NOP and Comment Letters

## NOTICE OF PREPARATION

### Program Environmental Impact Report Irvine 2045 Focused General Plan Update

**Date:** July 21, 2023

**To:** Reviewing Agencies, Interested Parties, and Organizations

**Subject:** Notice of Preparation of a Program Environmental Impact Report for the Irvine 2045 General Plan Update

**Scoping Meeting:** Tuesday, August 1, 2023 at 6:00 p.m.  
Virtual meeting accessible at the following link:  
<https://us06web.zoom.us/j/85141324890?pwd=eWdCN2NQaURTN21Vd245VmRHWE8zZz09>  
Passcode: 085026

**Comment Period:** July 21, 2023 to August 21, 2023

The City of Irvine (City) is preparing the 2045 Focused General Plan Update (project) that will serve as the long-range vision of the City for the next 20 to 25 years. The City as the lead agency has determined that the project will require the preparation of a Program Environmental Impact Report (Program EIR) in compliance with the California Environmental Quality Act (CEQA; California Public Resources Code, Section 21000 et seq.), and Title 14 of the California Code of Regulations (CCR; hereafter CEQA Guidelines, 14 CCR 15000 et seq.). The City has prepared this Notice of Preparation (NOP) in accordance with CEQA Guidelines Sections 15082(a) and 15375.

We need to know your views or the views of your agency or organization as to the scope and content of the environmental information that is germane to your agency's statutory responsibilities in connection with the project. If applicable, your agency will need to use the Program EIR prepared by our agency when considering your permit(s) or other approval(s) for the project. The project description, location, and the potential environmental effects are contained in the attached materials. Since the City has determined that a Program EIR is required for the project, pursuant to Section 15060(d) of the CEQA Guidelines (14 CCR 15000 et seq.), preparation of an Initial Study is not required and, therefore, one has not been prepared. Due to time limits mandated by state law, your response to this NOP must be submitted at the earliest possible date but no later than the close of the NOP review period, which runs as follows: July 21, 2023 to August 21, 2023. Written comments should be addressed to:

Marika Poynter  
City of Irvine  
1 Civic Center Plaza  
Irvine, CA 92606-5207  
mpoynter@cityofirvine.org

**Project Title:** Irvine 2045 Focused General Plan Update

**Project Applicant:** City of Irvine

## **PROJECT SETTING**

The City and its sphere of influence (SOI) encompass over 66 square miles located within the coastal and foothill region of central Orange County. Irvine is adjacent to the cities of Newport Beach, Lake Forest, Tustin, Santa Ana, Laguna Hills, Laguna Woods, and Laguna Beach. The City is a growing community with an increasing need for housing to accommodate its population. According to the California Department of Finance (DOF), the City has a total population of 303,051 (including 16,432 living in group quarters), which represents a 43 percent increase since 2010 and a 112 percent increase since 2000. The City of Irvine is the second largest jurisdiction in the County of Orange.

## **PROJECT DESCRIPTION**

With the adoption of the certified 2021-2029 Housing Element in May 2022, the City is required to update the appropriate elements of the General Plan to accommodate the residential site inventory from the 2021-2029 Housing Element. This includes updates to the land use element and the circulation element. Additionally, the City would update the open space element, safety element, and noise element to address statutory requirements. The City would introduce an environmental protection and climate action element and would also incorporate health and wellness throughout the updated General Plan. The project would provide long-term policy direction and communicate the vision, values, and goals for the City's physical development and overall quality of life. The project would serve to identify areas of opportunity and provide options to enhance development in key focus areas of the City.

Consistent with the 2021-2029 Housing Element, the project would update the General Plan land use element to support the City's Regional Housing Needs Assessment (RHNA) of 23,610 units. To ensure consistency with housing statute, including no-net loss and affirmatively furthering fair housing requirements, the 2021-2029 Housing Element identified adequate sites to accommodate 57,656 new residential units. The City's existing General Plan has a significant amount of unbuilt non-residential square footage available throughout the planning areas identified in the 2021-2029 Housing Element site inventory that would be available to convert to residential at a rate of 60 percent. This results in a residential equivalent of 23,113 units. Additionally, there are a remaining 4,249 units entitled throughout the City in the General Plan. As a result, the City would need to add an additional 30,294 new units to the General Plan. Specifically, to accommodate the City's RHNA requirement for new residential units, the project would implement 2021-

2029 Housing Element through the introduction of additional residential and/or mixed-use development throughout the City using overlay zones and/or specific plans to allow greater flexibility for property owners and developers. The overlays would promote higher density residential and mixed use in three main focus areas, targeted retail centers, conversion of hotel/motel, and on religious and school sites. The majority of the future residential growth would occur in the three main focus areas that are most suited for new growth and development as they are located near existing job centers, are along major travel corridors with access to existing and future public transit opportunities. Descriptions of these three key focus areas with the majority of the future residential potential are presented below:

- Focus Area 1 – Greater Irvine Business Complex Area: Planning Area 36 (Irvine Business Complex) and Planning Area 19 (Rancho San Joaquin) : Focus Area 1 includes expanding a residential and/or mixed-use overlay to the entire Irvine Business Complex (IBC) and the specific sites identified in the 2021-2029 Housing Element site inventory located in Rancho San Joaquin. Over the past 20 years, the IBC has transitioned from predominantly non-residential uses to a mixed-use area that is currently governed by the 2007 IBC Vision Plan. Under the existing General Plan, the IBC has a maximum of 15,000 units. The IBC continues to be one of the two employment centers located within the City and remains an opportunity area for high density residential. The IBC is connected to the Tustin Transportation Center (Metrolink and OCTA transit service) through the iShuttle and has direct access to Interstate 405, State Route 73, and State Route 55. The project proposes a new residential overlay and/or specific plan that would increase the total number of residential permitted in the Greater Irvine Business Complex Area by an additional 15,000 units.
- Focus Area 2 - Greater Spectrum Area: Planning Area 13 (Irvine Spectrum 4), Planning Area 31 (Irvine Spectrum 6), Planning Area 32 (Irvine Spectrum 3), and Planning Area 33 (Irvine Spectrum Center): The Greater Spectrum Area incorporates three non-residential planning areas (13, 31, and 32) that are located adjacent to the Irvine Spectrum Center area, are emerging employment centers, are located near the Irvine Transportation Center (ITC – Metrolink, Amtrak, and OCTA transit service), and with the introduction of a residential overlay and/or specific plan could transition to a network of micro-villages or residential nodes, connected by a variety of multi-modal and complete street strategies that provide new opportunities for residents and businesses in Irvine. The project proposes a new residential overlay and/or specific plan that would introduce a total number of 20,000 residential units to the Greater Spectrum Area.
- Focus Area 3 – Great Park Neighborhood Transit Village: Planning Area 51 (Great Park Neighborhood): The Great Park Neighborhood is an existing mixed-use planning area that features a mix of residential products at varying densities surrounding the Irvine Great Park. There are approximately 1,900 units remaining in the existing General Plan intensity, but a significant amount of the planning area remains vacant with no additional residential intensity. The project would increase

the number of residential units permitted in the Great Park with a focus on higher density product located near or adjacent to the ITC. The Great Park Neighborhood Transit Village area would have direct access to Focus Area 2, the Greater Spectrum Area through a network of proposed multi-modal improvements. The project would increase the residential intensity in Planning Area 51 by an additional 13,989 residential units.

The remaining units required by the City's RHNA assessment would be accommodated outside of the aforementioned focus areas, throughout the City, using the same residential overlays and/or specific plans. The project would encourage a micro-village approach, building upon the City's current approach to master planning in the City of Irvine. Utilizing a micro-village approach to planning would ensure that future development is balanced with a mix of uses including neighborhood supporting square footage, open space, and non-residential square footage that are connected through multi-modal transportation and complete street strategies. Figure 1 presents the boundaries of the three focus areas.

## **PROBABLE ENVIRONMENTAL EFFECTS**

The City has determined that a Program EIR will be prepared for the project. Section 15168 of the CEQA Guidelines states that a Program EIR may be prepared on a series of actions that can be characterized as one large project and are related either: (1) geographically; (2) as logical parts in the chain of contemplated actions; (3) in connection with issuance of rules, regulations, plans, or other general criteria to govern the conduct of a continuing program; (4) as individual activities carried out under the same authorizing statutory or regulatory authority and having generally similar environmental effects that can be mitigated in similar ways.

The Program EIR will be prepared in accordance with the requirements of CEQA Statute and Guidelines, as amended. Pursuant to Section 15146 of the CEQA Guidelines, the degree of specificity in the Program EIR will correspond to the degree of specificity involved in the project. The Program EIR will focus on the primary effects that can be expected to follow from adoption of the project and would allow future development in the three specific focus areas to move forward with streamlined environmental review. Specific development or construction projects within the three focus areas may be required to prepare subsequent site-specific analysis as required by the Program EIR, including traffic and/or access related studies. Based on the preliminary analysis of the project, the following environmental impact categories and their associated impact thresholds will be examined in the Program EIR: Aesthetics, Agricultural/Forest Resources, Air Quality, Biological Resources, Cultural Resources, Energy, Geology and Soils, Greenhouse Gas Emissions, Hazard/Hazardous Materials, Hydrology/Water Quality, Land Use/Planning, Mineral Resources, Noise, Population/Housing, Public Services, Recreation, Transportation, Tribal Cultural Resources, Utilities/Service Systems, and Wildfire.

The Draft Program EIR will address the short- and long-term effects of the project on the environment. A mitigation framework will be proposed for impacts that are determined to

be significant. A mitigation monitoring program will also be developed as required by Section 15100 of the CEQA Guidelines.

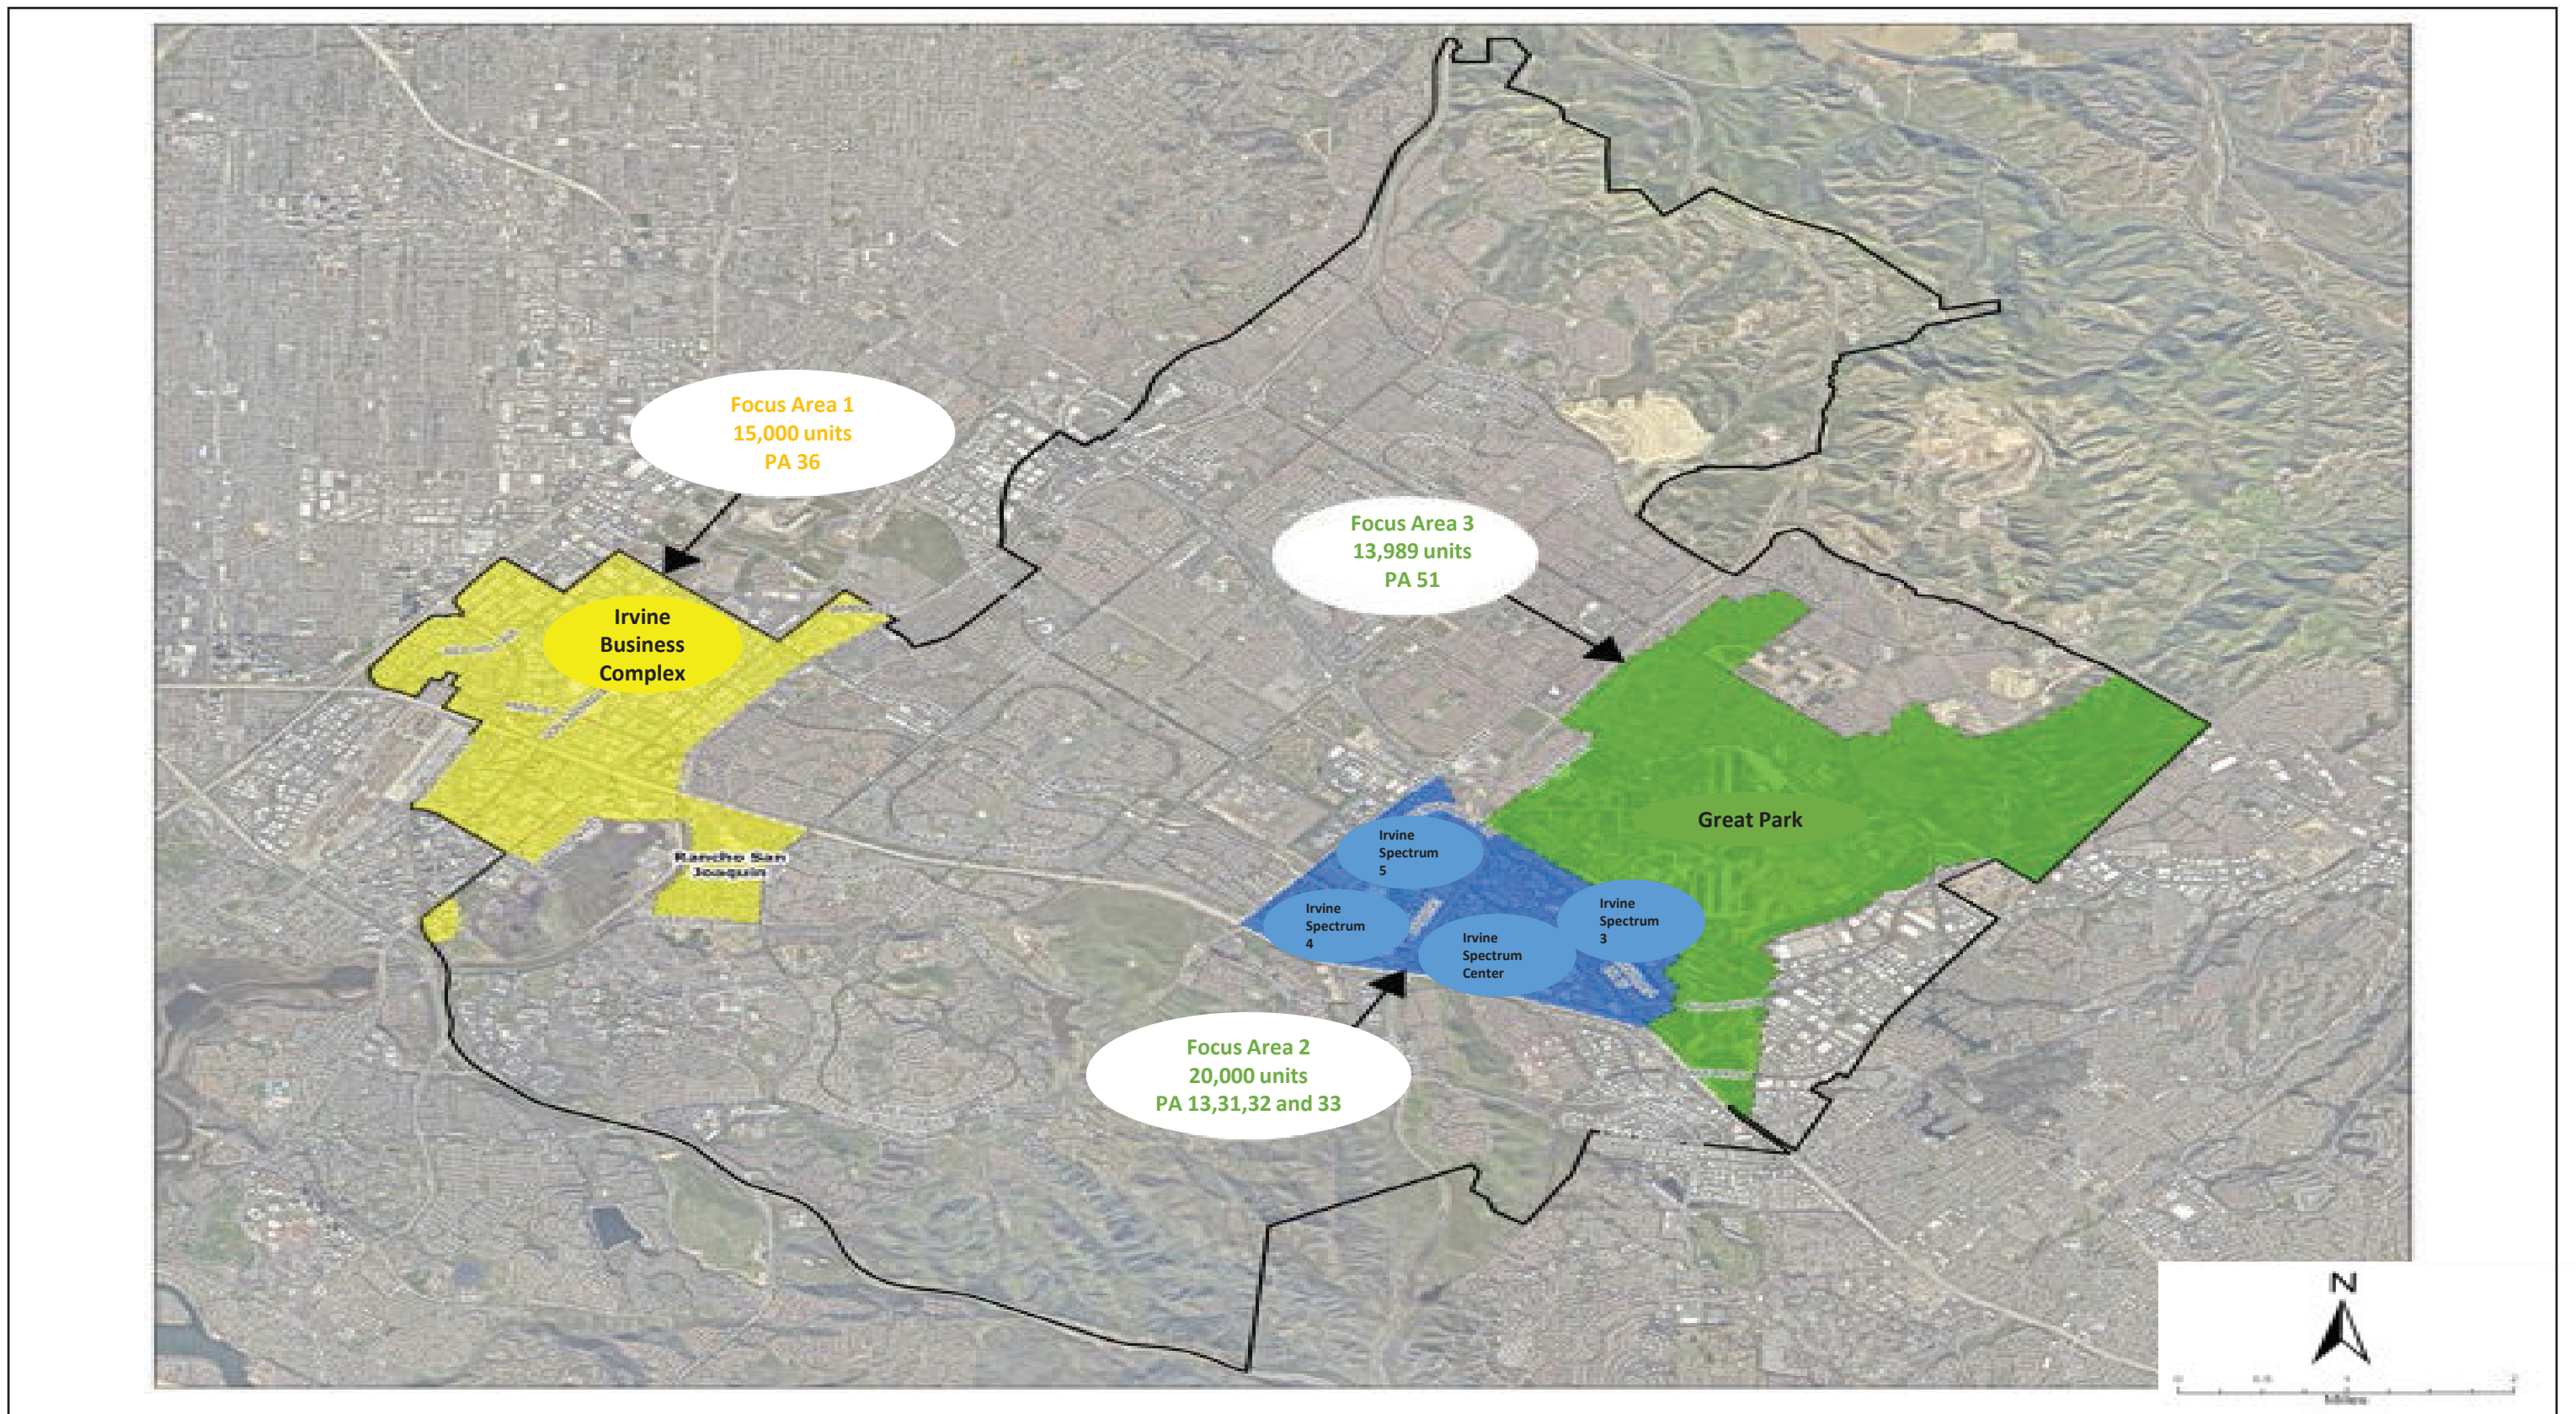

**SCOPING MEETING**

Pursuant to Section 21083.9(a)(2) of CEQA (California Public Resources Code, Section 21000 et seq.), scoping meetings are required for projects that may have statewide, regional, or area-wide environmental impacts. The City has determined that this project meets this threshold. A public scoping meeting has been scheduled and will be held by the City on Tuesday, August 1, 2023 at 6:00 p.m. The meeting will be virtual and can be accessed at the link provided above. Verbal and written comments regarding the scope of the proposed Program EIR will be accepted at the meeting. Written comments can also be mailed to the above-mentioned address, addressed to Marika Poynter, before the close of the NOP public comment period.

Please contact Marika Poynter at [mpoynter@cityofirvine.org](mailto:mpoynter@cityofirvine.org) with any questions regarding this notice or the scoping meeting.

  
Marika A Poynter  
Manager of Planning Services

**Subject:** Notice of Preparation of a Program EIR for the Irvine 2045 General Plan Update

Dear Ms. Poynter:

Thank you for the opportunity to provide comments on the Notice of Preparation (NOP) of a Program EIR for the Irvine 2045 General Plan Update. In the context of the Airport Environs Land Use Plan for John Wayne Airport (*AELUP for JWA*), the Airport Land Use Commission for Orange County (ALUC) offers the following comments and requests consideration of these comments as you proceed with your DEIR and General Plan Update.

The City of Irvine is located within the AELUP Notification Area for JWA. The DEIR and General Plan should address height restrictions and imaginary surfaces by discussing Federal Aviation Administration (FAA) Federal Aviation Regulation (FAR) Part 77 as the criteria for determining height restrictions for projects located within the airport planning area. To ensure the safe operation of aircraft activity at JWA, structures anywhere in the JWA airport planning area should not exceed the applicable elevations defined in FAR Part 77 (Objects Affecting Navigable Air Space). The General Plan should include height policy language and a mitigation measure in the DEIR that states that no buildings will be allowed to penetrate the FAR Part 77 imaginary surfaces for JWA to ensure the protection of its airspace.

Development proposals within the City, which include the construction or alteration of structures more than 200 feet above ground level, require filing with the FAA and Airport Land Use Commission (ALUC) notification. Projects meeting this threshold must comply with procedures provided by Federal and State law, and with all conditions of approval imposed or recommended by FAA and ALUC including filing a Notice of Proposed Construction or Alteration (FAA Form 7460-1). Depending on the maximum building heights that will be allowed within the General Plan, the City may wish to consider a mitigation and condition of approval specifying this 200 feet above ground level height threshold. In addition, any project that penetrates the Notification Surface for JWA is required to file FAA Form 7460-1.

Portions of the City of Irvine fall within the 60 and 65 dB CNEL noise contours for JWA including sections of the Irvine Business Complex (Planning Area 36) located to the north and west of the Airport. ALUC does not support residential uses within the 65 dB CNEL contour. In

accordance with the *ALUP for JWA* Section 3.2.3, all residential units within the 65 dB CNEL contour are inconsistent in this area unless it can be shown conclusively that such units are sufficiently sound attenuated for present and projected noise exposure so as not to exceed an interior standard of 45 dB CNEL.

As for residential development within the 60 dB CNEL contour, the ALUC may not find residential units incompatible in this area but would strongly recommend that residential units be limited or excluded from this area unless sufficiently sound attenuated not to exceed an interior level of 45 db. Because of the IBC proximity to airport noise, any prospective resident should be notified of the presence of aircraft overflight. We recommend that the DEIR include reference to where in the City's General Plan or Zoning Code this notification requirement can be found.

Portions of the City of Irvine are located within Safety Zones 2, 3, 4 and 6, and the primary approach corridor for JWA. The DEIR and General Plan should include a discussion of how to minimize locating residential and other noise-sensitive uses within these Safety Zones.

We also recommend that the DEIR and the General Plan Update identify if the development of heliports will be allowed within your jurisdiction. Should the development of heliports occur within your jurisdiction, proposals to develop new heliports may be submitted through the City to the ALUC for review and action pursuant to Public Utilities Code Section 21661.5. Proposed heliport projects must comply fully with the state permit procedure provided by law and with all conditions of approval imposed or recommended by FAA, by the ALUC for Orange County and by Caltrans/Division of Aeronautics.

To address consistency with the *ALUP for Heliports* we suggest adding the following language to your General Plan Update and inclusion as a mitigation measure in the DEIR:

“The City will ensure that development proposals including the construction or operation of a heliport or helistop comply fully with permit procedures under State law, including referral of the project to the ALUC by the applicant, and with all conditions of approval imposed or recommended by the Federal Aviation Administration (FAA), ALUC, and Caltrans, including the filing of a Form 7480-1 (Notice of Landing Area Proposal) with the FAA. This requirement shall be in addition to all other City development requirements.”

Section 21676 of the PUC requires that prior to the adoption or amendment of a general plan or specific plan, or the adoption or approval of a zoning ordinance or building regulation within the planning boundary established by the Airport Land Use Commission pursuant to Section 21675, the local agency shall first refer the proposed action to the ALUC. We recommend that the City include policy in its General Plan and a mitigation measure in the DEIR that states that the City shall refer projects to the Airport Land Use Commission (ALUC) for Orange County as required by Section 21676 of the California Public Utilities Code to determine consistency of projects with the *ALUP for JWA*.

With respect to submittals, please note that the Commission requests that referrals be submitted - to the ALUC for a determination between the Planning Commission and City Council hearings. Since the ALUC meets on the third Thursday afternoon of each month, complete submittals must be received in the ALUC office by the first of the month to ensure sufficient time for review, analysis, and agendizing. A General Plan submittal form is available at:

<https://www.ocair.com/about/administration/airport-governance/commissions/airport-land-use-commission/>

A separate form should be used for each element of the General Plan that is being amended. Thank you for the opportunity to comment on this Notice of Preparation. Please contact Julie Fitch at (949) 252-5284 or via email at [jfitch@ocair.com](mailto:jfitch@ocair.com) with any questions.

Sincerely,

Lea U. Choum  
Executive Officer

**CAUTION: EXTERNAL EMAIL**

Dear Marika Poynter,

The California Geological Survey (CGS) has received the Notice of Preparation of a Program Environmental Impact Report (Program EIR) for the Irvine 2045 General Plan Update. This email conveys the following recommendations from CGS concerning geologic issues related to the project area:

1. Liquefaction and Landslide Hazards

The project area encompasses earthquake zones of required investigation (ZORI) for liquefaction and landslides mapped by CGS. CGS has published Earthquake Zones of Required Investigation Maps (EZRIM) for liquefaction and landsliding covering the Tustin, Lake Forest, and Laguna Beach quadrangles, all of which affect the City of Irvine and the project area. The Program EIR and supporting documents should address this hazard as it relates to project development.

The combined extent of these EZRIM can be viewed here:

<https://maps.conservation.ca.gov/cgs/EQZApp/app/>

Individual Seismic Hazard Zone Reports, EZRIM, and associated GIS data are available for download here:

<https://maps.conservation.ca.gov/cgs/informationwarehouse/index.html?map=regulatorymaps>

CGS suggests the hazard and the zones of required investigation for liquefaction and landsliding be shown and discussed in the Program EIR.

2. Ground Shaking Hazards

The project area is not located in an Earthquake Fault Zone mapped by CGS. However, several active faults are nearby, and the site could be subject to significant ground shaking. The Program EIR and supporting documents should address this hazard as it relates to the project development. Additional information about ground shaking hazard can be obtained at the following sites: <https://usgs.maps.arcgis.com/apps/webappviewer/index.html?id=14d2f75c7c4f4619936dac0d14e1e468>

<https://earthquake.usgs.gov/scenarios/catalog/bssc2014/>

If you have any additional comments or questions, please feel free to call or email.

Thank you,  
Judy Zachariasen

Subject: Response to Notice of Preparation, Program Environmental Impact Report,  
Irvine 2045 Focused General Plan Update

Dear Ms. Poynter:

Thank you for the opportunity to provide comments on the scope for the upcoming Program Draft Environmental Impact Report (EIR) for the 2045 Focused General Plan Update (Project). The Irvine Unified School District (District) welcomes the opportunity to review the Draft EIR for potential environmental impacts on its schools and to work collaboratively with the City to maintain the District's reputation for high quality education.

It is our understanding that the General Plan update is required following the adoption of the 2021-2029 Housing Element in May 2022. Moreover, the City plans to update the land use, circulation, open space, safety, and noise elements to add 30,294 residential units to the Genal Plan. To accomplish this, the City will establish "overlay zones" and/or specific plans to allow greater flexibility for property owners and developers. The overlays would promote higher density residential and mixed use in three (3) main focus areas, targeted retail centers, conversion of hotel/motel, and on religious and school sites. The majority of the future residential growth would occur in the following three (3) main focus areas:

- **Focus Area 1 – Greater Irvine Business Complex Area: Planning Area 36 (Irvine Business Complex) and Planning Area 19 (Rancho San Joaquin)**

The Project entails a new overlay or specific plan to increase the total number of residential units by 15,000.

- **Focus Area 2 – Greater Spectrum Area: Planning Area 13 (Irvine Spectrum 4), Planning Area 31 (Irvine Spectrum 6), Planning Area 32 (Irvine Spectrum 3), and Planning Area 33 (Irvine Spectrum Center)**

The Project would create a new overlay or specific plan to allow a total of 20,000 residential units within the Greater Spectrum Area. The increase in units is not identified.

- **Focus Area 3 Great Park Neighborhood Transit Village: Planning Area 51 (Great Park Neighborhood)**

The Project would increase the number of residential units allowed by 13,989.

#### BOARD OF EDUCATION

PAUL BOKOTA / LAUREN BROOKS / JEFF KIM / KATIE MCEWEN / CYRIL YU  
TERRY L. WALKER, *Superintendent of Schools*

JOHN FOGARTY, *Assistant Superintendent, Business Services* / BRIANNE FORD, *Assistant Superintendent, Information Technology*  
EAMONN O'DONOVAN, *Assistant Superintendent, Human Resources* / CASSIE PARHAM, *Assistant Superintendent, Education Services*

In addition, beyond the Focus Areas, the City will address additional units as follows:

- **Remaining Regional Housing Needs Allocation (RHNA) Units**

The remaining units required by the City’s RHNA assessment would be accommodated through overlays and specific plans across the city outside the focus areas. The City plans to target retail centers, conversion of hotels/motels, and religious and school sites.

**Comments on the Notice of Preparation**

The District’s student generation rates for grades K-6, 7-8, and 9-12 are presented in Table 1. The District requests that the Draft EIR identify the number, type, and location of units anticipated and apply these generation rates to determine the total number of students.

The District requests additional detail on the type of units anticipated, because the number of students generated is largely determined by the type of unit. The Notice of Preparation (NOP) does not provide details on the types of units proposed.

Please clarify the increase in the number of residential units in Focus Area 2. The NOP references 20,000 total units but does not include the increase.

**TABLE 1. STUDENT GENERATION RATES**

PRODUCT TYPE	K-6	7-8	9-12
High Density Multifamily (IBC)	0.040	0.007	0.017
High Density Multifamily (Spectrum)	0.086	0.016	0.026
Multifamily (Apartments)	0.133	0.038	0.056
Affordable (Apartments)	0.197	0.101	0.176
Single-Family Attached (Condos)	0.263	0.065	0.111
Single-Family Detached (Homes)	0.352	0.090	0.154

In addition to these generation rates, a new State-mandated Pre-Kindergarten (PK) program will be fully implemented in 2025. The District projects that enrollment in the PK program will be 80 to 90 percent of the Kindergarten cohort. The District requests that the Draft EIR include these additional students in its assessment of the Project’s impact on school facilities. Note that PK and Kindergarten classes have special room requirements to accommodate young students.

Tables 2, 3, and 4 present the existing 2022-2023 enrollment data and capacities of the District’s elementary/K-8, middle, and high schools, respectively. The reported capacities assume every classroom seat is perfectly filled with the correct grade-level student, which is infeasible. To accommodate the ebb and flow of students throughout the year, the District operates with 90 percent of capacity as full capacity. The District requests that the City use 90 percent of seats as full capacity in the analysis of the Project’s school facility impacts.

**TABLE 2. ELEMENTARY AND K-8 SCHOOL ENROLLMENT AND CAPACITY**

SCHOOL	2022-2023 ENROLLMENT	CAPACITY AS # OF SEATS*
Alderwood Elementary and PK	812	905
Beacon Park K-8	1,035	1,061
Bonita Canyon Elementary	404	503
Brywood Elementary	560	599
Cadence Park K-8 and PK	924	1,000
Canyon View Elementary and PK	736	826
College Park Elementary	568	707
Culverdale Elementary and PK	576	783
Cypress Village Elementary and PK	1,057	1,141
Deerfield Elementary and PK	640	660
Eastshore Elementary	534	665
Eastwood and PK	627	697
Greentree Elementary	449	548
Loma Ridge Elementary	676	708
Meadow Park Elementary and PK	602	754
Northwood Elementary	516	676
Oak Creek Elementary	895	937
Plaza Vista K-8	798	975
Portola Springs and PK	886	972
Santiago Hills and PK	546	650
Solis Park Elementary (K-8 in 2024)	429	779
Springbrook Elementary and PK	506	670
Stonecreek Elementary	461	566
Stonegate Elementary	1,011	1,057
Turtle Rock Elementary and PK	836	911
University Park Elementary and PK	496	750
Vista Verde K-8	805	1,045
Woodbury Elementary and PK	1,070	1,158
Westpark Elementary and PK	826	911

\*Note: Operational capacity runs at 90% of the number of seats available.

**TABLE 3. MIDDLE SCHOOL ENROLLMENT AND CAPACITY**

SCHOOL	2022-2023 ENROLLMENT	CAPACITY AS # OF SEATS*
Jeffrey Trail Middle School	1,078	1,170
Lakeside Middle School	635	956
Rancho San Joaquin Middle School	806	1,022
Sierra Vista Middle School	1,127	1,200
South Lake Middle School	601	796
Venado Middle School	583	914

\*Note: Operational capacity runs at 90% of the number of seats available.

**TABLE 4. HIGH SCHOOL ENROLLMENT AND CAPACITY**

SCHOOL	2022-2023 ENROLLMENT	CAPACITY AS # OF SEATS*
Irvine High School	1,861	2,229
Northwood High School	2,251	2,333
Portola High School	2,296	2,400
University High School	2,165	2,600
Woodbridge High School	2,219	2,600

\*Note: Operational capacity runs at 90% of the number of seats available.

The students generated by the addition of 30,294 residential units should be applied to the schools within their attendance areas. Please see Focus Areas 1, 2, and 3 below for the locations of District schools.

● **Focus Area 1**

- Area Elementary Schools: Culverdale ES, Westpark ES, University Park ES
- Area Middle Schools: Rancho San Joaquin MS, South Lake MS
- Area High Schools: University HS, Woodbridge HS

● **Focus Area 2**

- Area Elementary Schools: Cadence Park K-8, Oak Creek ES
- Area Middle Schools: Cadence Park K-8, South Lake MS
- Area High Schools: Portola HS, University HS

● **Focus Area 3**

- Area Elementary/Middle Schools: Beacon Park K-8, Cadence Park K-8, Solis Park K-8
- Area High Schools: Portola HS

Ms. Marika Poynter  
Response to Notice of Preparation, Program Environmental Impact Report,  
Irvine 2045 Focused General Plan Update  
August 18, 2023  
Page 5

The analysis of school impacts should identify the Focus Area schools that will reach capacity because of the proposed Project. Each school's impact should be addressed and the District's overall ability to fund all such supporting improvements should be considered including reservation of land for educational facility uses and the land acquisition and construction costs for potential new schools. A lack of sufficient funding may impact various other environmental issues, including the home-to-school travel distances. These issues should be addressed in the Draft EIR.

The NOP states that the City is targeting retail centers, conversion of hotels/motels, and religious and school sites for additional residential development. Please identify the number and type of residential units anticipated outside of the Focus Areas. Please explain how the City plans to target the District's school sites for future housing development.

The District requests that the Draft EIR address potential circulation/pedestrian safety impacts at school sites associated with additional residential development. To the extent that student generation exceeds the capacity of the schools in the Focus Area attendance areas and these students must attend more remote schools, the District requests the Draft EIR address the increase in traffic, vehicle miles traveled (VMT) and greenhouse gas (GHG) emissions.

We welcome the opportunity to work closely with the City throughout the California Environmental Quality Act process and would welcome the opportunity to discuss these issues further.

If you have any questions, please contact me at (949) 936-5305 or [kelvinokino@iusd.org](mailto:kelvinokino@iusd.org).

Sincerely,

Re: Response to Notice of Preparation for 2045 General Plan Update Environment Impact Report

PEG Companies and its affiliates (together “PEG”) would like to submit for inclusion of the Environmental Impact Study for the 2045 General Plan Update a proposed mixed-use residential and hospitality project located at 18700 McArthur Boulevard (“Project”). The tentative details of the Project are outlined below for your consideration.

PEG is pursuing 800 Class A, highly-amenitized residential units in conjunction with a 150 key high-end select-service hotel. The 6.45 acre site is currently home to the Artium Hotel, which will be completely redeveloped in pursuit of the Project. Congruent with the objectives of Focus Area 1 of the General Plan Update, the Project will provide a significant number of residential units designed to enhance the community fabric of the Irvine Business Complex, provide residential opportunities adjacent to major employers with walkability in mind, and integrate residents into the existing transportation infrastructure. Additionally, the hotel component of the Project will attract and accommodate travelers within walking distance of the John Wayne Airport.

PEG would welcome the opportunity to further discuss the proposed Project in concert with Irvine’s Comprehensive Plan Update process.

Sincerely,

Tyler Phelps  
Director, Development  
949.610.6090  
tphelps@pegcompanies.com

Irvine, CA 92606

**Re: Notice of Preparation for 2045 General Plan Update Environment Impact Report / 2722 Michelson Drive**

Ms. Poytner:

Affiliates of IRA Capital own the approximately 9.35 acre site located at 2722 Michelson Drive on the southwest corner of Jamboree Road and Michelson Drive (APNs 445-102-11 and 445-102-12). By this letter, IRA respectfully requests that the Program Environmental Impact Report for the Irvine 2045 General Plan Update evaluate a mixed-use residential and/or hospitality project at this site consisting of up to one or more of the following:

1. 200 Residential Units per acre (i.e., 1,870 total Residential Units)
2. 500 Key Hotel
3. 200 Senior Housing Units
4. 500,000 SF Office

We believe the property is ideally suited for this level of density given its proximity to the airport, two freeways, as well as existing housing, employment, and commercial centers. We look forward to discussing our vision with City staff at your convenience.

Sincerely,

A handwritten signature in blue ink, appearing to read "Daniel Sitz".

Project Title: Notice of Preparation Program Environmental Impact Report (PEIR)  
Irvine 2045 Focused General Plan Update

Project Applicant: City of Irvine

Dear Ms. Poynter:

My name is Anne Whitehair, and I am writing to you as a representative and Board member of the California Cultural Resources Preservation Alliance, Inc. (CCRPA). CCRPA is a 501 (c) 3 non-profit organization with a mission to protect and preserve cultural resources such as sacred sites, archaeological sites, historical sites, and Traditional Cultural Places in Southern California, with a focus on Orange and Los Angeles Counties.

Thank you for the opportunity to comment on the Notice of Preparation of a Draft Environmental Impact Report for the proposed Irvine 2045 Focused General Plan Update. We believe that the project areas identified in the Notice are culturally sensitive and may contain archaeological sites. In particular, Focus Area 3 in the Great Park is geographically close to known areas of pre-historic tribal activity by the Acjachemen People in the Tomato Springs area near present-day Portola Springs Community Center.

We concur with your decision to examine multiple environmental impact categories in the Program EIR, particularly the categories of Cultural Resources and Tribal Cultural Resources. We look forward to the opportunity to review the Draft Program EIR and the proposed mitigation framework and monitoring programs when they are available.

Sincerely,

Anne R. Whitehair, MA  
Bioarchaeology  
Board Member and Secretary  
California Cultural Resources Preservation Alliance, Inc.

**CAUTION:** EXTERNAL EMAIL

Ms. Poynter:

I'm a 10 year resident of Stonegate Village near the Great Park. I'm writing in response to the Notice of Preparation of a Program Environmental Impact Report for the Irvine 2045 General Plan.

The concept of building almost 14,000 additional units in the Great Park is unrealistic given the lack of infrastructure to support them. The Woodbury Town Center is already seriously overcrowded because the Great Park does not have a locally available retail center. The Spectrum doesn't provide basic shopping needs for groceries, pharmacy, banking, etc. That's evident when it's hard to find parking in Woodbury on evenings and weekends. People prefer convenient neighborhood access that isn't always crowded. Irvine was built as a collection of self-contained villages, but the Great Park doesn't conform to that model.

Traffic is already heavy on Sand Canyon, especially during morning, mid afternoon, and evening rush times. The supposed timing of the lights hasn't significantly improved traffic flow. The reduction of one lane as you get closer to the 5 freeway makes the situation worse. It can take 15 minutes or more to drive the 4 miles from Crean High School to the 5 Freeway junction on Sand Canyon. Adding 14,000 units plus the 15,000 seat amphitheater and other planned amenities will severely impact traffic, and local residents.

I'm strongly opposed to the 2045 General Plan as currently proposed. Please consider common sense neighborhood consequences from intensive and excessive building. The vicinity around the Great Park can not absorb a dense urban plan in a suburban environment.

Concerned Resident,

Michele Jacknik

**CAUTION: EXTERNAL EMAIL**

Dear Ms. Poynter,

My name is Larry Lin and I am a Stonegate home owner at 55 Cummings.

I came across a new proposal by city of Irvine's 2045 development plan that called for nearly 14,000 units in the Great Park. Not mentioned the upcoming development of houses at the corner of Portola Parkway and Jeffrey up on the hill.

I can hardly imagine the impact on local streets this new development would bring about. With the Woodbury town center is already like a flea market with all the excessive residents coming this way to shop. We could not even find a parking place at the center Saturday morning when all grocery shoppers gushed out to the center. Other amenities like the planned 15,000 seat amphitheater will only add to magnitude of the problem.

I plead for the review and revisit of the proposal as an Irvine law abiding tax paying resident that the city of Irvine not to made the already deteriorating quality of living even worst.

Re: Input on General Plan Updates

Dear Tim Gehrich and Staff Planners,

We are writing to weigh in on forthcoming General Plan updates in the City of Irvine to address climate resilience locally and regionally, with particular focus on the need to incorporate wildlife connectivity as a vital part of the City vision going forward.

As you know, In 2013, the City, FivePoint, and nonprofit partners achieved an important milestone - establishing a portion of the Irvine Wildlife Corridor at the Great Park. However, the Irvine Wildlife Corridor is only one segment of the longer Irvine-Laguna Wildlife Corridor (ILWC), spanning an urban landscape and connecting six miles between the Santa Ana Mountains and South Coast Wilderness.

There is State support for connectivity. Governor Newsom's [30 x 30 plan](#) highlights connectivity within statewide guidelines for conservation. The ILWC has now been named as the first priority project for climate resiliency in the Southland region, and is a multi-benefit project that is essential for retaining and enriching the biodiversity and mitigation of the effects of climate change. Additionally, [AB 2344](#) (Safe Roads Bill) directs transportation departments to prioritize connectivity in projects throughout the State.

This General Plan update is a special opportunity for the City to again be on the leading edge of conservation and climate change planning. We hope the City will reflect a robust attention to wildlife connectivity in light of emerging findings about how vital connectivity is to long-term urban sustainability.

We are grateful for the opportunity to participate in this process and look forward to a continued mutually beneficial relationship with the City of Irvine.

Sincerely,

A handwritten signature in black ink, appearing to read "Norm Grossman". The signature is fluid and cursive, with the first name "Norm" being more prominent than the last name "Grossman".

## APPENDIX B

# Irvine General Plan Update Air Quality and Greenhouse Gas Emissions Summary

**DATE:** March 12, 2024  
**TO:** Nick Larkin, Recon Environmental, Inc.  
**FROM:** Haseeb Qureshi, Shannon Wong  
**JOB NO:** AQ & GHG Assessment

## IRVINE GENERAL PLAN UPDATE AIR QUALITY & GREENHOUSE GAS EMISSIONS SUMMARY

Nick Larkin,

Urban Crossroads, Inc. is pleased to provide the following Air Quality & Greenhouse Gas Emissions Summary for the Irvine General Plan Update (**Project**). The City of Irvine is adjacent to the cities of Newport Beach, Costa Mesa, Orange, Lake Forest, Tustin, Santa Ana, Laguna Hills, Laguna Woods, and Laguna Beach, as well as unincorporated areas of the County. With the adoption of the certified 2021-2029 Housing Element in May 2022, the City is required to update the appropriate elements of the General Plan to accommodate the residential site inventory from the 2021-2029 Housing Element. This includes updates to the land use element and the circulation element. Additionally, the City would update the open space element, safety element, and noise element to address statutory requirements. The City would introduce an environmental protection and climate action element and would also incorporate health and wellness throughout the updated General Plan. The Draft Program EIR will address the short- and long-term effects of the project on the environment.

### PROJECT SCENARIOS

The Project Scenarios evaluated in the Air Quality & Greenhouse Gas Emissions Summary are as follows:

- **Current General Plan/No Project** – This scenario represents the currently approved Buildout land uses. Future development includes unbuilt dwelling units and non-residential uses. The Great Park Framework Plan Phase 1 land uses are also included in this scenario. The Current General Plan land uses modeled for this assessment were obtained from Table 3-2 from the *Irvine General Plan Update VMT Study* prepared by Iteris, Inc.

- Conservative Project Scenario** – This alternative evaluates the Current General Plan plus 57,656 RHNA housing units within the adopted Housing Site Inventory sites. The 57,656 new residential units consist of 55,395 new dwelling units and 2,261 unbuilt units already in the General Plan. For the purpose of evaluating potential effects, 55,395 dwelling units are analyzed under this alternative. Both Phase 1 and Buildout of the Great Park Framework Plan land uses and the extension of Ada from the Irvine Metrolink/Amtrak Station to Marine Way are also included in this scenario. The Conservative Project Scenario land uses modeled for this assessment were obtained from Tables 2-1 and 2-3 from the *Irvine General Plan Update VMT Study* prepared by Iteris, Inc.
- Cumulative Plus Conservative Project Scenario** – This scenario evaluates the Conservative Project Scenario plus additional cumulative projects that are assumed to be built in the background conditions in both the City of Irvine and in surrounding jurisdictions. Cumulative projects include known future residential development in adjacent Cities. The Cumulative Plus Conservative Project Scenario land uses modeled in this assessment were obtained from Tables 2-1, 2-3, and 2-4 from the *Irvine General Plan Update VMT Study* prepared by Iteris, Inc.

