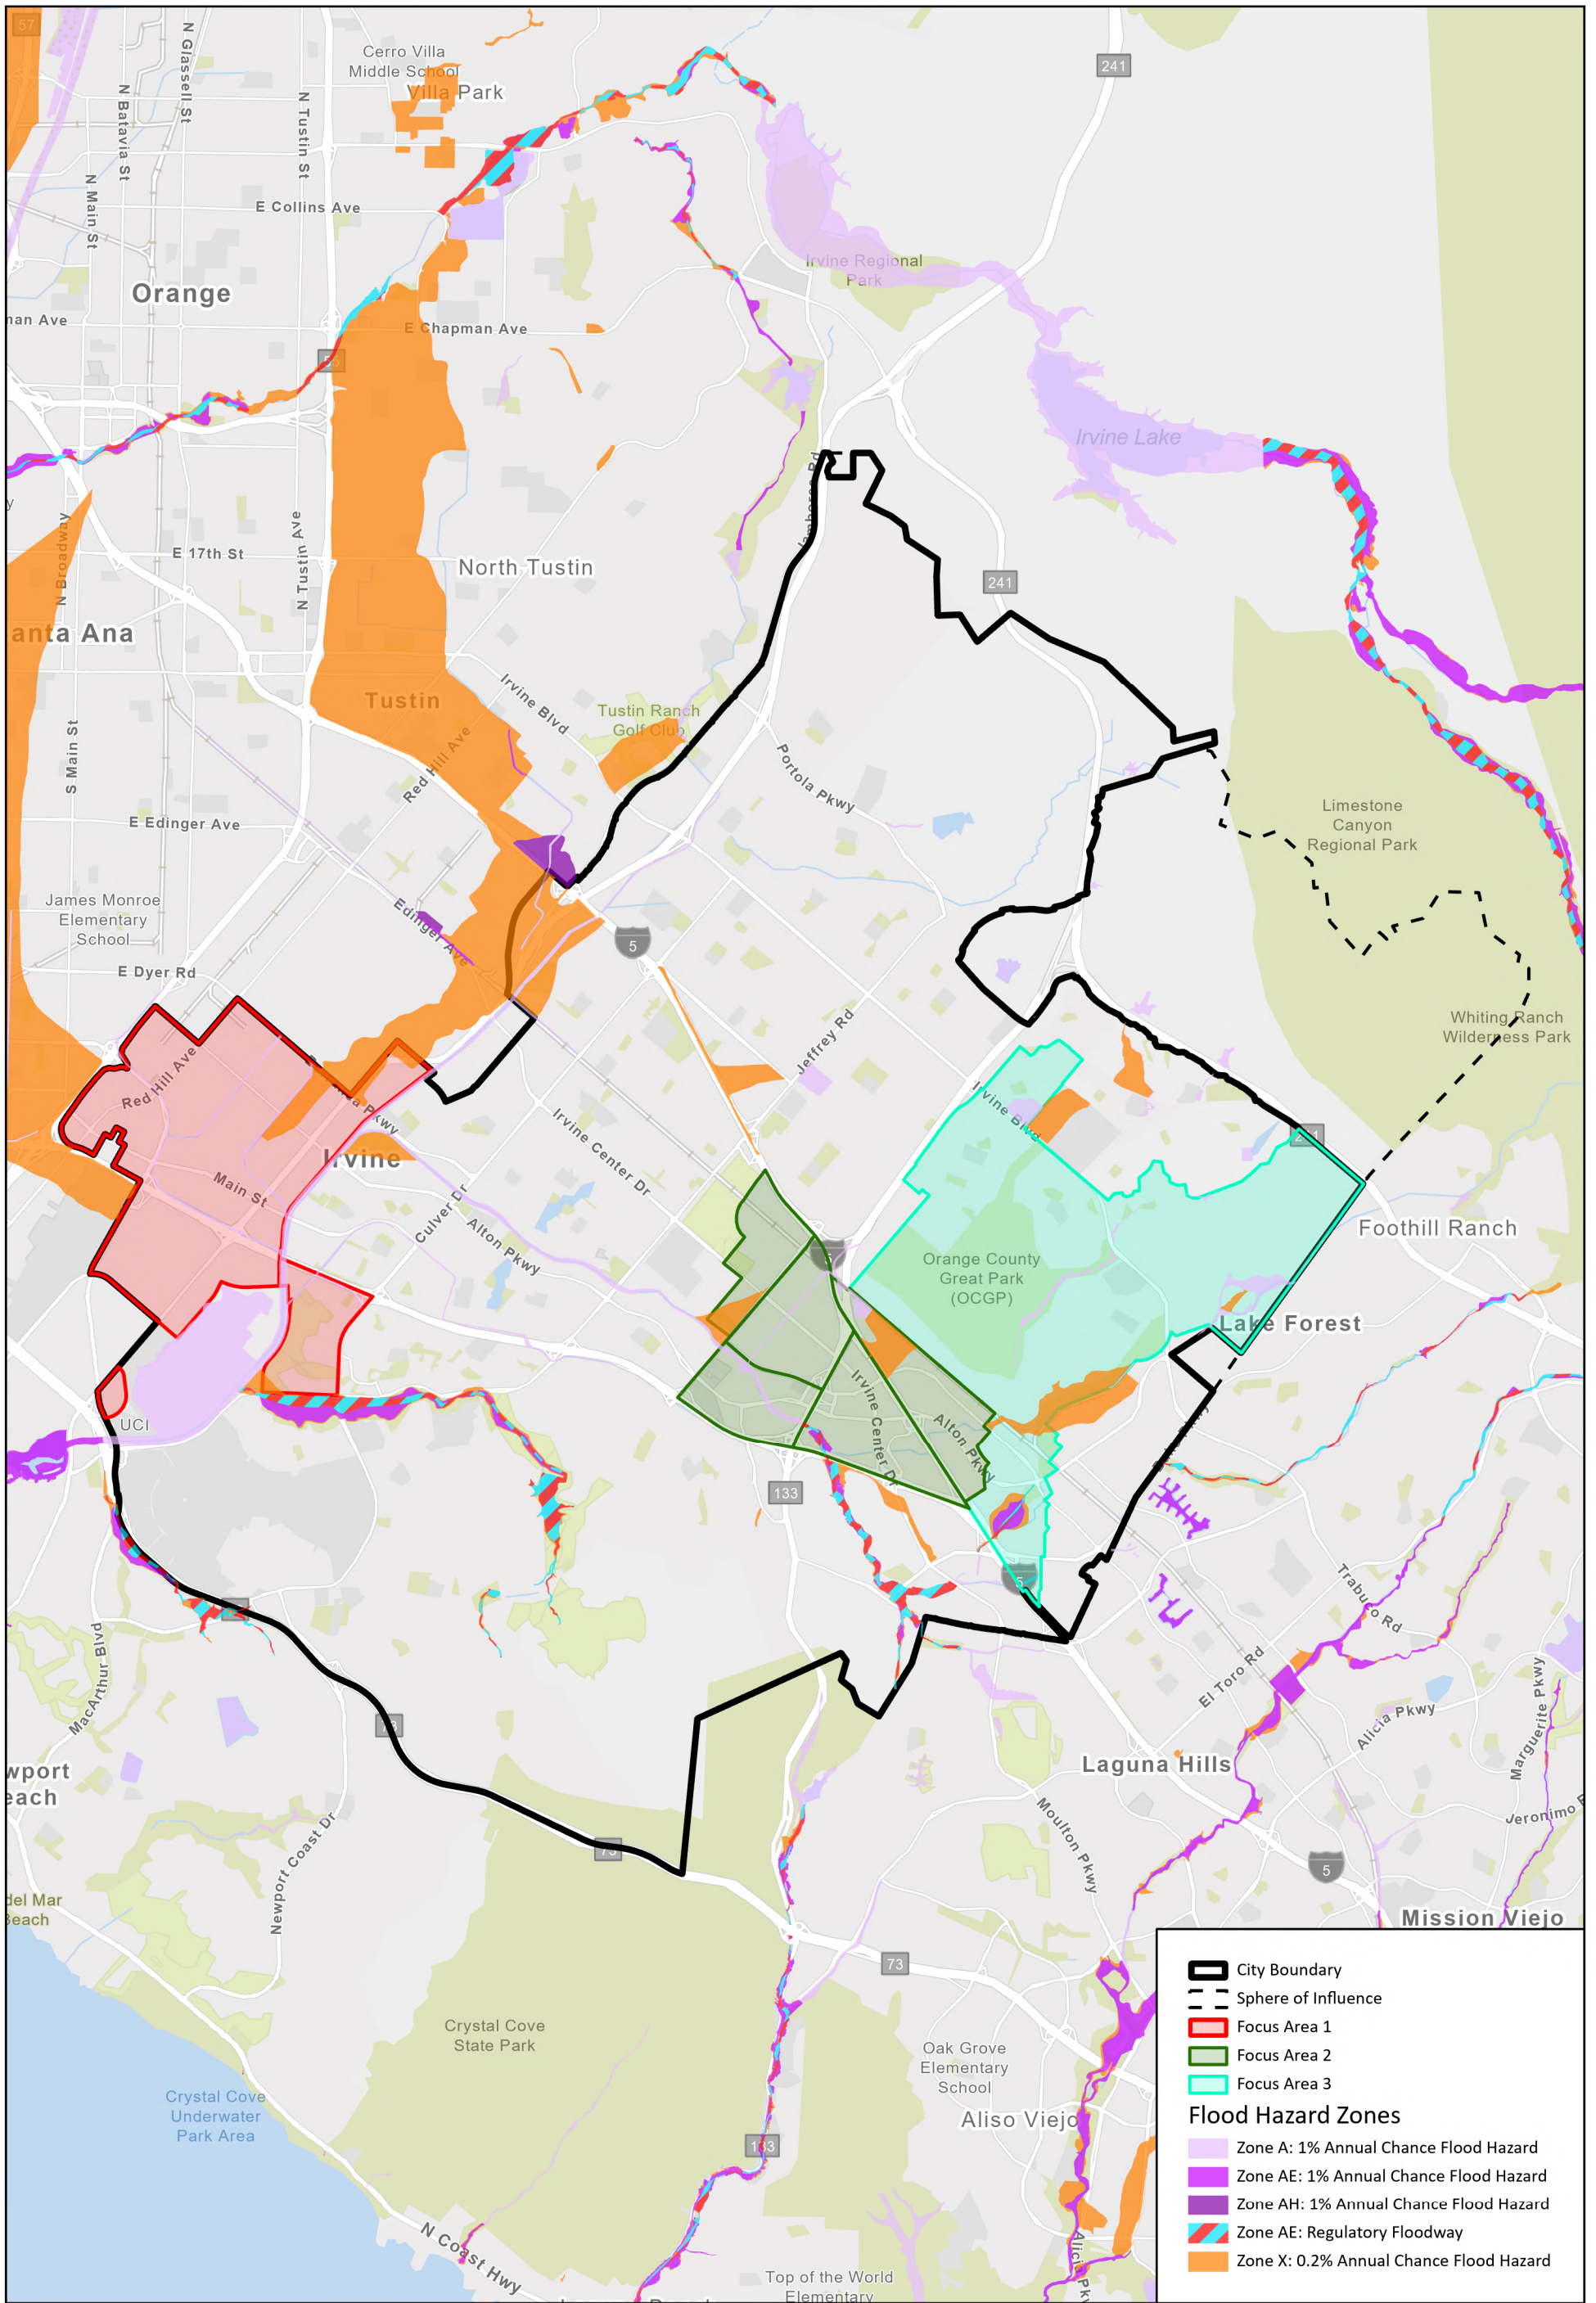

The National Flood Insurance Act (1968) established the National Flood Insurance Program, which is based on the minimal requirements for flood plain management and is designed to minimize flood damage within Special Flood Hazard Areas. The Federal Emergency Management Agency (FEMA) is the agency that administrates the National Flood Insurance Program. Special Flood Hazard Areas (SFHA) are defined as areas that have a 1-percent chance of flooding within a given year, also referred to as the 100-year flood. Flood Insurance Rate Maps (FIRMs) were developed to identify areas of flood hazards within a community. According to the Flood Zone determination, the City has several flood designations listed as Zone A, Zone AE, Zone AH, and Zone X (shaded). These zones are described below.

See Table 15 for description of the City’s flood zone designations.

**Table 15 FEMA Flood Zone Designations**

Zone Designation	Zone	Zone Description
Special Flood Hazard Area – With Base Flow Elevation or Depth	Zone A	Areas with a 1% annual chance of flooding and -a 26% chance of flooding over the life of a 30-year mortgage. Because detailed analyses are not performed for such areas; no depths or base flood elevations are shown within these zones.
	Zone AE	Areas with a 1% annual chance of flooding and a 26% chance of flooding over the life of a 30 year mortgage. Base flood elevations (BFE) are provided.
	Zone AH	Areas with a base floodplain, usually in the form of a pond, with an average depth ranging from 1 to 3 ft. where elevations (BFE) and flood hazard factors are determined.
Other Areas of Flood Hazard	Zone X	<u>Shaded</u> : Area of 500-year flood; area subject to the 100-year flood with average depths of less than 1 foot or with contributing drainage area less than one square mile; and areas protected by levees from the base flood. <u>Unshaded</u> : Area determined to be outside the 500-year floodplain