## AIR QUALITY EMISSIONS

### REGIONAL CONSTRUCTION EMISSIONS SUMMARY

Based on information provided by the City, a worst-case construction scenario for a future development occurring as a result of project implementation is expected to include the development of 1,500 units, with an average size of 670 square-feet (small apartments), on a 15-acre site. The estimated maximum daily construction emissions without mitigation are summarized on Table 1. Detailed construction model outputs are presented in Attachment A.

**TABLE 1: OVERALL REGIONAL CONSTRUCTION EMISSIONS SUMMARY**

Source	Emissions (lbs/day) <sup>1</sup>					
	VOC	NO <sub>x</sub>	CO	SO <sub>x</sub>	PM <sub>10</sub>	PM <sub>2.5</sub>
Summer						
2025	5.10	31.70	76.14	0.06	21.25	11.41
2026	4.82	18.26	72.45	0.06	15.90	4.07
Winter

Current General Plan + Cumulative + Conservative/Proposed Project Scenario	10,095.01	7,155.56	33,671.70	153.22	15,659.18	4,311.13

<sup>5</sup>The total maximum daily emissions number may not add up due to rounding.

## CO HOTSPOT ANALYSIS

It has long been recognized that CO hotspots are caused by vehicular emissions, primarily when idling at congested intersections. In response, vehicle emissions standards have become increasingly stringent in the last 20 years. Currently, the allowable CO emissions standard in California is a maximum of 3.4 grams/mile for passenger cars (there are requirements for certain vehicles that are more stringent). With the turnover of older vehicles, introduction of cleaner fuels, and implementation of increasingly sophisticated and efficient emissions control technologies, CO concentration in the SCAB is now designated as attainment. To establish a more accurate record of baseline CO concentrations affecting the SCAB a CO “hot spot” analysis was conducted in 2003 by the SCAQMD for four busy intersections in Los Angeles at the peak morning and afternoon time periods. This “hot spot” analysis did not predict any violation of CO standards. Based on the SCAQMD's 2003 AQMP and the 1992 Federal Attainment Plan for Carbon Monoxide (*1992 CO Plan*), peak carbon monoxide concentrations in the SCAB were a result of unusual meteorological and topographical conditions and not a result of traffic volumes and congestion at a particular intersection. Similar considerations are also employed by other Air Districts when evaluating potential CO concentration impacts. More specifically, the Bay Area Air Quality Management District (BAAQMD) concludes that under existing and future vehicle emission rates, a given project would have to increase traffic volumes at a single intersection by more than 44,000 vehicles per hour (vph)—or 24,000 vph where vertical and/or horizontal air does not mix—to generate a significant CO impact. The busiest intersection evaluated was that at Wilshire Boulevard and Veteran Avenue in Los Angeles, which has a daily traffic volume of approximately 100,000 vph and AM/PM traffic volumes of 8,062 vph and 7,719 vph respectively. The *2003 AQMP* estimated that the 1-hour concentration for this intersection was 4.6 ppm; this indicates that, should the daily traffic volume increase four times to 400,000 vehicles per day, CO concentrations ( $4.6 \text{ ppm} \times 4 = 18.4 \text{ ppm}$ ) would still not likely exceed the most stringent 1-hour CO standard (20.0 ppm). The Level of Service Traffic Study completed for the project determined that roadway segment and intersection volumes under the Cumulative Plus Conservative Project Scenario would not exceed 100,000 average daily trips. Therefore, the Cumulative Plus Conservative Project Scenario would not produce the volume of traffic required to generate a CO “hot spot” either in the context of the 2003 Los Angeles hot spot study or based on representative BAAQMD CO threshold considerations. Therefore, new development adjacent to heavily traveled streets or intersections would not expose sensitive receptors to substantial pollutant concentrations associated with CO hot spots, and impacts would be less than significant.

## GREENHOUSE GAS EMISSIONS

### CURRENT GENERAL PLAN/NO PROJECT SCENARIO

The estimated greenhouse gas emissions from the Current General Plan/No Project Scenario are summarized on Table 6. Detailed operation model outputs are presented in Attachment B.

**TABLE 6: CURRENT GENERAL PLAN GHG EMISSIONS**

Source	Emission (MT/year) <sup>6</sup>				
	CO <sub>2</sub>	CH <sub>4</sub>	N <sub>2</sub> O	R	Total CO <sub>2</sub> e

<b>Total CO<sub>2</sub>e (All Sources)</b>					<b>255,781.80</b>

<sup>8</sup>The total CO<sub>2</sub>e number may not add up due to rounding.

**GREENHOUSE GAS EMISSIONS SUMMARY**

The estimated greenhouse gas emissions from all Project Scenarios are summarized in Table 9.

**TABLE 9: TOTAL GHG EMISSIONS BY PROJECT SCENARIO**

Emission Source	Total CO <sub>2</sub> e <sup>9</sup>
Current General Plan/No Project Scenario	2,721,332.67
Current General Plan + Conservative/Proposed Project Scenario	2,926,270.34
Current General Plan + Cumulative + Conservative/Proposed Project Scenario	2,977,114.47

<sup>9</sup>The total CO<sub>2</sub>e number may not add up due to rounding.

# 15937 - Irvine GPU (Construction) Detailed Report

## Table of Contents

1. Basic Project Information
  - 1.1. Basic Project Information
  - 1.2. Land Use Types
  - 1.3. User-Selected Emission Reduction Measures by Emissions Sector
2. Emissions Summary
  - 2.1. Construction Emissions Compared Against Thresholds
  - 2.2. Construction Emissions by Year, Unmitigated
3. Construction Emissions Details
  - 3.1. Demolition (2025) - Unmitigated
  - 3.3. Site Preparation (2025) - Unmitigated
  - 3.5. Grading (2025) - Unmitigated
  - 3.7. Building Construction (2025) - Unmitigated
  - 3.9. Building Construction (2026) - Unmitigated
  - 3.11. Paving (2026) - Unmitigated

3.13. Architectural Coating (2026) - Unmitigated

4. Operations Emissions Details

4.10. Soil Carbon Accumulation By Vegetation Type

4.10.1. Soil Carbon Accumulation By Vegetation Type - Unmitigated

4.10.2. Above and Belowground Carbon Accumulation by Land Use Type - Unmitigated

4.10.3. Avoided and Sequestered Emissions by Species - Unmitigated

5. Activity Data

5.1. Construction Schedule

5.2. Off-Road Equipment

5.2.1. Unmitigated

5.3. Construction Vehicles

5.3.1. Unmitigated

5.4. Vehicles

5.4.1. Construction Vehicle Control Strategies

5.5. Architectural Coatings

5.6. Dust Mitigation

5.6.1. Construction Earthmoving Activities

5.6.2. Construction Earthmoving Control Strategies

5.7. Construction Paving

5.8. Construction Electricity Consumption and Emissions Factors

5.18. Vegetation

5.18.1. Land Use Change

5.18.1.1. Unmitigated

5.18.1. Biomass Cover Type

5.18.1.1. Unmitigated

5.18.2. Sequestration

5.18.2.1. Unmitigated

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

6.2. Initial Climate Risk Scores

6.3. Adjusted Climate Risk Scores

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

7.2. Healthy Places Index Scores

7.3. Overall Health & Equity Scores

7.4. Health & Equity Measures

7.5. Evaluation Scorecard

7.6. Health & Equity Custom Measures

8. User Changes to Default Data

# 1. Basic Project Information

## 1.1. Basic Project Information

Data Field	Value
Project Name	15937 - Irvine GPU (Construction)
Construction Start Date	6/2/2025
Lead Agency	—
Land Use Scale	Project/site
Analysis Level for Defaults	County
Windspeed (m/s)	2.50
Precipitation (days)	19.6
Location	33.688397, -117.841364
County	Orange
City	Irvine
Air District	South Coast AQMD
Air Basin	South Coast
TAZ	6804
EDFZ	7
Electric Utility	Southern California Edison
Gas Utility	Southern California Gas
App Version	2022.1.1.21

## 1.2. Land Use Types

Land Use Subtype	Size	Unit	Lot Acreage	Building Area (sq ft)	Landscape Area (sq ft)	Special Landscape Area (sq ft)	Population	Description
Apartments High Rise	1,500	Dwelling Unit	15.0	1,005,000	0.00	—	4,470	—

### 1.3. User-Selected Emission Reduction Measures by Emissions Sector

No measures selected

## 2. Emissions Summary

### 2.1. Construction Emissions Compared Against Thresholds

Criteria Pollutants (lb/day for daily, ton/yr for annual) and GHGs (lb/day for daily, MT/yr for annual)

Un/Mit.	TOG	ROG	NOx	CO	SO2	PM10E	PM10D	PM10T	PM2.5E	PM2.5D	PM2.5T	BCO2	NBCO2	CO2T	CH4	N2O	R	CO2e
Daily, Summer (Max)	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

##### 5.18.2.1. Unmitigated

Tree Type	Number	Electricity Saved (kWh/year)	Natural Gas Saved (btu/year)
-----------	--------	------------------------------	------------------------------

## 6. Climate Risk Detailed Report

### 6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Hazard	Result for Project Location	Unit
Temperature and Extreme Heat	9.03	annual days of extreme heat
Extreme Precipitation	3.50	annual days with precipitation above 20 mm
Sea Level Rise	—	meters of inundation depth
Wildfire	1.31	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about  $\frac{3}{4}$  an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (Radke et al., 2017, CEC-500-2017-008), and consider inundation location and depth for the San Francisco Bay, the Sacramento-San Joaquin River Delta and California coast resulting different increments of sea level rise coupled with extreme storm events. Users may select from four scenarios to view the range in potential inundation depth for the grid cell. The four scenarios are: No rise, 0.5 meter, 1.0 meter, 1.41 meters

Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

### 6.2. Initial Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	1	0	0	N/A
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	1	0	0	N/A
Wildfire	1	0	0	N/A
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A

Air Quality Degradation	0	0	0	N/A
-------------------------	---	---	---	-----

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.

The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.

The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

### 6.3. Adjusted Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	1	1	1	2
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	1	1	1	2
Wildfire	1	1	1	2
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	1	1	1	2

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.

The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.

The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores include implementation of climate risk reduction measures.

### 6.4. Climate Risk Reduction Measures

## 7. Health and Equity Details

### 7.1. CalEnviroScreen 4.0 Scores

The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Exposure Indicators	—

AQ-Ozone	58.2
AQ-PM	68.7
AQ-DPM	84.2
Drinking Water	53.2
Lead Risk Housing	28.7
Pesticides	11.8
Toxic Releases	91.4
Traffic	88.9
Effect Indicators	—

Unemployment	5.57

## 7.2. Healthy Places Index Scores

The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Economic	—
Above Poverty	47.45284229
Employed	76.27357885
Median HI	69.01065058
Education	—
Bachelor's or higher	70.42217375
High school enrollment	100
Preschool enrollment	16.21968433
Transportation	—
Auto Access	57.21801617
Active commuting	69.0619787
Social	—
2-parent households	42.17887848
Voting	31.99024766
Neighborhood	—
Alcohol availability	44.80944437
Park access	28.53843193
Retail density	94.63621199
Supermarket access	58.28307455
Tree canopy	29.41100988
Housing	—
Homeownership	19.54317978
Housing habitability	30.20659566
Low-inc homeowner severe housing cost burden	97.88271526
Low-inc renter severe housing cost burden	75.33684075
Uncrowded housing	22.40472219

Health Outcomes	—
Insured adults	50.3143847
Arthritis	98.6
Asthma ER Admissions	82.6
High Blood Pressure	98.8
Cancer (excluding skin)	96.0
Asthma	65.7
Coronary Heart Disease	98.7
Chronic Obstructive Pulmonary Disease	94.6
Diagnosed Diabetes	98.6
Life Expectancy at Birth	99.4
Cognitively Disabled	52.2
Physically Disabled	81.6
Heart Attack ER Admissions	76.4
Mental Health Not Good	58.7
Chronic Kidney Disease	99.0
Obesity	94.5
Pedestrian Injuries	72.5
Physical Health Not Good	93.2
Stroke	98.4
Health Risk Behaviors	—
Binge Drinking	4.3

2016 Voting	59.2

### 7.3. Overall Health & Equity Scores

Metric	Result for Project Census Tract
CalEnviroScreen 4.0 Score for Project Location (a)	64.0
Healthy Places Index Score for Project Location (b)	56.0
Project Located in a Designated Disadvantaged Community (Senate Bill 535)	No
Project Located in a Low-Income Community (Assembly Bill 1550)	No
Project Located in a Community Air Protection Program Community (Assembly Bill 617)	No

a: The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

b: The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

### 7.4. Health & Equity Measures

No Health & Equity Measures selected.

### 7.5. Evaluation Scorecard

Health & Equity Evaluation Scorecard not completed.

## 7.6. Health & Equity Custom Measures

No Health & Equity Custom Measures created.

## 8. User Changes to Default Data

Screen	Justification
Land Use	Taken from client data
Construction: Construction Phases	Project start date taken from client data
Construction: Off-Road Equipment	T/L/B replaced with Crawler Tractor to accurately calculate disturbance for Site Preparation and Grading phases. Standard 8 hours work days.

## 6. Climate Risk Detailed Report

### 6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Hazard	Result for Project Location	Unit
Temperature and Extreme Heat	9.03	annual days of extreme heat
Extreme Precipitation	3.50	annual days with precipitation above 20 mm
Sea Level Rise	—	meters of inundation depth
Wildfire	1.31	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about ¾ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (Radke et al., 2017, CEC-500-2017-008), and consider inundation location and depth for the San Francisco Bay, the Sacramento-San Joaquin River Delta and California coast resulting different increments of sea level rise coupled with extreme storm events.

Users may select from four scenarios to view the range in potential inundation depth for the grid cell. The four scenarios are: No rise, 0.5 meter, 1.0 meter, 1.41 meters

Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

## 6.2. Initial Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	1	0	0	N/A
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	1	0	0	N/A
Wildfire	1	0	0	N/A
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	0	0	0	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.

The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.

The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

## 6.3. Adjusted Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	1	1	1	2
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	1	1	1	2
Wildfire	1	1	1	2

Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	1	1	1	2

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.

The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.

The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores include implementation of climate risk reduction measures.

## 6.4. Climate Risk Reduction Measures

# 7. Health and Equity Details

## 7.1. CalEnviroScreen 4.0 Scores

The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Exposure Indicators	—
AQ-Ozone	58.2
AQ-PM	68.7
AQ-DPM	84.2
Drinking Water	53.2
Lead Risk Housing	28.7
Pesticides	11.8
Toxic Releases	91.4
Traffic	88.9
Effect Indicators	—
CleanUp Sites	97.3
Groundwater	99.0

Haz Waste Facilities/Generators	98.4
Impaired Water Bodies	83.0
Solid Waste	97.7
Sensitive Population	—
Asthma	17.0
Cardio-vascular	20.8
Low Birth Weights	54.8
Socioeconomic Factor Indicators	—
Education	49.2
Housing	39.2
Linguistic	59.4
Poverty	55.5
Unemployment	5.57

## 7.2. Healthy Places Index Scores

The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Economic	—
Above Poverty	47.45284229
Employed	76.27357885
Median HI	69.01065058
Education	—
Bachelor's or higher	70.42217375
High school enrollment	100
Preschool enrollment	16.21968433
Transportation	—

2016 Voting	59.2

### 7.3. Overall Health & Equity Scores

Metric	Result for Project Census Tract
CalEnviroScreen 4.0 Score for Project Location (a)	64.0
Healthy Places Index Score for Project Location (b)	56.0
Project Located in a Designated Disadvantaged Community (Senate Bill 535)	No
Project Located in a Low-Income Community (Assembly Bill 1550)	No
Project Located in a Community Air Protection Program Community (Assembly Bill 617)	No

a: The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

b: The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

### 7.4. Health & Equity Measures

No Health & Equity Measures selected.

### 7.5. Evaluation Scorecard

Health & Equity Evaluation Scorecard not completed.

### 7.6. Health & Equity Custom Measures

No Health & Equity Custom Measures created.

## 8. User Changes to Default Data

Screen	Justification
Operations: Hearths	SCAQMD Rule 445 no wood burning devices. Wood burning devices added to gas devices.

# 1. Basic Project Information

## 1.1. Basic Project Information

Data Field	Value
Project Name	15937 - Irvine GPU Conservative Project Alternative (Operations)
Operational Year	2045
Lead Agency	—
Land Use Scale	Plan/community
Analysis Level for Defaults	County
Windspeed (m/s)	2.50
Precipitation (days)	19.6
Location	33.688397, -117.841364
County	Orange
City	Irvine
Air District	South Coast AQMD
Air Basin	South Coast
TAZ	6804
EDFZ	7
Electric Utility	Southern California Edison
Gas Utility	Southern California Gas
App Version	2022.1.1.21

## 1.2. Land Use Types

Land Use Subtype	Size	Unit	Lot Acreage	Building Area (sq ft)	Landscape Area (sq ft)	Special Landscape Area (sq ft)	Population	Description
Condo/Townhouse	37,345	Dwelling Unit	2,334	39,585,700	0.00	—	111,288	—

Apartments High Rise	18,050	Dwelling Unit	291	17,328,000	0.00	—	53,789	Multi-Family Housing
City Park	20.0	Acre	20.0	0.00	0.00	0.00	—	Botanical Garden
City Park	20.0	Acre	20.0	0.00	0.00	0.00	—	Veterans Memorial Garden
Library	60.0	1000sqft	1.38	60,000	0.00	—	—	—
General Office Building	7.18	1000sqft	0.16	7,180	0.00	—	—	Discovery Center

## 6. Climate Risk Detailed Report

### 6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Hazard	Result for Project Location	Unit
Temperature and Extreme Heat	9.03	annual days of extreme heat
Extreme Precipitation	3.50	annual days with precipitation above 20 mm
Sea Level Rise	—	meters of inundation depth
Wildfire	1.31	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about ¾ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (Radke et al., 2017, CEC-500-2017-008), and consider inundation location and depth for the San Francisco Bay, the Sacramento-San Joaquin River Delta and California coast resulting different increments of sea level rise coupled with extreme storm events. Users may select from four scenarios to view the range in potential inundation depth for the grid cell. The four scenarios are: No rise, 0.5 meter, 1.0 meter, 1.41 meters

Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

### 6.2. Initial Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	1	0	0	N/A
Extreme Precipitation	N/A	N/A	N/A	N/A

Sea Level Rise	1	0	0	N/A
Wildfire	1	0	0	N/A
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	0	0	0	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.

The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.

The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

### 6.3. Adjusted Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	1	1	1	2
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	1	1	1	2
Wildfire	1	1	1	2
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	1	1	1	2

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.

The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.

The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores include implementation of climate risk reduction measures.

### 6.4. Climate Risk Reduction Measures

## 7. Health and Equity Details

### 7.1. CalEnviroScreen 4.0 Scores

The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Exposure Indicators	—
AQ-Ozone	58.2
AQ-PM	68.7
AQ-DPM	84.2
Drinking Water	53.2
Lead Risk Housing	28.7
Pesticides	11.8
Toxic Releases	91.4
Traffic	88.9
Effect Indicators	—
CleanUp Sites	97.3
Groundwater	99.0
Haz Waste Facilities/Generators	98.4
Impaired Water Bodies	83.0
Solid Waste	97.7
Sensitive Population	—
Asthma	17.0
Cardio-vascular	20.8
Low Birth Weights	54.8
Socioeconomic Factor Indicators	—
Education	49.2
Housing	39.2

Linguistic	59.4
Poverty	55.5
Unemployment	5.57

## 7.2. Healthy Places Index Scores

The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Economic	—
Above Poverty	47.45284229
Employed	76.27357885
Median HI	69.01065058
Education	—
Bachelor's or higher	70.42217375
High school enrollment	100
Preschool enrollment	16.21968433
Transportation	—
Auto Access	57.21801617
Active commuting	69.0619787
Social	—
2-parent households	42.17887848
Voting	31.99024766
Neighborhood	—
Alcohol availability	44.80944437
Park access	28.53843193
Retail density	94.63621199
Supermarket access	58.28307455
Tree canopy	29.41100988

Housing	—
Homeownership	19.54317978
Housing habitability	30.20659566
Low-inc homeowner severe housing cost burden	97.88271526
Low-inc renter severe housing cost burden	75.33684075
Uncrowded housing	22.40472219
Health Outcomes	—
Insured adults	50.3143847
Arthritis	98.6
Asthma ER Admissions	82.6
High Blood Pressure	98.8
Cancer (excluding skin)	96.0
Asthma	65.7
Coronary Heart Disease	98.7
Chronic Obstructive Pulmonary Disease	94.6
Diagnosed Diabetes	98.6
Life Expectancy at Birth	99.4
Cognitively Disabled	52.2
Physically Disabled	81.6
Heart Attack ER Admissions	76.4
Mental Health Not Good	58.7
Chronic Kidney Disease	99.0
Obesity	94.5
Pedestrian Injuries	72.5
Physical Health Not Good	93.2
Stroke	98.4
Health Risk Behaviors	—

Binge Drinking	4.3
Current Smoker	42.3
No Leisure Time for Physical Activity	69.0
Climate Change Exposures	—
Wildfire Risk	0.0
SLR Inundation Area	0.0
Children	25.4
Elderly	82.5
English Speaking	49.5
Foreign-born	80.9
Outdoor Workers	61.4
Climate Change Adaptive Capacity	—
Impervious Surface Cover	18.1
Traffic Density	92.8
Traffic Access	65.3
Other Indices	—
Hardship	52.6
Other Decision Support	—
2016 Voting	59.2

### 7.3. Overall Health & Equity Scores

Metric	Result for Project Census Tract
CalEnviroScreen 4.0 Score for Project Location (a)	64.0
Healthy Places Index Score for Project Location (b)	56.0
Project Located in a Designated Disadvantaged Community (Senate Bill 535)	No
Project Located in a Low-Income Community (Assembly Bill 1550)	No
Project Located in a Community Air Protection Program Community (Assembly Bill 617)	No

- a: The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.
- b: The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

## 7.4. Health & Equity Measures

No Health & Equity Measures selected.

## 7.5. Evaluation Scorecard

Health & Equity Evaluation Scorecard not completed.

## 7.6. Health & Equity Custom Measures

No Health & Equity Custom Measures created.

## 6. Climate Risk Detailed Report

### 6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Hazard	Result for Project Location	Unit
Temperature and Extreme Heat	9.03	annual days of extreme heat
Extreme Precipitation	3.50	annual days with precipitation above 20 mm
Sea Level Rise	—	meters of inundation depth
Wildfire	1.31	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about ¾ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (Radke et al., 2017, CEC-500-2017-008), and consider inundation location and depth for the San Francisco Bay, the Sacramento–San Joaquin River Delta and California coast resulting different increments of sea level rise coupled with extreme storm events. Users may select from four scenarios to view the range in potential inundation depth for the grid cell. The four scenarios are: No rise, 0.5 meter, 1.0 meter, 1.41 meters

Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

### 6.2. Initial Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
----------------	----------------	-------------------	-------------------------	---------------------

Temperature and Extreme Heat	1	0	0	N/A
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	1	0	0	N/A
Wildfire	1	0	0	N/A
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	0	0	0	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.

The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.

The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

### 6.3. Adjusted Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	1	1	1	2
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	1	1	1	2
Wildfire	1	1	1	2
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	1	1	1	2

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.

The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.

The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores include implementation of climate risk reduction measures.

## 6.4. Climate Risk Reduction Measures

# 7. Health and Equity Details

## 7.1. CalEnviroScreen 4.0 Scores

The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Exposure Indicators	—
AQ-Ozone	58.2
AQ-PM	68.7
AQ-DPM	84.2
Drinking Water	53.2
Lead Risk Housing	28.7
Pesticides	11.8
Toxic Releases	91.4
Traffic	88.9
Effect Indicators	—
CleanUp Sites	97.3
Groundwater	99.0
Haz Waste Facilities/Generators	98.4
Impaired Water Bodies	83.0
Solid Waste	97.7
Sensitive Population	—
Asthma	17.0
Cardio-vascular	20.8
Low Birth Weights	54.8
Socioeconomic Factor Indicators	—

Education	49.2
Housing	39.2
Linguistic	59.4
Poverty	55.5
Unemployment	5.57

## 7.2. Healthy Places Index Scores

The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Economic	—
Above Poverty	47.45284229
Employed	76.27357885
Median HI	69.01065058
Education	—
Bachelor's or higher	70.42217375
High school enrollment	100
Preschool enrollment	16.21968433
Transportation	—
Auto Access	57.21801617
Active commuting	69.0619787
Social	—
2-parent households	42.17887848
Voting	31.99024766
Neighborhood	—
Alcohol availability	44.80944437
Park access	28.53843193
Retail density	94.63621199

Supermarket access	58.28307455
Tree canopy	29.41100988
Housing	—
Homeownership	19.54317978
Housing habitability	30.20659566
Low-inc homeowner severe housing cost burden	97.88271526
Low-inc renter severe housing cost burden	75.33684075
Uncrowded housing	22.40472219
Health Outcomes	—
Insured adults	50.3143847
Arthritis	98.6
Asthma ER Admissions	82.6
High Blood Pressure	98.8
Cancer (excluding skin)	96.0
Asthma	65.7
Coronary Heart Disease	98.7
Chronic Obstructive Pulmonary Disease	94.6
Diagnosed Diabetes	98.6
Life Expectancy at Birth	99.4
Cognitively Disabled	52.2
Physically Disabled	81.6
Heart Attack ER Admissions	76.4
Mental Health Not Good	58.7
Chronic Kidney Disease	99.0
Obesity	94.5
Pedestrian Injuries	72.5
Physical Health Not Good	93.2

Stroke	98.4
Health Risk Behaviors	—
Binge Drinking	4.3
Current Smoker	42.3
No Leisure Time for Physical Activity	69.0
Climate Change Exposures	—
Wildfire Risk	0.0
SLR Inundation Area	0.0
Children	25.4
Elderly	82.5
English Speaking	49.5
Foreign-born	80.9
Outdoor Workers	61.4
Climate Change Adaptive Capacity	—
Impervious Surface Cover	18.1
Traffic Density	92.8
Traffic Access	65.3
Other Indices	—
Hardship	52.6
Other Decision Support	—
2016 Voting	59.2

### 7.3. Overall Health & Equity Scores

Metric	Result for Project Census Tract
CalEnviroScreen 4.0 Score for Project Location (a)	64.0
Healthy Places Index Score for Project Location (b)	56.0
Project Located in a Designated Disadvantaged Community (Senate Bill 535)	No

Project Located in a Low-Income Community (Assembly Bill 1550)	No
Project Located in a Community Air Protection Program Community (Assembly Bill 617)	No

a: The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.  
 b: The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

### 7.4. Health & Equity Measures

No Health & Equity Measures selected.

### 7.5. Evaluation Scorecard

Health & Equity Evaluation Scorecard not completed.

### 7.6. Health & Equity Custom Measures

No Health & Equity Custom Measures created.

## 8. User Changes to Default Data

Screen	Justification
Operations: Hearths	SCAQMD Rule 445 no wood burning devices. Wood burning devices added to gas devices.

## 1.0 INTRODUCTION

This Biological Technical Report describes the existing biological conditions within the City of Irvine (City; Figures 1 and 2). The information contained in this report will be used to inform the General Plan Update and Environmental Impact Report (EIR) for the City. Detailed information provided in this report includes regulatory context, existing biological conditions, sensitive biological resources, future opportunities to protect the natural environment, and constraints to development.

## 2.0 METHODS

Research for this report included a review of current federal, State, and local regulations; aerial imagery; U.S. Geological Survey (USGS) topographic maps; U.S. Department of Agriculture (USDA) Natural Resources Conservation Service (NRCS) soil survey maps; climate information for the City; and reputable online resources that provide data for the region. In addition, existing biological resource documents for the Natural Community Conservation Plan/Habitat Conservation Plan for the Central and Coastal Subregion of Orange County, California (NCCP/HCP) were also reviewed for pertinent information. Queries were also made of the California Natural Diversity Database (CNDDB) and U.S. Fish and Wildlife Service (USFWS) Listed Species Database to identify known sensitive biological resources in the vicinity of the City.

## 3.0 EXISTING BIOLOGICAL RESOURCES SETTING

This section describes the regulatory context, existing biological conditions, and sensitive biological resources found within the City.

### 3.1 REGULATORY CONTEXT

To establish the regulatory context for the City General Plan Update, a variety of federal, State, and local regulations were evaluated to determine if they may be applicable to future proposed projects within the City. In addition, regional land use and management, including established parks, reserves, and linkages were evaluated to provide the regional regulatory framework for the City General Plan Update.

#### 3.1.1 Federal Regulations

Several federal regulations may apply to future projects that are proposed within the City. These include, but are not limited to:

- National Environmental Policy Act
- Federal Endangered Species Act of 1973 (16 United States Code [USC] 1531 *et seq.*)
- Clean Water Act of 1972 (33 USC 1251 *et seq.*)
- Migratory Bird Treaty Act of 1918 (16 USC 703 through 711)
- Bald and Golden Eagle Protection Act (16 USC 668)
- Fish and Wildlife Coordination Act (16 USC 661 *et seq.*)
- Floodplain Management and Protection of Wetlands (42 FR 26961, 52 FR 34617)
- Invasive Species (64 FR 6138)

These federal regulations are described in detail below.

### **National Environmental Policy Act**

The National Environmental Policy Act (NEPA) was passed in 1969 and established a broad national framework for protecting the environment by assuring that all branches of government give proper consideration to the environment prior to undertaking any major federal action that has the potential to significantly affect the environment. NEPA applies to projects undertaken, funded, or requiring the issuance of a permit by a federal agency, including projects associated with airports, buildings, military complexes, highways, parkland purchases, and other federal activities are proposed.

NEPA is administered by the President's Council on Environmental Quality (CEQ), which is supported by a staff of environmental professionals. CEQ's main responsibilities in the NEPA process are to gather information on the conditions and trends in environmental quality, to evaluate federal programs in light of the goals established by NEPA, to develop and promote national policies to improve environmental quality, and to conduct studies, surveys, research, and analyses relating to ecosystems and environmental quality. In addition, federal agencies may involve the California Environmental Quality Act (CEQA) in the NEPA process when there are disagreements concerning the environmental effects of a proposed action.

The federal agency responsible for complying with NEPA is the agency that is proposing to implement the federal action; however, several federal agencies may be involved with the NEPA process based on an agency's expertise and relationship to the proposed action. A federal agency may be a Lead Agency or a Cooperating Agency in the NEPA process.

A Lead Agency is designated when more than one federal agency is involved in a proposed action. The Lead Agency is responsible for supervising the environmental analysis and the preparation of the appropriate environmental document, such as a Categorical Exclusion (CE), Finding of No Significant Impact (FONSI), Environmental Assessment (EA), or Environmental Impact Statement (EIS).

A Cooperating Agency is a federal, State, local, or tribal agency that has jurisdiction over a proposed action or that has special expertise with an environmental issue associated with the proposed action. The Cooperating Agency assists the Lead Agency by participating in the entire NEPA process, including the scoping, environmental analysis, and document preparation.

Any federal lead agency may be a Lead Agency or a Cooperating Agency, depending upon the specifics of the proposed action. However, the Environmental Protection Agency (EPA) has a unique role in the NEPA review process because it is required to review and publicly comment on the environmental impacts of major proposed federal actions, specifically those for which an EIS is required. If the EPA determines that the environmental analysis is unsatisfactory or that the proposed action would have adverse environmental effects, it is required to involve CEQ in the NEPA process.

 CITY OF IRVINE  
 GENERAL PLAN UPDATE

### **Federal Endangered Species Act of 1973 (16 United States Code [USC] 1531 *et seq.*)**

The Federal Endangered Species Act of 1973 (FESA) was designed to protect critically imperiled plant and wildlife species from extinction by eliminating or reducing the threats to these species and by aiding in the recovery and/or maintenance of the species populations. FESA designates species that are endangered or threatened, as well as species that are candidates for listing and protects these species from unauthorized “take”, which is defined as to "harass, harm, pursue, hunt, shoot, wound, kill trap, capture, or collect, or to attempt to engage in any such conduct." FESA also designates critical habitat for federally listed species and protects these species from interference with vital breeding and behavioral activities and from critical habitat degradation.

FESA is administered by the USFWS for freshwater fish and terrestrial wildlife and the National Oceanic and Atmospheric Administration (NOAA) for marine and anadromous species. A person, defined as an “individual, corporation, partnership, trust, association, or any other private entity; or any officer, employee, agent, department, or instrumentality of the Federal Government, of any State, municipality, or political subdivision of a State, or of any foreign government; any State, municipality, or political subdivision of a State; or any other entity subject to the jurisdiction of the United States,” is prohibited from taking a listed species until an appropriate permit pursuant to Section 7, 9, and/or 10 of the FESA has been obtained from USFWS and/or NOAA.

### **Clean Water Act of 1972 (33 USC 1251 *et seq.*)**

Sections 404 and 401 of the Clean Water Act of 1972 (CWA) apply to potential impacts to wetlands, Waters of the U.S., and Waters of the State. The EPA administers the CWA; however, some sections of the CWA are administered by other agencies.

Section 404 of the CWA regulates the discharge of dredged or fill material into navigable waters, including both wetlands and other Waters of the U.S. The discharge of dredged or fill material is typically associated with a variety of development projects, agricultural activities, and water resource projects. The U.S. Army Corps of Engineers (Corps) administers Section 404 of the CWA and is responsible for issuing general and individual permits and for making jurisdictional determinations.

Section 401 of the CWA requires a State Water Quality Certification or waiver for any activity requiring a Section 404 permit. The State Water Quality Certification ensures the activity will not violate any established State water quality standards. The State Water Resources Control Board (SWRCB), in conjunction with the nine California Regional Water Quality Control Boards (RWQCBs), administers Section 401 of the CWA and is responsible for issuing permits pursuant to the Section 401 Water Quality Certification Program.

### **Migratory Bird Treaty Act of 1918 (16 USC 703 through 711)**

The Migratory Bird Treaty Act of 1918 (MBTA) implements various conventions and treaties between the United States and Canada, Mexico, Japan, and Russia for the protection of over 800 migratory bird species. Under the MBTA, it is unlawful to "pursue, hunt, take, capture, kill, attempt to take, capture or kill, possess, offer for sale, sell, offer to purchase, purchase, deliver for shipment, ship, cause to be shipped, deliver for transportation, transport, cause to be transported, carry, or cause to be carried by any means whatever, receive for shipment, transportation or carriage, or export, at any time, or in any manner, any migratory bird...or any part, nest, or egg of any such bird" (16 USC 703).

The MBTA is administered by USFWS. Take permits for MBTA species are rarely issued, except for specific actions to aid recovery of a species; however, USFWS establishes hunting seasons for species for which there is a long tradition of hunting, as long as hunting will not adversely impact their population status or long-term conservation. While the MBTA includes approximately 170 species of game birds, hunting is typically authorized for fewer than 60 of these species each year.

### **Bald and Golden Eagle Protection Act (16 USC 668)**

The Bald and Golden Eagle Protection Act (BGEPA) provides protection for both the bald eagle (*Haliaeetus leucocephalus*) and the golden eagle (*Aquila chrysaetos*) by prohibiting the "take" of either of these species, including their parts, nests, or eggs. The MBTA defines "take" as to "pursue, shoot, shoot at, poison, wound, kill, capture, trap, collect, molest or disturb" any bald or golden eagle. The BGEPA is administered by the USFWS, and limited take authorizations are granted for qualifying activities. Persons who "take, possess, sell, purchase, barter, offer to sell, purchase or barter, transport, export or import, at any time or any manner, any bald eagle [or any golden eagle], alive or dead, or any part, nest, or egg thereof" without prior approval are subject to criminal penalties.

### **Fish and Wildlife Coordination Act (16 USC 661 et seq.)**

The Fish and Wildlife Coordination Act of 1934, as amended, requires coordination with USFWS and CDFW so that these agencies may evaluate impacts to fish and wildlife species that have the potential to result from proposed water resource development projects. Specifically, the Act requires that fish and wildlife species as well as habitats that may support them be given equal consideration to other project features. This Act also requires federal agencies that construct, license, or permit water resource development projects to first coordinate with USFWS and CDFW to determine impacts that may occur to fish and wildlife resources and establish appropriate avoidance, minimization, and/or mitigation measures to reduce these potential impacts.

### **Floodplain Management and Protection of Wetlands (42 FR 26961, 52 FR 34617)**

Executive Order 11990, Protection of Wetlands, as amended, requires federal agencies to minimize the destruction, loss, or degradation of wetlands and to preserve and enhance functions and values of these wetlands while carrying out their responsibilities pertaining to water supply, erosion and flood prevention, maintenance of natural systems, among others.

## **Invasive Species (64 FR 6138)**

Executive Order 13112, Invasive Species, as amended, requires federal agencies to coordinate efforts that prevent the introduction of invasive species (both plant and wildlife species not native to the U.S.), manage existing invasive species, and minimize the economic, ecological, and human health impacts that invasive species cause. This order defines invasive species, requires federal agencies to address invasive species concerns, and prohibits new actions that would cause or promote the introduction of invasive species. To comply with this Order, all enhancement, restoration, and creation activities should use native plants and should include measures to prevent the introduction of invasive species.

### **3.1.2 State Regulations**

Several State regulations may apply to future projects that are proposed within the City. These include, but are not limited to the:

- California Environmental Quality Act
- California Endangered Species Act (Fish and Game Code 2050 *et seq.*)
- California Fish and Game Code
- California Porter-Cologne Water Quality Control Act
- California Natural Community Conservation Planning Program

These State regulations are described in detail below.

### **California Environmental Quality Act**

The CEQA was passed in 1970 as the State counterpart to NEPA to institute a statewide policy of environmental protection. CEQA applies to projects undertaken, funded, or requiring the issuance of a permit by a State or local public agency and requires the project proponent to identify significant environmental impacts as well as avoidance, minimization, and/or mitigation measures to reduce these impacts to below a level of significance.

The CDFW has jurisdiction over the conservation, protection, and management of native habitats, plant species, and wildlife species found within California and is responsible for maintaining sustainable populations of these habitats and species. The CDFW provides biological expertise to review and comment on CEQA documents, including the impacts resulting from proposed project activities and the proposed avoidance, minimization, and mitigation measures associated with these impacts. The CDFW may play various roles in the CEQA process; the CDFW is always a Trustee Agency and may also be a Lead Agency or a Responsible Agency.

The CDFW is one of four trustee agencies, which also include the State Lands Commission, the Department of Parks and Recreation, and the University of California. As a Trustee Agency, the CDFW has jurisdiction over certain resources held in trust for the people of California and is typically required to be notified of CEQA documents that are relevant to its jurisdiction, such as documents for projects involving fish and wildlife resources. As a Trustee Agency, the CDFW cannot approve or disapprove a project; however, the lead and responsible agencies must consult

with the CDFW, and the CDFW reviews the CEQA document(s) and provides recommendations regarding the resources under their jurisdiction (Fish and Game Code Section 1802).

When the CDFW proposes to implement its own project, it is designated as the Lead Agency in the CEQA process and serves as the California government agency with principle responsibility for implementing or approving the proposed project. Such projects typically include projects in state wildlife areas and state fish hatcheries as well as habitat or stream restoration projects. Additionally, the CDFW is the Lead Agency when it is the only agency issuing a permit, as is sometimes the case with Streambed Alteration Agreements. As the Lead Agency for such projects, the CDFW is responsible for preparing the CEQA document and determines whether a Negative Declaration or an EIR is required by CEQA (CEQA Statutes, Sections 21080.3 and 21104.2; Guidelines, Sections 15050 and 15367).

The CDFW is also sometimes designated as a Responsible Agency, which is an agency, other than the Lead Agency, that has the legal responsibility for implementing and approving a proposed project. The CDFW is designated as the Responsible Agency when the Lead Agency requires a 1600 Streambed Alteration Agreement or a 2081(b) California Endangered Species Act Incidental Take Permit for a project. As a Responsible Agency, CDFW actively participates in the CEQA process by reviewing the Lead Agency's CEQA document and using that document to make decisions about the proposed project, to prepare and issue its own findings regarding the project (CEQA Guidelines, Sections 15096 and 15381), and to determine whether or not to issue an incidental take permit.

### **California Endangered Species Act (CESA; Fish and Game Code 2050 *et seq.*)**

The CESA parallels FESA and protects and/or preserves native plant and wildlife species and their habitats, especially those that are threatened with extinction and those that are experiencing significant decline that may lead to a threatened or endangered designation, within the State of California. CESA designates special status species that are protected from unauthorized "take", which is defined as to "hunt, pursue, catch, capture, or kill, or attempt to hunt, pursue, catch, capture, or kill."

CESA is administered by the CDFW. A State lead agency is required to consult with the CDFW to ensure that a proposed project is not likely to jeopardize the continued existence of a special status species or result in the destruction or adverse modification of essential habitat for a species. CESA allows for the issuance of incidental take permits for lawful development projects and emphasizes the benefits of early consultation between the lead agency and CDFW to avoid potential impacts to special status species and to develop appropriate mitigation measures to reduce impacts to and avoid loss of a special status species.

### **California Fish and Game Code**

Several sections of the California Fish and Game Code, which is administered by the CDFW, also may apply to future projects proposed in the City. These include Section 2081; Sections 1600 through 1616; Sections 1900, *et seq.*; Sections 2511, 4700, 5050, and 5515; Sections 3503, 3503.5, and 3513; and Title 14, California Code of Regulations, Section 670.2 and 670.6. Each of these sections is discussed in detail below.

## **Section 2081**

Section 2081 of the California Fish and Game Code allows for the issuance of an incidental take permit from CDFW for projects that have the potential to take a special status species, including a State-listed species, as long as the impacts are minimized and fully mitigated and will not jeopardize the continued existence of a State-listed species. The measures required to minimize and fully mitigate impacts must be roughly proportional to the extent of the proposed impact to the species and must be capable of successful implementation while maintaining the applicant's objectives to the greatest extent feasible. The applicant must show that adequate funding is available to implement the required avoidance and mitigation measures and monitor the effectiveness of the mitigation measures.

## **Sections 1600 through 1616**

Sections 1600 through 1616 of the California Fish and Game Code apply to all projects that would 1) substantially divert or obstruct the natural flow of, 2) substantially change or use any material from, or 3) deposit or dispose of debris, waste, or other material containing crumbled, flaked, or ground pavement into the bed, channel, or bank of any river, stream, or lake. Sections 1600 through 1616 require any person, business, public utility, or state or local government agency that proposes any activity within or adjacent to a lake, river, or stream that flows at least intermittently through a bank or channel, including watercourses with a subsurface flow (e.g., ephemeral streams, desert washes) and some flood plains, to notify the regional CDFW office of the proposed activity. CDFW will determine if the proposed activity may substantially adversely affect fish and wildlife resources and if a Streambed Alteration Agreement (SAA) is necessary.

## **Other Sections**

Additional sections of the California Fish and Game Code may apply to future projects proposed in the City, including, but not limited to, Sections 1900 through 1913; Sections 2511, 4700, 5050, and 5515; Sections 3503, 3503.5, and 3513; and Title 14, California Code of Regulations, Section 670.2 and 670.6. Sections 1900 through 1913 provide guidelines to preserve, protect, and enhance endangered or rare native plants within California. Sections 2511, 4700, 5050, and 5515 provide guidelines to protect wildlife species that are designated as "fully protected" by the CDFW and as therefore cannot be harmed, taken, or possessed. Sections 3503, 3503.5, and 3513 state that it is unlawful to take, possess, or destroy the nest or eggs of any bird species except otherwise allowed by the or any regulation made pursuant to the California Fish and Game Code. Section 3503.5 provides protection specifically in the orders Falconiformes (hawks, eagles, and falcons) and Strigiformes (owls), and Section 3513 provides protection specifically for migratory, non-game birds designated by the MBTA. Title 14, California Code of Regulations, Section 670.2 and 670.6 list wildlife species that are designated as California Species of Concern or are State-listed as threatened or endangered species.

## **California Porter-Cologne Water Quality Control Act**

The California Porter-Cologne Water Quality Control Act was enacted in 1969 and is administered by either the SWRCB and/or the RWQCB. This Act provides protection for Waters of the State, which are defined as “any surface water or groundwater, including saline waters, within the boundaries of the state.” If a proposed project involves alteration to any Waters of the State, the project proponent must file a Report of Waste Discharge with the appropriate RWQCB to obtain “Waste Discharge Requirements” (WDRs), which serve as the project discharge permit.

## **California Natural Community Conservation Planning Program**

The California Natural Community Conservation Planning (NCCP) program was initiated in 1991 and is administered by CDFW. It is a cooperative effort by the CDFW and numerous public and private partners that takes a broad scale, ecosystem approach to planning for the protection and perpetuation of biological diversity throughout California by protecting both habitats and the species within these habitats while also accommodating compatible land use.

An NCCP plan identifies and provides for the regional protection of plants, wildlife, and their habitats, while allowing compatible and appropriate economic activity in the region. By including key interests in the process and by working with landowners, environmental organizations, and other interested parties, an NCCP plan provides the framework for a local agency to oversee the numerous activities that compose the development of a conservation plan. Within California, there are currently 23 active NCCP plans covering more than 11 million acres, and several draft NCCP plans are pending approval. The City is a signatory to the Implementation Agreement of the NCCP/HCP for the Central and Coastal Subregion of Orange County (R.J. Meade Consulting, Inc. 1996a, 1996b).

## **Irvine Open Space Initiative**

In 1988, Irvine residents approved the “Irvine Open Space Initiative.” This initiative created the framework to preserve large, contiguous open space areas for conservation and open space as phased master-planned growth occurred in other areas of the City. This initiative set the stage for the preservation of natural open space resources that are home to a variety of wildlife species and habitats, including special status species. The Irvine Open Space Preserve, as it now is known, protects more than 93,000 acres of land from the “mountains to the sea,” linking the Cleveland National Forest, San Joaquin Marsh (San Joaquin Wildlife Sanctuary), Laguna Coast Wilderness Park, and other resources.

The Cleveland National Forest encompasses 460,000 acres and is the southernmost national forest in California located in San Diego, Riverside, and Orange counties. The San Joaquin Wildlife Sanctuary is a 300-acre constructed wetland in the floodplain of San Diego Creek just above its outlet to Upper Newport Bay. The Laguna Coast Wilderness Park encompasses 7,000 acres in the San Joaquin Hills and features some of the last remaining undeveloped coastal canyons in southern California and the only natural lakes in Orange County.

The City has committed to protect and manage the Irvine Open Space Preserve consistent with the NCCP. The City and many other local governments and public and private agencies adopted the NCCP/HCP to cover this area. Of the NCCP/HCP acres in Irvine, 10,587 are designated for the habitat reserve system, and 813 acres are non-reserve lands called special linkages. The special linkages contain biological value that could enhance connectivity between elements of the reserve system. The City is required to implement the NCCP/HCP and review project proposals for consistency with the plan.