Source: FEMA, Glossary. Found here: <a href="https://www.fema.gov/about/glossary">https://www.fema.gov/about/glossary</a> .		

Any development within special flood hazard areas must follow FEMA and the City’s floodplain safety requirements, including flood analysis, proper setbacks, and sufficient pad elevations. The City also has preparation measures to protect residents and limit damage and infrastructure loss. See Figure 10 for a map of the FEMA flood zones within the Irvine GPU.

**City of Irvine Flood Zones**

**Figure 10**

2/29/2024

#### **4.2.1 REGIONAL FLOOD CONTROL MASTER PLAN**

Unlike many other cities in Orange County, Irvine was designed as a master planned community. The City is divided into planning areas. As each planning area was developed, they were required to implement the necessary storm drain system for the full buildout of the planning area. This was repeated for all planning areas, resulting in a well-functioning system.

The 1999 Regional Flood Control Master Plan for San Diego Creek serves as the comprehensive engineering and flood protection document for the City's regional flood control facilities. The OCFCD and Irvine use the master plan to regulate peak flow discharges and ensure that runoff is managed in accordance with the design parameters in the master plan. When the City processes major land use changes within the watershed, detailed studies and addendums to the master plan are required. The master plan is used to determine where detention and flow attenuation is required to match up with the ultimate conditions within the master plan.

Irvine contains both natural areas where stormwater can be recharged into the ground and urbanized areas that are dominated by impervious (nonporous) surfaces and other hardscapes. However, most waterways in the City are channelized for flood control purposes. Because growth in Irvine has been master planned, stormwater infrastructure has been improved incrementally as the City has grown, keeping pace as development has occurred. Deficiencies in the system are limited. Periodically, the OCPW scours the San Diego Creek channels to reduce sedimentation and ensure the proper functioning of channels.

## **CITY OF IRVINE STORMWATER MANAGEMENT**

The City of Irvine Public Works' Maintenance Division is responsible for the maintenance and upkeep of the City's public drainage facilities. The Maintenance Division's responsibilities include the annual inspection and cleaning of all City storm drains and catch basins, erosion control of slopes along City open channels, and other City drainage facilities, cleaning of debris and clearance of drainage systems after storm events, and the prevention of standing water issues/concerns in City right-of-way areas.

### **STORMWATER DESIGN FOR NEW DEVELOPMENT**

The City of Irvine requires new development to submit to the City for review and approval, a hydrology & hydraulics report that presents the analyses of the grading and stormwater design, along with conclusions that demonstrate that any increases in stormwater discharges will be mitigated with onsite detention systems. What is typically required is that the stormwater discharges associated with the new development do not exceed those of the existing or master-planned condition. Since much of the City is built-out with commercial, industrial, or residential development, many of the redevelopment projects may not require detention. However, sites that are currently undeveloped may require detention, to mitigate for additional discharges associated with the new development or to meet local hydromodification requirements associated with the stormwater Municipal Separate Storm Sewer System (MS4) permit.