### **3.1.3 Local Regulations**

#### **Existing General Plan**

Irvine's existing General Plan (City 2015) established a Preservation land use designation to identify lands that contain visually significant ridgelines, biotic communities of high significance, geologic constraints, and cultural resources. This designation covers more than 11,000 acres, or nearly one-quarter of the land mass in the City. The Conservation and Open Space Element identifies goals, objectives, and policies to maintain and preserve these resources.

Key objectives and policies include, but are not limited to, the following:

- Objective L-1: Establish a program to permanently protect and preserve designated conservation and open space areas. Supporting policy addresses implementation of the phased dedication and compensating development program.
- Objective L-2: Maintain and preserve areas with significant, diverse biotic communities. Supporting policies address preservation of natural resource areas identified in the Master Environmental Assessment and development in biotic resource areas.
- Objective L-3: Participate in the NCCP/HCP to accomplish multi-species and multi-habitat conservation. Supporting policies ensure compliance with and implementation of the NCCP, including review of project proposals, payment of mitigation fees, and acquisition.
- Objective L-12: Coordinate land planning efforts with the appropriate federal, State & local agencies and landowners to encourage the integration of existing and future water sources (reservoirs, lakes, and drainage courses) into development.

#### **Municipal Code**

In Chapter 8-16 of the Zoning Code, Open Space Management and Conservation Plan (OSMCP), the City requires the preparation of such plans for qualified development projects. The OSMCP shall be utilized as the primary implementation tool for complying with biotic policies identified in biotic resources objectives L-2(a) and L-2(b) of the Conservation and Open Space Element, the timing and phasing of mitigation measures, and the responsibilities for implementation. This plan shall be prepared in conjunction with a concept plan and/or zone change application and in accordance with the City's guidelines for open space management and conservation plan reports. In addition, the plan will address "transition zones" described in the zoning code.

## **3.2 EXISTING BIOLOGICAL CONDITIONS**

### **3.2.1 Environmental Setting**

The City of Irvine lies within the coastal and foothill region of central Orange County, California (Figures 1 and 2).

The average, annual high temperature in the City is 72.7 degrees Fahrenheit. The warmest month, August, averages a high of 83 degrees Fahrenheit. The coolest months, December/January, average a low of 47 degrees Fahrenheit. The City receives average annual precipitation, as rainfall, of 14.42 inches, with most of the rain falling from November through March (U.S. Climate Data 2018).

The City has four major landform areas (Figure 2) that are generally described below.

#### Santiago Hills

The Santiago Hills consist of moderately steep to steep, unbuildable slopes, canyons, plateaus, and narrow ridges, which reach an elevation of 1,700 feet. Eroded sandstone gorges known as the “sinks” are the most significant physical feature in the southeast corner. Other important features are the canyons—Agua Chinon, Bee, Hicks, Little Joaquin, Rattlesnake, and Round. Santiago Hills have retained most of their natural biotic character; their biotic communities are freshwater marsh, coastal sage scrub, oak woodland, and grassland.

#### Northern Flatlands

The flatlands extend from the Santiago Hills to the Santa Ana Freeway (Interstate 5). This area is nearly flat, gradually sloping from the northeast to the southwest and traversed by many streams that are part of the San Diego Creek Watershed that originates in the Santiago Hills.

The increased demand for housing and employment in Orange County has resulted in substantial land use changes from agriculture to urban development within the San Diego Creek Watershed. Agricultural uses, which began in the 19<sup>th</sup> century, already altered the watershed’s natural conditions and hydrology, including increased runoff in Newport Bay and channelization of San Diego Creek (Corps 2008b rev. 2009).

The natural biotic communities of the Northern Flatlands have been altered by agricultural activities, except near the perimeters. This area hosts orchards, row crops, eucalyptus windrows, and non-native, ornamental vegetation.

#### Central Flatlands

The central flatlands are also a portion of the Tustin Plain between Interstate 5 and the San Diego Freeway (Interstate 405). The area is extremely flat and crossed by San Diego Creek and Peters Canyon Wash. The natural biotic communities have, for the most part, been altered by agricultural activities and urban development. The primary biotic communities are farmland/rural and urban, except for the riparian community in Planning Areas 12 and 13.

## San Joaquin Hills

The San Joaquin Hills consist of rolling terrain with moderately steep slopes, canyons, narrow ridges, and spectacular rock outcroppings, many of which contain eroded sandstone caves. Wildlife habitats and vegetation types include both rare and common wildlife and plant species. Important habitat for the coastal California gnatcatcher (*Polioptila californica californica*) and coastal cactus wren (*Campylorhynchus brunneicapillus sandiegensis*) is in the northeastern and southeastern corners of the City and unincorporated Orange County.

### **3.2.2 Topography and Soils**

The topography within the City consists generally of flatlands and hills as described above in Section 3.2.1 of this report. Elevations in the City range from approximately 10 to 1,700 feet above mean sea level. Forty-two soil types are mapped by the USDA NRCS within the City as listed in Table 1.

<b>Table 1 SOIL TYPES WITHIN THE CITY</b>	
<b>Name</b>	<b>Percent Slope</b>
Alo clay	9-50
Alo variant clay	9-50
Anaheim clay loam	15-75
Anaheim loam	15-50

Tidal Flats	NA
Water	NA
Yorba cobbly sandy loam	9-30
Yorba gravelly sandy loam	2-15

### 3.2.3 Vegetation and Land Cover Types

Vegetation and land cover types that occur within the City (Figure 3) were identified through the most current (2015) vegetation mapping from the Nature Reserve of Orange County. Based on this information, 17 types occur within the City and include:

- Annual Grassland
- Perennial Grassland
- Annual Grassland/Perennial Grassland
- Coastal Oak Woodland
- Mixed Chaparral
- Coastal Scrub
- Lacustrine
- Riverine
- Barren
- Riverine, Barren
- Estuarine, Lacustrine, Riverine
- Valley Foothill Riparian
- Eucalyptus
- Fresh Emergent Wetland
- Saline Emergent Wetland
- Orchard-Vineyard, Evergreen Orchard, Irrigated Row and Field Crops
- Urban

Each of these types is described in detail below. Because the Nature Reserve of Orange County vegetation map does not include descriptions of the land cover classifications, the descriptions below are based on information obtained from various resources that provide general vegetation community descriptions, including the CDFW Wildlife Habitat Relationships System among others.

In addition, some of these vegetation communities occur in transitional or ecotonal zones within the City (e.g., Estuarine, Lacustrine, Riverine), where one or more of the definitions provided below may apply. To avoid repetition, each is described separately (e.g., Riverine is described once instead of three times for Riverine; Riverine, Barren; and Estuarine, Lacustrine, Riverine).

#### **Annual Grassland**

Annual grassland is open grassland composed primarily of annual plant species. The community's structure depends largely on weather patterns and livestock grazing. Dramatic differences in physiognomy, both between seasons and between years, are characteristic of this habitat. Introduced annual grasses are the dominant plant species. These species include wild oats, soft chess, ripgut brome, red brome, wild barley, and foxtail fescue. Common forbs include broadleaf filaree, redstem filaree, turkey mullein, true clovers, bur clover, popcorn flower, and others. California poppy, the State flower, may also be found in this habitat (CDFW Wildlife Habitat Relationships System 2005).

### **Perennial Grassland**

Perennial grassland consists of climax stands of perennial bunchgrasses, such as purple needlegrass, on wetter sites (CDFW Wildlife Habitat Relationships System 2005).

### **Coast Oak Woodland**

Coastal live oak woodland occurs in more mesic areas of coastal California from Sonoma County south into Baja California, Mexico. These woodlands are found within a 50-mile radius of the coast. Fog is common in these areas, and the soils are typically well drained. Although not limited to these areas, coastal live oak woodland is common in ravines and moist drainages between grassy hillsides. The dominant plant species is coast live oak (*Quercus agrifolia*; Cal Poly 2018).

### **Mixed Chaparral**

Mixed Chaparral is a structurally homogeneous community dominated by shrubs with thick, evergreen leaves. Shrub height and crown cover vary considerably with age since last burn, precipitation regime, aspect, and soil type. At maturity, cismontane Mixed Chaparral typically is a dense, nearly impenetrable thicket with greater than 80 percent absolute shrub cover (Hanes 1977).

### **Coastal Scrub**

Coastal scrub is dominated by semi-woody, low- to moderate-sized shrubs with shallow root systems. No single species is typical of all Coastal Scrub stands. Species composition changes with progressively more xeric conditions from north to south along the coast. Species dominance appears to shift from evergreen species in the north to drought-deciduous species in the south (CDFW Wildlife Habitat Relationships System undated).

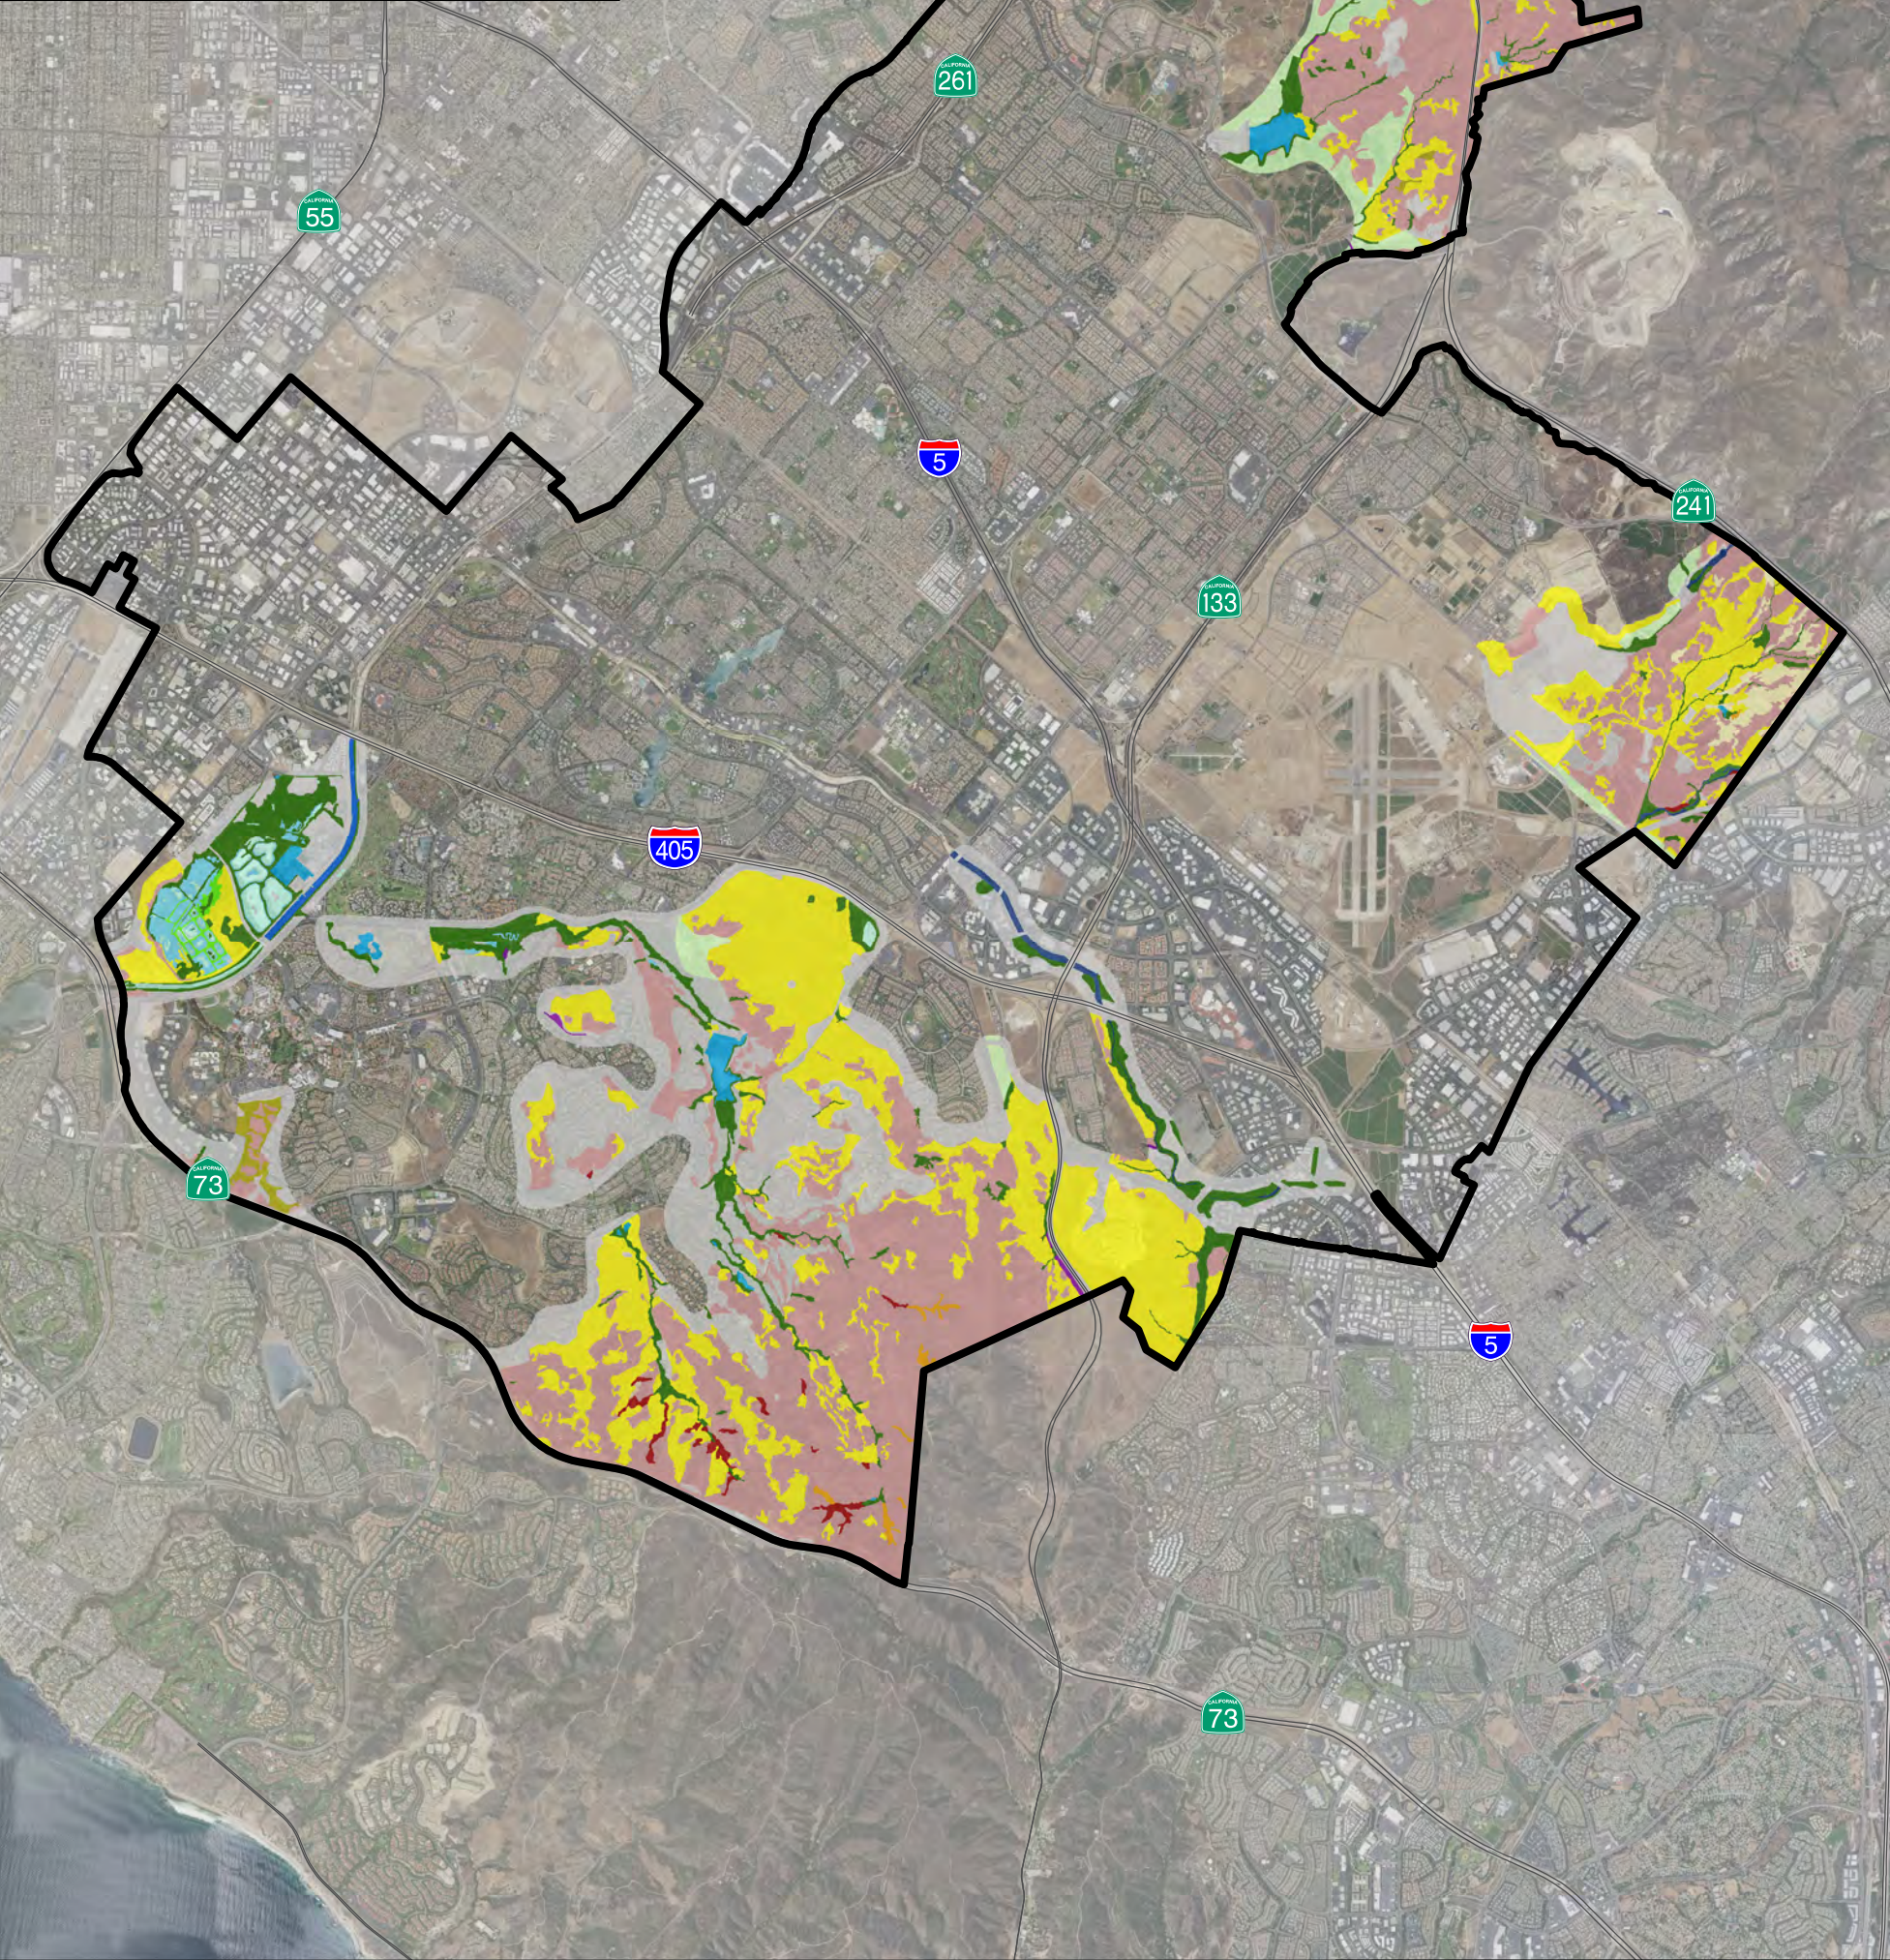

### **Lacustrine**

Lacustrine habitats are inland depressions or dammed riverine channels containing standing water (Cowardin et al. 1979). Depth can vary from a few centimeters to hundreds of meters. Typically, lacustrine habitats include permanently flooded lakes and reservoirs, intermittent lakes, and ponds (including vernal pools; CDFW Wildlife Habitat Relationships System undated).

### **Riverine**

Riverine systems consist of intermittent or continually running water. A stream originates at an elevated source, such as a spring or lake, and flows downward at a rate relative to slope or gradient and the volume of surface runoff or discharge. Velocity generally declines at progressively lower altitudes, and the volume of water increases until the enlarged stream finally becomes sluggish (McNaughton and Wolf 1973). Some streams, except for occasional pools, dry up seasonally every year (CDFW Wildlife Habitat Relationships System undated).

**Vegetation and  
Land Cover Types**

BIOLOGICAL TECHNICAL REPORT  
CITY OF IRVINE  
GENERAL PLAN UPDATE

## **Barren**

Barren land lacks vegetation, typically because of recent and/or continuous clearing of vegetation. It often consists of rock, gravel, and/or soil. These areas differ from “urban,” discussed below, because they do not support buildings, paved roads, parking lots, or ornamental plantings.

## **Riverine, Barren**

See Riverine and Barren as described above.

## **Estuarine, Lacustrine, Riverine**

Estuarine habitats either 1) have constant exchange and interaction with ocean water or marine embayment (estuary, tidal flat, tidal marsh, or eel-grass meadow) or 2) are often separated from ocean water exchange (coastal lagoon; CDFW Wildlife Habitat Relationships 2002). The latter situation is present in the City where Lacustrine and Riverine habitats in the western part of the City are often separated from Upper Newport Bay waters that occur west of State Route 73 outside the City limits. This same area in the City also supports Lacustrine and Riverine habitats. See above for descriptions of those habitats.

## **Valley Foothill Riparian**

Valley Foothill Riparian habitats are found in valleys generally associated with low velocity water flow, flood plains, and gentle topography (Cheatham and Haller 1975). Some dominant species in the canopy layer are cottonwood (*Populus* spp.), California sycamore (*Platanus racemosa*), and oak (*Quercus* spp). Typical understory shrub layer plants include species such as wild grape (*Vitis girdiana*), wild rose (*Rosa californica*), California blackberry (*Rubus ursinus*), blue elderberry (*Sambucus nigra* ssp. *caerulea*), poison oak (*Toxicodendron diversilobum*), and willows (*Salix* spp.). The herbaceous layer consists of species such as sedges, rushes, grasses (CDFW Wildlife Habitat Relationships undated).

## **Eucalyptus**

*Eucalyptus* an introduced genus, whose tree species have been planted typically for wind blocking, ornamental, and hardwood production purposes. If sufficient moisture is available, this genus becomes naturalized and is able to reproduce and expand its areal coverage. Eucalyptus occurs in the City in naturalized patches, landscaping, and windrows.

## **Fresh Emergent Wetland**

Fresh Emergent Wetlands are flooded frequently and are characterized by dominant vegetation generally consisting of perennial monocots to 6.6 feet tall (Cheatham and Haller 1975, Cowardin et al. 1979). Characteristic species on the upper margins of the habitat include those such as sedges and rushes, and on more alkali sites, saltgrass (*Distichlis* sp.). On wetter sites, potential dominant species include cattail (*Typha* spp.) and bulrushes (*Scirpus* spp.; CDFW Wildlife Habitat Relationships undated).

### **Saline Emergent Wetland**

Saline Emergent Wetland occurs above intertidal sand and mud flats (Küchler 1977) and below upland communities not subject to tidal action (Macdonald 1977). It is characterized as salt or brackish marsh with characteristic species such as cordgrass (*Spartina* spp.), pickleweed and glasswort (*Salicornia* spp.), bulrushes, and carex (*Carex* spp.).

### **Orchard, Vineyard, Evergreen Orchard, Irrigated Row and Field Crops**

Orchards, vineyards, and row crops are land uses primarily for the production of food and fiber. On aerial imagery, the chief indications of agricultural activity are distinctive geometric field and road patterns on the landscape and the traces produced by mechanized equipment. The number of building complexes is smaller and the density of the road and highway network is much lower among these land uses than in Urban areas (see Urban below).

### **Urban**

Urban lands typically support little to no native vegetation and are characterized by the presence of man-made structures such as buildings, paved roads, parking lots, parks, and residential areas that are either unvegetated or are dominated by exotic, ornamental plant species.

#### **3.2.4 Flora**

Despite the urbanization of most of the City, there are still areas within the City that provide open space and relatively untouched habitats that support native plant species.

The City also supports many agricultural lands and developed areas. While these lands typically support planted crops and orchards as well as ornamental species, respectively, they likely support both native and non-native plant species. Native plant species that can tolerate disturbance, and even thrive in disturbed areas, probably can be found growing alongside of the planted crops or as the understory within the orchards.

Some of the non-native plant species are likely invasive. These species likely have replaced native habitats that historically occurred because they produce larger quantities of seeds than the native plant species, have aggressive root systems that spread long distances and can steal resources (e.g., water, minerals) from native plant species, have dense root systems that smother the root systems of surrounding vegetation, and/or produce chemicals that inhibit the growth of other plant species around them. Invasive species pose serious environmental threats because they can invade healthy, native ecosystems and degrade the quality of the habitat so that it no longer provides the functions and values of the native ecosystems that occurred there historically.

### 3.2.5 Fauna

A variety of resident and migratory wildlife species occur within the City. Many of the resident species have adapted to survival within the interface of the urban lands and adjacent open space, parks, and preserves. The City provides habitat for both common and special status species including invertebrates, amphibians, reptiles, birds, and mammals.

Birds are the most numerous type of readily observable wildlife that occur within the City. Many common bird species can be seen such as mourning dove (*Zenaida macroura*), northern mockingbird (*Mimus polyglottos*), European starling (*Sturnus vulgaris*), house sparrow (*Passer domesticus*), and lesser goldfinch (*Spinus psaltria*). Common small and large mammals are also likely present in the City. Some of these species include woodrats (*Neotoma* spp.), mice (e.g., *Peromyscus* and *Chaetodipus* spp.), coyote (*Canis latrans*), raccoon (*Procyon lotor*), Virginia opossum (*Didelphis virginiana*), and striped skunk (*Mephitis mephitis*). Both the bobcat (*Lynx rufus*) and mountain lion (*Puma concolor*) have also been reported in the City.

### 3.3 SENSITIVE BIOLOGICAL RESOURCES

Sensitive biological resources include sensitive vegetation communities, special status plant species, special status wildlife species, wildlife movement corridors, and wetland/riparian resources. In general, the principal reason that a species, subspecies, or variety is considered sensitive is the documented or perceived decline or limitation of its population size or geographical extent and/or distribution resulting in most cases from habitat loss. Wildlife movement corridors or linkages also are considered sensitive by local, State, and federal resource and conservation agencies because these corridors allow wildlife to move between adjoining open space areas that are becoming increasingly isolated as open space becomes increasingly fragmented from urbanization, rugged terrain, or changes in vegetation (Beier and Loe 1992). In addition, wetland and riparian resources are considered sensitive because of their limited distribution and high wildlife value.

Many sensitive biological resources are known to occur or have the potential to occur within the City based on historical data for the region identified through a query of the CNDDDB and USFWS database, the National Hydrography Dataset, and/or the presence of potentially suitable habitat within the City. The following section describes these sensitive biological resources.

#### 3.3.1 Sensitive Vegetation Communities

Sensitive vegetation communities are vegetation assemblages, associations, or subassociations that have cumulative losses throughout the region, have relatively limited distribution, support or potentially support sensitive plant or wildlife species, or have particular value to other wildlife. Typically, sensitive vegetation communities are considered sensitive whether or not they have been disturbed. Sensitive vegetation communities are regulated by various local, State, and federal resource agencies.

The CNDDDB provides an inventory of natural communities that are considered sensitive by State and federal resource agencies, academic institutions, and conservation groups such as the California Native Plant Society (CNPS). Determination of the level of sensitivity is based on the Nature Conservancy Heritage Program Status Ranks that rank both species and plant communities on a global and statewide basis according to the number and size of remaining occurrences as well as recognized threats such as proposed development, habitat degradation, and invasion by non-native species.

Based on a California Sensitive Natural Communities (CDFW 2018) search, ten sensitive vegetation communities were identified within the City and are listed below. According to the CDFW (2018), natural communities with ranks of 1 to 3, or Y (for alliances), are considered sensitive. Since the specific species composition and dominance in each of the communities in the City is not known for this report, the sensitivity for the alliance was used.

Vegetation communities that are wetland and/or riparian resources are also considered sensitive biological resources and are regulated by the Corps, CDFW, and/or RWQCB pursuant to several federal and State regulations. Wetland and/or riparian resources are also identified in the list below. See Section 3.3.5 of this report for more information about wetland and riparian resources.

- Perennial Grassland (Y)
- Annual/Perennial Grassland (Y; annual grassland is not sensitive, but perennial is)
- Coastal Oak Woodland (Y)
- Coastal Scrub (Y)
- Lacustrine (Wetland/Riparian)
- Riverine (Wetland/Riparian)
- Riverine (Wetland/Riparian), Barren (the barren portion of this community is not sensitive)
- Estuarine, Lacustrine, Riverine (Wetland/Riparian)
- Freshwater Emergent Wetland (Y, Wetland)
- Saline Emergent Wetland (Y, Wetland)

### 3.3.2 Special Status Plant Species

For purposes of this report, special status plant species include those that are:

- listed or proposed for listing by federal or State agencies as threatened or endangered;
- on List 1B (considered endangered throughout its range) or List 2 (considered endangered in California but more common elsewhere) of the CNPS' *Inventory of Rare and Endangered Vascular Plants of California*;
- considered rare, endangered, or threatened by the CDFW or other local conservation organizations or specialists; and/or
- covered under the NCCP/HCP

Noteworthy plant species are considered to be those on:

- List 3 (more information about the plant distribution and rarity needed) and
- List 4 (plants of limited distribution) of the CNPS *Inventory*.

The CNPS is a Statewide resource conservation organization that has developed an inventory of California's sensitive plant species. The CNPS listing is sanctioned by the CDFW and essentially serves as an early warning list of potential candidate species for threatened or endangered status.

According to USFWS, a federal endangered species is defined as a species facing extinction throughout all or a significant portion of its geographic range, and a federally threatened species is defined as a species that is likely to become endangered within the foreseeable future throughout all or a significant part of its range. CDFW defines an endangered species as one whose prospects of survival and reproduction are in immediate jeopardy, a threatened species as one present in such small numbers throughout its range that it is likely to become an endangered species in the near future in the absence of special protection or management, and a rare species as one present in such small numbers throughout its range that it may become endangered if its present environment worsens.

Species that are federal- or State-listed threatened or endangered species; are designated as CNPS List 1B or 2 species; and/or are considered rare, endangered, or threatened by the CDFW and are afforded a degree of protection that entails a permitting process including specific mitigation measures to compensate for impacts to the species. Species that are proposed to be listed by the USFWS are treated similarly to listed species by that agency. Recommendations of the USFWS, however, are advisory rather than mandatory in the case of proposed species. Although plant species that are classified as List 3 or 4 species by CNPS are not provided legal protection, this designation is used to identify declining plant species that are considered sensitive by the CNPS but not considered threatened or endangered.

There are 33 special status plant species known to occur historically from the region of the City. Ten of these species have been reported within the City or just outside the City limits (Figure 4). All 33 special status plant species are summarized in Table 2. No critical habitat has been designated by the USFWS within the City for any plant species.

**Table 2**  
**SPECIAL STATUS PLANT SPECIES REPORTED WITHIN THE CITY OF IRVINE OR THE REGION**

Scientific Name	Common Name	Status	Habitat Description	Occurrence Info
<i>Aphanisma blitoides</i>	Aphanisma	List 1B.2	Coastal bluffs	May occur within the City because potential habitat may be present.
<i>Astragalus brauntonii</i>	Braunton's milk-vetch	FE List 1B.1	Chaparral, coastal scrub, grassland—recent burns or disturbed areas	May occur within the City because potential habitat may be present.
<i>Atriplex coulteri</i>	Coulter's saltbush	List 1B.2	Grassland, sage scrub, eroded coastal terrace	Reported in the City (Figure 4).
<i>Atriplex serenana</i> var. <i> davidsonii</i>	Davidson's saltscale	List 1B.2	Alkaline coastal bluff scrub, coastal scrub	Reported in the City (Figure 4).
<i>Atriplex pacifica</i>	South Coast saltscale	List 1B.2	Coastal bluff scrub, coastal dunes, coastal scrub, playas	May occur within the City because suitable habitat may be present.
<i>Calochortus catalinae</i>	Catalina mariposa lily	List 4.2 Covered	Chaparral, cismontane woodland, coastal scrub, grassland	May occur within the City because suitable habitat may be present.
<i>Calochortus weedii</i> var. <i> intermedius</i>	Intermediate mariposa-lily	List 1B.2 Covered	Rocky, calcareous chaparral, coastal scrub, grassland.	Reported in the City (Figure 4).
<i>Camissoniopsis lewisii</i>	Lewis' evening-primrose	List 3.0	Sand bars with salt marsh	May occur within the City because suitable habitat may be present.
<i>Chloropyron maritimum</i> ssp. <i> maritimum</i>	Salt marsh bird's-beak	FE SE List 1B.2	Salt marsh	May occur within the City because suitable habitat may be present.
<i>Chorizanthe polygonoides</i> var. <i> longispina</i>	Long-spined spineflower	List 1B.2	Chaparral, coastal scrub, meadows and seeps, grassland, vernal pools—often with clay soils	May occur within the City because suitable habitat may be present.
<i>Cistanthe maritima</i>	Seaside calandrinia	List 4.2	Sandy coastal bluff scrub, coastal scrub, grassland	May occur within the City because suitable habitat may be present.
<i>Convolvulus simulans</i>	Small-flowered morning glory	List 4.2	Grassland with clay soil	May occur within the City because suitable habitat may be present.
<i>Deinandra paniculata</i>	Paniculate tarplant	List 4.2	Coastal scrub, grassland vernal pools	May occur within the City because suitable habitat may be present.

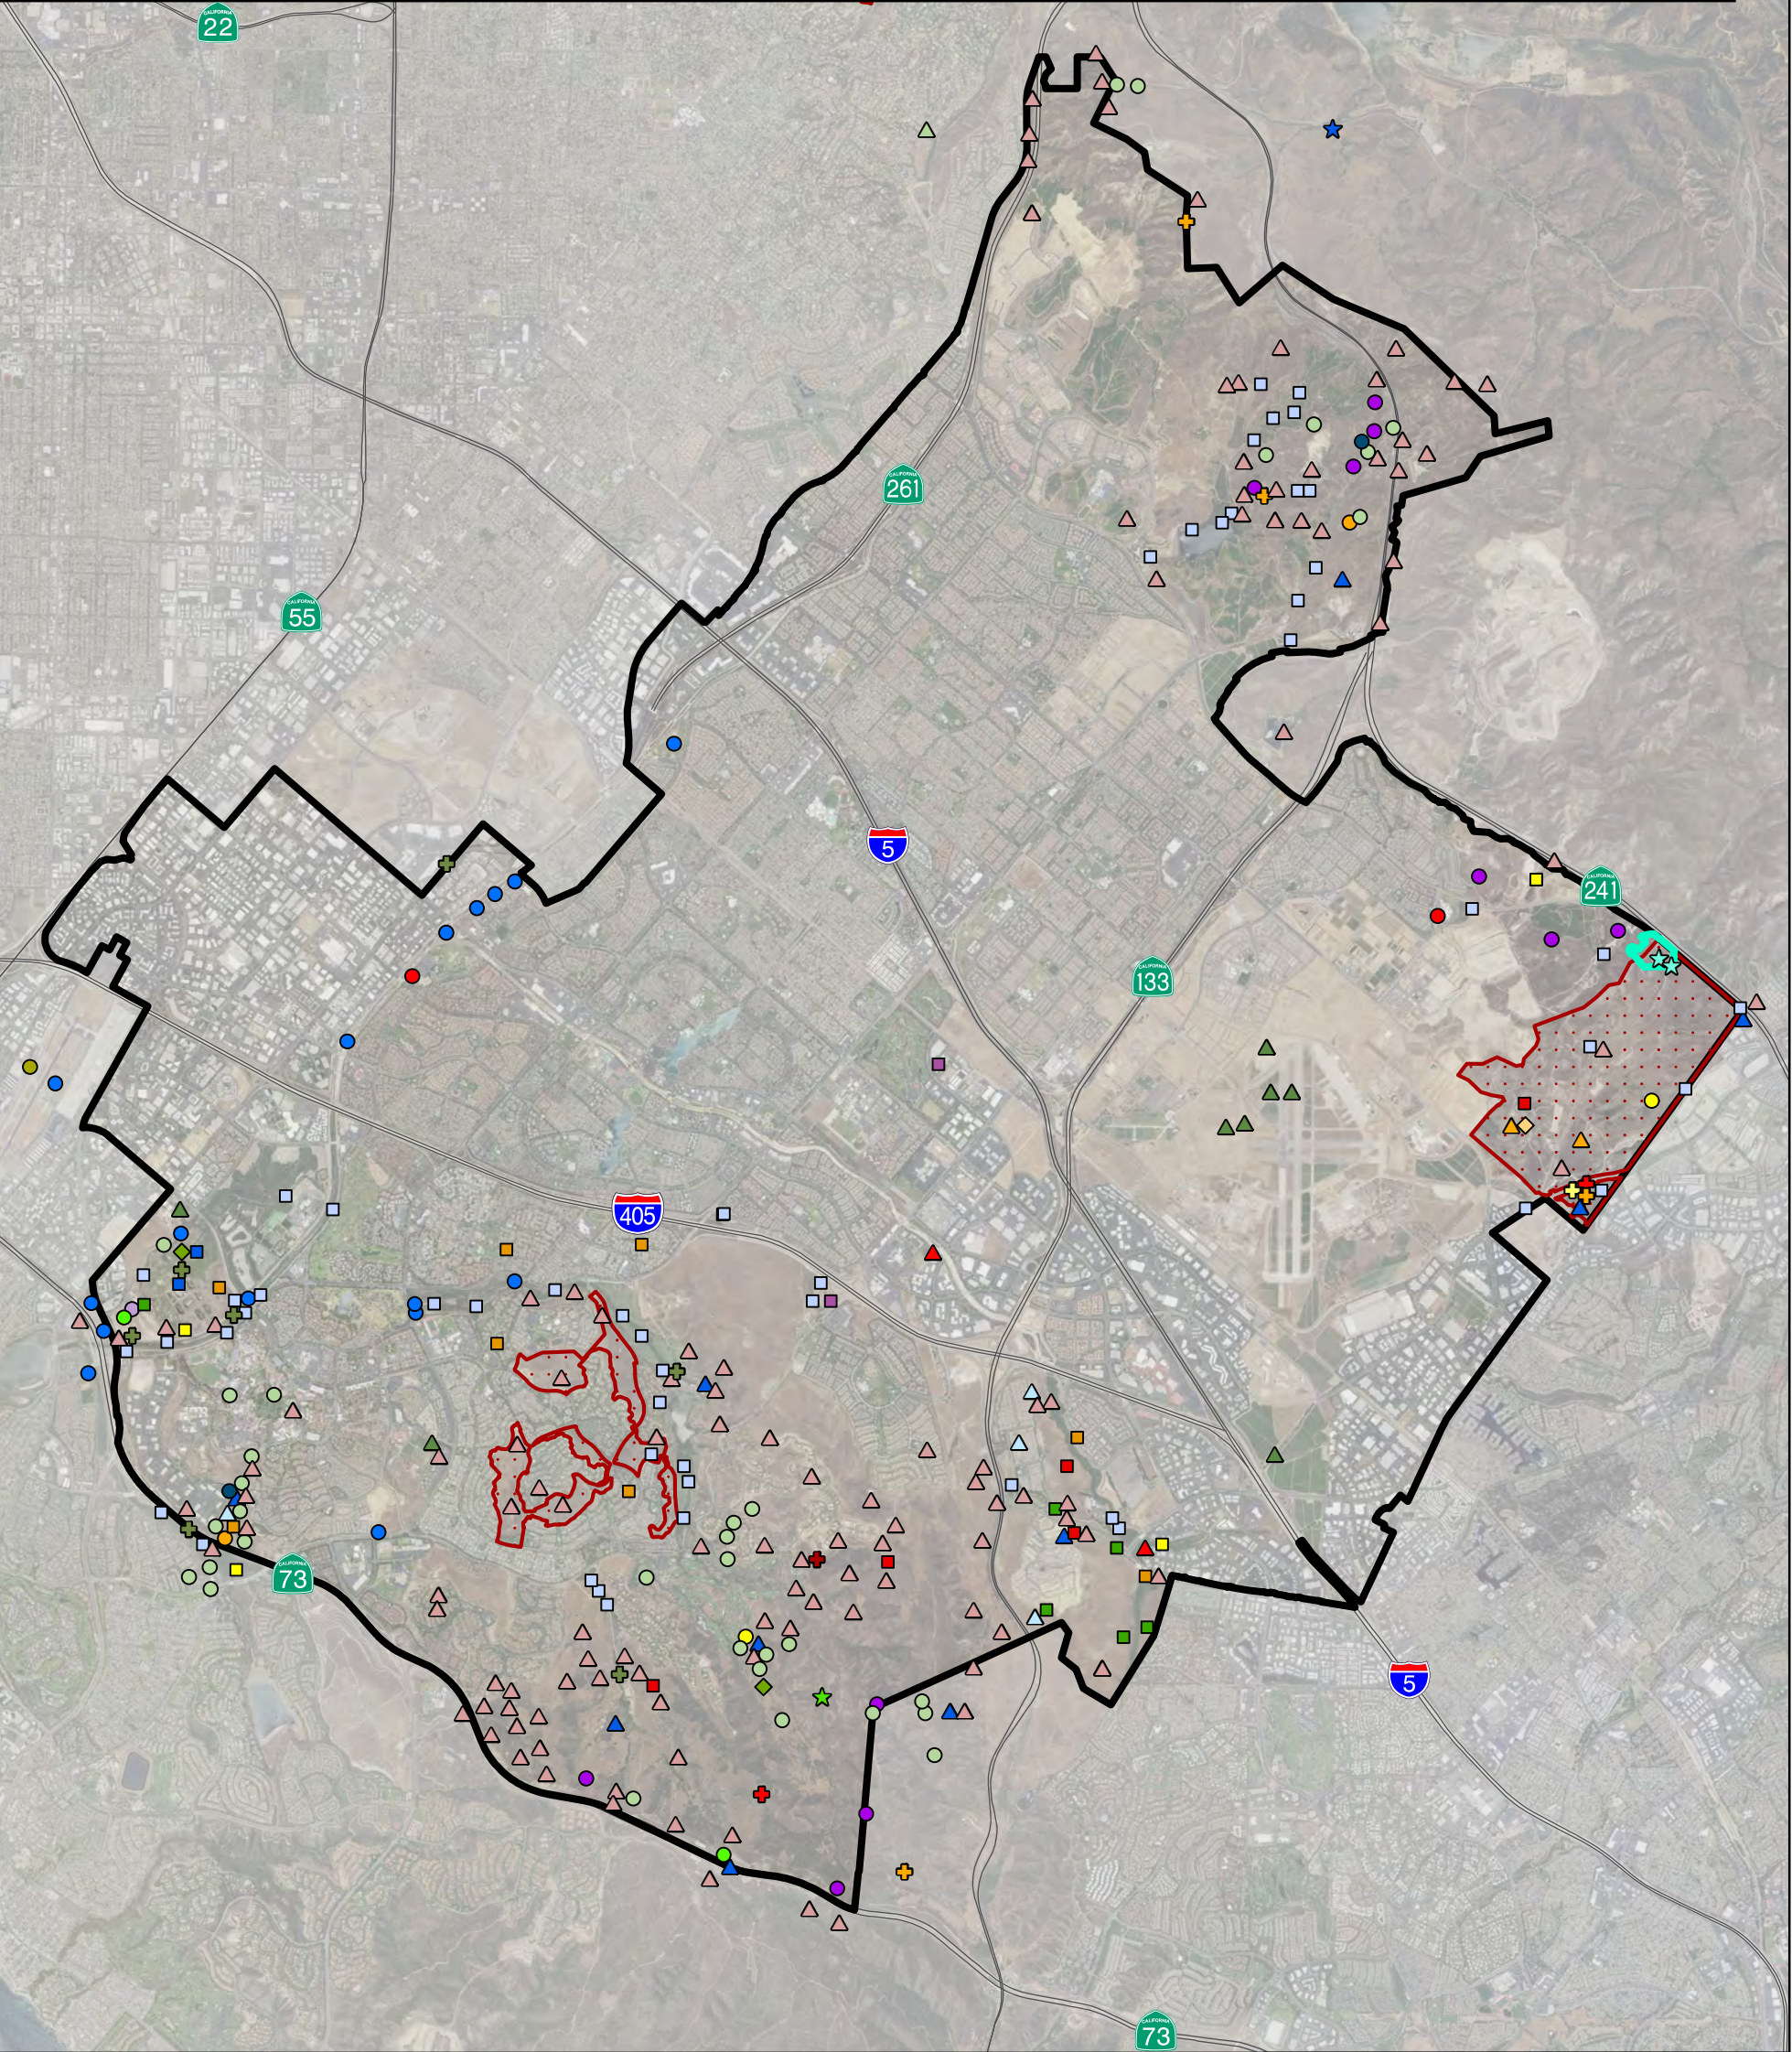

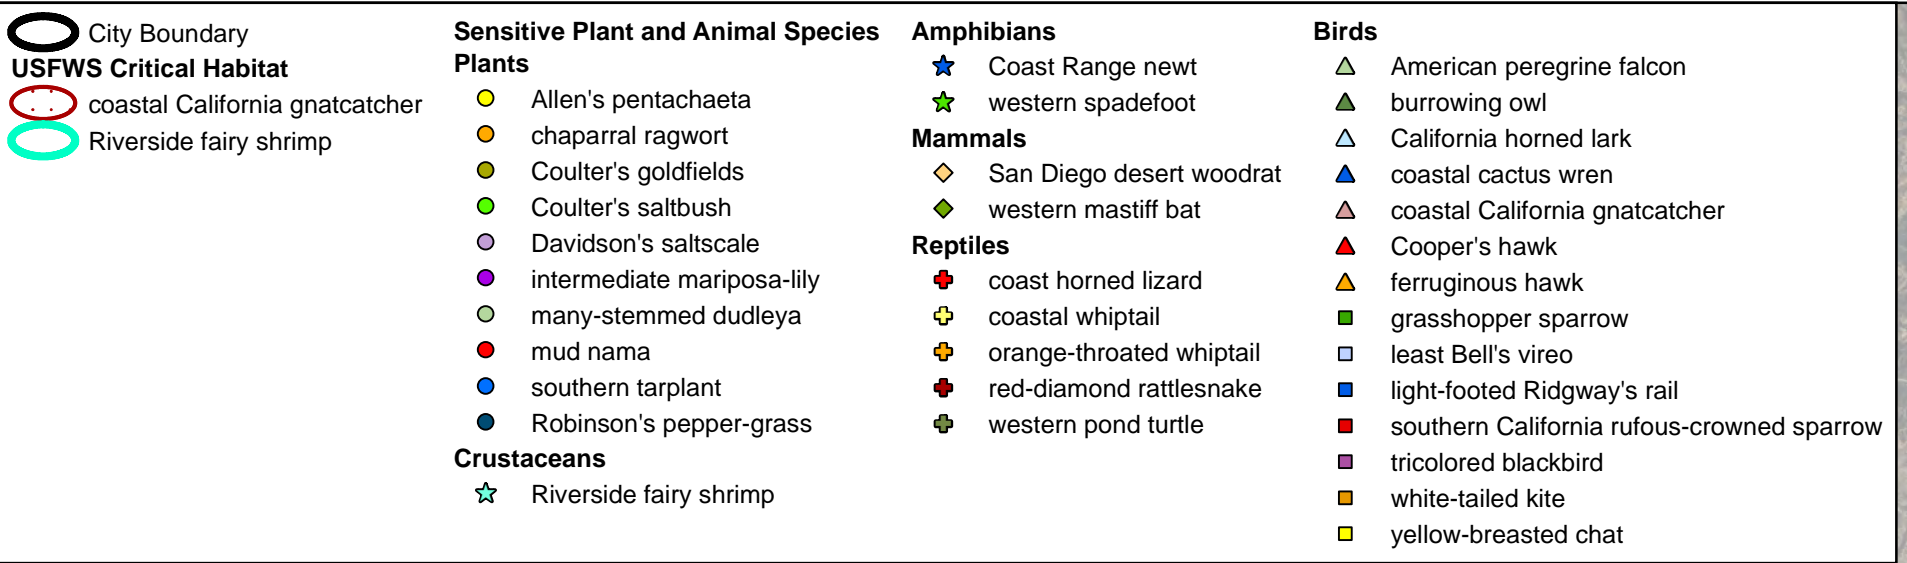

**Table 2**

### 3.3.3 Special Status Wildlife Species

For purposes of this report, special status wildlife species include those that are 1) listed or proposed for listing as threatened or endangered by the USFWS or the CDFW; 2) designated as Birds of Conservation Concern by the USFWS; 3) designated as California Fully Protected or California Species of Special Concern by the CDFW; and/or 4) covered under the NCCP/HCP. In addition, raptors (birds of prey) and active raptor nests are protected by the California Fish and Game Code 3503.5, which states that it is “unlawful to take, possess, or destroy any birds of prey or to take, possess, or destroy the nest or eggs of any such bird” unless authorized. The federal MBTA, which restricts the killing, taking, collecting, selling, or purchasing of native bird species or their parts, nests, or eggs, also provides legal protection for almost all breeding bird species occurring in the U.S. The MBTA is supplemented by the BGEPA, which provides protection for both the bald eagle and the golden eagle by prohibiting the “take” of either of these species, including their parts, nests, or eggs. Noteworthy wildlife species are those given the informal designation of California Species of Concern by the CDFW. This designation applies to animals not listed under FESA or CESA but which nonetheless (1) are declining at a rate that could result in listing or (2) historically occurred in low numbers and known threats to their persistence currently exist.