#### **4.3 EXISTING WATER QUALITY REGULATIONS**

The City of Irvine is mandated by a federal National Pollutant Discharge Elimination System (NPDES) permit to implement Storm Water Runoff Management Programs. Unlike the sanitary sewer system, any discharge to the municipal storm drain system does not get treated and will ultimately end up in the ocean. The Storm Water Runoff Management Programs are therefore designed to protect the water quality and beneficial uses of the receiving water body, by requiring onsite water quality treatment of the stormwater prior to discharging offsite into the municipal storm drain system.

A project Water Quality Management Plan (WQMP) must be submitted for new development and significant redevelopment projects in the City of Irvine.

Project WQMPs describe how property owners/managers will comply with the post construction water quality requirements described in the City's National Pollutant Discharge Elimination System (NPDES) permit (issued by the Santa Ana Regional Water Quality Control Board), and the City's Local Implementation Plan (LIP). This project WQMP template has been designed to facilitate the expeditious review and approval of project WQMPs by the City's Building and Safety Division, and to reduce the number of revisions and re-submittals of project WQMPs before approval is granted. Project plans submitted for plan check must be consistent with the approved project WQMP, and the project WQMP must be approved prior to the issuance of building or grading permits.

The Water Quality Ordinance (No. 10-06) gives the City of Irvine adequate legal authority as may be necessary to carry out the requirements of the NPDES Permit and accomplish the requirements of the Clean Water Act.

In addition to the programs and requirements discussed above there are several state and regional regulations that focus on protecting storm water quality throughout the City and County region. They are described as follows.

### **COUNTY OF ORANGE MS4 PERMIT, DRAINAGE AREA MANAGEMENT PLAN (DAMP) & LOCAL IMPLEMENTATION PLANS (LIP)**

In May 2009, the Santa Ana RWQCB re-issued the North Orange County MS4 Storm Water Permit as WDR Order R8-2009-0030 (NPDES Permit No. CAS618030) to the County of Orange, the incorporated cities of Orange County, and the Orange County Flood Control District within the Santa Ana Region. Pursuant to this “Fourth Term” MS4 Permit, the Co-permittees were required to update and implement a Drainage Area Management Plan (DAMP) for its jurisdiction, as well as Local Implementation Plans (LIPs), which describe the Co-permittees’ urban runoff management programs for their local jurisdictions.

Under the City’s LIP, land development policies pertaining to hydromodification, and low impact development (LID) are regulated for new developments and significant redevelopment projects. The term “hydromodification” refers to the changes in runoff characteristics from a watershed caused by changes in land use condition. More specifically, hydromodification refers to “the change in the natural watershed hydrologic processes and runoff characteristics (i.e., interception, infiltration, overland flow, interflow and groundwater flow) caused by urbanization or other land use changes that result in increased stream flows and sediment transport.” The use of LID Best Management Practices (BMPs) in project planning and design is to preserve a site’s predevelopment hydrology by minimizing the loss of natural hydrologic processes such as infiltration, evapotranspiration, and runoff detention. LID BMPs try to offset these losses by introducing structural and non-structural design components that restore these water quality functions into the project’s land plan. These land development requirements are detailed in the County-wide Model Water Quality Management Plan (WQMP) and Technical Guidance Document (TGD), last updated in 2013, which Cities have incorporated into their discretionary approval processes for new development and redevelopment projects.

The LID hierarchy requires new developments and re-developments to implement BMPs under the LID hierarchy as described in the TGD. The LID hierarchy requires new projects to first attempt to infiltrate if feasible, then harvest and reuse, then biofilter stormwater runoff from their project site depending on site constraints. New projects and redevelopments within the City will follow the set hierarchy of BMP selection, and more runoff throughout the City will be effectively treated as development occurs.

### **TOTAL MAXIMUM DAILY LOADS (TMDLS)**

Once a water body has been listed as impaired on the 303(d) list, a TMDL for the constituent of concern (pollutant) must be developed for that water body. A TMDL is an estimate of the daily load of pollutants that a water body may receive from point sources, non-point sources, and natural background conditions (including an appropriate margin of safety), without exceeding its water quality standard. Those facilities and activities that are discharging into the water body, collectively, must not exceed the TMDL. In general terms, Municipal Separate Storm Sewer System (MS4) and other dischargers within each watershed are collectively responsible for meeting the required reductions and other TMDL requirements by the assigned deadline.

The Newport Bay Watershed was historically home to agricultural uses, but now contains the cities of Irvine, Tustin, Santa Ana, Costa Mesa, Lake Forest, Laguna Hills, Orange, and Newport Beach, and unincorporated areas of Orange County. Because of its historical agricultural uses and present urbanized uses, including industry and commerce, many of the waterways are impaired with various pollutants. TMDL allocations have been developed for the Newport Bay Watershed for nutrients, sediment, and toxics; there is also a fecal coliform TMDL for Newport Bay. Additional TMDL allocations are pending. Table 16 provides a list of impaired waterways in Irvine, type of contaminants causing the impairment, and estimated date for addressing the TMDL requirements<sup>19</sup>.

Presented below in Table 16 are the 303(d) list and TMDLs for the applicable regional channels and water bodies that receive flows from the Irvine GPU area.

**Table 16 List of 303(d) Impairments and TMDLs**

<b>Water Body / Channel</b>	<b>List of 303(d) Impairments</b>	<b>TMDL</b>
Borrego Creek Reach 2	Ammonia, Indicator Bacteria	N/A
Peter Canyon Channel	Benthic Community Effects, DDT, Indicator Bacteria, Malathion, pH, Selenium, Toxaphene, Toxicity	DDT, Toxaphene
San Diego Creek Reach 1	Benthic Community Effects, DDT, Indicator Bacteria, Malathion, Nutrients, Sedimentation/Siltation, Selenium, Toxaphene, Toxicity	Newport Bay/San Diego Creek Nutrient TMDL, Newport Bay Toxics TMDL,
San Diego Creek Reach 2	Sedimentation/Siltation, Nutrients, Indicator Bacteria, Benthic Community Effects, Toxicity	N/A

**IRWD NATURAL TREATMENT SYSTEMS**

In 1997, IRWD implemented a treatment program, by creating wetlands that use organisms, plants and soil to naturally remove bacteria, nitrogen and phosphorus from water. The wetlands at the San Joaquin Marsh and Wildlife Sanctuary in Irvine use this natural treatment process to handle urban runoff from San Diego Creek. Plants and

<sup>19</sup> Orange County Public Works, Drainage Area Management Plan, Appendix D - Newport Bay Watershed Chapter. February 2021. Found here: <https://ocerws.ocpublicworks.com/sites/ocpwocerws/files/2021-02/Newport%20Bay%20WAP.pdf>

soils in the manmade ponds take about seven to 10 days to remove nitrates and other pollutants and deliver cleaner water back into the creek before it makes its way through Upper Newport Bay to the ocean. The success of the program led to the expansion of the natural treatment system (NTS) created throughout the San Diego Creek watershed to enhance water to treat urban runoff prior to reaching the San Joaquin Marsh. There are approximately 40 smaller NTS systems currently built and operating with additional sites under consideration. Overall, the NTS program has resulted in a significant improvement in water quality for dry weather flows and smaller storm events resulting in the protection of existing receiving waters.

#### **4.3.1 EXISTING GROUNDWATER CONDITIONS**

The GPU area lies within the Orange County Groundwater Basin (OC Basin or Basin 8-1).<sup>20</sup> The OC Basin is the source of approximately 60 to 70 percent of the water supply for 2.3 million people. OCWD is responsible for managing the OC Basin. To maintain groundwater quality, OCWD conducts an extensive monitoring program that serves to manage the OC Basin's groundwater production, control groundwater contamination, and comply with all required laws and regulations. A network of nearly 700 wells provides OCWD a source for samples, which are tested for a variety of purposes. OCWD collects 600 to 1,700 samples each month to monitor Basin water quality. These samples are collected and tested according to approved federal and state procedures as well as industry-recognized quality assurance and control protocols.

The OC Basin also has prescribed groundwater beneficial uses and water quality objectives, which are described in greater detail in Appendix C of the Basin Plan.

#### **GROUNDWATER QUALITY**

Portions of the groundwater table beneath Irvine have high salts levels because of the natural geology and the history of agricultural use. The Irvine Desalter Project (IDP) includes five wells located near the I-5 freeway in Irvine. Salty water is pumped from these wells and sent to the IDP treatment facility. The treatment process uses reverse osmosis, decarbonation, and disinfection to make the water suitable for drinking purposes. The purified water provides 5,100 acre-feet or 1.6 billion gallons of drinking water, enough for 50,000 people per year.

The El Toro Groundwater Remediation program is designed to address trichloroethylene (TCE) in the groundwater basin beneath the former El Toro MCAS. TCE is a volatile organic compound that was used as a solvent for aircraft cleaning prior to the development of stricter environmental regulations. The IRWD, OCWD, and federal authorities are pumping water from a three-square-mile plume, treating the water, and returning the cleaned water to irrigate landscaping. This program provides 1.3 billion gallons of clean water annually.

Nitrate is one of the most common and widespread contaminants in groundwater supplies. Elevated levels of nitrate originate from fertilizer use, animal feedlots,

---

<sup>20</sup> Map of the Orange County Groundwater Basin. Found here:  
<https://www.ocwd.com/media/3656/threelayerbasinmodelextent.pdf>

wastewater disposal systems, and other sources. Plants and bacteria break down nitrate, but excess amounts can leach into groundwater. Certain portions of Irvine have nitrate levels exceeding MCLs established in state law. IRWD Wells 21 and 22 contain nitrate at levels exceeding the primary MCL of 10 mg/L and total dissolved solids concentrations above the secondary MCL. IRWD has therefore constructed a reverse osmosis treatment facility to reduce concentrations in the water to meet state water quality standards before conveying water to the potable supply distribution system.

Selenium is a naturally occurring micronutrient found in soils and groundwater in the Newport Bay Watershed. Selenium is essential for reproductive health and immune system function in humans, fish, and wildlife. However, selenium bio-accumulates in the food chain and can cause public health concerns. Prior to urban development, the Irvine Subbasin contained an area known as the Swamp of the Frogs. Runoff from local foothills over thousands of years accumulated selenium-rich deposits in the swamp. To make this region suitable for farming, drains and channels were constructed. This mobilized selenium from sediments into the shallow groundwater. Thus, the Nitrogen and Selenium Management Program was formed to develop and implement a work plan to address selenium and nitrate in the watershed to comply with the requirements of NPDES Permits issued by the Santa Ana RWQCB.