According to the USFWS, a federal endangered species is defined as a species facing extinction throughout all or a significant portion of its geographic range, and a federal threatened species is defined as a species that is likely to become endangered within the foreseeable future throughout all or a significant part of its range. The CDFW defines an endangered species as one whose prospects of survival and reproduction are in immediate jeopardy, a threatened species as one present in such small numbers throughout its range that it is likely to become an endangered species in the near future in the absence of special protection or management, a California Fully Protected species as one that is rare or faces possible extinction, and a California Species of Concern as one that is declining in numbers.

Species that are federal- or State-listed threatened or endangered are afforded a degree of protection that entails a permitting process, including specific mitigation measures to compensate for impacts to the species. Species that are proposed to be listed by the USFWS are treated similarly to listed species by that agency. Recommendations of the USFWS, however, are advisory rather than mandatory in the case of proposed species. As regulated by the CDFW, Fully Protected species may not be taken or possessed at any time and no licenses or permits may be issued for their take except for collecting these species for necessary scientific research and relocation of the bird species for the protection of livestock. Wildlife species classified as California Species of Concern or Watch List by the CDFW are not typically provided legal protection; however, there are exceptions for some species such as the burrowing owl (*Athene cunicularia*). Similarly, Birds of Conservation Concern refers to non-listed subspecies or populations of federal threatened or endangered species.

There are 59 special status wildlife species known to occur historically from the region. Twenty-four of these species have been reported within the City or just outside the City limits (Figure 4). All 59 special status wildlife species are summarized in Table 3. Critical habitat has been designated by the USFWS for two species within the City: Riverside fairy shrimp (*Streptocephalus woottoni*) and coastal California gnatcatcher (Figure 4).

**Table 3  
SPECIAL STATUS WILDLIFE SPECIES REPORTED WITHIN  
THE CITY OF IRVINE OR THE REGION**

Scientific Name	Common Name	Status	Habitat Description	Occurrence Info
<b>Invertebrates</b>				
<i>Branchinecta sandiegonensis</i>	San Diego fairy shrimp	FE Covered	Vernal pools or other ephemeral basins in coastal southern California south to extreme northwestern Baja California, Mexico	May occur within the City because suitable habitat may be present.
<i>Streptocephalus woottoni</i>	Riverside fairy shrimp	FE Covered	Restricted to a few vernal pools in southwestern Riverside, Orange, and San Diego counties	Reported in the City, and critical habitat has been designated in the City (Figure 4).
<b>Fish</b>				
<i>Eucyclogobius newberryi</i>	Tidewater goby	FE CSC	Shallow brackish lagoons and lower stream reaches	May occur within the City because potential habitat may be present.
<b>Amphibians</b>				
<i>Aneides lugubris</i>	Arboreal salamander	Covered	Moist places in a variety of habitats from coastal dunes to woodlands	May occur within the City because suitable habitat may be present.
<i>Anaxyrus californicus</i>	Arroyo toad	FE CSC Covered	Breeds in shallow pools along stream edges with sand/gravel flats between March and June. Adults use sage scrub, mixed chaparral, oak woodland habitats up to within one mile of breeding sites.	May occur within the City because suitable habitat may be present.
<i>Batrachoseps nigriventris</i>	Blackbelly slender salamander	Covered	Moist places, mainly in woodlands, but also found in grasslands and riparian habitats	May occur within the City because suitable habitat may be present.
<i>Spea hammondi</i>	Western spadefoot	CSC Covered	Washes, river floodplains, alluvial fans, playas, alkali flats, temporary ponds, vernal pools in mixed woodlands, grasslands, coastal sage scrub, and chaparral. Surface activity October to April. Oviposition late February to May in temporal pools and slow-moving sections of streams	Reported in the City (Figure 4).
<i>Taricha torosa</i>	Coast Range newt	CSC	In southern California, habitats include drier chaparral, oak woodland, and grasslands	Reported just outside the City limits (Figure 4).
<b>Reptiles</b>				
<i>Phrynosoma blainvillii</i>	Coast horned lizard	CSC Covered	Scrubland, grassland, coniferous woods, and broadleaf woodlands, especially in areas with sandy soils, scattered shrubs, and ant colonies, such as along the edges of arroyo bottoms or dirt roads.	Reported in the City (Figure 4).
<i>Aspidoscelis hyperythra</i>	Orange-throated whiptail	WL Covered	Open coastal sage scrub, chaparral, and streamside growth with loose sandy soils, revegetation sites.	Reported in the City (Figure 4).

**Table 3**  
**SPECIAL STATUS WILDLIFE SPECIES REPORTED WITHIN**  
**THE CITY OF IRVINE OR THE REGION**

Scientific Name	Common Name	Status	Habitat Description	Occurrence Info
<i>Aspidoscelis tigris stejnegeri</i>	Coastal western whiptail	CSC Covered	Coastal sage scrub, chaparral, and wash habitats	Reported in the City (Figure 4).
<i>Anniella stebbinsi</i>	Southern California legless lizard	CSC	Found in leaf litter and loose soil on beaches and in coastal scrub, chaparral, and open riparian habitats. Sandy washes and beach dunes are used for burrowing, while logs and leaf litter are used for cover and feeding.	May occur within the City because suitable habitat may be present.
<i>Charina trivirgata</i>	rosy boa	Covered	Rocky areas in coastal sage scrub and chaparral	May occur within the City because potential habitat may be present.
<i>Crotalus ruber</i>	red-diamond rattlesnake	CSC Covered	Arid scrub (including coastal sage scrub), chaparral, woodlands, and cultivated areas, often with large rocks or boulders	Reported in the City (Figure 4).
<i>Diadophis punctatus modestus</i>	San Bernardino ringneck snake	Covered	Semi-arid brushy areas and chaparral in canyons, rocky hillsides, and plains	May not occur in the City due to limited or lacking potential habitat.
<i>Emys marmorata</i>	Western pond turtle	CSC	Slow-water aquatic habitats with available basking sites (e.g., submerged logs, open mud banks)	Reported in the City (Figure 4).
<i>Plestiodon skiltonianus interparietalis</i>	Coronado skink	WL Covered	Occurs in variety of mesic habitats including coastal sage, chaparral, oak woodlands, pinon-juniper, and riparian woodlands to pine forests	May occur within the City because suitable habitat may be present.
<i>Salvadora hexalepis virgulata</i>	Coast patch-nosed snake	CSC	Semi-arid brushy areas and chaparral in canyons, rocky hillsides, and plains	May occur within the City because potential habitat may be present.
<i>Thamnophis hammondi</i>	Two-striped garter snake	CSC	Permanent fresh water, inhabiting streams, ponds, vernal pools. Occupies adjacent coastal sage scrub and grasslands during the winter.	May occur within the City because suitable habitat may be present.
<b>Birds</b>				
<i>Accipiter cooperii</i>	Cooper's hawk	WL	Occurs in various woodland habitats, including riparian	Reported in the City (Figure 4).
<i>Accipiter striatus</i>	Sharp-shinned hawk	WL Covered	Woodland areas and open lowlands	May occur within the City because potential habitat may be present.
<i>Agelaius tricolor</i>	Tricolored blackbird	BCC CSC, (SE Candidate)	Cattail or tule marshes; forages in fields, farms. Breeds in large freshwater marshes in dense stands of cattails or bulrushes. At all seasons (including when breeding), does most of its foraging in open habitats such as farm fields, pastures, cattle pens, and large lawns.	Reported in the City (Figure 4).

**Table 3**  
**SPECIAL STATUS WILDLIFE SPECIES REPORTED WITHIN**  
**THE CITY OF IRVINE OR THE REGION**

Scientific Name	Common Name	Status	Habitat Description	Occurrence Info
<i>Aimophila ruficeps canescens</i>	Southern California rufous-crowned sparrow	WL Covered	Coastal sage scrub, coastal bluff scrub, low-growing chaparral	Reported in the City (Figure 4).
<i>Ammodramus savannarum</i>	Grasshopper sparrow	CSC	Grasslands, prairies, hayfields, and open pastures with little to no scrub cover and often with some bare ground	Reported in the City (Figure 4).
<i>Aquila chrysaetos</i>	golden eagle	CFP, WL Covered	Requires vast foraging areas in grassland, broken chaparral, or sage scrub. Nests on cliffs and boulders.	May not occur within the City because of limited potential habitat.
<i>Athene cunicularia</i>	Burrowing owl	BCC CSC	Grassland, agricultural land, coastal dunes	Reported in the City (Figure 4).
<i>Buteo lineatus</i>	Red-shouldered hawk	Covered	Riparian woodland	May occur within the City because suitable habitat may be present.
<i>Buteo regalis</i>	Ferruginous hawk	BCC WL	Winter resident of grassland and agricultural areas in southwestern California	Reported in the City (Figure 4).
<i>Campylorhynchus brunneicapillus sandiegensis</i> (San Diego and Orange counties only)	Coastal cactus wren	BCC CSC Covered	Coastal sage scrub and chaparral plant communities with substantial cacti ( <i>Opuntia</i> spp.) stands	Reported in the City (Figure 4).
<i>Charadrius alexandrinus nivosus</i>	Western snowy plover	FT, BCC CSC	Breeds primarily on coastal beaches from southern Washington to southern Baja California, Mexico. The Pacific coast population breeds above the high tide line on coastal beaches, sand spits, dune-backed beaches, sparsely-vegetated dunes, beaches at creek and river mouths, and salt pans at lagoons and estuaries.	May occur within the City because potential habitat may be present.
<i>Circus hudsonius</i>	Northern harrier	CSC Covered	Open habitats, such as grasslands and fields, as well as marshes.	May occur within the City because suitable habitat may be present.
<i>Coccyzus americanus occidentalis</i>	western yellow-billed cuckoo	FT, BCC SE	Extensive riparian woodlands	May not occur within the City because of limited or lacking potential habitat.
<i>Elanus leucurus</i>	white-tailed kite	CFP	Nests in riparian woodland, oaks, sycamores and forages in open, grassy areas	Reported in the City (Figure 4).

**Table 3  
SPECIAL STATUS WILDLIFE SPECIES REPORTED WITHIN  
THE CITY OF IRVINE OR THE REGION**

Scientific Name	Common Name	Status	Habitat Description	Occurrence Info
<i>Empidonax traillii extimus</i>	southwestern willow flycatcher	FE SE Covered	Nests in extensive willow-dominated riparian forests and woodlands, occasionally oak woodlands	May not occur within the City because of limited or lacking potential habitat.
<i>Eremophila alpestris actia</i>	California horned lark		Short vegetation or bare ground and low-growing or fallow agricultural fields	Reported in the City (Figure 4).
<i>Falco peregrinus anatum</i>	American peregrine falcon	BCC CFP Covered	Nests in open landscapes with cliffs or tall man-made structures. Found along coastlines, shorelines, etc. where shorebird or rock pigeon prey occurs.	Reported just outside the City limits (Figure 4).
<i>Icteria virens</i>	Yellow-breasted chat	CSC	Dense riparian woodland	Reported in the City (Figure 4).
<i>Ixobrychus exilis</i>	Least bittern	BCC CSC	Dense marshes	May occur within the City because suitable habitat may be present.
<i>Lanius ludovicianus</i>	loggerhead shrike	BCC CSC	Open-canopied valley foothill hardwood, valley foothill hardwood-conifer, valley foothill riparian, pinyon-juniper, juniper, desert riparian, and Joshua tree woodland habitats with scattered shrubs, trees, posts, fences, utility lines, or other perches	May occur within the City because potential habitat may be present.
<i>Laterallus jamaicensis coturniculus</i>	California black rail	BCC ST, CFP	Salt marshes, freshwater marshes, and wet meadows	May occur within the City because suitable habitat may be present.
<i>Passerculus sandwichensis beldingi</i>	Belding's savannah sparrow	SE	Coastal salt marsh	May occur within the City because suitable habitat may be present.
<i>Poliptila californica californica</i>	coastal California gnatcatcher	FT CSC Covered	Coastal sage scrub, maritime succulent scrub.	Reported in the City (Figure 4).
<i>Pelecanus erythrorhynchos</i>	American white pelican	CSC	Breeds mainly on isolated islands in freshwater lakes or on ephemeral islands in shallow wetlands. Forages in marshes, along lake or river edges, and in wetlands.	May occur within the City because potential habitat may be present.
<i>Pelecanus occidentalis californicus</i>	California brown pelican	CFP	Nests from the Channel Islands along the Baja California coast and in the Gulf of California to coastal southern Mexico. Builds nests of sticks on the ground, typically on islands or offshore rocks. Between breeding seasons, wanders along the west coast.	May not occur within the City because of limited or lacking potential habitat.

**Table 3**  
**SPECIAL STATUS WILDLIFE SPECIES REPORTED WITHIN**  
**THE CITY OF IRVINE OR THE REGION**

Scientific Name	Common Name	Status	Habitat Description	Occurrence Info
<i>Phalacrocorax auritus</i>	Double-crested cormorant	WL	Lakes and ponds	May occur within the City because potential habitat may be present.
<i>Plegadis chihi</i>	White-faced ibis	WL	Freshwater wetlands and marshes but also may feed in flooded meadows, agricultural fields, and estuarine wetlands.	May occur within the City because potential habitat may be present.
<i>Rallus obsoletus levipes</i>	Light-footed Ridgway's rail	FE SE, CFP	Salt marshes and lagoons	Reported in the City (Figure 4).
<i>Rynchops niger</i>	Black skimmer	CSC	Mostly ocean beaches, tidewater. Favors coastal waters protected from open surf such as lagoons, estuaries, inlets, and sheltered bays. Occurs locally on inland lakes	May occur within the City because potential habitat may be present.
<i>Setophaga petechia</i>	yellow warbler	BCC CSC	Well-developed riparian habitats, often with mature willows, usually in close proximity to water along streams and meadows	May occur within the City because suitable habitat may be present.
<i>Sternula antillarum browni</i>	California least tern	FE SE, CFP	Nests are situated on barren to sparsely vegetated places near water, normally on sandy or gravelly substrates, and may appear along marine or estuarine shores in areas free from humans or predators. Wintering locations are unknown.	May not occur within the City because of limited or lacking potential habitat.
<i>Vireo bellii pusillus</i>	Least Bell's vireo	FE SE Covered	Dense, stratified canopy within willow-dominated woodland or scrub, <i>Baccharis</i> scrub, mixed oak/willow woodland, mesquite woodland, and elderberry scrub in riparian habitat.	Reported in the City (Figure 4).
<b>Mammals</b>				
<i>Antrozous pallidus</i>	pallid bat	CSC	Open desert scrub, grasslands, shrub lands, woodlands, and forests. Roosts in rock crevices, caves, mines, tree hollows, and buildings.	May occur within the City because suitable habitat may be present.
<i>Chaetodipus fallax fallax</i>	Northwestern San Diego pocket mouse	CSC	Sparse, disturbed coastal sage scrub or grasslands with sandy soils.	May occur within the City because suitable habitat may be present.
<i>Eumops perotis californicus</i>	western mastiff bat	CSC	Occurs in many open, semi-arid to arid habitats, including conifer and deciduous woodlands, coastal scrub, grasslands, chaparral, etc.; roosts in crevices in vertical cliff faces, high buildings, trees, and tunnels, and travels widely when foraging.	Reported in the City (Figure 4).
<i>Lepus californicus bennettii</i>	San Diego black-tailed jackrabbit	CSC	Open areas of scrub, grasslands, agricultural fields with ample grasses and forbs.	May occur within the City because suitable habitat may be present.

**Table 3  
SPECIAL STATUS WILDLIFE SPECIES REPORTED WITHIN  
THE CITY OF IRVINE OR THE REGION**

Scientific Name	Common Name	Status	Habitat Description	Occurrence Info
<i>Neotoma lepida intermedia</i>	San Diego desert woodrat	CSC Covered	Coastal sage scrub and chaparral. Prefers rock outcrops.	Reported in the City (Figure 4).
<i>Perognathus longimembris pacificus</i>	Pacific pocket mouse	FE CSC	Fine-grained, sandy or gravelly substrates in coastal strand, coastal dunes, river alluvium, and coastal sage scrub growing on marine terraces. Nearly all historic observations of are within 4 km (approximately 2.48 miles) of the Pacific coast, with a few as far as 6 km (approximately 3.72 miles). Currently known only from Dana Point Headlands in Orange County, California and three locations on Marine Corps Base Camp Pendleton in San Diego County (Spencer 2005).	May not occur within the City because it is largely too far inland.
<i>Sorex ornatus salicornicus</i>	Southern California saltmarsh shrew	CSC	Salt marsh	May occur within the City because suitable habitat may be present.
<i>Taxidea taxus</i>	American badger	CSC	Drier, open stages of shrub steppes, agricultural fields, open woodland forests, and large grass and sagebrush meadows and valleys with friable soils.	May occur within the City because suitable habitat may be present.
Status: FE=Federal endangered; FT=Federal threatened; BCC=Birds of Conservation Concern; SE=State endangered; ST=State threatened; CFP=California Fully Protected; CSC=California Species of Special Concern; WL=CDFW Watch List; Covered = Covered under the NCCP/HCP				

### 3.3.4 Wildlife Movement Corridors

Wildlife corridors are essential to maintain populations of healthy and genetically diverse plant and wildlife species. At a minimum, wildlife corridors promote colonization of habitat and genetic variability for both plant and wildlife species by connecting fragments of habitat that are separated by otherwise foreign or inhospitable habitats. Because the isolation of plant and wildlife populations can have many harmful effects on local and regional species' populations and may contribute significantly to local species extinctions, wildlife corridors are important to sustain individual species distributions within these habitat fragments. Studies have concluded that many wildlife species would not likely persist in these habitat fragments over time because isolation through fragmentation would prohibit the infusion of new individuals and genetic information into the population (Harris and Gallagher 1989). While the debate over the value of corridors has been extensive (Noss 1987, Beier and Loe 1992, Beier and Noss 1998, Haddad et al. 2002, Beier and Noss 2000), most leading wildlife corridor biologists agree that, if corridors are used in appropriate situations and designed properly, they can be useful tools in conservation.

Wildlife corridors are considered sensitive by local, State, and federal resource and conservation agencies because these corridors allow wildlife to move between adjoining open space areas that are becoming increasingly isolated as open space becomes fragmented from urbanization, rugged terrain, and/or changes in vegetation (Beier and Loe 1992). In southern California, habitat fragmentation is one of the main concerns for the maintenance of healthy wildlife populations because natural areas are often scarce and maintaining connectivity between these habitats is perhaps one of the best feasible options for preventing localized extinctions and enhancing biodiversity (Penrod et al. 2001). In addition, roadway mortality must be considered when evaluating the importance of maintaining habitat connectivity and providing well-designed wildlife crossings (e.g., over/underpasses). If animals are inclined to move between habitat patches, a narrow road or even a wider highway isn't an absolute barrier. However, if these animals choose to cross these roadways, the likelihood of mortality increases and potentially could depress regional species' populations if these failed crossing attempts become a common occurrence.

As explained in Section 3.1.3 of this report, the Irvine Open Space Initiative created the framework to preserve large, contiguous open space areas for conservation and open space as phased master-planned growth occurred in other areas of the City. The Irvine Open Space Preserve, as it now is known, protects more than 93,000 acres of land from the "mountains to the sea," linking the Cleveland National Forest, San Joaquin Wildlife Sanctuary, Laguna Coast Wilderness Park, and other resources.

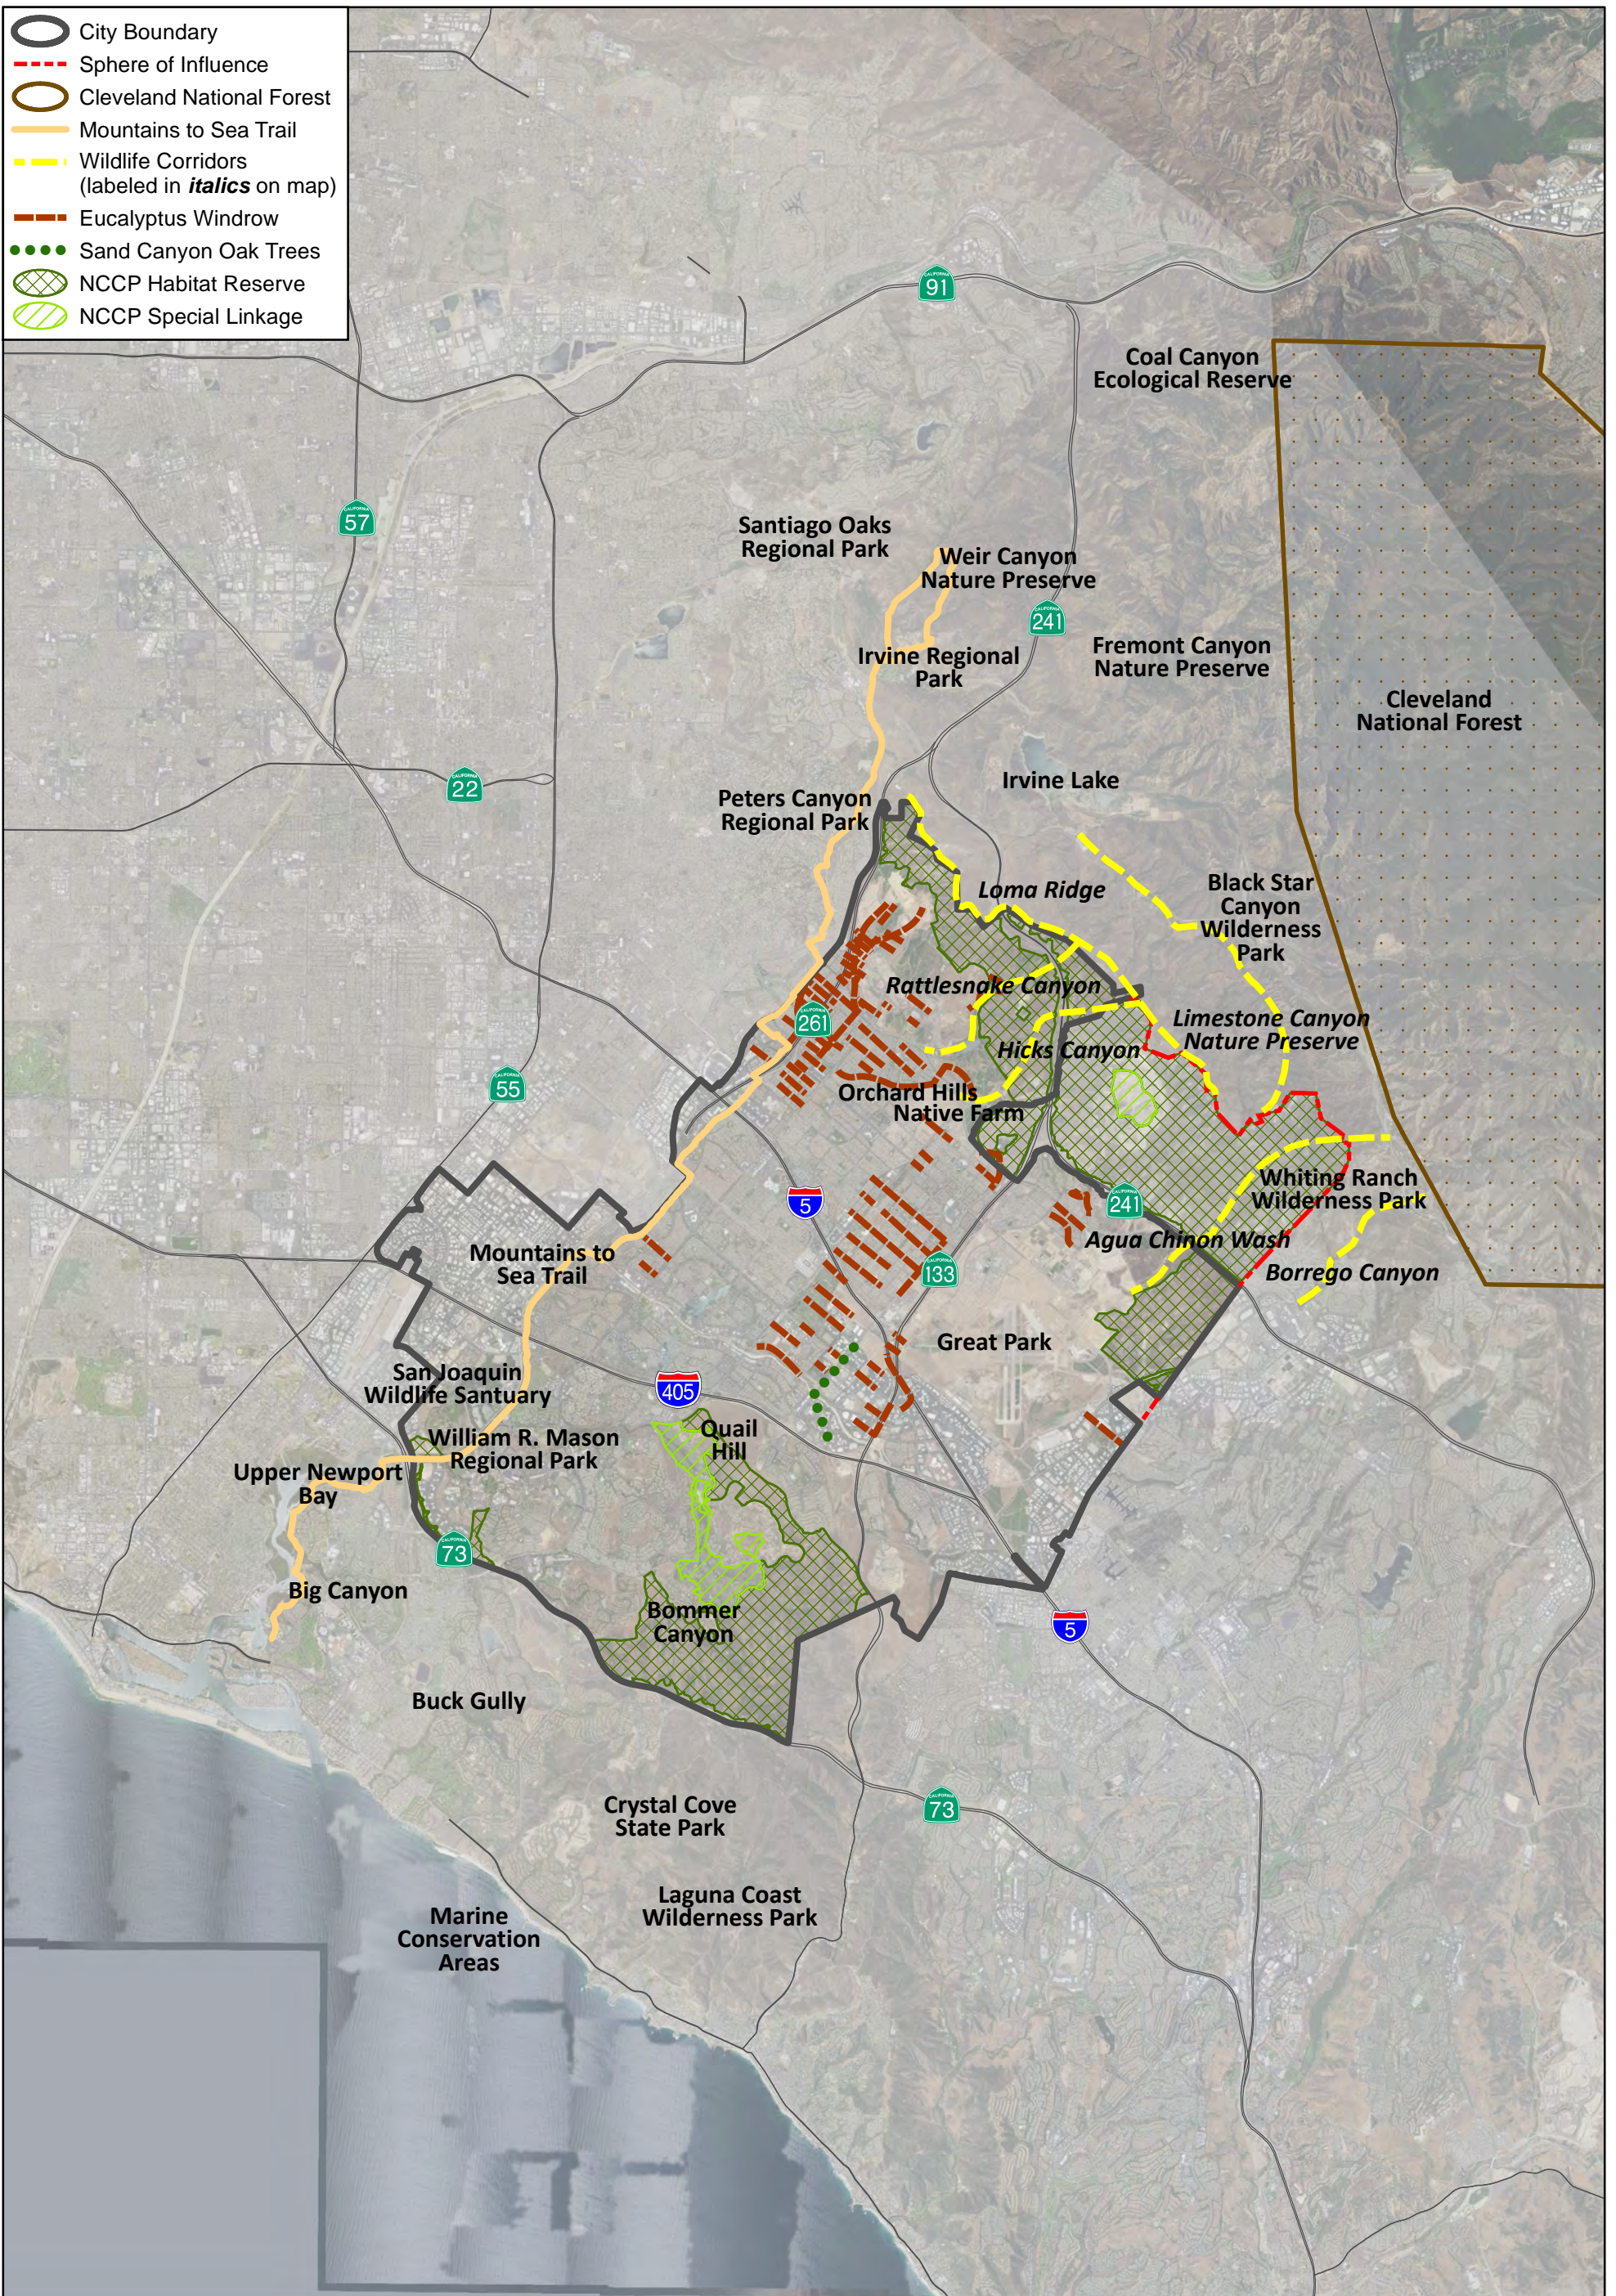

The City has committed to protect and manage the Irvine Open Space Preserve consistent with the NCCP. Of the NCCP/HCP acres in Irvine, 10,587 are designated for the NCCP habitat reserve system, and 813 acres are non-reserve lands called special linkages. The special linkages contain biological value that enhance connectivity between elements of the larger reserve system. The City's portion of the NCCP habitat reserve system and the NCCP special linkages in the City are shown on Figure 5.

Irvine has several wildlife corridors—Hicks Canyon, Rattlesnake Canyon, Loma Ridge, Limestone Canyon, and upper Borrego Canyon form wildlife corridors that stretch to the Cleveland National Forest. Wildlife corridors are also preserved along the Eastern Transportation Corridor at Agua Chinon and the SR-241/133 interchange (Figure 5).

Historically, a wildlife corridor also connected lands in Irvine's northern sphere (e.g., Santiago Hills) to coastal lands along the Pacific Ocean. In 2013, the Irvine City Council adopted the Irvine Wildlife Corridor Plan, taking a step toward creating a wildlife corridor that would link protected lands in the Laguna Coast to wilderness areas that include the Cleveland National Forest, Whiting Ranch, and Limestone Canyon.

### **3.3.5 Wetland and Riparian Resources**

Wetland and riparian resources within the City are considered sensitive biological resources and are regulated by the Corps, CDFW, and/or RWQCB pursuant to several federal and State regulations. A description of each agency's jurisdiction is provided in this section, and the potential wetland and riparian resources within the City are discussed as well.

**Biological Resources  
and NCCP Areas**

BIOLOGICAL TECHNICAL REPORT  
CITY OF IRVINE  
GENERAL PLAN UPDATE

## **United States Army Corps of Engineers Jurisdiction**

In accordance with Section 404 of the CWA, the Corps has regulatory authority over the discharge of dredged or fill material into waters of the U.S. (including non-wetland Waters of the U.S. and wetlands). Federal jurisdiction is dependent on a demonstrated nexus between the subject water feature and navigable waters or interstate commerce.

The Corps and EPA define wetlands as "those areas that are inundated or saturated by surface or groundwater at a frequency and duration sufficient to support, and that under normal circumstances do support, a prevalence of vegetation typically adapted to life in saturated soil conditions" (Corps 1987 and 2008). To be considered a Corps jurisdictional wetland under Section 404 of the CWA, an area must possess three wetland characteristics: 1) hydrophytic vegetation, 2) hydric soils, and 3) wetland hydrology. The definition of a wetland includes the phrase "under normal circumstances" because there are situations in which the vegetation of a wetland has been removed or altered as a result of recent natural event or human activities (Corps 1987). The terms "atypical situation" and "problem area" are used to describe wetlands that exhibit these conditions. An atypical situation refers to a wetland area in which one or more wetland parameters (vegetation, soil, and/or hydrology) have been sufficiently altered by recent human activities or natural events to preclude the presence of wetland indicators of the parameter (Corps 1987 and 2008). A problem area refers to a wetland area in which wetland indicators of one or more wetland parameters may be periodically lacking due to normal seasonal or annual variations in environmental conditions that result from causes other than human activities or catastrophic natural events (e.g., seasonal wetlands, wetlands on drumlins, prairie potholes, and vegetated flats; Corps 1987 and 2008). Although atypical situations and problem areas may lack one or more wetland parameters, these areas may still be considered wetlands if background information on the previous condition of the area and field observations indicate that the missing wetland criteria were present before the disturbance and would occur at the site under normal circumstances.

The Corps defines non-wetland Waters of the U.S. as drainages, or portions thereof, which have strong hydrology indicators such as the presence of seasonal flows and an ordinary high watermark (OHWM). An OHWM is defined as "that line on the shore established by the fluctuations of water and indicated by physical characteristics such as [a] clear, natural line impressed on the bank, shelving, changes in the character of soil, destruction of terrestrial vegetation, the presence of litter and debris, or other appropriate means that consider the characteristics of the surrounding areas" (Corps 1987 and 2008). Areas delineated as non-wetland waters of the U.S. may lack hydrophytic vegetation or hydric soil characteristics. Hydrophytic vegetation may be absent for various reasons such as the lack of sufficient water flow to support hydrophytic vegetation or the influence of frequent scouring due to rapid water flow. Hydric soil indicators may be missing for various reasons such as the lack of sufficient water or the presence of steep topography that precludes ponding and prohibits the development of hydric soils. Non-wetland Waters of the U.S. are delineated by the lateral and upstream/downstream extent of the OHWM of the particular drainage or depression.

The Corps developed the Special Area Management Plan for the San Diego Creek Watershed (SAMP; Corps 2008b rev. 2009) with the CDFW to integrate a watershed approach to address anticipated regulated activities and aquatic resource conservation needs. The SAMP process was initiated in 1998 as a coordinated process with local landowner/managers and State and federal agencies to consider known projects and anticipated regulated activities resulting in a watershed approach to issuing CWA permits and SAAs.

The SAMP reflects a front-end analysis of the watershed's aquatic resources and consideration of how regulated activities may affect those resources. The SAMP allows the Corps and CDFW to target staff review and evaluation time towards regulated activities and projects with greater potential to result in adverse impacts to the overall integrity of aquatic resources in the watershed. Conversely, projects and regulated activities with minor impacts that affect low-integrity aquatic resources would undergo modified permitting procedures to improve efficiency. Low-integrity resources are those with low hydrology, water quality, and habitat integrity; little habitat value for threatened and/or endangered species; or low wildlife connectivity value. Regardless of value, the permanent loss of aquatic resources would require compensatory mitigation for unavoidable impacts.

### **California Department of Fish and Wildlife Jurisdiction**

In accordance with Sections 1600 to 1616 of the Fish and Game Code, the CDFW regulates activities that would divert or obstruct the natural flow or substantially change the bed, channel, or bank of any river, stream, or lake that supports fish or wildlife. These sections discuss the process by which an individual, government agency, or public utility must notify the CDFW prior to any activity that would substantially divert or obstruct the natural flow or substantially change the bed, channel, or bank of any river, stream, or lake. The CDFW regulates wetland areas only to the extent that those wetlands are part of a river, stream, or lake as defined by the CDFW. Following such notification, the CDFW must inform the individual, agency, or utility of the existence of any fish and wildlife resources that may be substantially adversely affected by the activity. The CDFW must also include a proposal called the Streambed Alteration Agreement for measures to protect fish and wildlife resources.

The CDFW exerts jurisdiction over all Waters of the State, such as streams and rivers (measured from bank to bank) and any "riparian" vegetation associated with the waters. Streams and rivers are defined by the presence of a channel bed and banks, and at least an intermittent flow of water. The term "riparian" vegetation refers to vegetation that occurs in and/or adjacent to a watercourse. Typical "riparian" vegetation includes willows, mule fat (*Baccharis salicifolia*), western sycamore (*Platanus racemosa*), Fremont cottonwoods (*Populus fremontii*), cattails, and other vegetation found in moist areas and typically associated with the banks of a stream or lake shoreline. CDFW jurisdictional areas are delineated by the outer edge of riparian vegetation or from the top of one channel bank to the top of the opposite channel bank, whichever is wider. Thus, defining the limits of the CDFW jurisdiction based on riparian habitat will include wetland areas and may include areas that do not meet the Corps criteria for soils and/or hydrology. In addition, the CDFW may take jurisdiction over isolated wetlands and streambeds in cases where the Corps may not. Therefore, the CDFW jurisdiction is typically equal to or greater than the Corps jurisdiction.

The CDFW developed the SAMP with the Corps to integrate a watershed approach to address anticipated regulated activities and aquatic resource conservation needs. See the SAMP discussion under the heading, *United States Army Corps of Engineers Jurisdiction*, above.

### **Regional Water Quality Control Board**

The RWQCB is the primary agency responsible for protecting water quality in California. The RWQCB regulates discharges to surface waters under Section 401 of the CWA and the California Porter-Cologne Water Quality Control Act. The RWQCB's jurisdiction extends to all Waters of the State and to all Waters of the U.S. as considered jurisdictional by the Corps and CDFW. The RWQCB also regulates isolated wetlands, such as vernal pools, that are not regulated by the Corps. Section 401 of the CWA and the state Porter-Cologne Water Quality Control Act give the RWQCB the authority to regulate any proposed activity that may affect water quality. Water quality certification and/or a Report of Waste Discharge must be based upon a finding that the proposed discharge will comply with water quality standards.

### **Wetland and Riparian Resources in the City**

Potential jurisdictional wetland and riparian resources that occur within the City are based on data from the USGS National Hydrography Dataset (Figure 6) and the most current (2015) vegetation mapping for the City from the Nature Reserve of Orange County (Figure 3). All wetland and riparian resources must be protected according to federal, State, and local regulations. These potential jurisdictional resources in the City include streams/rivers, lakes/ponds, reservoirs, inundation areas, canals/ditches, and associated habitats (coast live oak woodland; estuarine, lacustrine, riverine; fresh emergent wetland; lacustrine; riverine; riverine, barren; saline emergent wetland; and valley foothill riparian). The major wetlands/waterways in the City include San Diego Creek, Peters Canyon Wash, and San Joaquin Wildlife Sanctuary.

San Diego Creek is a 16-mile-long waterway with its headwaters in the City of Laguna Woods that flows into Upper Newport Bay. The increased demand for housing and employment in Orange County has resulted in substantial land use changes from agriculture to urban development within the creek's watershed, especially over the last several decades. Agricultural uses, which began in the 19<sup>th</sup> century, had previously altered the watershed's natural conditions and hydrology, including increased runoff in Newport Bay and channelization of San Diego Creek (Corps 2008b rev 2009). According to the City (Storm Drainage Utilities), this waterbody is currently impaired by fecal coliform, indicator bacteria, nutrients, pesticides, sedimentation, selenium, and toxaphene.

Most of the creek has been converted to a concrete flood control channel, but it does provide aquatic and riparian habitats along its course and its tidal estuary near the San Joaquin Wildlife Sanctuary and Upper Newport Bay (Figure 3). Peters Canyon Wash is a tributary of San Diego Creek that is approximately 11.8 miles long, mostly channelized, and flows in a relatively straight course southwest from the Peters Canyon Reservoir near the Orange/Tustin border to its confluence with San Diego Creek near the Irvine Civic Center Plaza (Figure 3). According to the City (Storm Drainage Utilities), this wash is currently impaired by DDT, bacteria, pH, and toxaphene.

The San Joaquin Wildlife Sanctuary is a 300-acre constructed wetland in the floodplain of San Diego Creek just above its outlet to Upper Newport Bay. The site is owned by the Irvine Ranch

Water District; it was used for farmland in the 1950s and 1960s, and (prior to its reconstruction) as a duck hunting range. Original restoration of the wetlands began in 1988 and was completed in 2000. The site serves a dual purpose of removing nitrates from the creek's water and providing bird habitat. The Southern California Wetlands Recovery Project (2019), a partnership of public agencies, scientists, and local communities that work cooperatively to acquire and restore wetlands in coastal Southern California, has a plan to restore and enhance 120 acres of perennial marsh habitat in San Joaquin Marsh.

## **4.0 EVALUATION OF FUTURE ENVIRONMENTAL OPPORTUNITIES, CONSTRAINTS, AND MITIGATION MEASURES**

The City's opportunities to protect the natural environment within the City as the potential development constraints for future projects associated with the natural resources that could potentially occur are discussed in this section.

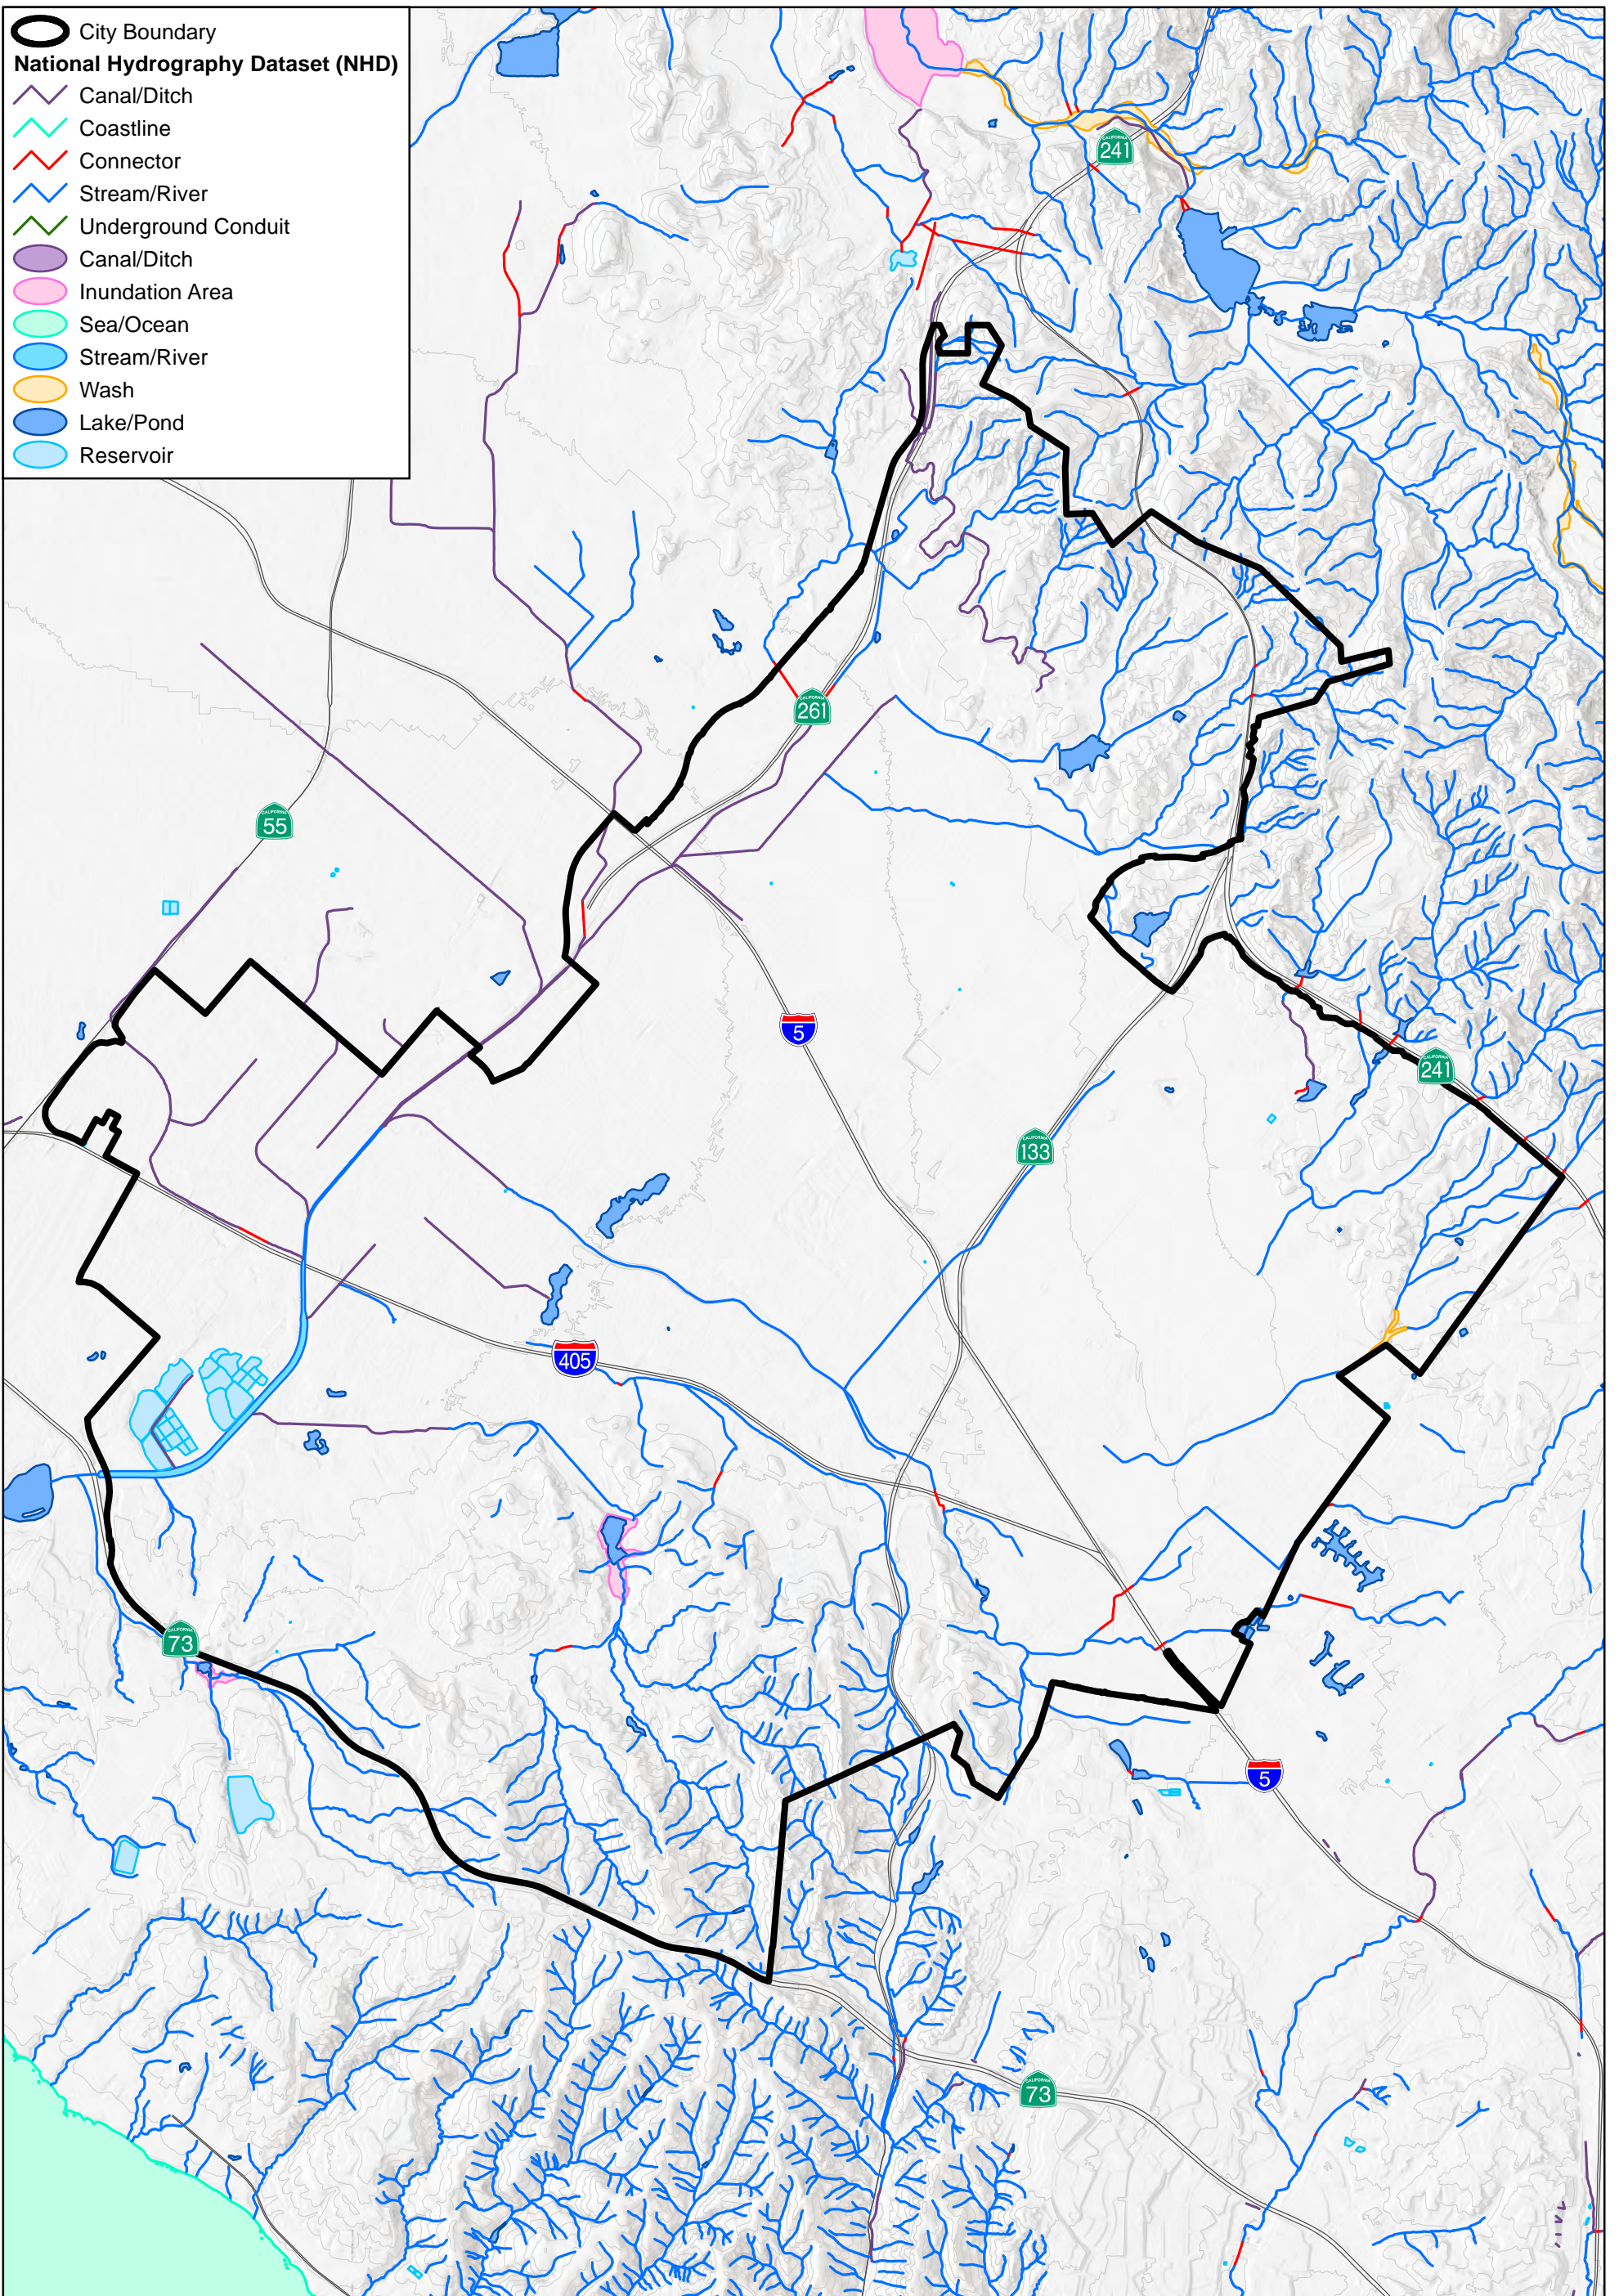

### **4.1 OPPORTUNITIES**

While much of Irvine's open space has been reserved or designated as special linkages (Figure 5), the potential still exists for the identification and acquisition of additional non-designated open space areas to provide preservation of biological resources, particularly NCCP/HCP-covered species, and active recreation opportunities such as walking, equestrian, or bike trails. The opportunity exists for the City to ensure that allowances are made through General Plan policies to encourage or require proposed development plans to allocate open space areas.

The large area in the City (and sphere of influence), as well as non-reserve areas containing species covered under the NCCP/HCP, will result in limitations on development, though some impact is anticipated under specific permitting and mitigation requirements already in the NCCP/HCP. The disposition and/or suitability of other open space areas remain uncertain; however, the special linkages that are slated for wildlife corridors in the vicinity of the formerly proposed El Toro National Wildlife Sanctuary to the San Joaquin Hills are being addressed by the Irvine Wildlife Corridor Plan (Glenn Lukos Associates, Inc. 2013). This Plan is to establish a wildlife corridor that provides opportunity for movement from Irvine Boulevard to Interstate 5 through the length of the MCAS El Toro base property for NCCP/HCP target species in a manner that allows demographic and genetic exchange between populations or subpopulations.

### **4.2 CONSTRAINTS AND COMPENSATORY MITIGATION MEASURES**

Local, State, and federal agencies regulate sensitive biological resources and require an assessment of their presence or potential presence to be conducted for each proposed project site. These assessments should be conducted for all sensitive vegetation communities and special status species that have the potential to occur within or adjacent to a proposed project site prior to the approval and implementation of that project. Because the information provided in this report is based solely on an analysis of existing literature and historical data for the region, and no surveys were conducted to prepare this report, future development projects will require a more refined evaluation of biological resources.

Source: USGS National Hydrography Dataset (NHD); Esri

**Figure 6**

**Hydrology and Water Features**

BIOLOGICAL TECHNICAL REPORT  
CITY OF IRVINE  
GENERAL PLAN UPDATE

Sensitive biological resources in the City include, but are probably not limited to, those addressed in this report. The City's environment is not static and may change over time as a result of development, fire, or other factors. In addition, vegetation communities may become sensitive and/or species may become listed in the future. For future proposed development projects, it is the responsibility of each Project Proponent to evaluate the known and potential sensitive biological resources within the proposed project area.

This section provides the City and future Project Proponents with guidelines to evaluate potential project-related impacts and design appropriate avoidance, minimization, and/or mitigation measures to assure impacts are reduced to below a level of significance as defined by CEQA. These measures are not intended to replace requirements outlined in the NCCP/HCP, General Plan, Municipal Code, and the SAMP.

#### **4.2.1 General Measures for Impact Assessments**

As part of the project approval process, each future proposed project should include an initial site assessment to determine if sensitive biological resources could be present within and/or adjacent to the proposed development project and whether the project site lies inside the NCCP/HCP Reserve System (including the Irvine Open Space Preserve of the Irvine Open Space Initiative) or Special Linkage Areas or whether it lies outside.

If no sensitive biological resources have a potential to occur within and/or adjacent to the proposed project, the City may approve the proposed project to proceed without further biological resource analyses.

If sensitive biological resources have potential to occur, the following general biological mitigation measures would apply.

**Bio-1:** Applicants for future development projects shall include a biological resources survey. The survey shall be conducted by a qualified biologist. The biological resources survey shall include, but not be limited to:

- A search of available literature and biological databases, such as CNDDDB to determine sensitive biological resources that have been reported from the proposed project vicinity.
- Mapping vegetation communities on the proposed project site.
- A general assessment and mapping of all potential jurisdictional resources (wetlands and riparian habitats).
- Evaluating wildlife movement corridors in the vicinity of the proposed project site.

**Bio 2:** If the proposed development project site supports vegetation communities that may provide habitat for special status plant or animal species, a focused habitat assessment shall be conducted by a qualified biologist to determine the potential for special status plant and/or animal species to occur within or adjacent to the proposed development project area.

**Bio-3:** If one or more special status species has the potential to occur within the proposed development project area, focused species surveys shall be conducted to determine the presence/absence of these species to adequately evaluate potential direct and/or indirect impacts to these species.

**Bio-4:** If construction activities are not initiated immediately after focused surveys have been completed, additional pre-construction special status species surveys may be required to assure impacts are avoided or minimized to the extent feasible. If pre-construction activities are required, a qualified biologist would perform these surveys as required for each special status species that is known to occur or has a potential to occur within or adjacent to the proposed development project area.

**Bio-5:** The results of the biological survey shall be presented in a biological survey letter report for proposed development projects with no significant impacts, or in a biological technical report for proposed development projects with significant impacts that require mitigation to reduce the impacts to below a level of significance.

**Bio-6:** If sensitive biological resources are identified within or adjacent to the proposed development project area, the construction limits shall be clearly flagged to ensure impacts to sensitive biological resources are avoided or minimized to the extent feasible. Prior to implementing construction activities, a qualified biologist shall verify that the flagging clearly delineates the construction limits and that sensitive resources to be avoided.

**Bio-7:** If sensitive biological resources are known to occur within or adjacent to the proposed development project area, a project-specific contractor training program shall be developed and implemented to educate project contractors on the sensitive biological resources within and adjacent to the proposed development project area and measures being implemented to avoid and/or minimize impacts to these species. A qualified biologist shall develop and implement the contractor training program.

**Bio-8:** If sensitive biological resources are present within or adjacent to the proposed development project area and impacts may occur from implementation of construction activities, a qualified biological monitor may be required during a portion or all of the construction activities to ensure impacts to the sensitive biological resources are avoided or minimized to the extent feasible. The specific biological monitoring requirements shall be evaluated on a project-by-project basis. The qualified biological monitor shall be approved by the City on a project by project basis based on applicable experience with the sensitive biological resources that may be impacted by the proposed development project activities.

**Bio-9:** If birds that are protected by the MBTA are identified within or adjacent to the proposed development project area, the proposed development project may result in direct or indirect impacts to these species, especially during breeding season. If impacts cannot be avoided, potential impacts during the breeding season may be considered significant depending on the species and the extent of the impact. To ensure that active nests are not impacted, pre-construction general nesting bird surveys shall be conducted within all suitable nesting habitat that may be impacted by active construction during the general avian breeding season (February 1 through August 31). The pre-construction surveys shall be conducted no more than 7 days prior to initiation of construction. If no active avian nests are identified within the proposed development project area or within a 300-foot buffer of the proposed development project area, no further mitigation is necessary. If active nests of avian species protected by the MBTA are detected within the proposed development project area or within a 300-foot buffer of the proposed development project area, construction shall be halted until the young have fledged, until a qualified biologist has determined the nest is

inactive, or until appropriate mitigation measures that respond to the specific situation have been developed and implemented in consultation with the regulatory agencies.

#### **4.2.2 Measures for Impacts to Jurisdictional Areas**

Impacts to jurisdictional areas could be considered significant under CEQA depending on the extent of the proposed impact. Survey requirements and mitigation measures for unavoidable impacts to jurisdictional areas resulting from future proposed development projects are discussed below.

**Bio-10:** If a proposed project has the potential to affect jurisdictional resources, a qualified biologist shall conduct a jurisdictional delineation following the methods outlined in the 1987 Corps Wetland Delineation Manual (Corps 1987) and the Regional Supplement to the Corps Wetland Delineation Manual: Arid West Region (Corps 2008a) to map the extent of wetlands and non-wetland waters, determine jurisdiction, and assess potential impacts. The results of the delineation shall be presented in a wetland delineation letter report and shall be incorporated into the CEQA document(s) required for approval and permitting of the proposed project.

**Bio-11:** If a proposed project would impact jurisdictional features, permits and authorizations shall be obtained from the Corps, CDFW, and/or RWQCB. The regulatory agency authorization(s) would include impact avoidance and minimization measures as well as mitigation measures for unavoidable impacts. Specific avoidance, minimization, and mitigation measures for impacts to jurisdictional resources shall be determined through discussions with the regulatory agencies during the proposed project permitting process and may include monetary contributions to a mitigation bank or habitat creation, restoration, and/or enhancement.

## **SUMMARY OF FINDINGS**

The objective of this study is to review and summarize available information regarding known paleontological, archaeological, and historical resources within the boundaries of the City of Irvine (City) to support the update of the City's General Plan. The update will provide long-term policy direction and communicate the vision, values, and goals for the City's physical development and overall quality of life. The City of Irvine 2045 General Plan will serve to identify areas of opportunity and provide options to enhance development in key focus areas of the City.

The City has a complicated paleontological history which began at the age of dinosaurs about 100.5 million years (Ma) ago. The past 100.5 Ma has seen the City transition back and forth several times from marine to terrestrial deposits. A search for paleontological records was completed by the Natural History Museum of Los Angeles County and in the literature. Numerous fossils have been recovered in the City and an updated sensitivity map is provided.

The Vaqueros, Sespe-Vaqueros, Sespe, Monterey, Puente and Capistrano Formations are assigned a high paleontological sensitivity. Formations assigned a moderate sensitivity include the Williams Formation Pleasants Sandstone Member, the Santiago Formation, the Topanga Group, the undifferentiated Puente Formation, and the Pliocene Niguel Formation. A programmatic mitigation measure is recommended.

Cogstone conducted a search of the California Historic Resources Inventory System at the South Central Coastal Information Center on September 24 and 25, 2018. Results of the record search indicate that 647 previous cultural resources studies have been completed within the boundaries of the City. The records search also determined 379 previously recorded cultural resources are located within the City boundaries; over half are prehistoric resources.

Prehistoric sites/Tribal Cultural Resources are most abundant in the San Joaquin Marsh area and San Joaquin Hills, both south of Interstate 405. Sites are also abundant along what were, at the time, permanent water sources such as creeks and springs northeast of Irvine Blvd. Only ten sites are known on the plain between I-405 and Irvine Blvd. On this basis the areas south of I-405 and north of Irvine Blvd. are ranked as highly sensitive and the plain in between as less sensitive. An updated sensitivity map is provided. Three programmatic mitigation measures are recommended.

## INTRODUCTION

### PURPOSE OF STUDY

The objective of this study is to review and summarize available information regarding known paleontological, archaeological, and historical resources within the boundaries of the City of Irvine (City) to support an update of the City’s General Plan. The City is located in southern Orange County and covers 42,175.58 acres with an additional Sphere of Influence (SOI) of 4,830.83 acres (Figure 1).

### PROJECT LOCATION AND DESCRIPTION

Located in Orange County, the City of Irvine is located approximately two miles inland east of the Pacific Ocean (refer to Figure 1). The City is bounded by Tustin to the north with a small portion bordering Orange County unincorporated land by SR 261, Santa Ana to the northwest, Lake Forest to the East, Laguna Hills and Laguna Woods to the southeast, Costa Mesa to the west, and Newport Beach to the southwest. The City of Irvine is located primarily within the Tustin and El Toro United States Geographical Survey (USGS) 7.5-minute topographic maps but also includes portions of the Black Star Canyon, Laguna Beach, Orange, and San Juan Capistrano USGS 7.5’-minute topographic maps (Table 1).

**Table 1. City of Irvine Cadastral Information**

USGS 7.5’ Topographic Quad(s)	Township	Range	Section(s)
Orange	4S	8W	31
	5S	8W	6, 7
		9W	12
Black Star Canyon	5S	8W	5, 6, 7, 8

		9W	25
San Juan Capistrano	6S	8W	29, 30

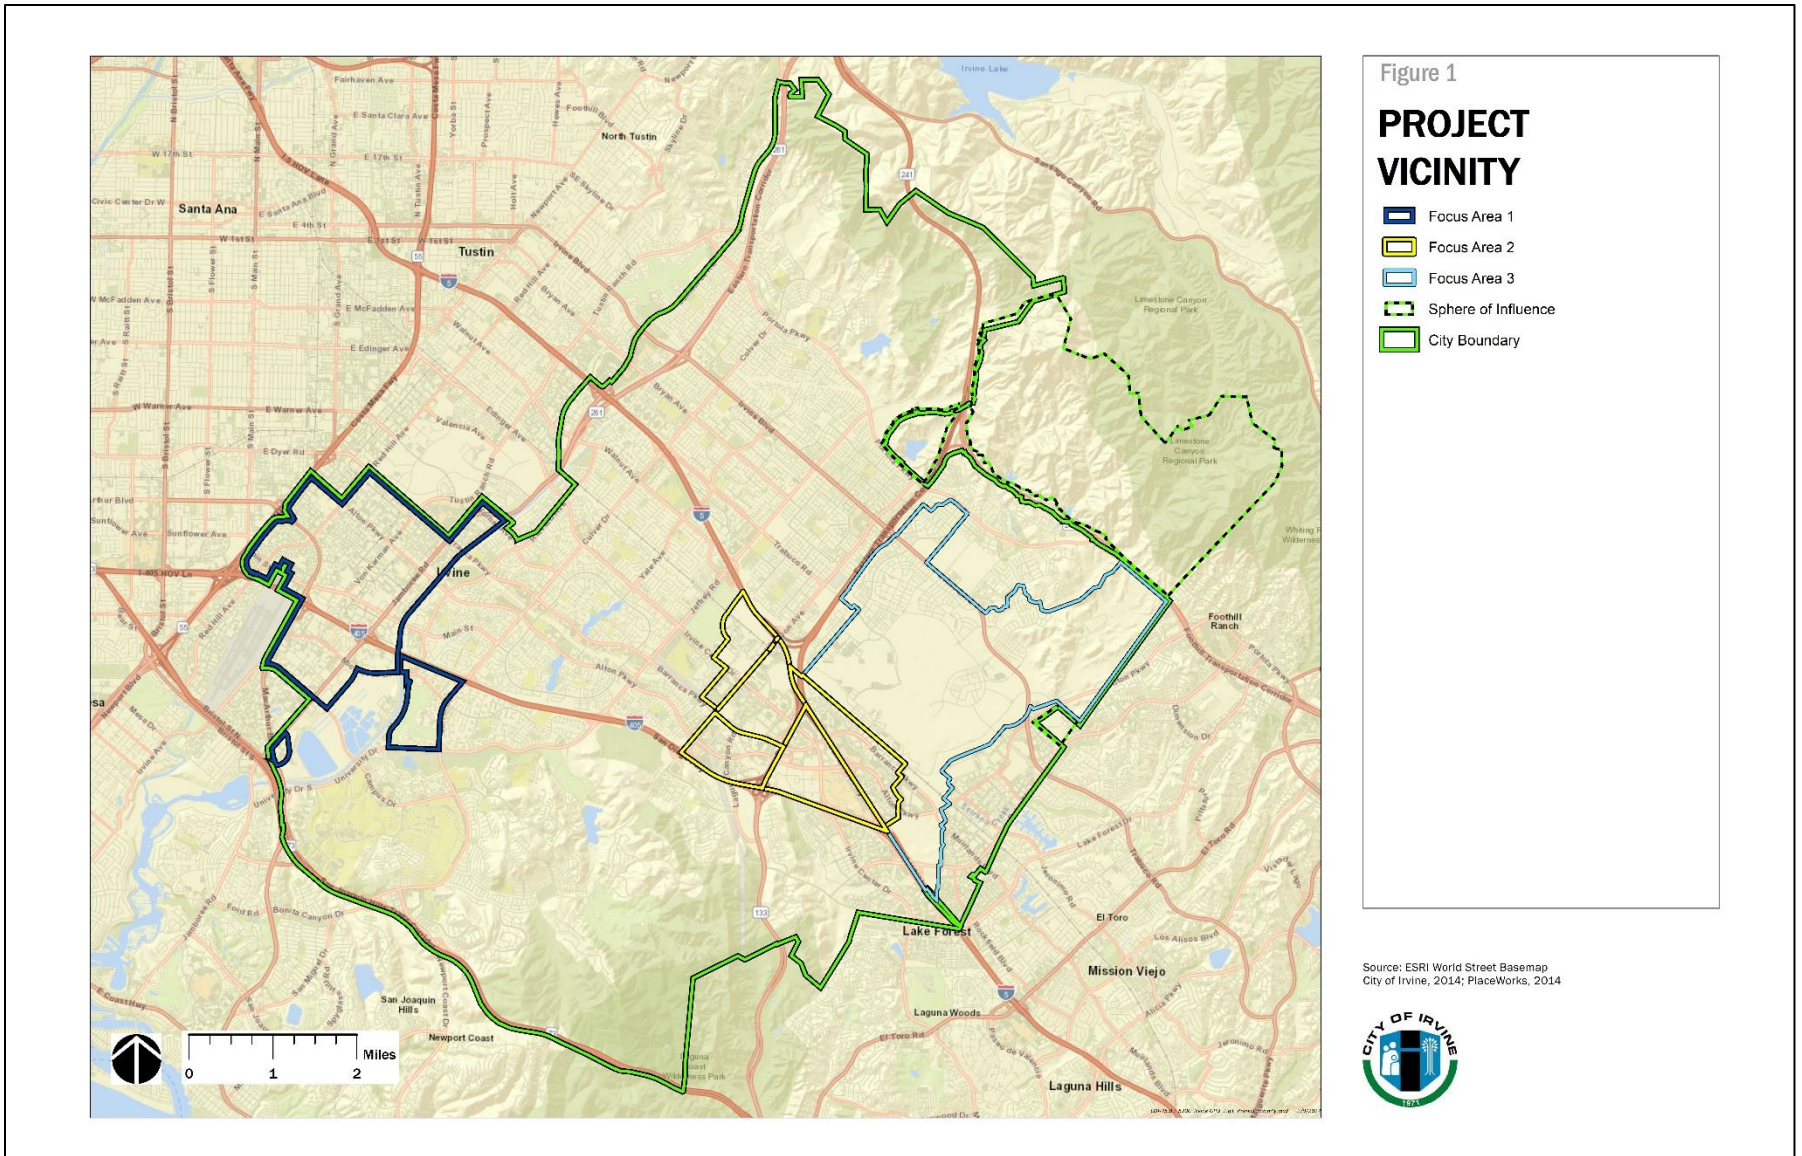

Figure 1. Project Vicinity Map

Incorporated in 1971, the City of Irvine adopted the first General Plan in December 1973. The City's General Plan was last comprehensively updated in 2000 and has been updated over the years to address necessary General Plan amendments. Since 2000, the City has continued to grow and the community has matured and evolved. As Irvine moves forward, the focus of the General Plan objectives and policies must be reexamined to ensure that the high quality-of-life factors that make Irvine exceptional are maintained and enhanced for residents, businesses, and visitors into the future. The update will provide long-term policy direction and communicate the vision, values, and goals for the City's physical development and overall quality of life. The City of Irvine 2045 General Plan will serve to identify areas of opportunity and provide options to enhance development in key focus areas of the City.

In addition, with the adoption of the certified 2021-2029 Housing Element in May 2022, the City is required to update the appropriate elements of the General Plan to accommodate the residential site inventory from the 2021-2029 Housing Element.

### **Project Buildout**

The City is preparing the 2045 Focused General Plan Update that will serve as the long-range vision of the City for the next 20 to 25 years. The City as the lead agency has determined that the project will require the preparation of a Program Environmental Impact Report (Program EIR) in compliance with the California Environmental Quality Act (CEQA; California Public Resources Code, Section 21000 et seq.), and Title 14 of the California Code of Regulations (CCR).

Consistent with the 2021-2029 Housing Element, the Project would update the General Plan land use element to support the City's Regional Housing Needs Assessment (RHNA) of 23,610 units. To ensure consistency with State housing statutes, including no-net loss and affirmatively furthering fair housing requirements, the 2021-2029 Housing Element identified adequate sites to accommodate 57,656 new residential units. However, the City's current General Plan has a significant amount of unbuilt non-residential square footage available throughout the planning areas identified in the 2021-2029 Housing Element site inventory that would be available for the potential conversion to residential uses. As a result of the likely conversion of non-residential uses to residential uses, the City would need to add 15,019 fewer units under the Reduced Project Alternative (the Preferred Project) compared to the Proposed Project (the Conservative Alternative). In total, the Reduced Project Alternative would add 42,637 new units to the General Plan as compared to the 57,656 units proposed as part of the Project. The Project would accommodate the City's RHNA requirement for new residential units and implement the 2021-2029 Housing Element through the introduction of additional residential and/or mixed-use development throughout the City using overlay zones and/or master plans to allow greater flexibility for property owners and developers. The overlays would promote higher density residential and mixed-use in three focus areas, targeted retail centers, conversion of hotel/motel,

and on religious and school sites. It is anticipated that the majority of the future residential growth would occur in the three focus areas that are most suited for new growth and development as they are located near existing job centers and are along major travel corridors with access to existing and future public transit opportunities. Focus Area 1 is the Irvine Business Complex (Planning Area [PA] 19, 36); Focus Area 2 is the Spectrum area (PAs 13, 31, 32, and 33); and Focus Area 3 is Great Park Neighborhoods (PA 51), each of which is shown in Figure 1.

***Focus Area 1 – Greater Irvine Business Complex Area:*** Planning Area 36 (Irvine Business Complex) and Planning Area 19 (Rancho San Joaquin): Focus Area 1 includes expanding a residential and/or mixed-use overlay to the entire Irvine Business Complex (IBC) and the specific sites identified in the 2021-2029 Housing Element site inventory located in Rancho San Joaquin. Over the past twenty years, the IBC has transitioned from predominantly non-residential uses to a mixed-use area that is currently governed by the 2007 IBC Vision Plan. Under the existing General Plan, the IBC has a maximum of 15,000 units. The IBC continues to be one of the two employment centers located within the City and remains an opportunity area for high density residential. The IBC is connected to the Tustin Transportation Center (Metrolink and OCTA transit service) through the iShuttle and has direct access to Interstate 405, State Route 73, and State Route 55. The General Plan Update proposes a new residential overlay and/or specific plan that will increase the total number of residential permitted in the Greater Irvine Business Complex Area by an additional 15,000 units.

***Focus Area 2 - Greater Spectrum Area:*** Planning Area 13 (Irvine Spectrum 4), Planning Area 31 (Irvine Spectrum 6), Planning Area 32 (Irvine Spectrum 3), and Planning Area 33 (Irvine Spectrum Center): The Greater Spectrum Area incorporates three non-residential planning areas (13, 31, and 32) that are located adjacent to the Irvine Spectrum Center area, are emerging employment centers, are located near the Irvine Transportation Center (ITC – Metrolink, Amtrak, and OCTA transit service), and with the introduction of a residential overlay and/or specific plan could transition to a network of micro-villages or residential nodes, connected by a variety of multi-modal and complete street strategies that provide new opportunities for residents and businesses in Irvine. The General Plan Update proposes a new residential overlay and/or specific plan that will introduce a total number of 26,607 residential units to the Greater Spectrum Area.

***Focus Area 3 – Great Park Neighborhood Transit Village:*** Planning Area 51 (Great Park Neighborhood): The Great Park Neighborhoods is an existing mixed-use planning area that features a mix of residential products at varying densities surrounding the Irvine Great Park. There are approximately 1,900 units remaining in the existing General Plan intensity, but a significant amount of the planning area remains vacant with no additional residential intensity. The proposed General Plan Update will increase the number of residential units permitted in the

Great Park with a focus on higher density product located near or adjacent to the Irvine Transportation Center. The Great Park Neighborhood Transit Village area will have direct access to Focus Area 2, the Greater Spectrum Area through a network of proposed multi-modal improvements. The General Plan Update will increase the residential intensity in Planning Area 51 by an additional 5,252 residential units.

The remaining units will be accommodated throughout the City per the 2021-2029 Housing Element site inventory. The residential overlays and/or specific plans will encourage a micro-village approach, building upon the historic and successful approach to master planning in the City of Irvine. Utilizing a micro-village approach to planning will ensure the focus areas are balanced with a mix of uses including neighborhood supporting square footage, open space, and non-residential square footage that are connected through multi-modal transportation and complete street strategies.

## **PROJECT PERSONNEL**

Cogstone Resource Management (Cogstone) conducted the cultural and paleontological resources studies. Qualifications of Cogstone personnel are provided (Appendix A).

- Molly Valasik served as the Principal Archaeologist for the Project and reviewed the report. Valasik has an M.A. in Anthropology from Kent State University, a B.A. in Anthropology from Ohio State University, and 15 years of experience in southern California archaeology.
- Kim Scott served as the Principal Paleontologist for the Project and wrote the geological and paleontological portions of this report. Scott has an M.S. in Biology with paleontology emphasis from California State University, San Bernardino, a B.S. in Geology with paleontology emphasis from the University of California, Los Angeles, and over 29 years of experience in California paleontology and geology.
- Holly Hickman authored portions of the report. Ms. Hickman has a B.A. in Archaeology and History from Simon Fraser University, British Columbia, Canada, and 11 years of experience in southern California archaeology.
- Sherri Gust (late) wrote the prehistoric and ethnographic sections of this report. Ms. Gust was a Registered Professional Archaeologist (RPA) with an M.S. in Anatomy (Evolutionary Morphology) from the University of Southern California, a B.S. in Anthropology from the University of California at Davis and over 36 years of experience in California.

- Shannon Lopez conducted the archaeological and historic records search and wrote the historic context. Lopez has an M.A. in Architectural History from California State University, Fullerton, and a B.A. in History from California State University, Dominguez Hills, and five years of professional experience.
- Logan Freeberg prepared the GIS maps for the report. Mr. Freeberg has a B.A. in Anthropology from UC Santa Barbara and a GIS certification from CSU Fullerton and over 20 years of experience in California archaeology.

## **REGULATORY ENVIRONMENT**

### **CALIFORNIA ENVIRONMENTAL QUALITY ACT**

CEQA states that: “It is the policy of the state that public agencies should not approve projects as proposed if there are feasible alternatives or feasible mitigation measures available which would substantially lessen the significant environmental effects of such projects, and that the procedures required are intended to assist public agencies in systematically identifying both the significant effects of proposed project and the feasible alternatives or feasible mitigation measures which will avoid or substantially lessen such significant effects.”

CEQA declares that it is State policy to: "take all action necessary to provide the people of this state with...historic environmental qualities." It further states that public or private projects financed or approved by the state are subject to environmental review by the state. All such projects, unless entitled to an exemption, may proceed only after this requirement has been satisfied. CEQA requires detailed studies that analyze the environmental effects of a proposed project. In the event that a project is determined to have a potential significant environmental effect, the act requires that alternative plans and mitigation measures be considered. If archaeological or paleontological resources are identified as being within the proposed project study area, the sponsoring agency must take those resources into consideration when evaluating project effects. The level of consideration may vary with the importance of the resource.

### **TRIBAL CULTURAL RESOURCES**

In 2015, CEQA was amended and established that “[a] project with an effect that may cause a substantial adverse change in the significance of a tribal cultural resource is a project that may have a significant effect on the environment” (Public Resources Code [PRC] § 21084.2). In order to be considered, a “tribal cultural resource” must be a site, feature, place, cultural landscape, sacred place, or object, which is of cultural value to a California Native American Tribe and is either:

- (1) listed, or determined to be eligible for listing, on the national, state, or local register of historic resources, or
- (2) a resource that the lead agency chooses, in its discretion, to treat as a tribal cultural resource.

To help determine whether a project may have such an effect, the lead agency must consult with any California Native American tribe that requests consultation and is traditionally and culturally affiliated with the geographic area of a proposed project. California Native American tribe means a Native American tribe located in California that is on the contact list maintained by the

Native American Heritage Commission for the purposes of Chapter 905 of the Statutes of 2004 (PRC §21073.2.5). Consultation must take place prior to the determination of whether a negative declaration, mitigated negative declaration, or environmental impact report is required for a project (PRC § 21080.3.1).

In applying those criteria, a lead agency must consider the value of the resource to the tribe. For example, in considering the criterion that a resource is “associated with the lives of persons important in our past,” a lead agency would ask whether the resource is associated with the lives of persons important to the relevant tribe’s past. That determination must be supported with substantial evidence which is defined in PRC §20180 (e) (1) as “fact, a reasonable assumption predicated on fact, or expert opinion supported by fact”.

If a lead agency determines that a project may cause a substantial adverse change to tribal cultural resources, the lead agency must consider measures to mitigate that impact. PRC §20184.3 (b) (2) provides examples of mitigation measures that lead agencies may consider to avoid or minimize impacts to tribal cultural resources.

## **CALIFORNIA REGISTER OF HISTORICAL RESOURCES**

The California Register of Historical Resources (CRHR) is a listing of all properties considered to be significant historical resources in the state. The California Register includes all properties listed or determined eligible for listing on the National Register, including properties evaluated under Section 106, and State Historical Landmarks number No. 770 and above. The California Register statute specifically provides that historical resources listed, determined eligible for listing on the California Register by the State Historical Resources Commission, or resources that meet the California Register criteria are resources that must be given consideration under CEQA (see above). Other resources, such as resources listed on local registers of historic registers or in local surveys, may be listed if they are determined by the State Historic Resources Commission to be significant in accordance with criteria and procedures to be adopted by the Commission and are nominated; their listing in the California Register, is not automatic.

Resources eligible for listing include buildings, sites, structures, objects, or historic districts that retain historical integrity and are historically significant at the local, state or national level under one or more of the following four criteria:

- 1) It is associated with events that have made a significant contribution to the broad patterns of local or regional history, or the cultural heritage of California or the United States;
- 2) It is associated with the lives of persons important to local, California, or national history;

- 3) It embodies the distinctive characteristics of a type, period, region, or method of construction, or represents the work of a master or possesses high artistic values; or
- 4) It has yielded, or has the potential to yield, information important to the prehistory or history of the local area, California, or the nation.

In addition to having significance, resources must have integrity for the period of significance. The period of significance is the date or span of time within which significant events transpired, or significant individuals made their important contributions. Integrity is the authenticity of a historical resource's physical identity as evidenced by the survival of characteristics or historic fabric that existed during the resource's period of significance.

Alterations to a resource or changes in its use over time may have historical, cultural, or architectural significance. Simply, resources must retain enough of their historic character or appearance to be recognizable as historical resources and to convey the reasons for their significance. A resource that has lost its historic character or appearance may still have sufficient integrity for the California Register, if, under Criterion 4, it maintains the potential to yield significant scientific or historical information or specific data.

## **PUBLIC RESOURCES CODE SECTION**

Section 5097.5: No person shall knowingly and willfully excavate upon, or remove, destroy, injure or deface any historic or prehistoric ruins, burial grounds, archaeological or vertebrate paleontological site, including fossilized footprints, inscriptions made by human agency, or any other archaeological, paleontological or historical feature, situated on public lands (lands under state, county, city, district or public authority jurisdiction, or the jurisdiction of a public corporation), except with the express permission of the public agency having jurisdiction over such lands. Violation of this section is a misdemeanor. As used in this section, "public lands" means lands owned by, or under the jurisdiction of, the state, or any city, county, district, authority, or public corporation, or any agency thereof.

## **NATIVE AMERICAN HUMAN REMAINS**

Sites that may contain human remains important to Native Americans must be identified and treated in a sensitive manner, consistent with state law (i.e., Health and Safety Code §7050.5 and Public Resources Code §5097.9). In the event that human remains are encountered during project development and in accordance with the Health and Safety Code Section 7050.5, the County Coroner must be notified if potentially human bone is discovered. The Coroner will then determine within two working days of being notified if the remains are subject to his or her authority. If the Coroner recognizes the remains to be Native American, he or she shall contact

the Native American Heritage Commission (NAHC) by phone within 24 hours, in accordance with Public Resources Code Section 5097.98. The NAHC will then designate a Most Likely Descendant (MLD) with respect to the human remains. The MLD then has the opportunity to recommend to the property owner or the person responsible for the excavation work means for treating or disposing, with appropriate dignity, the human remains and associated grave goods.

### **CALIFORNIA ADMINISTRATIVE CODE, TITLE 14, SECTION 4307**

This section states that “No person shall remove, injure, deface or destroy any object of paleontological, archeological or historical interest or value.”

### **CITY GUIDELINES**

The City of Irvine General Plan includes Element E on Cultural Resources. It recognizes the importance of historical, archaeological and paleontological resources in the City and establishes a process for their early identification, consideration, and where appropriate, preservation. It requires assessment of potential resources on projects and utilizes planning policies, ordinances, approval conditions and mitigation measures to protect the resources. This Project is itself a General Plan Update and may include updates to these goals and objectives.

### **ELEMENT E: CULTURAL RESOURCES**

**GOAL:** Ensure the proper disposition of historical, archaeological, and paleontological resources to minimize adverse impacts, and to develop an increased understanding and appreciation for the community’s historic and prehistoric heritage, and that of the region.

#### **OBJECTIVE E-1: HISTORICAL, ARCHAEOLOGICAL, PALEONTOLOGICAL SURVEYS**

Identify and obtain information on the existence and significance of historical, archaeological, and paleontological sites and encourage land use planning which incorporates this information.

#### **OBJECTIVE E-2: HAZARD OCCURRENCE**

Evaluate surveyed sites for their present and potential cultural, educational, recreational, and scientific value to the community and the region, and determine their proper disposition prior to the approval of any project which could adversely affect them.

## **DEFINITION OF SIGNIFICANCE FOR PALEONTOLOGICAL RESOURCES**

Only qualified, trained paleontologists with specific expertise in the type of fossils being evaluated can determine the scientific significance of paleontological resources. Fossils are considered to be significant if one or more of the following criteria apply:

1. The fossils provide information on the evolutionary relationships and developmental trends among organisms, living or extinct;
2. The fossils provide data useful in determining the age(s) of the rock unit or sedimentary stratum, including data important in determining the depositional history of the region and the timing of geologic events therein;
3. The fossils provide data regarding the development of biological communities or interaction between paleobotanical and paleozoological biotas;
4. The fossils demonstrate unusual or spectacular circumstances in the history of life;
5. The fossils are in short supply and/or in danger of being depleted or destroyed by the elements, vandalism, or commercial exploitation, and are not found in other geographic locations.

As so defined, significant paleontological resources are determined to be fossils or assemblages of fossils that are unique, unusual, rare, uncommon, or diagnostically important. Significant fossils can include remains of large to very small aquatic and terrestrial vertebrates or remains of plants and animals previously not represented in certain portions of the stratigraphy. Assemblages of fossils that might aid stratigraphic correlation, particularly those offering data for the interpretation of tectonic events, geomorphologic evolution, and paleoclimatology are also critically important (Scott and Springer 2003, Scott et al. 2004).

## **BACKGROUND**

### **GEOLOGICAL SETTING**

The project area is in the northern extent of the California Geomorphic Province known as the Peninsular Ranges. The Peninsular Ranges geomorphic province extends from Mount San Jacinto in the north, through the tip of Baja, Mexico in the south. Subparallel to these ranges on the east is the San Andreas Fault Zone. The northwestwards motion of the Pacific Plate has created these ranges and their corresponding valleys (Wagner 2002).

### **PALEONTOLOGICAL SETTING**

The City has a complicated paleoenvironmental history that began during the Mesozoic Era (the “Age of Dinosaurs”), about 93 million years ago (93 Ma; Table 2). The past 93 Ma has seen the City transition from deep water marine in the Late Cretaceous, to coastal lowlands during the Paleocene to Oligocene, to shallow marine during the early Miocene, to deep marine during the early to early-late Miocene, back to shallow marine in the latest Miocene through the Pliocene, and finally to increasingly arid terrestrial deposits from the Pleistocene to the Holocene. In addition, younger sediments have been washed into the ocean by action of streams. Detail on each geological unit is in the Stratigraphy Section below.

### **STRATIGRAPHY**

Geologic mapping by Morton and Miller (2006) maps the area as 27 separate rock units ranging from modern deposits to Late Cretaceous sediments (Table 2; Figure 2). Geological units are discussed in order from oldest to youngest.