### **Sustainable Groundwater Management Act**

The California Sustainable Groundwater Management Act ("SGMA"), a three-bill package signed into law in 2014, creates a framework for the management of groundwater sources throughout the state. Under SGMA, local agencies form Groundwater Sustainability Agencies ("GSAs") and create Groundwater Sustainability Plans (GSPs). If a GSA is not formed, special act districts, such as OCWD, can submit "Alternative Plans" to GSPs. Timelines and requirements are based upon basin priority. Under SGMA, the Orange County Groundwater Basin (Basin 8-1) is considered a medium-priority basin.

In January 2017 OCWD, the City of La Habra, and Irvine Ranch Water District submitted the Basin 8-1 Alternative Plan. The Alternative Plan incorporates the requirements of GSPs and is considered "functionally equivalent" to a GSP. The Alternative Plan analyzes existing basin conditions and demonstrates that the Basin has been operated within its sustainable yield for more than 10 years without degrading water quality, reducing storage, or lowering groundwater levels. The Alternative Plan will be updated and resubmitted every 5 years as part of SGMA requirements.

Under the Alternative Plan, four management areas have been created for the Orange County Groundwater Basin. Each of these management areas has slightly different management goals and strategies based on the government bodies that serve them. The management areas are as follows:

- ***La Habra-Brea Management Area***
  - Includes the northern portion of the Basin located outside of the OCWD service area.
- ***OCWD Management Area***
  - Includes OCWD's service area, covering approximately 89% of the Basin.
- ***South East Management Area***

- Includes the southern and southeastern portions of the Basin that are outside of OCWD's service area.
- **Santa Ana Canyon Management Area**
  - Includes the eastern portion of the Basin outside of OCWD's service area.

As the OC Basin is a medium priority basin, details regarding sustainable groundwater basin management will be required for future projects within the Irvine GPU area that trigger Senate Bill 610 and the development of a Water Supply Assessment (WSA). Projects that require the development of a WSA include residential developments over 500 dwelling units, shopping centers having 500,000 sf or more of floor space, a hotel with more than 500 rooms, a commercial office building with 250,000 sf of floor space, an industrial land use over 40 acres of land or 650,000 sf of floor area, or a mixed-use project that includes any combination of the limits noted above.

## **DRINKING WATER QUALITY**

The Irvine Ranch Water District strives to provide residents and business consumers with safe drinking water supplies. IRWD, OCWD, and the Metropolitan Water District of Southern California (MWD) conduct extensive testing for regulated and unregulated chemicals in their water supplies. OCWD manages the quality of the groundwater basin, MWD supplies imported treated surface water, and IRWD operates a surface water treatment plant and several ground water treatment plants.

Communities are required to adhere to stringent state regulations regarding primary and secondary drinking water standards. Primary standards are legally enforceable standards that are needed to protect public health. Secondary standards affect the color, appearance, and taste of drinking water, but are not health-related standards. Adherence to standards is measured in terms of maximum contaminant levels allowed in drinking water. Progress toward public health goals, as described below, is also required to be reported.

The EPA, the Office of Environmental Health Hazard Assessment, and the SWRCB Division of Drinking Water have set voluntary drinking water quality goals for some contaminants. The most common measure is public health goals (PHGs). Water quality goals are often set at such low levels that they are not achievable in practice and are not directly measurable. Nevertheless, these goals provide useful guideposts and direction for water management practices. IRWD strives to meet PHGs although state and federal law do not require adherence. IRWD produces an annual consumer confidence report that tracks the quality of Irvine's drinking water. IRWD continues to meet and/or exceed all primary and secondary drinking water standards that are required by state and federal law<sup>21</sup>.

---

**4.3.2 CAPITAL IMPROVEMENT PLANS**

**City of Irvine, Public Drainage Program** – There are three water quality improvements project currently in the City of Irvine, all occurring at the Great Park or PA 51. These CIPs are described in Table 18 and consists of improvements to the Great Parks water quality infrastructure, landscape enhancements, and utility modifications. All of these projects ensure water quality systems, irrigation components, and pond utility connections function at maximum efficiency. Table 18 identifies applicable City CIP projects.

**Table 17 Drainage System Capital Improvement Plans – City of Irvine**

Project Name	CIP Year	Project Description
Great Park Site Utility Infrastructure (CIP: 361612)	FY 23-24 Construction Phase <sup>1</sup>	Modification of the utility and water quality infrastructure to enable the addition, relocation and reconnection of various utility lines and service to new backbone infrastructure.
Great Park Western Sector Water Quality Basins (CIP: 361921)	FY 23-24 Design Phase <sup>1</sup>	The project consists of designing the plan for rehabilitation and modification of the storm water recirculation system for the Western Sector. This plan will detail the re-engineering and installation of effective water treatment and filtration systems. Additional water fountain features have been added to the scope of work.
Great Park Water Quality Enhancements (CIP: 371804)	FY 23-24 DesignPhase <sup>1</sup>	Design and installation of Western Sector water quality landscape enhancements and utility modifications
Sources <sup>1</sup> City of Irvine, Capital Improvement Program (CIP) Map. Accessed. March 2024 Found here: <a href="https://www.cityofirvine.org/public-works-department/interactive-capital-improvement-projects-map">https://www.cityofirvine.org/public-works-department/interactive-capital-improvement-projects-map</a>		