**Table 2. Geologic units within the City from oldest to youngest**

Rock Unit Name	Paleoenvironment	Epoch	Epoch Age Range	
Williams Formation, Pleasants Sandstone Member (Kwps)	shallow marine	Late Cretaceous	~100.5 Ma - ~66 Ma	
Silverado Formation (Tsi)	coastal nonmarine to very shallow-marine	Paleocene	~66 Ma - ~56 Ma	
Santiago Formation (Tsa)	coastal nonmarine to very shallow-marine	middle Eocene	~47.8 Ma to ~37.8 Ma	
Sespe Formation (Ts)	nonmarine	late Eocene to early Miocene	~41.2 Ma - ~17.4 Ma	
Vaqueros Formation (Tv)	shallow marine	latest Oligocene to latest early Miocene	~27 Ma - ~16 Ma	
Vaqueros-Sespe Formation (Tvs)	shallow marine - nonmarine			
El Modeno Volcanics (Tiemd, Tiemd?)	volcanics	middle Miocene	middle Miocene	
Topanga Group	Paulerino Formation (Ttp)			shallow marine
	Los Trancos Formation (Ttlt)			shallow marine
	Bommer Formation (Ttb)			shallow marine
Monterey Formation (Tm)	deep marine	late Miocene	~11.6 Ma - ~5.3 Ma	
Puente Formation (Tp, Tpsq, Tplv)	deep marine, submarine fan			
Capistrano Formation, Oso Member (Tco)	shallow marine	late Miocene to early Pliocene	~11.6 Ma - ~3.6 Ma	
Niguel Formation (Tn)	shallow marine	Pliocene	~5.3 Ma - ~2.6 Ma	
very old alluvial-fan deposits (Qvof)	alluvial fan	early to middle Pleistocene	~2.6 million years (Ma) - ~126 ka -	
very old axial-channel deposits (Qvoa)	flood-plains			
old paralic and alluvial fan deposits (Qopf)	shoreline overlain by alluvial fans	middle to late Pleistocene	~774 ka - ~11.7 ka -	
young landslide deposits (Qyls?)	landslide	late Pleistocene to Holocene	<126 ka	
young alluvial-fan deposits (Qyf)	alluvial fan			
young colluvium (Qyc)	slope deposit			
young axial-channel deposits (Qya)	flood-plains			
very young slope wash deposits (Qsw)	slope wash	late Holocene	<5,000 years (<5 ka)	
very young landslide deposits (Qls, Qls?)	slope wash			
artificial fill (Qaf)	human-made	modern	<200 years	

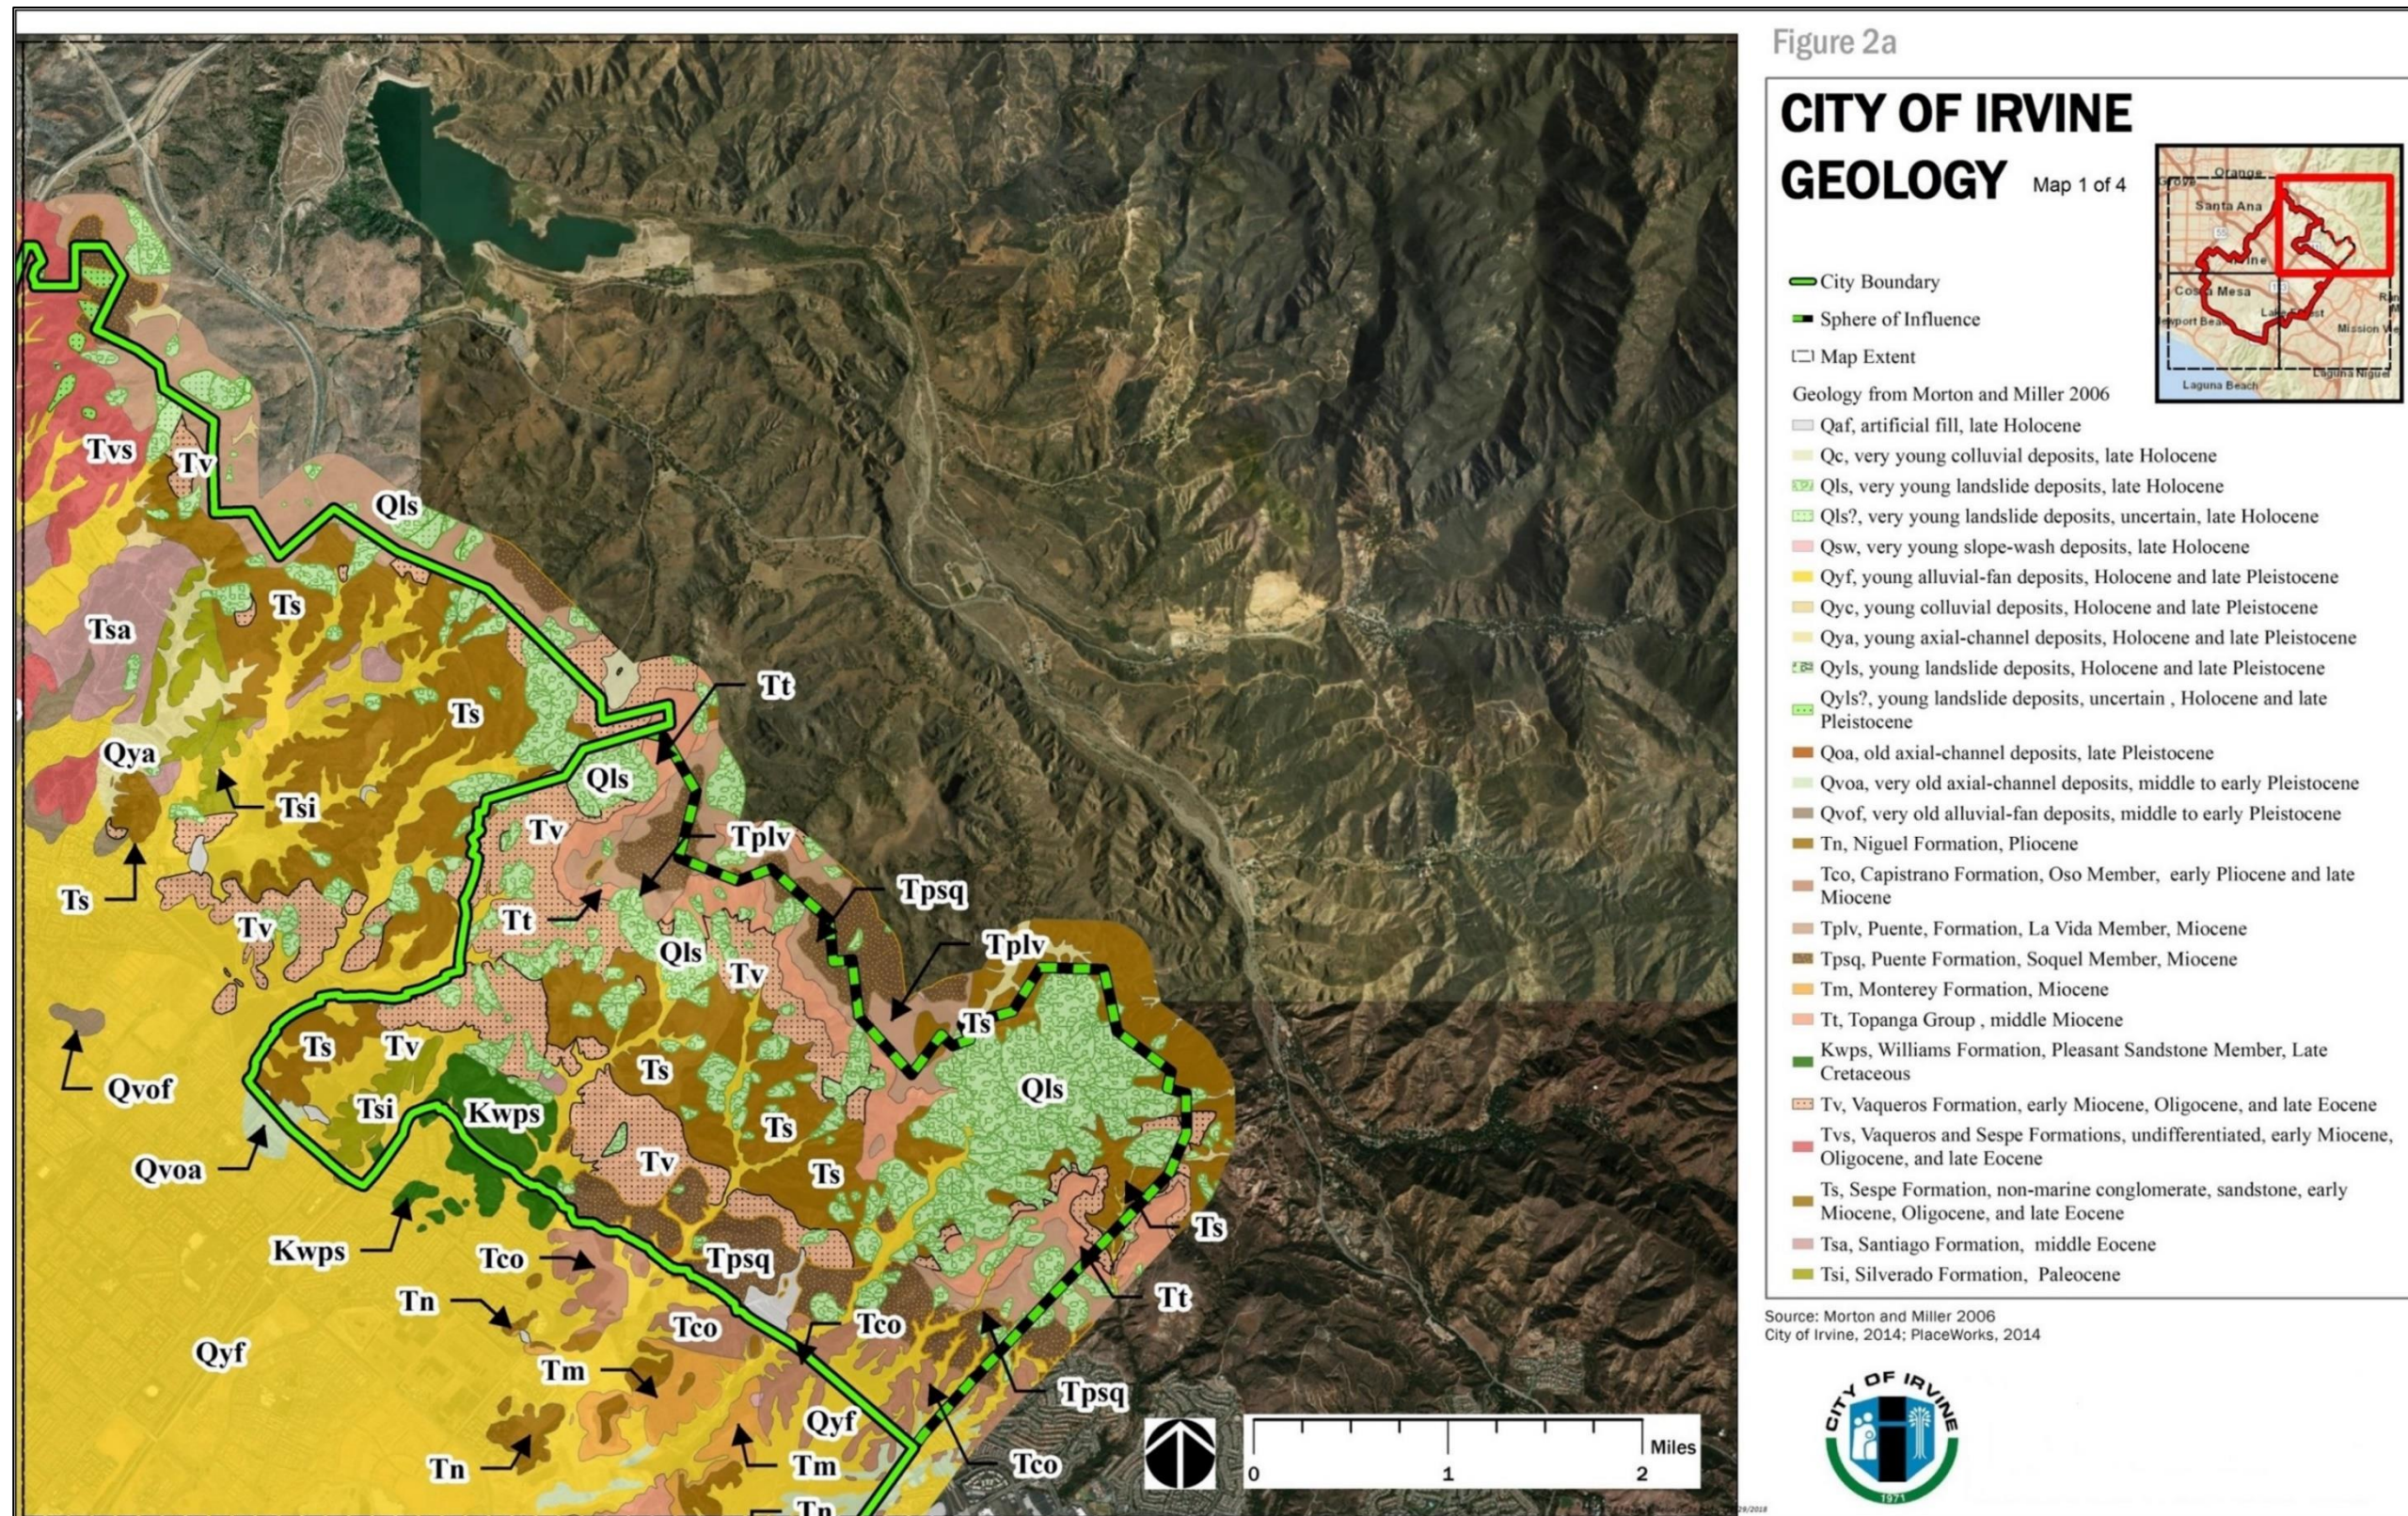

Figure 2a. Geology Map, 1 of 4

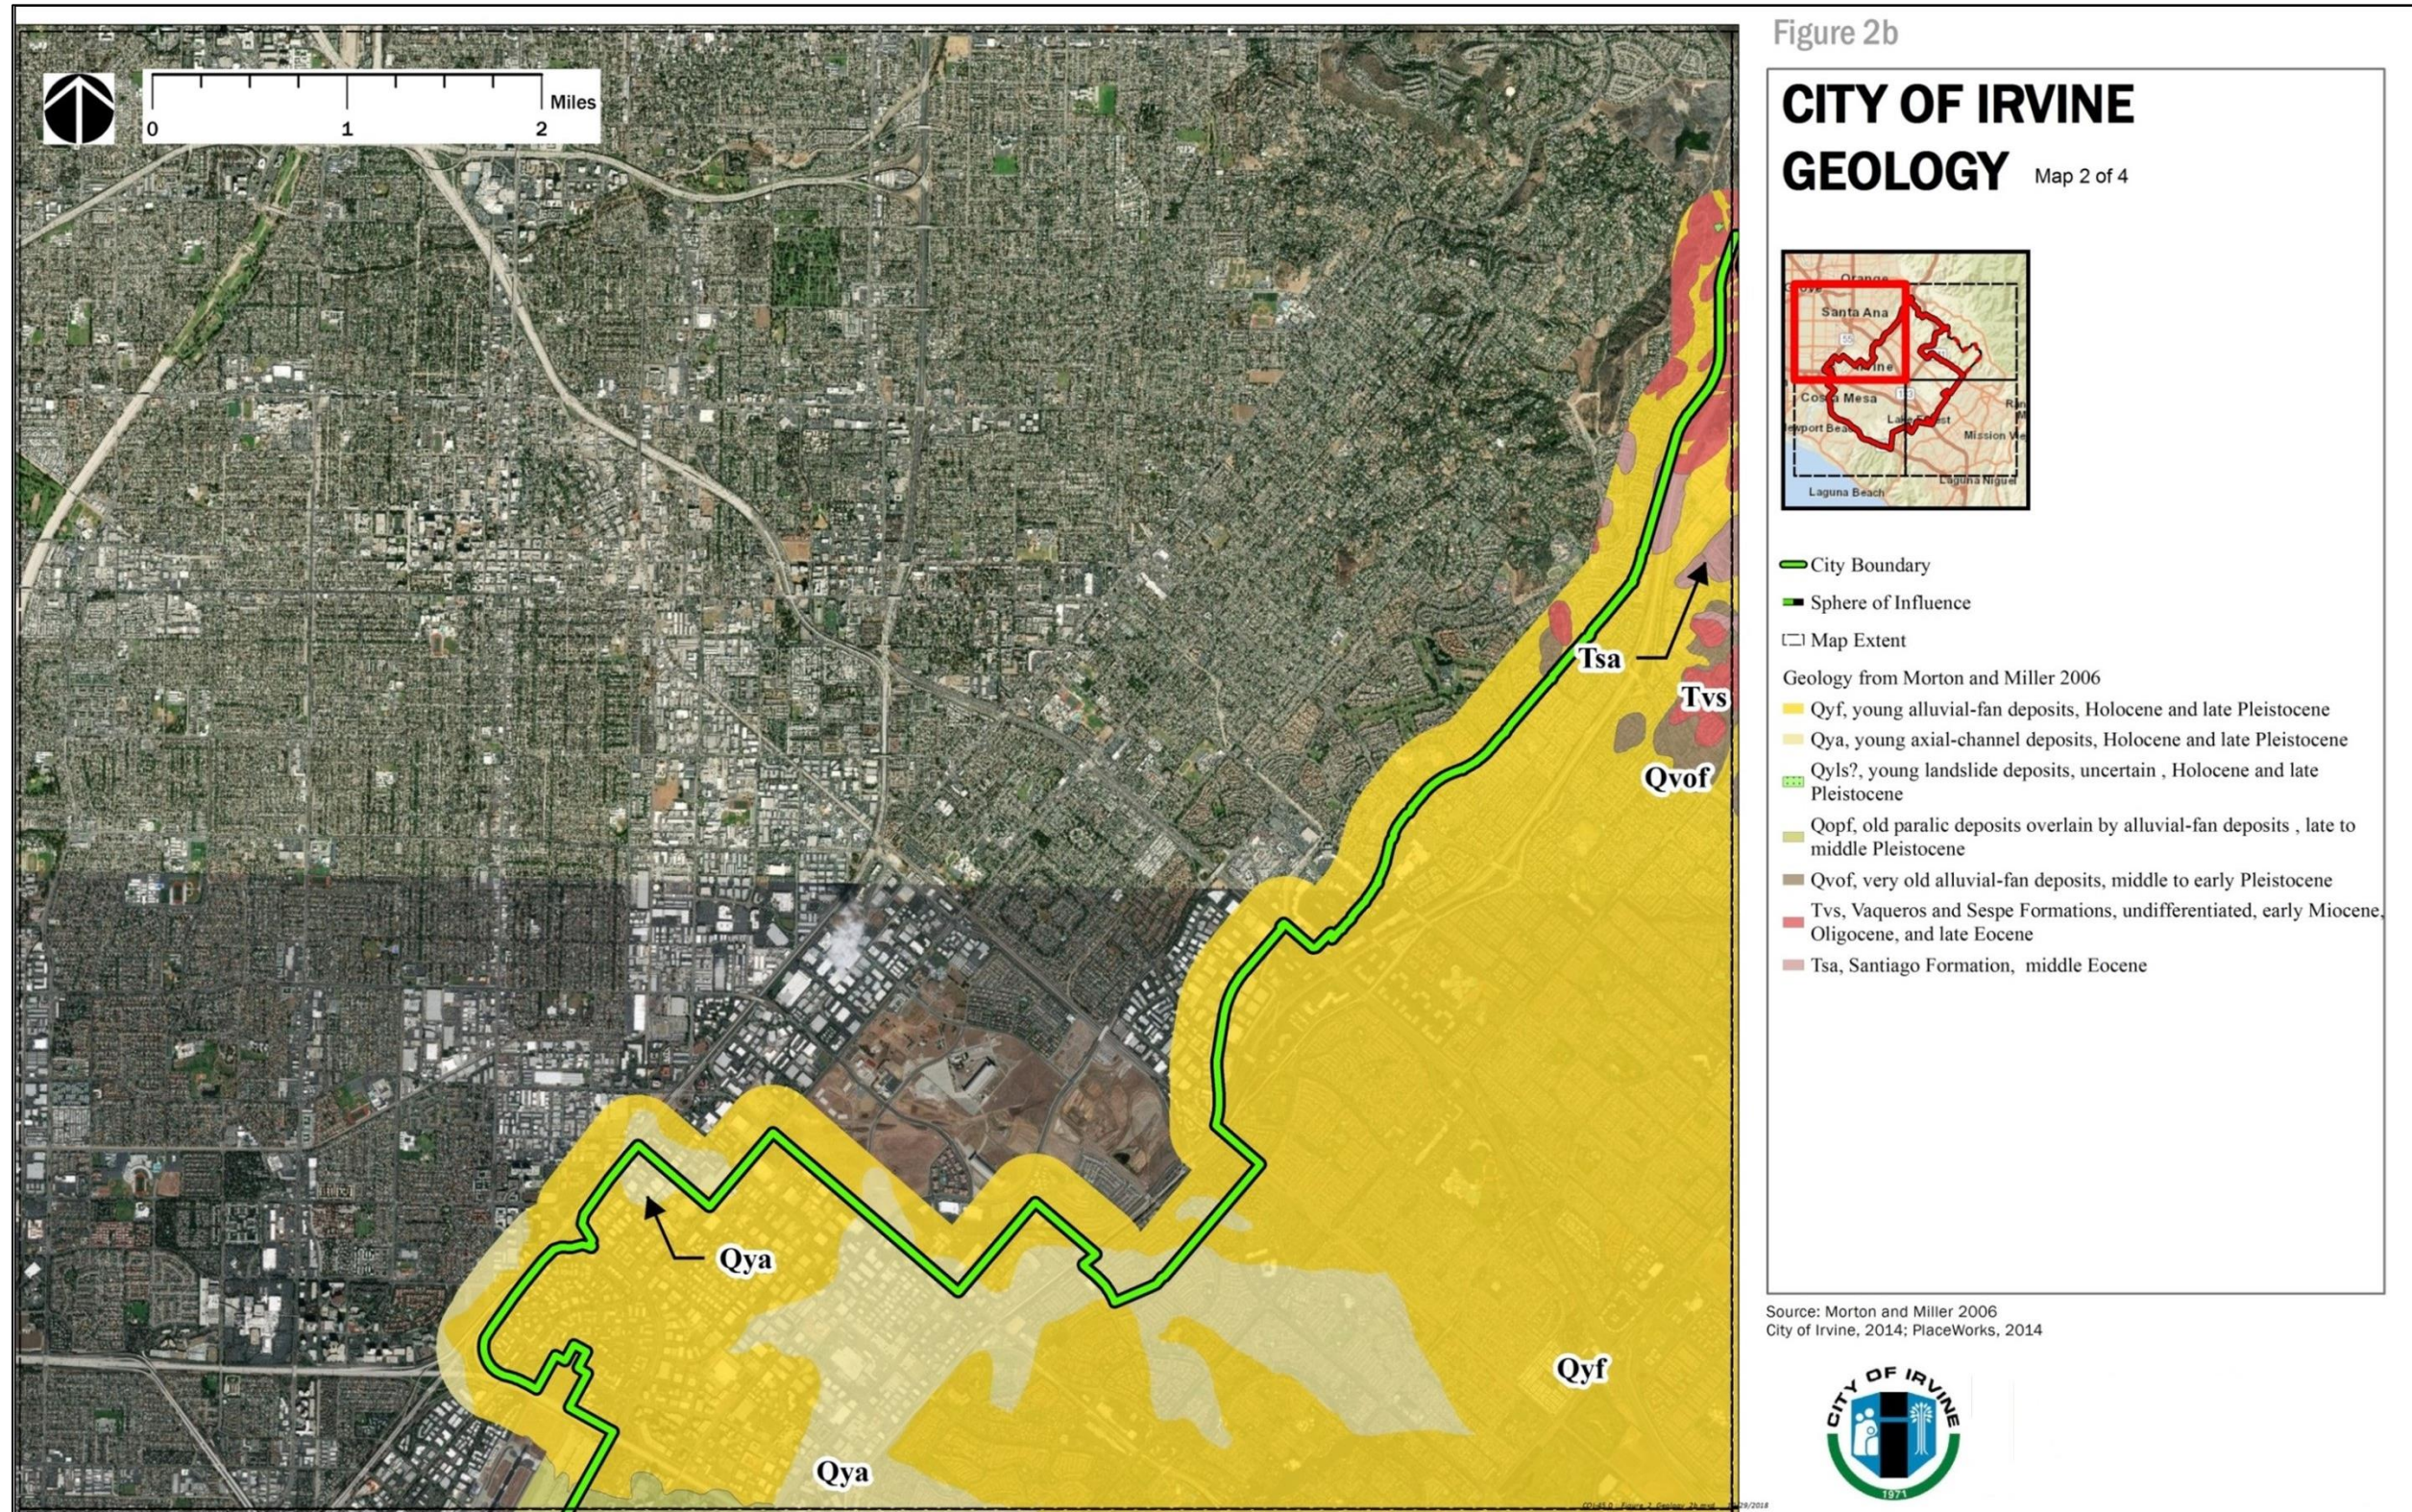

Figure 2b. Geology Map, 2 of 4

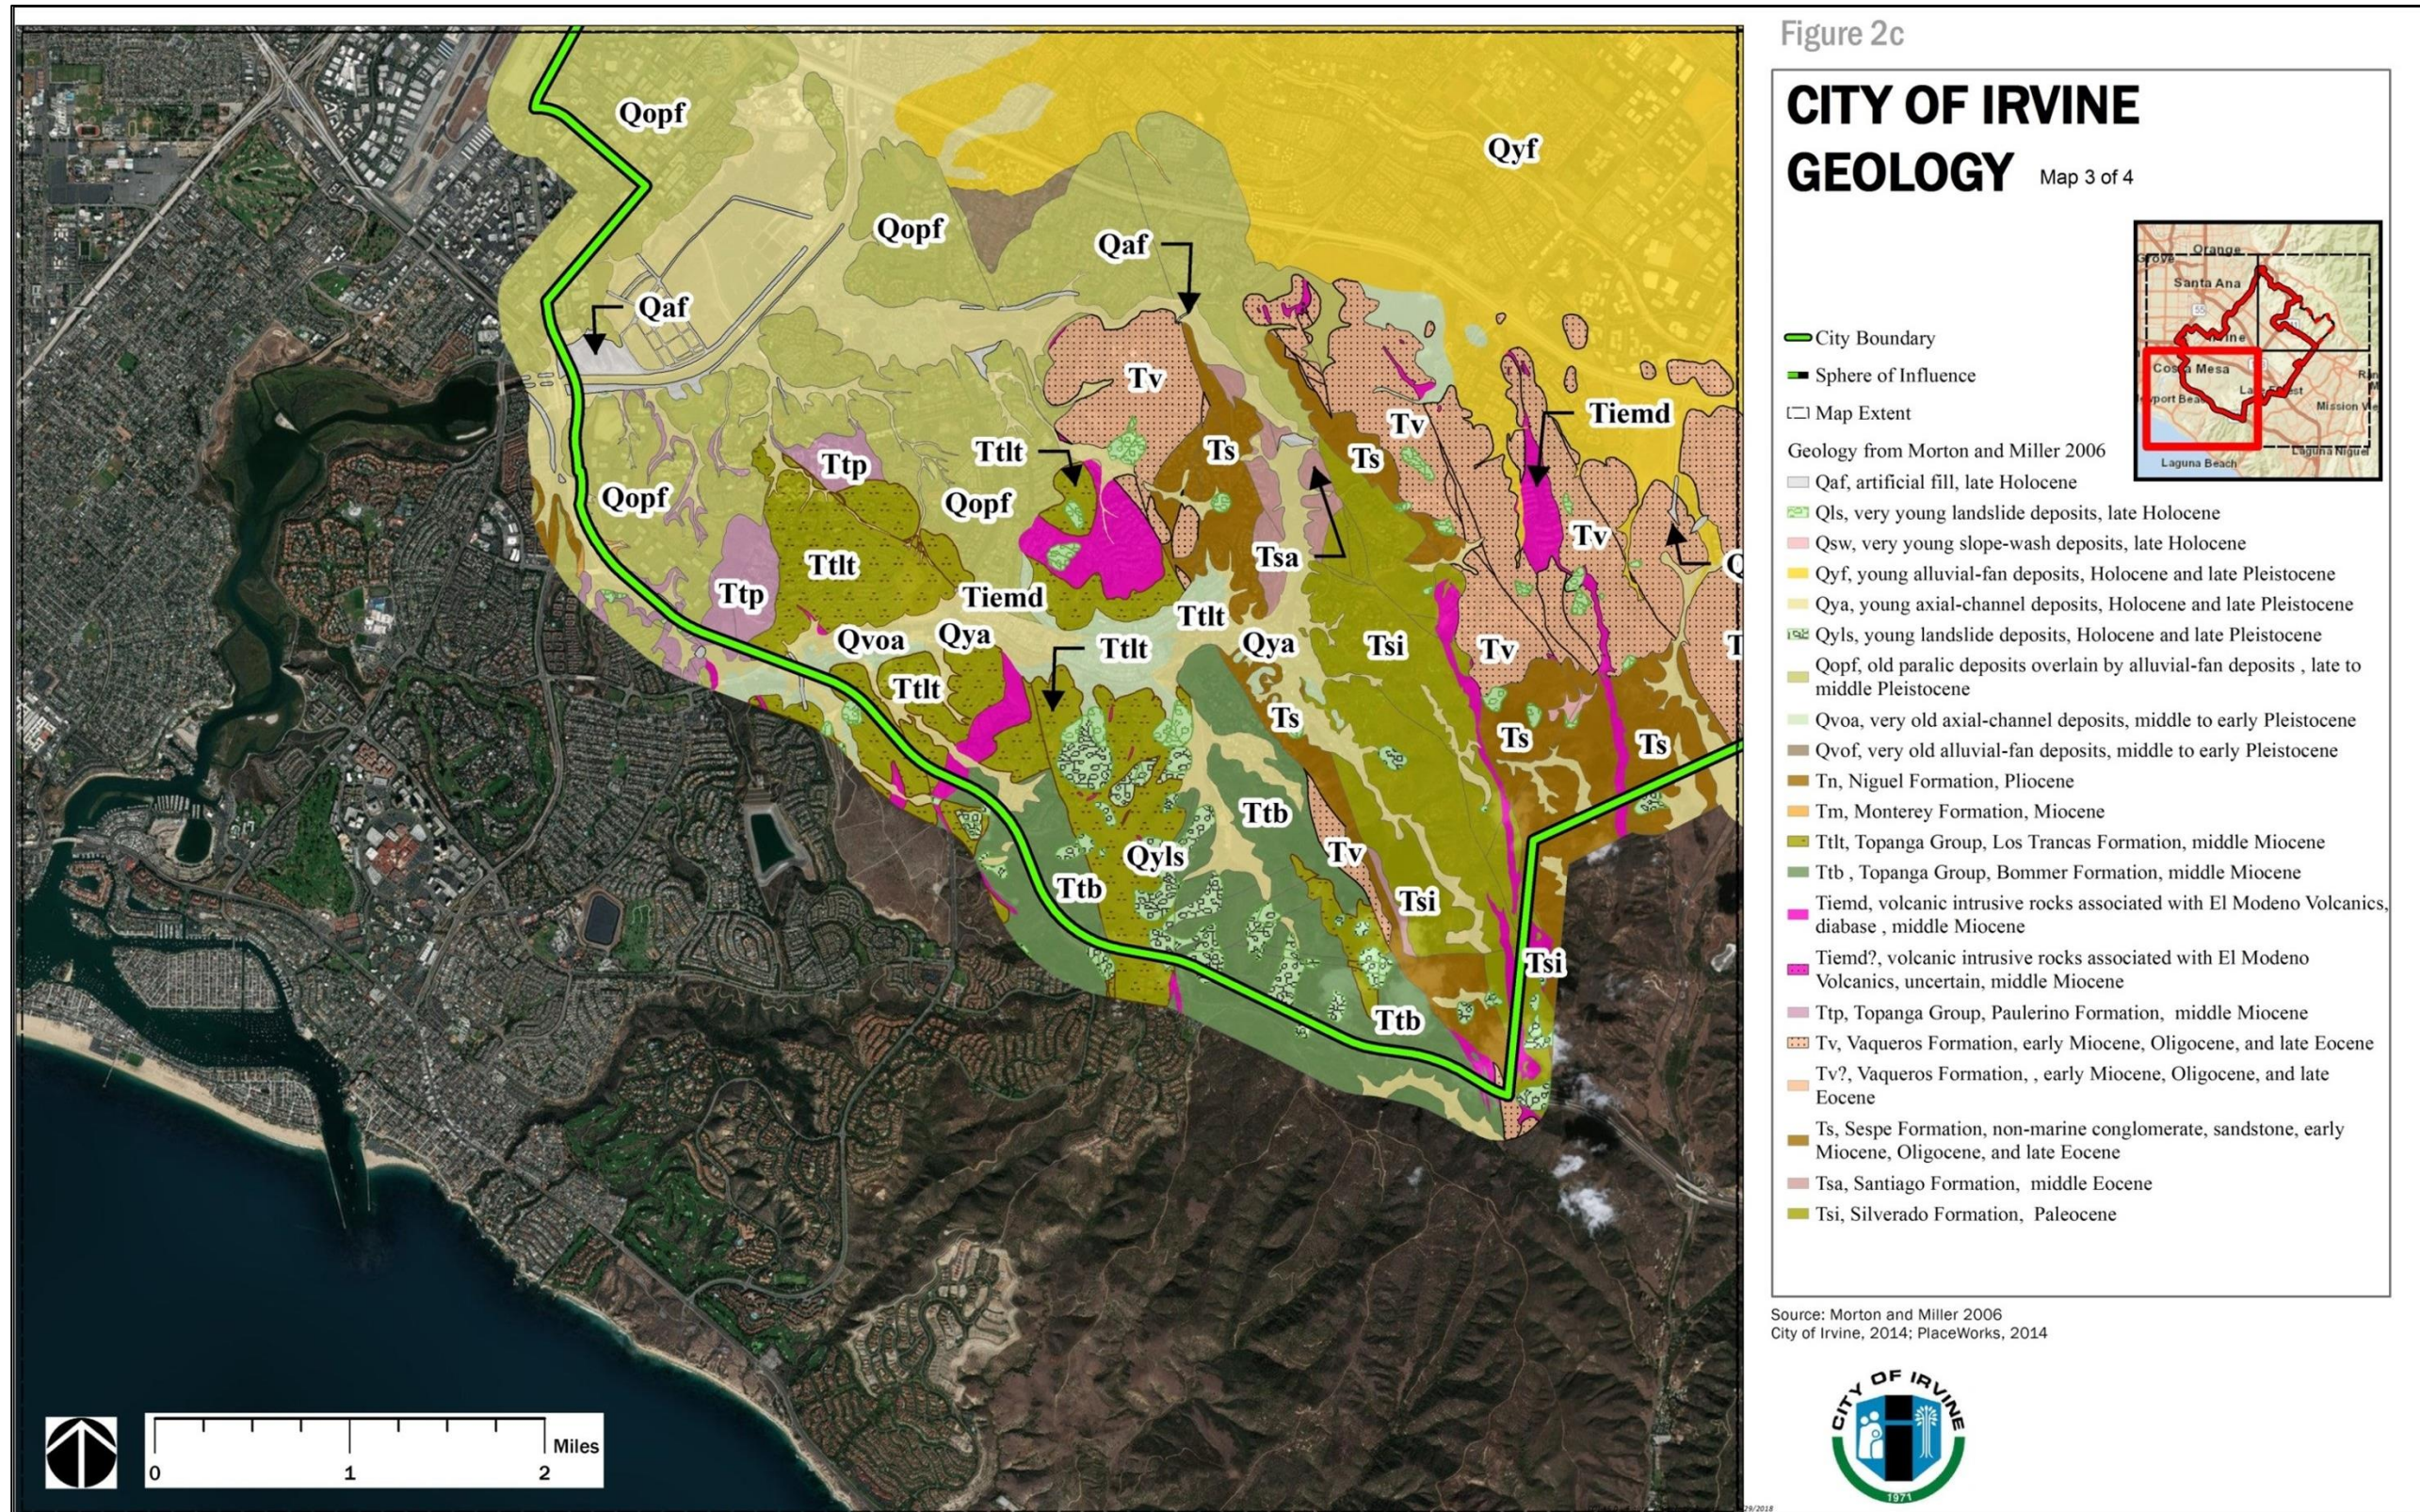

Figure 2c. Geology Map, 3 of 4

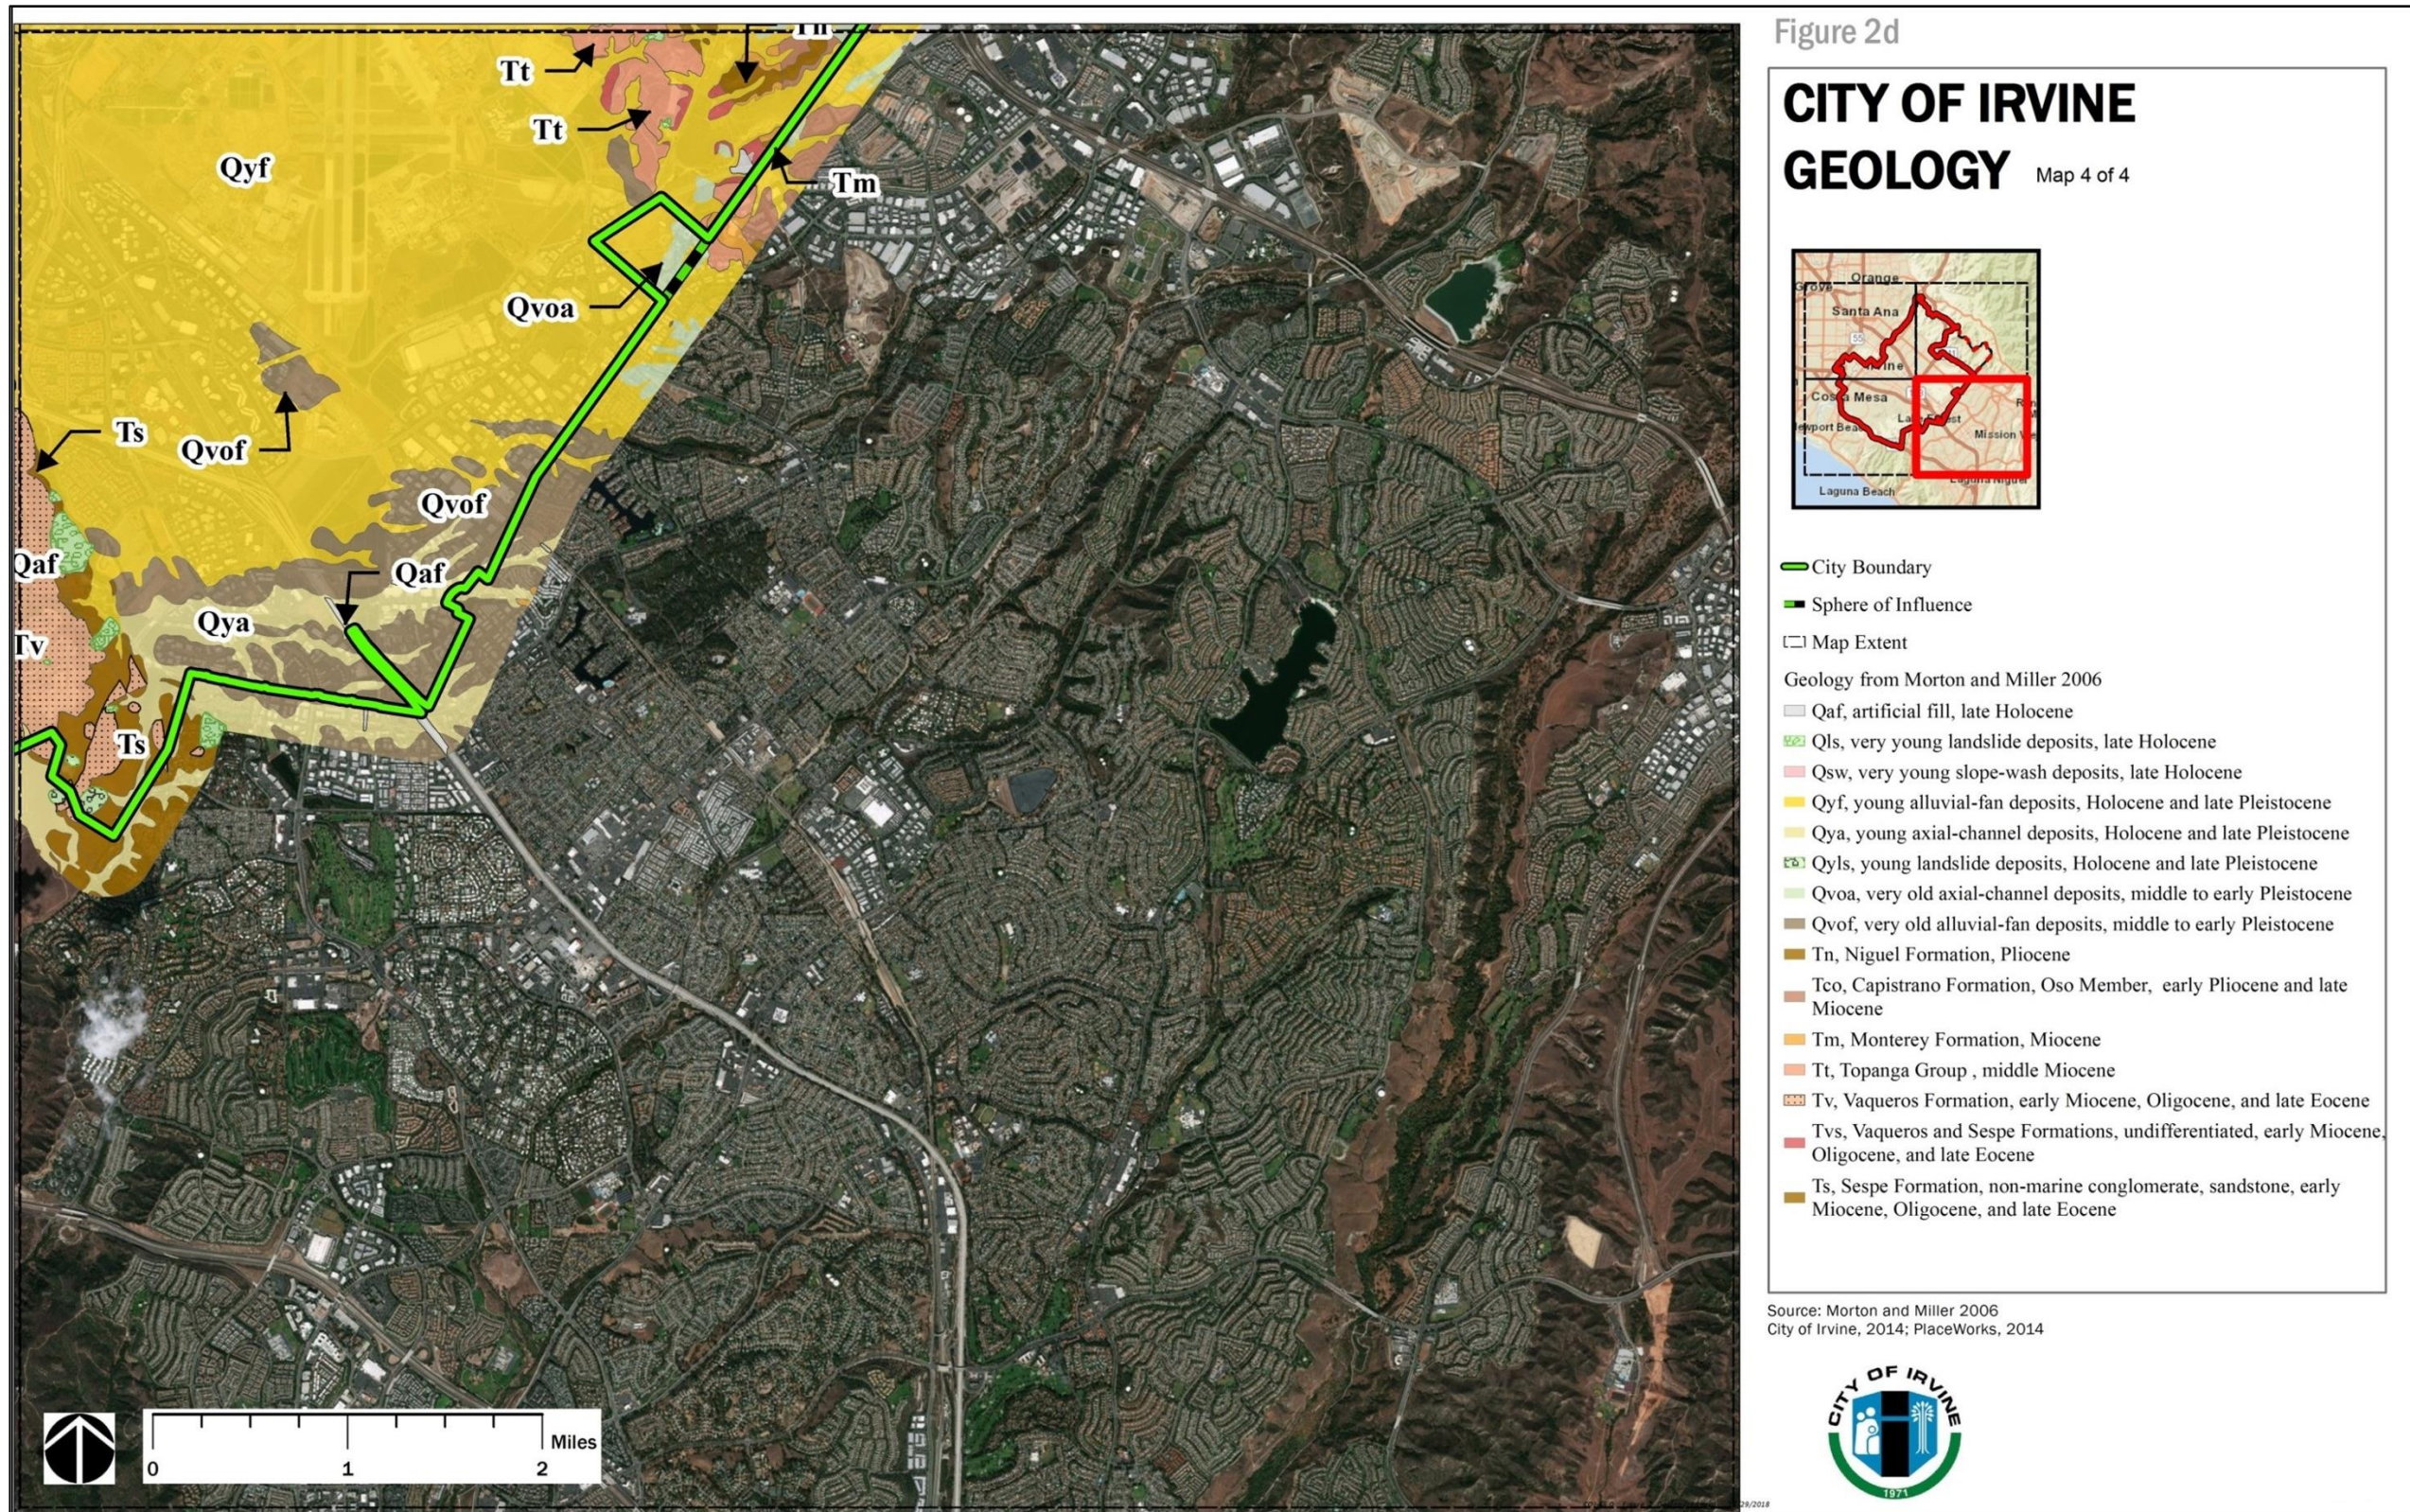

Figure 2d. Geology Map, 4 of 4

### **Late Cretaceous Rocks (~100.5 million years old [Ma] to ~66 Ma)**

#### **Williams Formation, Pleasants Sandstone Member (Kwps)**

The thickness of this shallow marine sandstone ranges from 0 m to 150 m in the Santa Ana Mountains. The lower portion of this formation consists of a massive sandstone with biotite, black carbonaceous fragments, scattered conglomerate lenses, and thin-bedded, biotite- and muscovite-bearing sandstone. The upper portion consists of poorly bedded, white to pale gray, feldspathic sandstone (Schoellhamer et al. 1981, Morton and Miller 2006).

### **Paleocene Rocks (~66 Ma to ~56 Ma)**

#### **Silverado Formation (Tsi)**

Deposited in coastal nonmarine swamps and sloughs to very shallow-marine deltas and bays, the thickness of this formation ranges from 200 m to 450 m in the Santa Ana Mountains. This formation is divided into a basal conglomerate (Tsicg) overlain by sandstone and siltstone of the undifferentiated Silverado Formation (Tsi; Schoellhamer et al. 1981, Morton and Miller 2006).

Above the basal conglomerate, the Silverado Formation consists of marine and nonmarine, sandstone and siltstone. Clasts are largely of quartz and clay with some conglomerate. The locally mapped Serrano Clay (Tsis) is present within the upper Silverado Formation. It is a 1 m thick marker bed composed of pale gray to white, soft and plastic clay and quartz with carbonaceous shale and lignite beds (Schoellhamer et al. 1981, Eisentraut and Cooper 2002, Morton and Miller 2006).

### **Middle Eocene Deposits (~47.8 Ma to ~37.8 Ma)**

#### **Santiago Formation (Tsa)**

These sediments consist of marine and nonmarine deposits from a coastal lowland paleoenvironment. At the base is a conglomerate with the clasts that originated from western central Mexico where the Santiago Formation was originally deposited. The north-westerly movement of the Pacific Plate by the San Andreas Fault Zone brought these sediments into southern California. Pale gray sandstone and some interbedded siltstone occurs above the conglomerate (Schoellhamer et al. 1981, Morton and Miller 2006).

### **Late Eocene to latest early Miocene Deposits (~41.2 Ma to ~17.4 Ma)**

#### **Sespe Formation (Ts)**

This red to grey, non-marine mudstone to conglomerate occurs as massive to thick bedded deposits with poorly developed bedforms (Eisentraut and Cooper 2002, Morton and Miller

2006). This terrestrial deposit includes fluvial, floodplain, and alluvial fan deposits. This formation also reflects a major drop in global sea levels (Eisentraut and Cooper 2002, McCulloch and Bayer 2004).

### **Miocene Epoch (~23 Ma to ~5.3 Ma)**

The Miocene Epoch was a dramatic time in southern California. The San Andreas Fault began bringing Pacific Plate lands from the south, volcanoes erupted, mountains grew, and numerous coastal marine basins were formed. Orange County rests in one of these basins - the Los Angeles Basin. During the Miocene, the Los Angeles Basin was tectonically active. Opening of the basin began about 17.4 Ma (McCulloch and Bayer 2004) and was followed by subsidence and creation of a deep marine depositional basin. Sediments are estimated to be up to six miles thick, one of the thickest Neogene stratigraphic successions in the world (Eisentraut and Cooper 2002).

### **Latest Oligocene to latest early Miocene (~27 Ma to ~16 Ma)**

#### **Sespe-Vaqueros Formation (Tvs)**

These two formations interfinger so much in many areas of California that they are mapped together. Sespe Formation sediments are generally coarser than those of the Vaqueros Formation. The Vaqueros-Sespe section can reach thicknesses between 1,500 and 2,000 feet in the Lake Forest area (McCulloch and Bayer 2004). See the individual descriptions for each for more information.

#### **Sespe Formation (Ts)**

This formation is of terrestrial origin and consists of sandstones and conglomerates from riverine, shoreline and floodplain environments. Commonly, the sandstones weather to reddish-brown, maroon, pinkish-gray, tan and green colors. Many of the sandstones are resistant to erosion and thus form dramatic outcrops and ridgelines.

#### **Vaqueros Formation (Tv)**

The shallow marine Vaqueros Formation occurs as greenish-gray to very dark gray, massive- to thick-bedded silty sandstone. Sandstone beds interfinger with thin-bedded siltstone and shale, mudstone, and minor conglomerate (McCulloch and Bayer 2004, Morton and Miller 2006). Deposition of the Vaqueros Formation began about 24 Ma and ended in most of the Los Angeles area between 17.5 Ma and 17.4 Ma based on the dating of volcanics, marine mollusks, benthic foraminifera, magnetic polarity stratigraphy, and other methods (Nagle and Parker 1971, Yerkes and Campbell 1979, Schoellhamer et al. 1981, Blake 1983, Mason and Swisher 1989, Nourse et al. 1998, Prothero et al. 1996, Lucas et al. 1997, Liddicoat 2001, McCulloch et al. 2001, Prothero and Donohoo 2001, McCulloch et al. 2002, Ludtke and Prothero 2003, Lander et al. 2003,

Whistler and Lander 2003, McCulloch and Bayer 2004). The appearance of marine sediments after the non-marine Sespe Formation indicates rising global sea levels.

### **Middle Miocene Deposits (~17.4 Ma to ~11.6 Ma)**

#### **El Modeno Volcanics (Tiemd)**

This unit consists of a fine grained diabasic intrusive rock (Morton and Miller 2006) created by volcanic eruptions.

#### **Topanga Group, undifferentiated (Tt)**

Undifferentiated Topanga Group (Tt) sediments consist primarily of coarse-grained, massive to thick-bedded sandstone and conglomerate. A basal tan to grey, well indurated, sandy conglomerate bed ranging from 2 m to 9 m is present (Schoellhamer et al. 1981). Clasts in this basal unit are predominantly granitic and gneissic with some volcanics. Above the basal conglomerate, are interfingering, thinly bedded, fine to coarse-grained sandstone, siltstone, and minor amounts of diatomaceous and partially silicified shale. While the shale is grey to greyish-white, coarser sediments are yellow to yellowish-tan (Morton and Miller 2006). Deposition began about 17.4 Ma and ended about 15.9 Ma based on dating of underlying and overlying volcanics (Turner and Campbell 1979, McCulloch et al. 2002, McCulloch and Bayer 2004).

The shallow to deep marine Topanga Group was one of the first units to be deposited in the rapidly deepening Los Angeles Basin. Much of these deep submarine fan and plain deposits occurred between 13 Ma and 5 Ma and corresponds with deposition of the Topanga and Monterey formations (Redin 1991, McCulloch and Bayer 2004). The Los Angeles Basin/ Tustin Plain continues to be filled by modern deposition today.

#### **Formations of the Topanga Group (Ttb, Ttlt, Ttp)**

In Orange County, the Topanga Group includes three formations: the basal Bommer Formation (Ttb), the middle Los Trancos Formation (Ttlt), and the upper Paulerino Formation (Ttp). Prior to Morton and Miller (2006) the Topanga Group formations were member level.

The basal Bommer Formation consists of gray to brownish-gray, thick-bedded, medium- to coarse-grained sandstone with interfingering fine-grained sandstone and siltstone. The formation is locally conglomeratic. The pale gray to brownish-gray, thin- to medium-bedded, siltstone and fine-grained sandstone of the Los Trancos Formation is up to 945 m thick. The upper Paulerino Formation consists of pale gray, tuffaceous sandstone and thin-bedded siltstone (Morton and Miller 2006).

## **Late Miocene Deposits (~11.6 Ma to ~5.3 Ma)**

### **Monterey Formation (Tm)**

This siliceous and diatomaceous marine mudstone, shale, diatomite, and some chert is primarily white to pale brown and thinly laminated or bedded. In the San Juan Capistrano area, lower part of Puente Formation grades laterally southward into Monterey Formation (Morton and Miller 2006). Sediments are part of a deep submarine fan and plain deposits that were deposited between 13 Ma and 5 Ma (Redin 1991). Locally named “Pecten Reef”, a limestone in the Aliso Viejo area has produced abundant invertebrate and vertebrate fossils. The Monterey Formation was deposited at the same time as the Soquel Member, La Vida Member, and the lower portion of the undifferentiated Puente Formation (Morton and Miller 2006).

### **Puente Formation (Tp, Tpsq, Tplv)**

The deep marine Puente Formation has produced numerous fossil localities of marine animals and algae as well as terrestrial plants and animals that were washed in from the land. These sediments were deposited at the same time as the Monterey Formation. Within the City are three units: the undifferentiated Puente Formation (Tp), the younger Soquel Member (Tpsq), and the basal La Vida Member (Tplv; Morton and Miller 2006).

The undifferentiated Puente Formation (Tp) consists of sandstone, siltstone, and shale. The Soquel Member (Tpsq) is primarily marine sandstone with minor amounts of shale. Beds are yellowish grey to grey, massive to well-bedded, silts to very coarse grained sandstone, interbedded with matrix supported pebble conglomerate (Morton and Miller 2006). The member ranges from 200 to 310 feet thick in the eastern Puente Hills and the sediments have been interpreted to be middle to inner submarine fan facies (Cooper 1981).

The basal La Vida Member (Tplv) sediments are primarily light-gray to black, massive to well-bedded, generally friable siltstone with some sandstone beds from 2 cm to over 1 meter thick. Fish remains are common and include deep water species (Morton and Miller 2006).

## **Late Miocene to early Pliocene Deposits (~11.6 Ma to ~3.6 Ma)**

### **Capistrano Formation, Oso Sand (Tco)**

The Oso Sand of the Capistrano Formation consists of white to light gray, massive, medium- to coarse-grained, friable, marine sandstone with scattered matrix-supported pebbles, cobbles, and concretions (Morton and Miller 2006). The bay that occupied the region was named the Capistrano Embayment (Reed and Hollister 1936). This embayment was a broad flat-bottomed structural trough that extended at least 22 miles inland from the present-day shoreline. How far offshore it extended is undetermined because of its merging with the deep offshore basins. Water depths in the Capistrano Embayment reached nearly 2,000 meters at its deepest point (Ingle 1979).

### **Pliocene Deposits (~5.3 Ma to ~2.6 Ma)**

#### **Niguel Formation (Tn)**

These very near-shore marine, brownish-gray, poorly sorted, coarse-grained sandstones are interbedded with conglomeratic sandstone and conglomerates. The paleoenvironment represented is near-shore marine (Vedder 1960, Morton and Miller 2006).

### **Early to middle Pleistocene Deposits (2.6 Ma to 126,000 years old [120 ka])**

#### **Very old axial channel deposits (Qvoa)**

Axial channel deposits were emplaced adjacent to streams in through-going stream valleys. Undifferentiated very old axial channel sediments are dominated by sand, but contain scattered gravel and pebble layers, as well as silt and clay-bearing alluvium. These deposits are moderately to well-indurated, reddish-brown, and are highly pigmented in upper parts. The upper surfaces are typically very dissected (Morton and Miller 2006).

#### **Very old alluvial fan deposits (Qvof)**

Alluvial fan deposits are deposited into our valleys from local mountains via the mouths of canyons. Sediments are moderately to well indurated, silts to bouldery conglomerates, with slightly to moderately dissected fan surfaces. In much of Peninsular Ranges these sediments are moderately well indurated, orangish brown sand and silt with well dissected fan surfaces (Morton and Miller 2006). Clasts coarsen upstream with boulders up to several meters across being deposited near the mountains during flash floods

### **Middle to late Pleistocene Deposits (774,000 [774 ka] to 126 ka)**

#### **Old paralic deposits (Qopf)**

Paralic deposits were emplaced adjacent to the ocean and include interfingering strandline, beach, estuarine, and colluvial deposits. These poorly sorted, moderately permeable, reddish-brown, are composed of silt, sand, and cobbles. The top of the unit is capped by thin but extensive sand-rich alluvial fan deposits derived from local sources (Morton and Miller 2006).

### **Late Pleistocene to Holocene Deposits (less than 126 ka)**

#### **Young axial channel deposits (Qya)**

Axial channel deposits were emplaced adjacent to streams in through-going stream valleys. Sediments are slightly to moderately indurated and consist of silts to pebbles (Morton and Miller 2006).

### **Young colluvial deposits (Qyc)**

Colluvium is present as scree, soils, or other materials and is primarily found at the base of hills. These sediments have been emplaced by rain wash or slow continuous downslope creep. The young deposits are undissected to slightly dissected, unconsolidated to slightly consolidated and have minor amounts of soil development (Morton and Miller 2006).

### **Young alluvial fan deposits (Qyf)**

Alluvial fan deposits are deposited into our valleys from local mountains via the mouths of canyons. Sediments are unindurated to moderately indurated, silts to bouldery conglomerates, with slightly to moderately dissected fan surfaces (Morton and Miller 2006). Clasts coarsen upstream with boulders up to several meters across being deposited near the mountains during flash floods.

### **Young landslide deposits (Qyls?)**

Landslides are the result of slope failures and typically result in chaotically emplaced sediments. Slides may or may not be active and have slightly dissected or modified surfaces (Morton and Miller 2006). In less chaotic slides and slumps beds can sometimes be traced and given stratigraphic context.

## **Late Holocene Deposits (less than 5 ka)**

### **Very young landslide deposits (Qls, Qls?)**

Landslides are the result of slope failures and typically result in chaotically emplaced sediments. Slides may or may not be active and have well preserved morphology (Morton and Miller 2006). In less chaotic slides and slumps beds can sometimes be traced and given stratigraphic context.

### **Very young slope wash deposits (Qsw)**

Very similar to the colluvial deposits, slope wash is also associated with hillsides. The unconsolidated, typically angular, sand to boulder sized clasts have been emplaced by water not confined to channels (Morton and Miller 2006).

## **Modern Deposits (less than 200 years old)**

### **Artificial fill (Qaf)**

Modern fill is frequently not mapped on geologic maps due to its ubiquitous nature. Although fill is typically less than a few feet thick, it can be substantially thicker in the areas of overpasses, freeways, and other large earthworks. Any fossils that may be encountered therein are not scientifically significant.

## **ETHNOGRAPHY**

The City of Irvine is located within the traditional tribal territory of the Gabrielino with the Acjachemen (Juaneño) located immediately to the south (McCawley 1996, Figure 3). The traditional tribal territory of the Gabrielino includes large portions of Los Angeles County, the northern part of Orange County, small sections of Riverside and San Bernardino Counties as well as the southern Channel Islands of Santa Barbara, San Clemente, San Nicolas, and Santa Catalina (McCawley 1996, Figure 3). The traditional tribal territory of the Acjachemen includes northern San Diego County and southern Orange County (O'Neil and Evans 1980). Tribal boundaries are fluid and the Acjachemen territory may have extended north to include the City of Irvine. Background sections for both the Gabrielino and Acjachemen are provided below.

### **GABRIELINO**

The Gabrielino are considered to have been one of the wealthiest tribes and to have greatly influenced tribes they traded with (Kroeber 1976:621). Houses were domed, circular structures thatched with tule or similar materials (Bean and Smith 1978:542). The best known artifacts were made of steatite and were highly prized. Many common everyday items were decorated with inlaid shell or carvings reflecting an elaborately developed artisanship (Bean and Smith 1978:542).

The main food zones utilized were marine, woodland and grassland (Bean and Smith 1978). Plant foods were, by far, the greatest part of the traditional diet at contact. Acorns were the most important single food source. Villages were located near water sources necessary for the leaching of acorns, which was a daily occurrence. Grass seeds were the next most abundant plant food used along with chia. Seeds were parched, ground, and cooked as mush in various combinations according to taste and availability. Greens and fruits were eaten raw or cooked or sometimes dried for storage. Bulbs, roots, and tubers were dug in the spring and summer and usually eaten fresh. Mushrooms and tree fungus were prized as delicacies. Various teas were made from flowers, fruits, stems, and roots for medicinal cures as well as beverages (Bean and Smith 1978:538-540).

The principal game animals were deer, rabbit, jackrabbit, woodrat, mice, ground squirrels, antelope, quail, dove, ducks, and other birds. Most predators were avoided as food, as were tree squirrels and most reptiles. Trout and other fish were caught in the streams, while salmon were available when they ran in the larger creeks. Marine foods were extensively utilized. Sea mammals, fish, and crustaceans were hunted and gathered from both the shoreline and the open ocean, using reed and dugout canoes. Shellfish were the most common resource, including abalone, turban, mussels, clams, scallops, bubble shells, and others (Bean and Smith 1978:538-540).

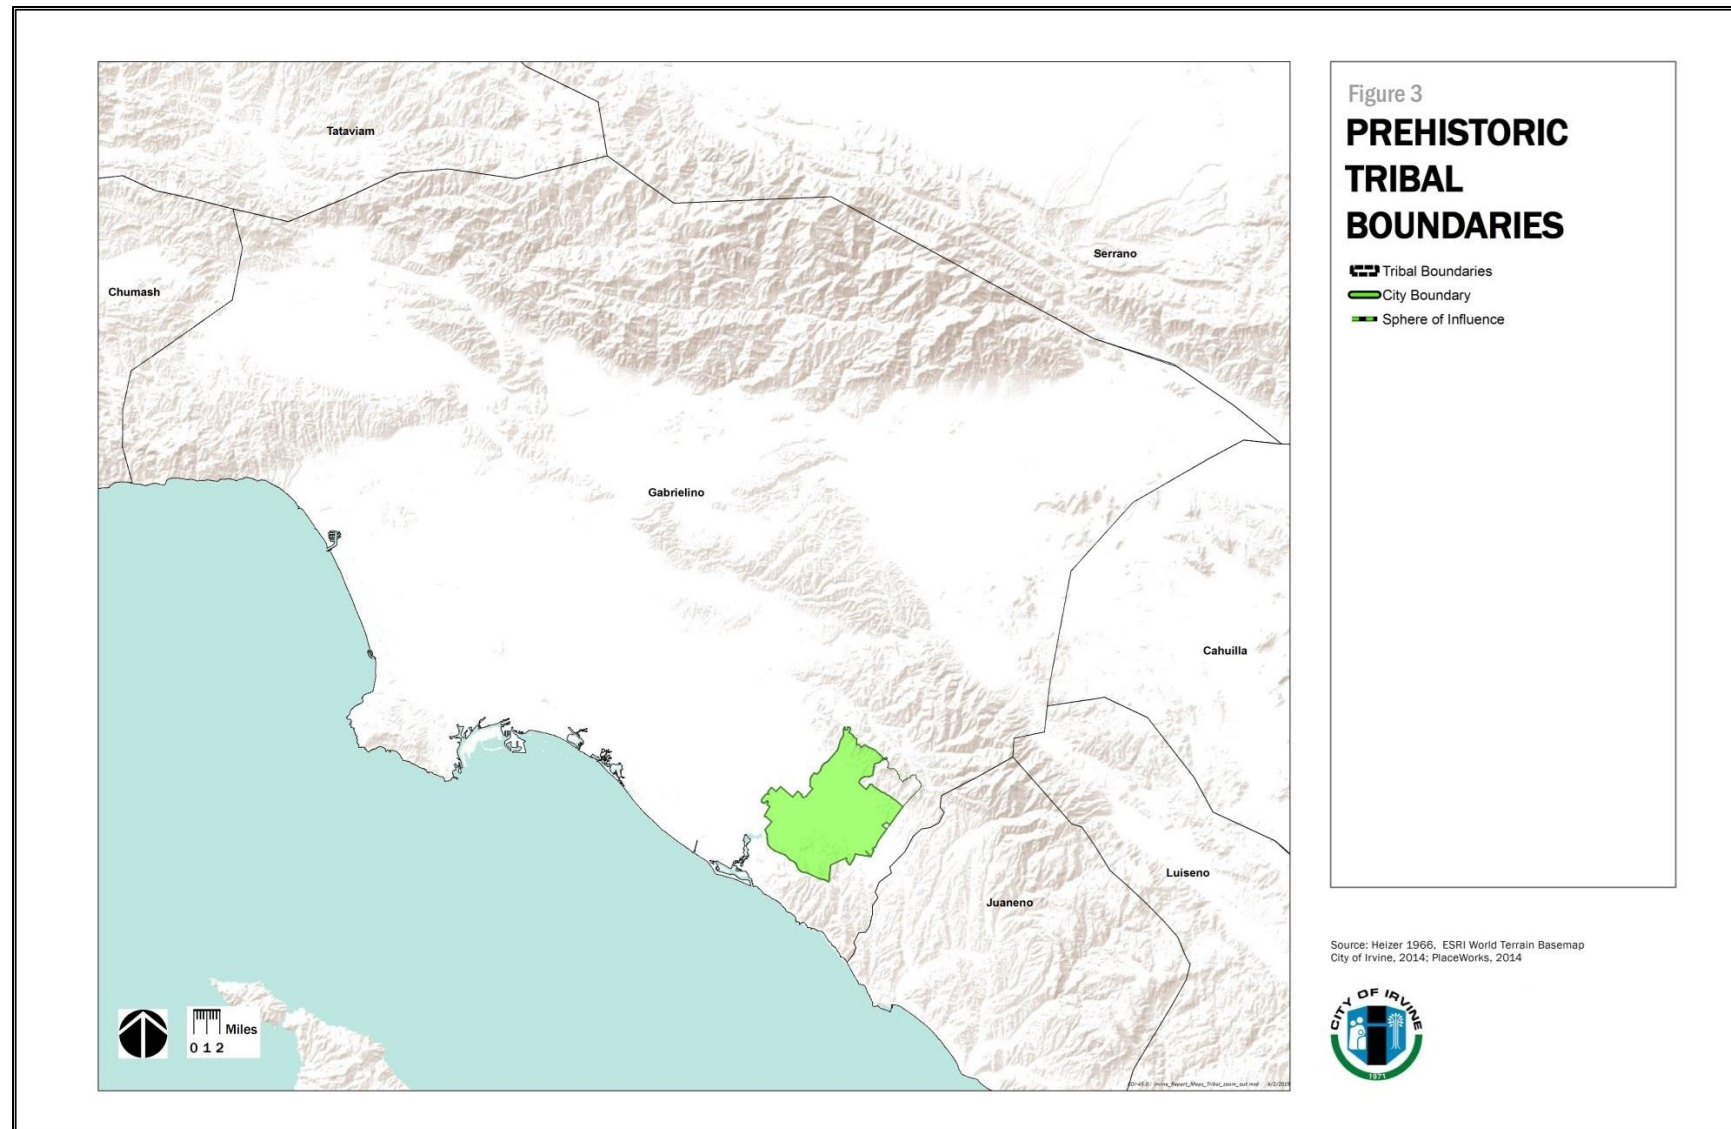

Figure 3. Tribal Territory Map

## **JUANEÑO ACJACHEMEN**

About 1,300 years ago the Acjachemen (Juaneño), who were hunters and gatherers of the San Luis Rey Cultural Pattern, moved into southern Orange County. The Acjachemen speak a language that is part of the Takic language family. Their traditional tribal territory was situated partly in northern San Diego County and partly in southern Orange County (see Figure 3). The boundaries were Las Pulgas Creek (south), Aliso Creek (north), the Pacific Ocean (west) and the Santa Ana Mountains (east). Villages were mostly along San Juan Creek, Trabuco Creek and San Mateo Creek (O'Neil and Evans 1980).

In prehistory, the Acjachemen had a patrilineal society and lived in groups with other relatives. These groups had established claims to places including the sites of their villages and resource areas. Marriages were usually arranged from outside villages establishing a social network of related peoples in the region. There was a well-developed political system including a hereditary chief. Religion was an important aspect of their society. Religious ceremonies included rites of passage at puberty and mourning rituals (Kroeber 1925).

Houses were typically conical in shape and thatched with locally available plant materials. Work areas were often shaded by rectangular brush-covered roofs (ramada). Each village had a ceremonial structure in the center enclosed by a circular fence where all religious activities were performed (Bean and Shipek 1978).

Women are known to have been the primary gatherers of plant foods, but also gathered shellfish and trapped small game animals. Men hunted large game, most small game, fished, and assisted with plant food gathering, especially of acorns. Adults were actively involved in making tools including nets, arrows, bows, traps, food preparation items, pottery and ornaments. Tribal elders had important political and religious responsibilities and were involved in education of younger members (Bean and Shipek 1978).

## **PREHISTORIC SETTING**

Review of archaeological data has resulted in a revised synthesis of cultural change as evidenced by material culture and archaeologically visible cultural practices. A large part of what was previously referred to as the Millingstone Period is now called the Topanga pattern of the Encinitas Tradition. This pattern is replaced in the Project Area by the Angeles pattern of the Del Rey Tradition later in time (Sutton 2010; Table 3).

**Table 3. Culture Change Chronology**

Pattern	Phase	Dates (BP)	Material Traits	Other Traits
Encinitas	Topanga I	8,500 to 5,000	Abundant manos and metates, many core tools and scraper s, few but large points, charmstones, cogged stones, early discoidals, bone gorge fishhooks, faunal remains rare; <i>Olivella</i> spire/end lopped beads appear	Estuary/lagoon shellfish and sharks/rays common, hunting important, secondary burials under metate cairns (some with long bones only), some extended inhumations, no cremations
	Topanga II	5,000 to 3,500	Abundant but decreasing manos and metates, adoption of mortars and pestles, smaller points, cogged stones, late discoidals, fewer scraper planes and core tools, some stone balls and charmstones; inhumations common; <i>Olivella</i> Grooved Rectangular beads introduced	Estuary/lagoon shellfish and sharks/rays common, addition of acorns, reburial of long bones only, addition of flexed inhumations (some beneath metate cairns), cremations rare
Angeles	Angeles I	3,500 to 2,600	Appearance of Elko dart points and an increase in the overall number of projectile points from Encinitas components; beginning of large-scale trade in small steatite artifacts (effigies, pipes, and beads) and <i>Olivella</i> shell beads; appearance of single-piece shell fishhooks and bone harpoon points; Coso obsidian becomes important; appearance of donut stones; appearance of <i>Mytilus</i> beads	apparent population increase; fewer and larger sites along the coast; collector strategy; less overall dependence on shellfish but fishing and terrestrial hunting more important; appearance of flexed and extended inhumations without cairns, cremations uncommon
	Angeles II	2,600 to 1,600	Continuation of basic Angeles I material culture with the addition of mortuary features containing broken tools and fragmented cremated human bone; fishhooks become more common	Shellfish change to mudflat species, more emphasis on fish, birds and mammals, continuation of basic Angeles I settlement and subsistence systems; appearance of a new funerary complex
	Angeles III	1,600 to 1,250	Appearance of bow and arrow technology (e.g., Marymount or Rose Spring points); changes in <i>Olivella</i> beads; asphaltum becomes important; reduction in obsidian use; Obsidian Butte obsidian largely replaces Coso	larger seasonal villages; flexed primary inhumations but no extended inhumations and an increase in cremations; appearance of obsidian grave goods
	Angeles IV	1,250 to 800	Cottonwood points appear; some imported pottery appears; birdstone effigies at the beginning of the phase and “spike” effigies dropped by the end of the phase; possible appearance of ceramic pipes, <i>Mytilus</i> shell disks	change in settlement pattern to fewer but larger permanent villages; flexed primary inhumations continue, cremations uncommon

Pattern	Phase	Dates (BP)	Material Traits	Other Traits
	Angeles V	800 to 450	Trade of steatite artifacts from the southern Channel Islands becomes more intensive and extensive, with the addition or increase in more and larger artifacts, such as vessels and comals; larger and more elaborate effigies; portable mortars and pestles	strengthening of ties, especially trade, with southern Channel Islands; expansion into the northern Santa Ana Mountains and San Joaquin Hills
	Angeles VI	450 to 150	Addition of Euroamerican material culture (e.g., glass beads and metal tools), locally made pottery, metal needle-drilled <i>Olivella</i> beads	change of settlement pattern, movement close to missions and ranches; use of domesticated species obtained from Euroamericans; flexed primary inhumations continue; apparent adoption of Chingichngish religion

Topanga Pattern groups were relatively small and highly mobile. Sites tend to be along the coast in wetlands, bays, coastal plains, near-coastal valleys, marine terraces and mountains. The Topanga toolkit is dominated by manos and metates with projectile points scarce (Sutton and Gardner 2010: 9).

In Topanga Phase I other typical characteristics were a few mortars and pestles, abundant core tools (scraper planes, choppers, and hammerstones), relatively few large, leaf-shaped projectile points, cogged stones, and early discoidals (Table 3). Secondary inhumation under cairns was the common mortuary practice. In Orange County as many as 600 flexed burials were present at one site and dated 6, 435 calibrated radiocarbon years before present (Sutton and Gardner 2010: 9, 13).

In Topanga Phase II, flexed burials and secondary burial under cairns continued. Adoption of the mortar and pestle is a marker of this phase. Other typical artifacts include manos, mutates, scrapers, core tools, discoidals, charmstones, cogged stones, and an increase in the number of projectile points. In Orange County stabilization of sea level during this time period resulted in increased use of estuary, near shore and local terrestrial food sources (Sutton and Gardner 2010: 14-16).

The Angeles pattern generally is restricted to the mainland and appears to have been less technologically conservative and more ecologically diverse, with a largely terrestrial focus and greater emphases on hunting and nearshore fishing. In Angeles Phase I Elko points for atlatls or darts appear, small steatite objects such as pipes and effigies are found, shell beads and ornaments increase, fishing technologies increase including bone harpoons/fishhooks and shell

fishhooks, donut stones appear, and hafted micro blades for cutting/graving wood or stone appear. In addition, several Encinitas traits, such as discoidals, cogged stones, plummet-like charm stones and cairn burials virtually disappear from the record. Mortuary practices changed to consist of primarily flexed primary inhumations, with extended inhumations becoming less common. Settlement patterns made a shift from general use sites being common to habitation areas separate from functional work areas. Subsistence shifted from mostly collecting to increased hunting and fishing.

The Angeles Phase II is identified primarily by the appearance of a new funerary complex, with other characteristics similar to Angeles I. The complex features killed (broken) artifacts plus highly fragmented cremated human bones and a variety of faunal remains. In addition to the cremains, the other material also often burned. None of the burning was performed in the burial feature.

The Angeles III Phase is the beginning of what has been known as the Late Period and is marked by several changes from Angeles I and II. These include the appearance of small projectile points, steatite shaft straighteners and increased use of asphaltum all reflecting adoption of bow and arrow technology, obsidian sources changed from mostly Coso to Obsidian Butte and shell beads from Gulf of California species began to appear. Subsistence practices continued as before and the geographic extent of the Angeles Pattern increased (Sutton 2010).

Angeles Phase IV is marked by new material items including Cottonwood points for arrows, Olivella cupped beads and Mytilus shell disks, birdstones (zoomorphic effigies with magico-religious properties) and trade items from the Southwest including pottery. It appears that populations increased and there was a change in the settlement pattern to fewer but larger permanent villages. Presence and utility of steatite vessels may have impeded the diffusion of pottery into the Los Angeles Basin. Smaller, special-purpose sites continued to be used (Sutton 2010).

Angeles Phase V components contain more and larger steatite artifacts, including larger vessels, more elaborate effigies, and comals. Settlement locations shifted from woodland to open grasslands. The exploitation of marine resources seems to have declined and use of small seeds increased. Many Gabrielino inhumations contained grave goods while cremations did not (Sutton 2010).

The Angeles Phase VI reflects the ethnographic mainland Gabrielino of the post-contact (i.e., post-A.D. 1542) period. One of the first changes in Gabrielino culture after contact was undoubtedly population loss due to disease, coupled with resulting social and political disruption. Angeles Phase VI material culture is essentially Angeles Phase V, augmented by a number of Euro-American tools and materials, including glass beads and metal tools such as knives and needles (used in bead manufacture). The frequency of Euro-American material culture increased

through time until it constituted the vast majority of materials used. Locally produced brownware pottery appears along with metal needle-drilled Olivella disk beads (Sutton 2010).

The ethnographic mainland Gabrielino subsistence system was based primarily on terrestrial hunting and gathering; although nearshore fish and shellfish played important roles. Sea mammals, especially whales (likely from beached carcasses), were prized. In addition, a number of European plant and animal domesticates were obtained and exploited. Ethnographically, the mainland Gabrielino practiced interment and some cremation (Sutton 2010).

## **HISTORIC SETTING**

### **Spanish Exploration**

Juan Cabrillo was the first European to sail along the coast of California in 1542 and was followed in 1602 by Sebastian Vizcaino (Bean and Rawls 1993). The Spanish colonization of what was then known as Alta California began with the 1769 overland expedition led by Gaspar de Portolá with a crew of 63 men in order to explore the land between San Diego and Monterey (Fox 1979). Between 1769 and 1822 the Spanish had colonized California and established missions, presidios, and pueblos and documented the people and landscape along the way (McCawley 1996).

Portola and his expedition crossed the area north of Lake Forest in July 1769, naming the perennial creek that empties from the Santa Ana Mountains “*aliso*”, the Spanish word for alder; an error on the Spanish identifier, since they were in fact, referring to the sycamore tree, which still grows along the creek. It should be noted that the Juaneño term for the creek was *Seeevenga*, meaning “at the sycamores” (O’Neil 1988). However, historically, alder and sycamore trees were much more prominent, particularly in the riparian and floodplain areas where an oak-woodland habitat existed. During the Mission period, many of the trees along the creek, including alder, oak, sycamore, and other species were cut down for the construction of ships and structures, charcoal production, and other uses (Nasser 2003).

Following the Portolá Expedition, vast tracts of land were granted to the Missions. The seventh of the Franciscan missions in California was Mission San Juan Capistrano, founded in 1776; shortly after Portolá’s visit to the area. The goals of the missions were tri-fold: they helped establish a Spanish presence on the west coast, allowed for a means to Christianize the native peoples, and served to exploit the native population as laborers. The Spanish also hoped each mission would become a town center, whereas, “the pueblo would receive a ground of four square leagues of land... and other property would be parceled out among the Indians.” The missionaries, or padres, would essentially serve as a mayor, or head of the town (Bean 1978:29-30).

Portions of Irvine lie within the boundaries of Rancho Santiago de Santa Ana (Figure 4). The Rancho Santiago de Santa Ana was given to Jose Antonio Yorba and his nephew Pablo Peralta in 1810 by Governor José Joaquín de Arrillaga on behalf of the Spanish Government. This grant was extremely rare at this time and was the only land grant in present-day Orange County to be given under Spanish Rule. The grant consisted of the lands east of the Santa Ana River to the Santa Ana Mountains. The land was originally petitioned for by Juan Pablo Grijalva, who was a Spanish soldier that had travelled to California with the De Anza expedition. He died before the grant was approved, which resulted in the land being granted to his son-in-law (Yorba) and grandson (Peralta).

### **Mexican Period**

In 1821 Mexico won its independence from Spain and worked to lessen the wealth and power held by the missions. The Secularization Act was passed in 1833, appropriating the vast mission lands to the Mexican governor and downgrading the missions' status to that of parish churches. The governor then redistributed the former mission lands, in the form of land grants, to private owners (Bean and Rawls 1993; Robinson 1948). The lands were typically granted to soldiers who proved their loyalty to the Mexican government once liberated from the Spanish crown.

In addition to the land granted for the Rancho Santiago de Santa Ana under the Spanish Government, additional land grants were given by the Mexican government including Rancho San Joaquin and Rancho Lomas de Santiago (Figure 4). The Rancho San Joaquín land grant was a combination of the Rancho Cienega de las Ranas and the Ranch La Bolsa de San Joaquín. This land grant was issued to José Antonio Andrés Sepúlveda in 1837 and 1842, respectively. The Spanish *Cienega de las Ranas* means “marsh of the frogs” and *bolsa* means “pocket”, and together refers to a wetlands area. Rancho Lomas de Santiago was granted to Teodosio Yorba by the Mexican Governor Pío Pico in 1846. Teodosio was the son of Jose Antonio Yorba, who was granted Rancho Santiago de Santa Ana

### **American Period**

Following the cession of California to the United States after the Mexican-American War, the Treaty of Guadalupe Hidalgo in 1848 ensured that the land grants would be honored. In 1852 a claim for Rancho Santiago de Santa Ana was filed with the Public Land Commission as required by the Land Act of 1851, and the grant was patented to Bernardo Teodoro and Ramón Yorba in 1883. The Yorba family sold the Rancho to José Antonio Andrés Sepúlveda in 1854 and Sepúlveda later lost the lands due to bankruptcy caused by trying to uphold his land claims in court. Sepúlveda also filed a land claim for Rancho San Joaquin in 1852, which was patented to José Sepúlveda in 1867. In 1864 Sepúlveda sold his lands to Benjamin and Thomas Flint, Llewellyn Bixby and James Irvine.

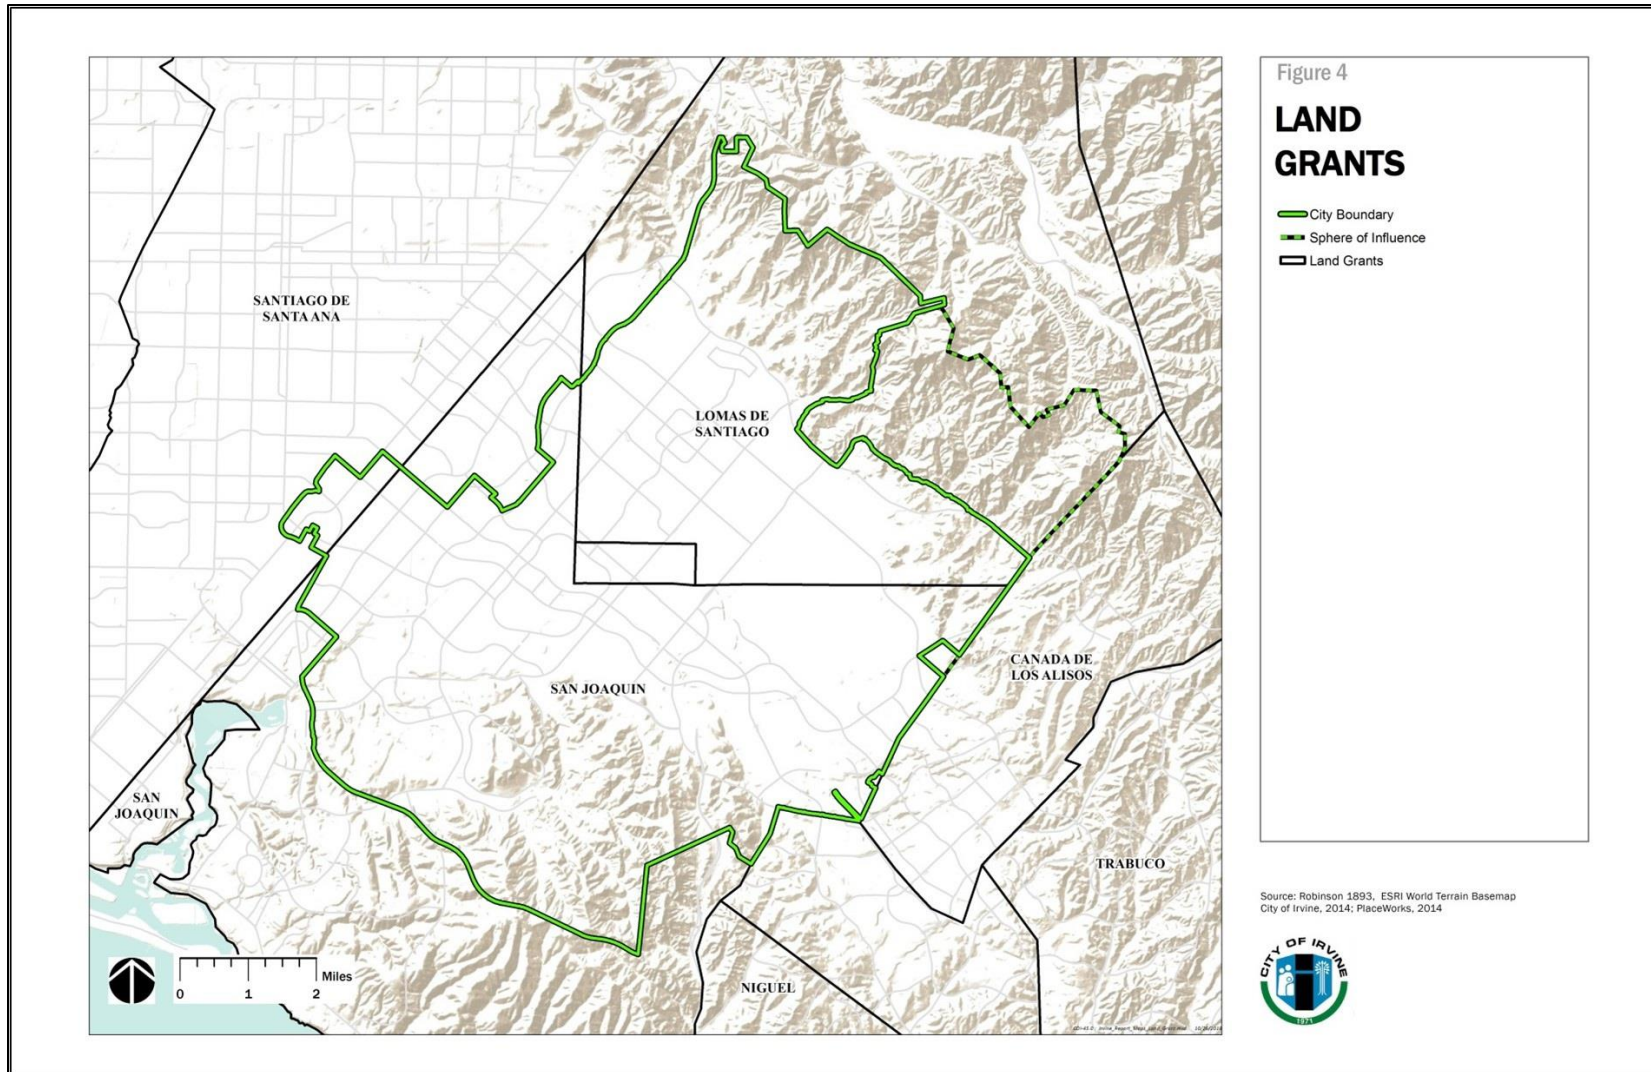

In 1876, James Irvine bought out his partners in Flint, Bixby and Co. and became the sole owner of the Irvine Ranch. It continued to be largely a ranching operation for many years. James Irvine and James McFadden played pivotal roles in the history of the City of Irvine. James Irvine was the largest landholder in the region and was interested in identifying the most lucrative agricultural uses for the enormous tract of land. When he died in 1886, James II took control of the ranch and increased its agricultural production. In 1894 James Irvine II incorporated the land holdings as the Irvine Company.

In 1899, the newly formed San Joaquin School District approached James Irvine with the intent to build a school for the children of his ranch tenant. A spot was chosen, upon which the school house was raised. In 1911, the school and land upon which it resided was donated by Irvine to Orange County. By this point 100 pupils were enrolled in the school. The same year in 1899, a post office was opened in a boarding house across the street from the school. Irvine named the post office “Myford” after his young son (Liebeck 1990, Figure 5).

In 1909, Frederick Culver received Irvine’s permission to build a blacksmith shop near the ranch’s warehouse operations. The shop was used to maintain farm machinery as well as making buggy parts, wagon wheels, and horseshoes. By the beginning of the 20<sup>th</sup> century Irvine set aside 320 acres at the intersection of the Santa Fe Railroad tracks and Central Avenue for the purpose of developing a town for the residence of both his permanent and seasonal workers. In 1914, the Orange County town of Myford was renamed “Irvine” (Liebeck 1990).

While already the number one producer of lima beans in the world, the Irvine Ranch’s bean production reached its zenith during the First World War. In 1918, the ranch contained 60,000 acres of lima bean fields which produced 900,000 sacks equating to a total value of \$6 million. After WW1, the 1920s saw significant changes to the Irvine Ranch. The Irvine Service Station was enlarged to accommodate the area’s growing car culture and the town initially planned by Irvine saw an increase in housing for workers.

The Second World War saw to the end of the Irvine’s “Agricultural Empire” (Liebeck 1990). Seeking a site for the Navy’s air operations the Santa Ana Chamber of Commerce chose the Irvine Ranch’s prime 17,000-acre lima bean field. Despite Irvine’s attempts to offer the Navy alternative sites on his ranch the Navy refused and continued with the purchase of Irvine’s two of the best pieces of agricultural land. This resulted in the establishment of the El Toro Marine Corps Air Station and the Tustin Lighter-Than-Air base. The Navy’s purchase of Irvine’s land allowed for the Orange County Assessor’s Office to reassess the ranch’s property value. Up to this point, the ranch has paid a tax base far below those of other county lands and with the reassessment this advantage was soon removed (Liebeck 1990).

**Figure 4. Map of Land Grants**

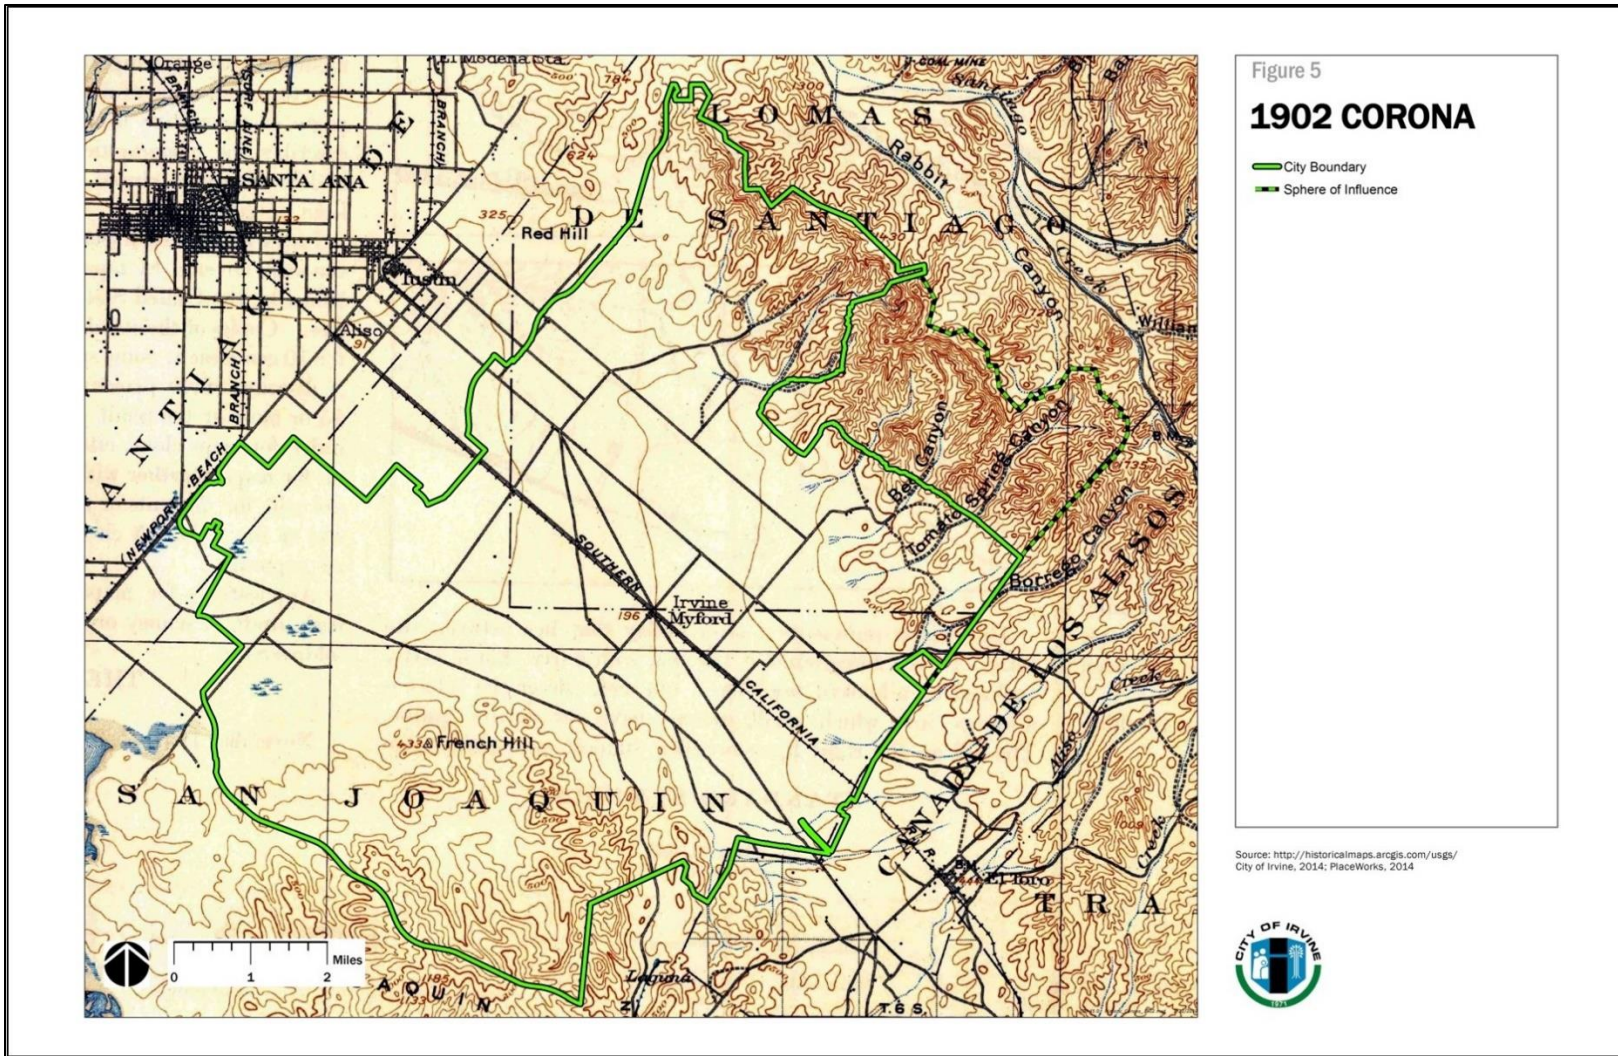

Figure 5. 1902 Corona Topographic Map

While the Irvine Ranch would continue to produce food for the war effort significant damage was incurred upon the fields surrounding the Tustin and El Toro bases as planes and rescue vehicles would cut through, tearing the crops to shreds (Liebeck 1990).