**OC Public Works**– OC Public Works Infrastructure Programs provides engineering services for regional flood control programs, such as OCFCD, throughout Orange County. OC Public Works manages the design of the County’s horizontal infrastructure, roadways, bridges, bikeways, channels, storm drains, dams, pump stations and other drainage related facilities. OC Public Works maintains a 7-year CIP list with several proposed projects within the City of Irvine which is in the design and construction phase for 2022-2023 year. See Table 18 for a summary of CIP projects lead by OC Public Works within the City and Focus Areas.<sup>22</sup>

**Table 18 Drainage System Capital Improvement Plans – OC Public Works**

Project Name	CIP Year	Project Description
NC IRWM Projects: William Mason Regional Park & UC Irvine WIPS Project	5-10 years Planning <sup>1</sup>	The project consists of diversion of runoff from F15P11 to natural treatment systems and then to the existing lake, diversion of Sand Canyon Channel, a storm drain line, a

<sup>22</sup> OCFCD 7-year Capital Improvement Program 2023-24 to 2029-30. Projects found at the link below: <https://ocpw.maps.arcgis.com/apps/Shortlist/index.html?appid=1e3a74d5dcb744fb9bab39f427fb0079>

		tank at the UCI Cheerleader Field, and a pump for water to the UCI Marsh.
NC IRWM Projects: NCWMA OCWD South OC Water Storage in OCWD	FY 25-26 In Design Water Supply <sup>1</sup>	Store additional water in the OCWD groundwater basin for use by interested south Orange County retail agencies for emergency supply.
NC IRWM Projects: Lane Channel (F08), Jamboree to Main Phase 1 OCPW	FY 23-24 In Design Flood Management <sup>1</sup>	This project will rehabilitate the existing dilapidated channel to pre-storm damage existing condition to convey the design discharge. Work on the channel will bring the status back to US Army Corps standings of receiving funding from PL84-99.
NC IRWM Projects: San Diego Creek Diversion/Trash Removal Project – Newport Beach	FY 23-24 Water Quality <sup>1</sup>	This project would mirror the Santa Ana-Delhi Channel Diversion project to (1) capture all dry weather trash and trash from a first flush storm, and (2) divert nuisance flows to OCSW for eventual use in the Groundwater Replenishment System.
NC IRWM Projects: Barranca Channel (F09), F05 Confluence to Barranca Pkwy	FY 23-24 Flood Management <sup>1</sup>	This project will rehabilitate the existing dilapidated channel to pre-storm damage existing condition to convey the design discharge. Work on the channel will bring the status back to US Army Corps standings of receiving funding from PL84-99.
NC IRWM Projects: Lane Channel (F08), F05 Confluence to SR-55 Freeway Phase 2	FY 26-27 In Design <sup>1</sup>	This project will rehabilitate the existing dilapidated channel to pre-storm damage existing condition to convey the design discharge. Work on the channel will bring the status back to US Army Corps standings of receiving funding from PL84-99.
OCPW - Santa Ana-Delhi Channel (F01)	FY 23-24 <sup>1</sup>	The project consists of widening portions of the channel to create additional habitat area, restoring channel slopes to convey a 100-year storm event, and replacing the existing bicycle bridge to allow continued coastal access.
MIP Construction Projects: Barranca Channel (F09) MIP Repair Phase 1A	FY 23-24 Active <sup>2</sup>	This project will excavate the earthen slope and invert. Remove & repair existing riprap. Install new riprap. Remove & replace CAB on maintenance road.
MIP Construction Projects: Borrego Canyon Channel (F20) Concrete Repairs	FY 24-25 Future <sup>2</sup>	This project will install a concrete invert and implement miscellaneous concrete repairs.

As shown above in Table 17 and Table 18, there are multiple CIP projects within the Irvine GPU area over the next ten years. These projects will improve the regional drainage infrastructure serving the GPU and its focus areas.

#### **4.4 PROPOSED STORMWATER CONDITION AND CEQA THRESHOLD ANALYSIS**

California Environmental Quality Act (CEQA) significance criteria are used to evaluate the degree of impact caused by a development project on environmental resources such as hydrology and water quality. According to Appendix G of the CEQA Guidelines<sup>23</sup>, a project would normally have a significant effect on the environment if the project would impact any of the items listed below.

Would the Project:

- A. Violate any water quality standards or waste discharge requirements or otherwise substantially degrade surface or groundwater quality?
- B. Substantially decrease groundwater supplies or interfere substantially with groundwater recharge such that the project may impede sustainable groundwater management of the basin.
- C. Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river or through the addition of impervious surfaces, in a manner which would:
  - (i) Result in a substantial erosion or siltation on- or off-site;
  - (ii) Substantially increase the rate or amount of surface runoff in a manner which would result in flooding on- or offsite;
  - (iii) Create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff; or
  - (iv) Impede or redirect flood flows?
- D. In flood hazard, tsunami, or seiche zones, risk release of pollutants due to project inundation?
- E. Conflict with or obstruct implementation of a water quality control plan or sustainable groundwater management plan?

Should the answers to these environmental factors prove to be a potentially significant impact, mitigation measures would be required to reduce those impacts to a less-than-significant threshold.

#### ***Impact A: Violate any water quality standards or waste discharge requirements or otherwise substantially degrade surface or groundwater quality?***

**Impact Analysis:** Construction activities within the GPU area could potentially result in soil erosion and temporary adverse impacts to surface water quality from construction materials and wastes if left unregulated or unmitigated.

---

<sup>23</sup> California Natural Resources Agency, CEQA appendix G. Found here:  
<https://resources.ca.gov/CNRALegacyFiles/ceqa/docs/ab52/final-approved-appendix-G.pdf>

Implementation of State and Local regulations will effectively mitigate construction storm water runoff impacts from the proposed land use changes that take place during construction. Standard erosion control practices shall be implemented for all construction within the City. Additionally, construction sites over one acre will be required to prepare and implement a Storm Water Pollution Prevention Plan (SWPPP) in accordance with the requirements of the Statewide Construction General Permit and subject to the oversight of the Santa Ana Regional Water Quality Control Board. The SWPPP must include BMPs to reduce or eliminate erosion and sedimentation from soil disturbing activities, as well as proper materials and waste management. Implementation of these State and Local requirements would effectively prohibit projects from violating any water quality standards or waste discharge requirements resulting from construction activities.

In terms of post-construction related impacts, the incorporation of site design, LID features and BMPs as required under the County of Orange MS4 Permit implemented by the City of Irvine are designed to protect surface waters and groundwater. The redevelopment of existing non-residential sites into the proposed higher density residential land uses will result in improvement to water quality runoff based on the implementation of water quality BMPs that likely do not exist under current conditions.

The individual development and redevelopment projects within the GPU will effectively retain or treat the 85th percentile 24-hour stormwater runoff for pollutants such as bacteria, metals, nutrients, oil & grease, organics, pesticides, sediment, trash, and oxygen demanding substances prior to discharge off their property. As properties within the City undergo redevelopment, existing properties that do not have water quality BMPs will be replaced with projects incorporating LID BMPs. Therefore, long-term surface water quality of runoff from the GPU areas would be expected to improve over existing conditions as more LID BMPs are installed and implemented. This is considered an overall benefit of the proposed land use changes associated with implementation of the GPU. Impacts to surface water and groundwater quality will be less than significant.

***Impact B: Substantially decrease groundwater supplies or interfere substantially with groundwater recharge such that the project may impede sustainable groundwater management of the basin.***

**Impact Analysis:** Since groundwater is actively managed throughout the City by numerous water agencies and stakeholders, individual projects will not utilize site-specific wells for groundwater supply. All groundwater is managed through OCWD and the water retailers and planning documents such as the Urban Water Management Plans. It is also likely that through LID features, infiltration will be feasible in specific areas throughout the City and will augment groundwater recharge. Through management by the local water districts, land development and redevelopment within the City will not result in interference with groundwater recharge or management of the groundwater basin. Therefore, the impacts are expected to be less than significant.

***Impact C: Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river or through the addition of impervious surfaces, in a manner which would:***

- (i) Result in a substantial erosion or siltation on- or off-site;
- (ii) Substantially increase the rate or amount of surface runoff in a manner which would result in flooding on- or offsite;
- (iii) Create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff; or
- (iv) Impede or redirect flood flows?

**Impact Analysis:** Under the existing conditions and proposed conditions, drainage patterns will largely be maintained and will utilize the existing drainage facilities within the public right of way. The majority of the development to occur through the proposed land use changes will be in-fill of vacant lots (new development) or redevelopment of existing non-residential properties into high density residential. In both circumstances, the surrounding area has already been developed and the overall drainage patterns, the primary public storm drain system and points of connection are set. Implementation of the proposed land uses will rely on the existing drainage systems to convey runoff. Current runoff is captured and conveyed by existing City or County storm drain infrastructure throughout the City before discharging to regional County flood control facilities and channels. From there, the runoff is ultimately discharged into Newport Bay. The City is primarily built-out, and no major changes in storm flows are anticipated. As noted previously, the City and the County have policies in-place that would require design and installation of detention systems to mitigate peak flows for certain development projects, and/or if downstream drainage facilities ever become deficient.

In addition, most storm drainage structures, streams, and channels that collect and convey runoff within the City are concrete-lined and not susceptible to scour or erosion. For areas that are tributary to streams that may be susceptible to scour, hydromodification requirements, as part of the regional MS4 permit, and will ensure that impacts are minimized. Overall impacts to erosion and siltation, because of GPU land use changes, are anticipated to be less than significant.

***Impact D: In flood hazard, tsunami, or seiche zones, risk release of pollutants due to project inundation?***

**Impact Analysis:** The majority of the City of Irvine is located outside the 100-year flood zone, and therefore potential impacts to flooding in the City are less than significant. Areas of the City within FEMA designations of Zone A, AE, or AH represent areas where there is a 1% chance of annual flood hazard. All development within these areas will require conformance with FEMA requirements along with pad elevations and setbacks to adequately protect structures from flood hazards. These requirements are typically implemented through the City, and impacts are also considered less than significant for these areas when meeting all FEMA requirements. The City is not subject to impacts

from tsunami or seiche zones, and thus risks from these hazards are not applicable.

***Impact E: Conflict with or obstruct implementation of a water quality control plan or sustainable groundwater management plan?***

**Impact Analysis:** New development and redevelopment within the City of Irvine does not impact implementation of local or regional water quality control plans or sustainable groundwater management plans. All development within the City will follow the Santa Ana Regional Water Quality and Control Boards MS4 permit. Groundwater levels are managed by various stakeholders, and development projects with infiltration will be reviewed for conformance with groundwater management goals. Impacts to water quality and groundwater management will be less than significant.