### **Modern Period**

As a result of the Second World War pressure mounted towards the development of urban areas in California. However, private farm owners such as the Irvine Company kept developers away from the central and south county. However, after James Harvey Irvine, Sr.'s death on August 24, 1947, control of The Irvine Company fell to his last remaining child Myford Plum Irvine. Unlike his predecessors, Myford did not have a passion for farming. Instead, Myford was interested in the development of residential communities. Under his guidance, Cameo Highlands, Irvine Terrace, Harbor View Hills, Cameo Shores, Westcliff Batcrest, and Irvine Cove in Laguna were developed (Liebeck 1990)

In 1957, Myford granted the first industrial lease on the Irvine Ranch to the Philco Corporation, a subsidiary of the Ford Motor Company. In 1957, representatives of the firm Pereira & Luckman were commissioned by the regents of the University of California System (U.C.S) to scout out possible locations for a new University as a reaction of major shifts in population towards southern Los Angeles. The firm decided on the Irvine Ranch as a choice location and intense negotiation underwent between the Irvine Company and regent of the U.C.S. (Liebeck 1990).

On January 11, 1959, Myford was found shot to death in the basement of the Irvine family home. The day of Myford's funeral Arthur McFadden was elected president of The Irvine Company. Under this new leadership, the company saw greater profit in the real-estate market and thus transitioned into full-scale property development (Liebeck 1990)

In 1960, the Irvine Company gifted 1,000 acres of land to the University of California with a provision for the sale of an additional 500 acres. The establishment of the University provided a central focus around which the company would create a master plan for the Irvine Ranch. To create this master plan, The Irvine Company hired William Pereira & Associates. The intent of Pereira was to prevent uncontrolled suburbanization of Ranch property and to keep out outside developers (Liebeck 1990).

Pereira divided the ranch into three sections: north, central, and south. The central section represented prime agricultural land, the north contained a remote mountainous region, and the southern basin. The southern basin was considered the top priority of urban development as it ran from the coast to the alignment of the 405 (San Diego) Freeway. Development of each community underwent meticulous planning as each "village" would include its own churches, shopping centers, and schools. The same attention to detail was utilized in master land-use plan in the development of the Irvine Industrial Complex and the Newport "downtown" Center.

Pereira's plan for the university outlined the campus as a large wheel. The park would include a lake and an amphitheater as "the focus of university life." The University of California at Irvine was dedicated on June 20, 1964. (Liebeck 1990)

In September 2, 1965, the "Old" Irvine town started by James Irvine at the turn of the century was renamed "East Irvine." At this time, much of the agricultural land on the ranch was being converted into housing tracts. Multiple electronic firms, aerospace companies, and research and development companies made their way to the Irvine Industrial Complex. Thousands of new job opportunities emerged and as many wealthy white-collar employees arrived so increased the need for comfortable residential neighborhoods. (Liebeck 1990)

In 1971, the Irvine Company campaigned for cityhood and in that same year the city of Irvine was incorporated. The new city's council's first act was to temporarily freeze all new development project within the city to reevaluate and revise the master plan. A consulting firm was hired to assist in the drafting of the 1973 Irvine General Plan. The following plan emphasized an increase in cycling, hiking, and equestrian trails, reduce car dependency, and increase access to recreational facilities. (Liebeck 1990)

In 1977, the Irvine Historical Society was formed and sought to protect historic structures on the Irvine Ranch. By 1981, the Irvine Historical Society discussed plans on the preservation of East Irvine. By 1990, after a series of buy-outs and lawsuits, the involvement of the Irvine family in the Irvine Company ceased when Joan Irvine Smith and her daughter Athalie Clark received \$149 million for their remaining shares in the company from Donald Bren. (Liebeck 1990)

According to the 2020 census, 307,665 people lived within the City. The census indicates that in 2020 Irvine had a total of 110,465 households. (U.S. Census Bureau n.d.)

## RECORD SEARCHES AND LITERATURE REVIEW

### PALEONTOLOGICAL

A search for paleontological records was completed by the Natural History Museum of Los Angeles County (LACM; McLeod 2018a; Appendix B). Published literature, unpublished paleontological reports, and fossil databases were also searched for fossil records (Appendix C). Databases included the Orange County Paleontology Database (OCPC 2018), the Paleobiology Database (PBDB 2018), the San Diego Natural History Museum (SDNHM 2018), and the University of California Museum of Paleontology (UCMP 2018).

A deficit in the data reported here was created by closure of the John D. Cooper Center by the County of Orange in May 2018. More recently, the former Cooper Center re-opened as the John D. Cooper Laboratory, and a record search request was submitted on April 18, 2023.

Unfortunately, the Cooper Lab has not responded to our request as of this reporting. The Cooper Lab maintains the database of fossils recovered in the County that we are not able to access. We list fossils by scientific and common name in Appendix C. When available, data of the location where the fossils were collected have been included. Please note that many entirely marine formations contain small numbers of land animal and plant fossils that were washed down streams into the ocean.

Sediments that are geologically young (artificial fill, Holocene sediments) or heat altered (El Modeno Volcanics) do not contain fossils. Landslides of any age may contain fossils; however, sediment jumbling makes it frequently difficult to determine stratigraphic context. This results in variable significance of the specimens. The rest of the formations have produced fossils from within the City. In some cases, the units or members were not listed in the literature or databases. Formations are discussed from oldest to youngest.

**Williams Formation.** Two localities are known from the Pleasants Sandstone Member and 53 are known from the undifferentiated sediments. These have produced marine invertebrates including ammonites, crabs, bivalves, gastropods, sea urchins, and sand dollars. Marine vertebrates known are including sharks, fishes and turtles. Plant fossils including wood and leaves have also been recovered.

**Silverado Formation.** Two localities are known within the City. These produced a sea tortoise and a leaf, possibly of a willow.

**Santiago Formation.** Within the City, one locality is known based on currently available information. It produced fossils of a crocodile and plants.

**Sespe-Vaqueros Formation.** A minimum of 38 localities are known within the City. These have produced marine vertebrates including baleen whales, toothed whales, fishes, sharks and rays. Marine invertebrates include brachiopods, bivalves, gastropods, crabs, and sand dollars. Terrestrial vertebrates known are rodents, shrews, birds, snakes and lizards. Plant fossils include wood, palm fronds and tree leaves.

**Vaqueros Formation.** Eight localities are known within the City based on information currently available. These have produced baleen whale, bivalves, and gastropods.

**Topanga Group.** A minimum of three localities are known in the City. They have produced fossils of fishes, sharks, sea urchins, algae, and terrestrial leaves.

**Monterey Formation.** Localities within the City number 28. These localities have produced vertebrate fossils of baleen and toothed whales, pinnipeds, fishes, and sharks. Invertebrates known include marine bivalves and crabs. Tree leaves of many species are also known.

**Puente Formation.** A minimum of three localities are known in the City. These have produced fishes and terrestrial leaves.

**Capistrano Formation.** Three localities are known in the City. These localities have produced fossils of baleen whale, sea cow, walrus, and fur seal.

**Niguel Formation.** Two localities are known from the Niguel Formation within the City. These localities have produced fossils of fish, sharks, and marine invertebrates.

**Pleistocene deposits.** These fossils are listed by time period due to lack of geological detail in most records which would permit discussion by sediment unit. About forty localities are known based on currently available information. Abundant terrestrial fossils have been recovered from the San Joaquin Marsh area between MacArthur Blvd, Highway 405, and San Diego Creek. These localities have produced fossils of mammoth, mastodon, giant ground sloth, ancient bison, horse, tapir, camel, llama, diminutive pronghorn, dire wolf, coyote, bear, American lion, and saber-toothed cat along with bats, rodents, birds, reptiles, and amphibians. Additionally, six localities within the City have produced marine bivalve invertebrates from approximately 60 feet deep just north of Jamboree and Michelson (Cogstone 2018).

**CULTURAL**

**CALIFORNIA HISTORIC RESOURCES INVENTORY SYSTEM**

The purpose of the records search is to identify all previously recorded cultural resources (prehistoric and historic archaeological sites, historic buildings, structures, objects, or districts) within the Project Area. All cultural resources, as well as cultural resource surveys, performed within the city boundaries were reviewed.

Shannon Lopez performed a search for archaeological and historical records on the September 24 and 25, 2018 at the South Central Coastal Information Center (SCCIC) of the California Historical Resource Inventory System (CHRIS) located on the campus of the California State University, Fullerton. The record search covered the entire area within the boundaries of the City of Irvine. The search radius included El Toro, San Juan Capistrano, Laguna Beach, Tustin, Orange, and Black Star Canyon 7.5-minute topographic quad maps.

The results of the record search indicated that 647 prior studies were located within the City (Appendix D). The records search also determined 379 previously recorded cultural resources are located within the City boundaries, which are summarized in the tables below (Table 4; Appendix E).

**Table 4. Cultural Resources within the City of Irvine by Type**

<b>Resource Type</b>	<b>Quantity</b>
Prehistoric Site	216
Prehistoric Isolate	85
Multi-Component Site	9
Multi-Component Isolate	1
Unknown Isolate	1
Historic Resource	62
Historic Site	2
Historic Isolate	3
<b>Grand Total</b>	<b>379</b>

Well known prehistoric villages were centered around Turtle Rock and Tomato Springs but others were numerous in the marsh, hills and mountains. Historic resources by contrast are mostly on the plain and include Mexican period resources like the Don Jose Sepulveda adobe, American period resources like the San Joaquin Gun Club and early 20<sup>th</sup> century buildings including homes.

**OTHER SOURCES**

In addition to the SCCIC records search, a variety of sources were consulted in October 2018 to obtain information regarding the cultural context of the City of Irvine. Sources included the National Register of Historic Places (NRHP) and the California Register of Historic Resources (CRHR) which includes the California Historical Resources Inventory (CHRI)<sup>1</sup>, California Historical Landmarks (CHL), and California Points of Historical Interest (CPHI). The Bureau of Land Management (BLM) General Land Office records were also searched.

Four buildings within the City are listed on the NRHP and the CRHR (Table 8). Eight properties are listed on the CHRI (Table 5). One area has a CHL plaque (Table 8). Three areas have CPHI plaques. The Orange County Parks lists the Irvine Ranch Historic Park. The City of Irvine lists 19 historically important properties.

**Table 5. Additional Sources Consulted**

Source	Results
Historic USGS Topographic Maps	Positive. See historic setting section.
Historic US Department of Agriculture Aerial Photographs	Positive. See historic setting section.
National Register of Historic Places (NRHP)	Positive: (1) NRL#:77000319, “Frances Packing House”, Listed 8/2/1977. (2) NRL#: 86000068, “Irvine Bean and Growers Association Building”, Listed 1/13/1986. (3) NRL#: 86000452, “Irvine Blacksmith Shop”, 3/20/1986. (4) NRL#: 93000300, “Christ College Site”, 4/16/1993.
California Register of Historic Resources (CRHR)	Positive: (1) “Frances Packing House”, (2) “Irvine Bean and Growers Association Building”, (3) “Irvine Blacksmith Shop”, (4) “Christ College Site”.
California Historical Resource Inventory (CHRI)	Positive: (1) Tustin USAR Center, 1963; (2) Christ College Site; (3) Val Verde Sportsmen's Club, 1924; (4) The Echberria Home, 1925; (5) Buffalo Ranch/ Urnabus Square, 1962; (6) Agricultural Shed, 1930; (7) Transi Housing; Irvine Hotel, 1913; (8) South Coast Gun Club, 1945
California Historical Landmarks (CHL)	Positive: Plaque #: 1004 “Old Town Irvine”, Listed 11/8/1991.
California Point of Historical Interest (CPHI)	Positive: (1) Plaque #: P753, “Irvine Bean and Grain Growers Building”, Listed 8/8/1991. (2) Plaque #: P630, “Irvine Historical Society Museum/ Rancho San Joaquin Headquarters., Listed 5/31/1984. (3) Plaque #:P485, “Irvine Park”, Listed 9/1/1976.
County of Orange	Positive: OC Parks: Irvine Ranch Historic Park.
Irvine Historic Resources List	(1) Lambert Reservoir, (2) First Irvine Office/ Ranch Headquarters, (3) Irvine Family Home Site and Gardens, (4) C.F. Kraus Residence, (5) Irvine Employee Housing, (6) Irvine Community Center/ Public School, (7) Irvine Bean Warehouse, (8) East Irvine Garage and Service Station, (9) A.T.S.F. Station, (10) East Irvine Post Office/ General Store/ Blacksmith Shop, (11) Dirigible Hangars “Lighter Than Air” Base, (12) Live Oaks-Laguna Canyon Road, (13) Site of Michelson Vacuum Tube (Speed of Light Experiments), (14) First Home in University Park, (15) French Hill-AKA, Turtle Rock, (16), Martin Airport (original site of Orange County Airport), (17) San Joaquin Marsh/Peat Bogs, (18) Bommer Canyon Cattle Camp, (19) Urbanus Square (Old Buffalo Ranch).

<sup>1</sup> The CHRI has been replaced by the California Built Environment Resource Database (BERD)

## **SENSITIVITY**

### **PALEONTOLOGICAL SENSITIVITY**

Previous City documents used a four-tiered ranking system to assess the sensitivity of sediments for fossils (General Plan Element E). Using the City's system, geologic units are classified according to the relative abundance of vertebrate fossils or scientifically significant invertebrate or plant fossils and their sensitivity to adverse impacts within the known extent of the geological unit (Table 6, Figure 6). Although significant localities may occasionally occur in a geologic unit, a few widely scattered important fossils or localities do not necessarily indicate a higher potential; instead, the relative abundance of localities is intended to be the major determinant for the value assignment. Thousands of fossils have been recovered within the City boundaries.

The Vaqueros, Sespe-Vaqueros, Sespe, Monterey, Puente and Capistrano Formations are assigned a high sensitivity. Formations assigned a moderate sensitivity include the Williams Formation Pleasants Sandstone Member, the Santiago Formation, the Topanga Group, the undifferentiated Puente Formation, and the Pliocene Niguel Formation.

Pleistocene sediments generally lie beneath young sediments with no fossils. Shallow excavations should not impact Pleistocene fossils. Because the presence of Pleistocene fossils has been demonstrated we have ranked the sediments as moderate.

The Silverado Formation has a low sensitivity along with young sediments. The El Modeno Volcanics and artificial fill are assigned no sensitivity (Table 6).

All three Focus Areas are mapped as moderate sensitivity for fossils with small areas of high sensitivity in Focus Areas 2 and 3.

**Table 6. Paleontological Sensitivity Rankings**

Age	Unit Name	City Paleontological Sensitivity Zones			
		none	low	moderate	high
modern	artificial fill (Qaf)	X			
late Holocene	very young landslide (Qls, Qls?)		X		
	very young slope wash (Qsw)		X		
Pleistocene	unlisted			X <sup>1</sup>	
late Pleistocene to Holocene	young axial-channel (Qya)			X <sup>1</sup>	
	young colluvium (Qyc)		X		
	young alluvial-fan (Qyf)			X <sup>2</sup>	
	young landslide (Qyls?)		X		
middle to late Pleistocene	old paralic and alluvial fan (Qopf)			X <sup>1</sup>	
early to middle Pleistocene	very old axial-channel (Qvoa)			X <sup>1</sup>	
	very old alluvial-fan (Qvof)			X <sup>2</sup>	
Pliocene	Niguel Fm. (Tn)			X	
late Miocene to early Pliocene	Capistrano Fm., Oso Mbr. (Tco)			X <sup>1</sup>	X
late Miocene	Puente Fm	La Vida Mbr. (Tplv)			X
		Soquel Mbr. (Tpsq)			X
		unlisted			X
	Monterey Fm. (Tm)			X	
middle Miocene	Topanga Group	Paulerino Fm. (Ttp)			X
		Los Trancos Fm. (Ttlr)			X
		Bommer Fm. (Ttb)			X
		unlisted			X
	El Modeno Volcanics (Tiemd, Tiemd?)	X			
latest Oligocene to latest early Miocene	Vaqueros Fm. (Tv)				X
	Sespe-Vaqueros Fm. (Tvs)				X
late Eocene to early Miocene	Sespe Fm. (Ts)				X
middle Eocene	Santiago Fm. (Tsa)			X	
Paleocene	Silverado Fm. (Tsi)		X		
Late Cretaceous	Williams Fm., Pleasants Sandstone Mbr. (Kwps)			X	

Fm. - Formation

Mbr. - Member

<sup>1</sup> Indicates that the unit has low sensitivity at depths of less than 8 feet.

<sup>2</sup> Indicates that the low sensitivity in Mtns and increases to moderate sensitivity on the plain.

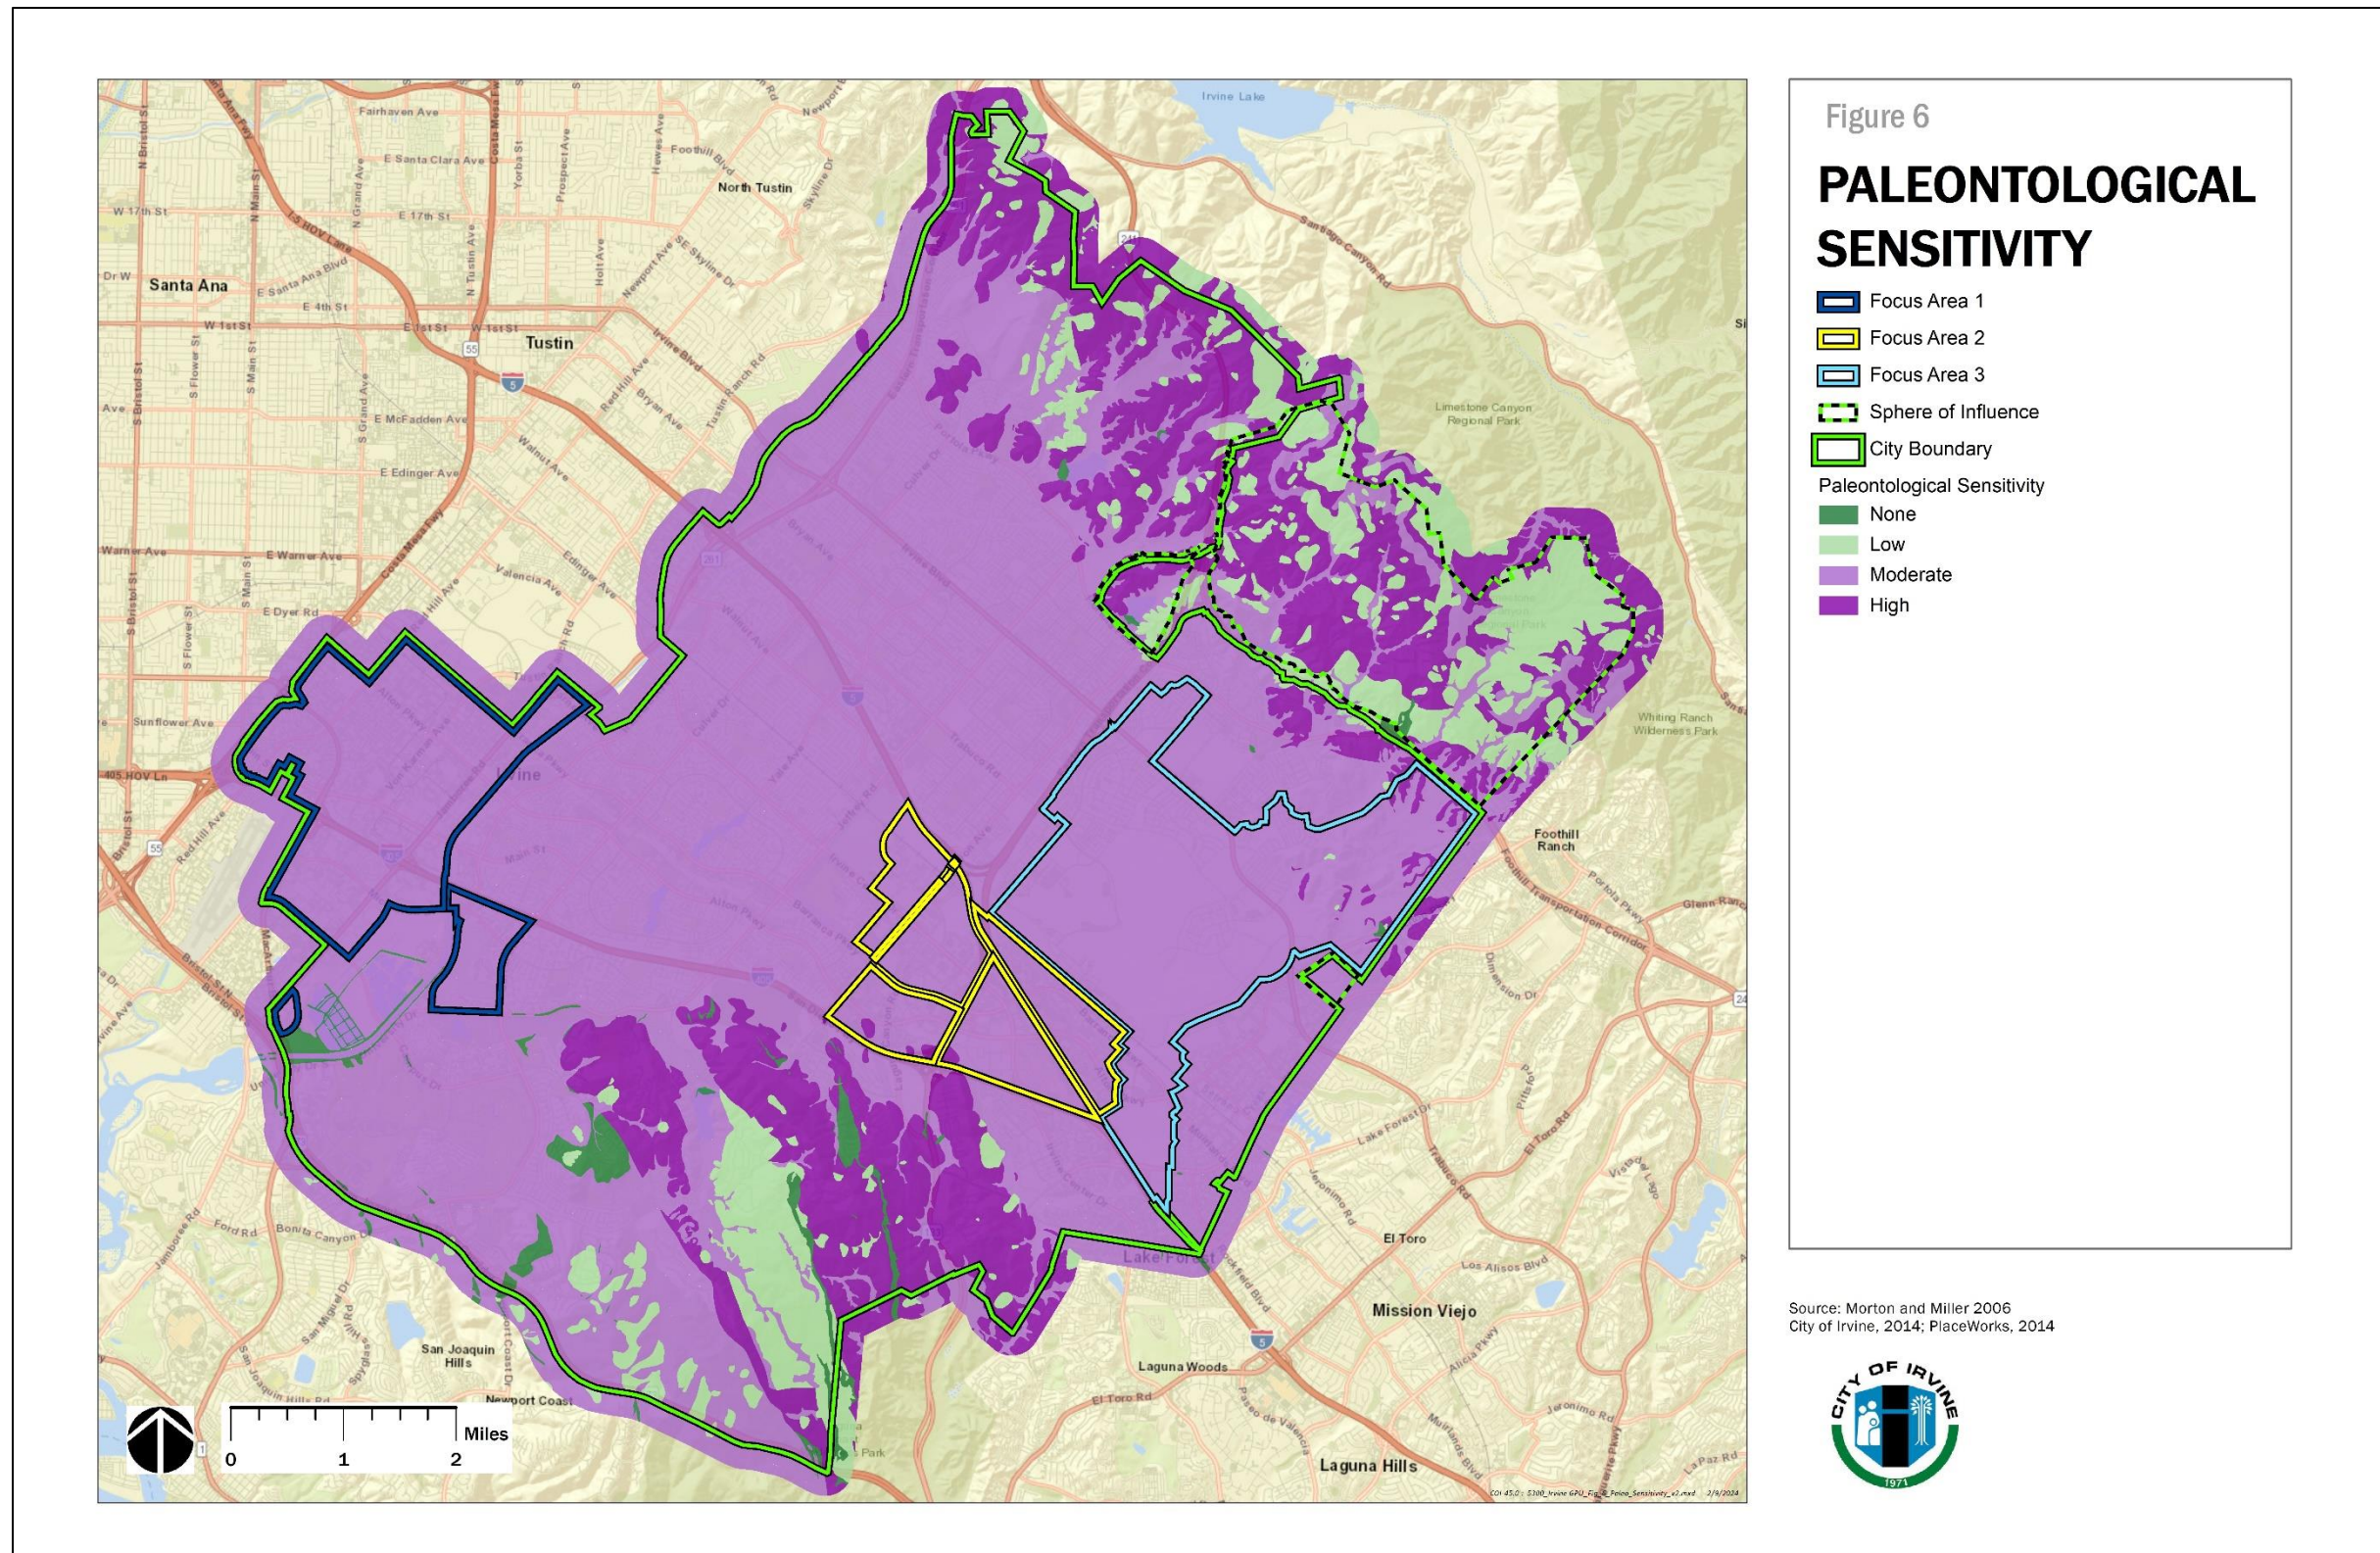

Figure 6. Paleontological Sensitivity of the City

## **ARCHAEOLOGICAL SENSITIVITY**

Prehistoric site locations are confidential to protect them from vandalism. All known sites were mapped to help establish sensitivity rankings. Prehistoric sites are most abundant in the San Joaquin Marsh area and San Joaquin Hills, both south of Interstate 405 (I-405). Sites are also abundant along what were, at the time, permanent water sources such as creeks and springs northeast of Irvine Blvd. Only ten sites are known on the plain between I-405 and Irvine Blvd. On this basis we rank the areas south of I-405 and north of Irvine Blvd. as highly sensitive and the plain in between as less sensitive (Figure 7). All known sites have been mitigated. Unknown resources may be present.

Only two historical archaeological sites have been recorded in Irvine. Both are in the eastern portion of the City and consisted of historic domestic refuse. Due to the low number of sites, no sensitivity map was created.

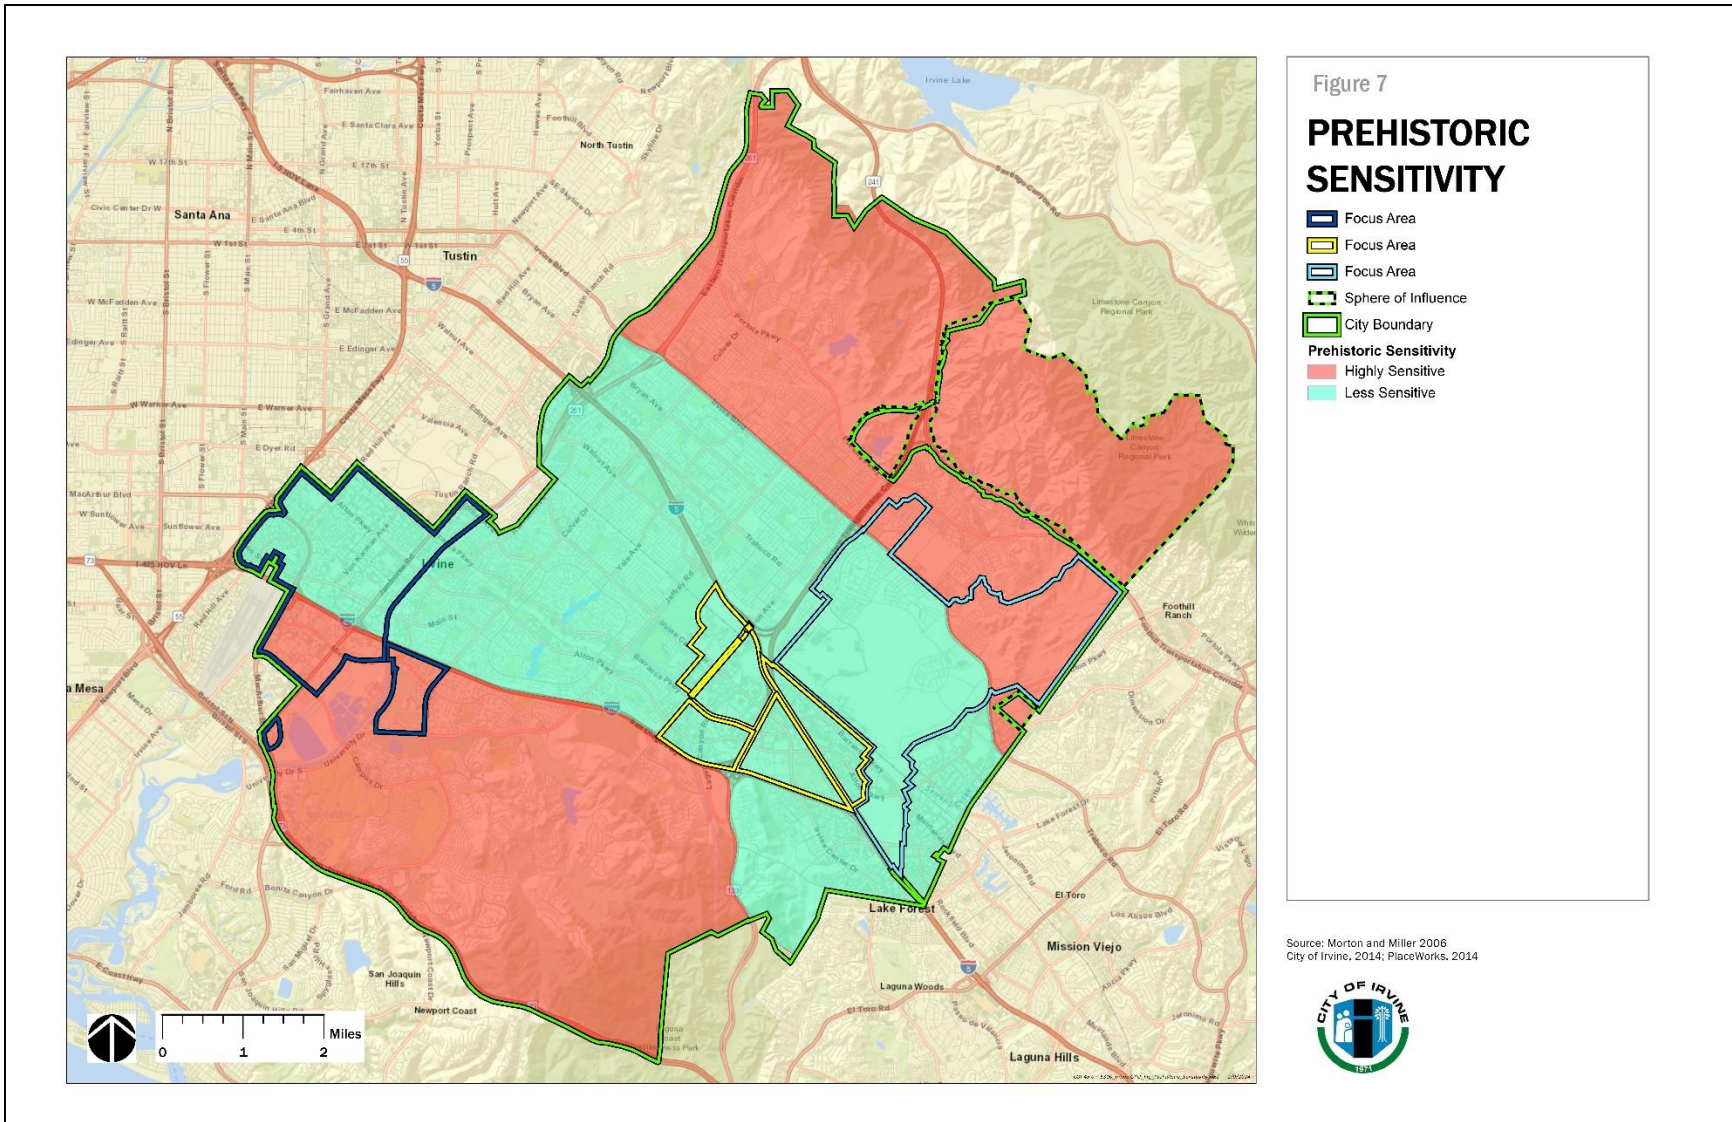

Portions of Focus Areas 1 and 3 are mapped as highly sensitivity for prehistoric archaeological sites. Focus Area 2 is mapped entirely as less sensitive for prehistoric archaeological sites.

## **HISTORICAL SENSITIVITY**

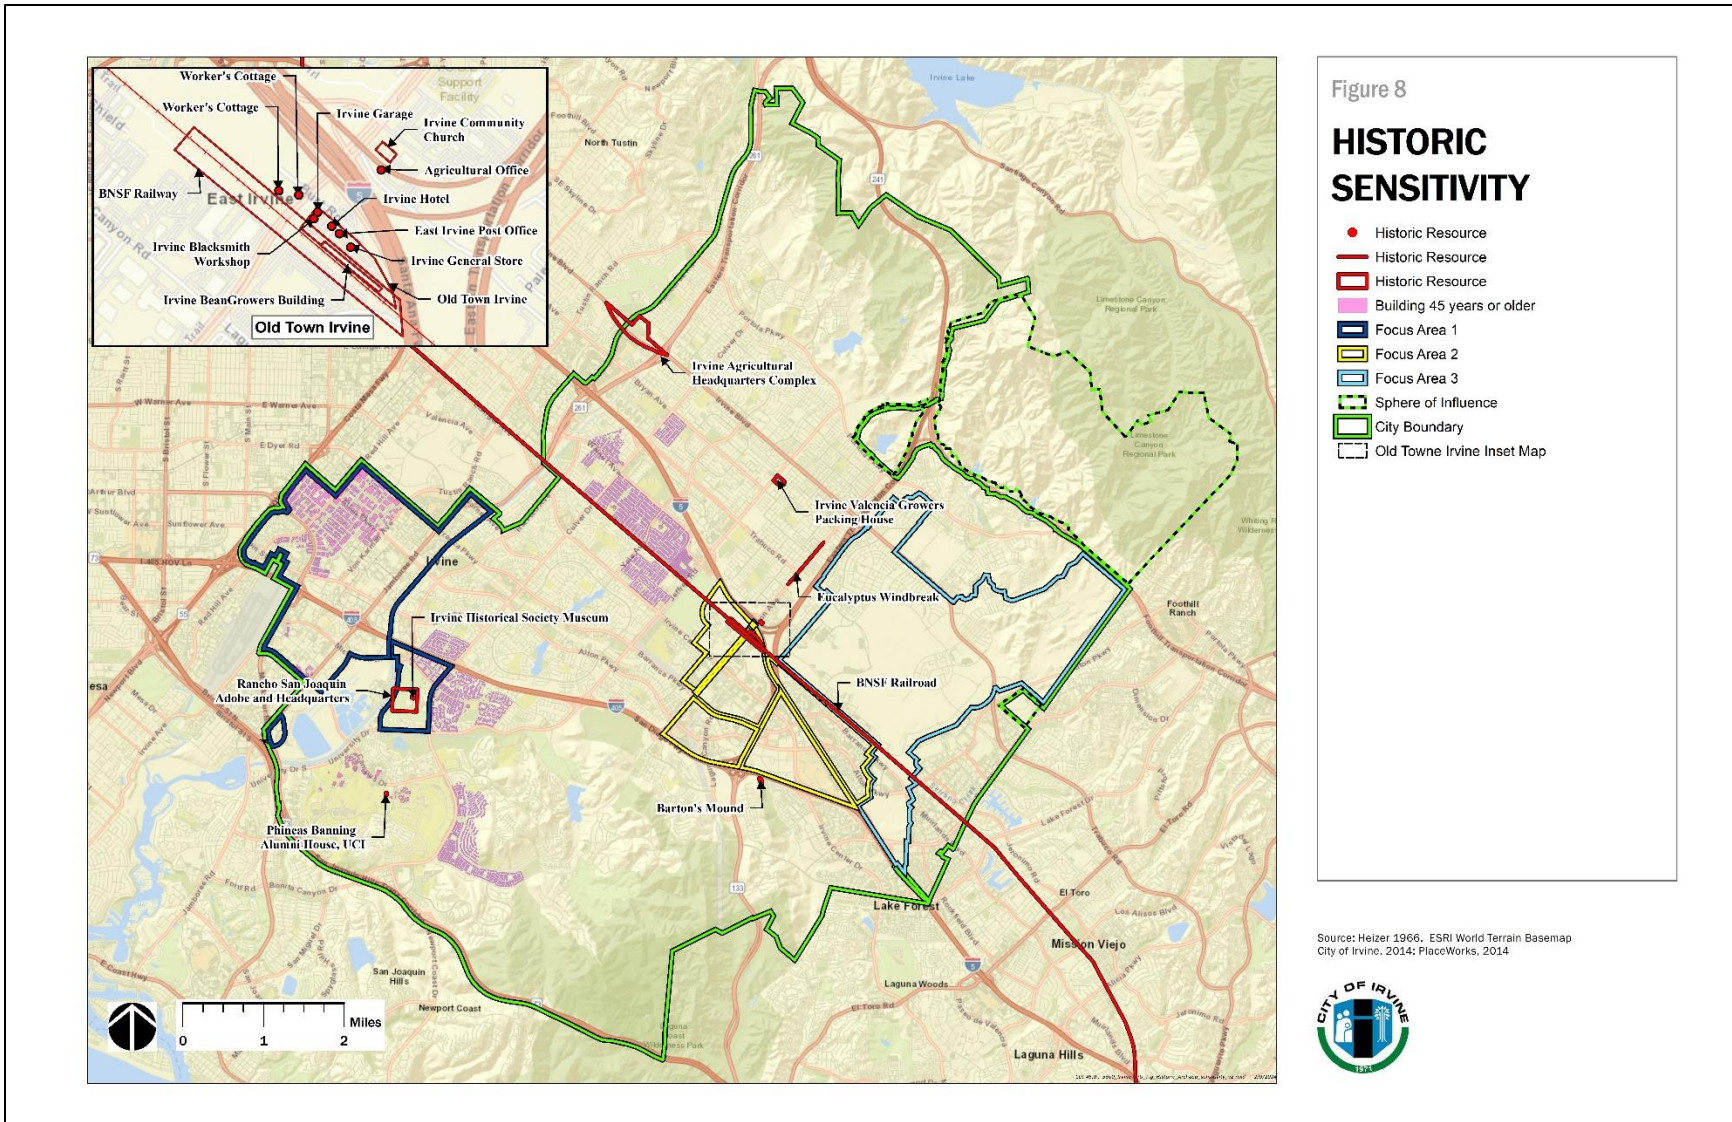

Historical resources include current and former locations of historic buildings, historical archaeological sites (often near historic use areas) and the location of extant historic homes more than 45 years old (Figure 8). Old Town Irvine has the highest number of historic buildings. Other resources north of I-405 include the railroad, a eucalyptus windbreak, Valencia Growers Packing House and the Irvine Agricultural Headquarters Complex. South of I-405 they include the Rancho San Joaquin Adobe, the San Joaquin Gun Club, Phineas Banning House, Bommer Canyon Cattle Camp and Barton's Mound. Only those that have been determined to be significant under CEQA are mapped (Figure 8).

All Focus Areas have historical resources located within their boundaries. Focus Area 2 has the most resources due to Old Town Irvine's location within its boundary. Focus Area 1 includes concentrated areas of buildings 45 years or older.

**Figure 7. Prehistoric Sensitivity**

**Figure 8. Historic Resources Sensitivity**

## MITIGATION MEASURES

Future proposed projects within the City of Irvine have the potential to impact paleontological and cultural resources. The following mitigation measures are recommended.

**MM GEO-1.** City staff shall require applicants for future proposed ground disturbing projects in undisturbed sediments ranked moderate or above to either (1) provide a technical paleontological assessment consisting of a record search, survey, background context and project specific recommendations performed by a qualified paleontologist (with a graduate degree and a specialization in vertebrate paleontology) or (2) agree to monitoring all excavations below five feet. If resources are known or reasonably anticipated the recommendations shall provide a detailed mitigation plan requiring monitoring during grading and other earthmoving activities in undisturbed sediments. The plan will establish a fossil recovery protocol that includes data to be collected, requires professional identification, radiocarbon dates and other special studies as appropriate and requires curation at local curation facility such as such as the John D. Cooper Center operated by the County of Orange for fossils meeting significance criteria. A comprehensive final mitigation compliance report including a catalog of fossil specimens with museum numbers and an appendix containing a letter from the museum stating that they are in possession of the fossils shall be required.

**MM CUL-1.** City staff shall require applicants for future proposed projects with intact extant building(s) more than 45 years old to provide a historic resource technical study evaluating the significance and data potential of the resource. If significance criteria are met, detailed mitigation recommendations are required as part of the technical study. All work shall be performed by a qualified architectural historian meeting Secretary of the Interior Standards.

**MM CUL-2.** City staff shall require applicants for future proposed ground disturbing projects to either (1) provide a technical cultural resources assessment consisting of a record search, survey, background context and project specific recommendations performed by a qualified archaeologist meeting Secretary of the Interior Standards and certified by the County of Orange or (2) agree to full-time monitoring by an archaeologist and a Native American. If resources are known or reasonably anticipated the recommendations shall provide a detailed mitigation plan which shall require monitoring during grading and other earthmoving activities in undisturbed sediments. The plan will provide a treatment plan for potential resources that includes data to be collected, requires professional identification, other special studies as appropriate, and requires curation at a repository for artifacts meeting significance criteria. A comprehensive final mitigation compliance report including a catalog of specimens with museum numbers and an appendix containing a letter from the museum stating that they are in possession of the materials shall be required.

**MM CUL-3.** Unanticipated discoveries of human remains shall require immediate cessation of ground disturbance within 50 feet and notification to City staff and the Coroner and shall follow state law as stated in Health and Safety Code Section 7050.5 and Public Resources Code Section 5097.98.

**APPENDIX A. QUALIFICATIONS**

**EDUCATION**

2009 M.A., Anthropology, Kent State University, Kent, Ohio  
2006 B.A., Anthropology, Ohio State University, Columbus, Ohio

**EXPERIENCE**

Ms. Valasik serves as Cogstone’s CEO and CFO and helps guide the vision and direction of Cogstone. She has been with the company since 2009 and has helped transition Cogstone from sole ownership to multiple owners with an active board of directors. Ms. Valasik is a Registered Professional Archaeologist (RPA) with 15 years of experience. She is a skilled professional who is well-versed in the compliance procedures of the California Environmental Quality Act (CEQA), the National Environmental Policy Act (NEPA), and Sections 106 and 110 of the National Historic Preservation Act (NHPA) and regularly prepares cultural resources assessment reports for a variety of federal, state, and local agencies throughout California. Ms. Valasik has managed a variety of projects at Cogstone in the water, transportation, energy, development, and federal sectors. She meets the qualifications required by the Secretary of the Interior’s *Standards and Guidelines for Archaeology and Historic Preservation*. She is accepted as a Principal Investigator for prehistoric archaeology by the State Historic Preservation Office (SHPO) and is listed as a Principal Investigator on Cogstone’s Bureau of Land Management (BLM) Cultural Resource Use Permit.

**SELECTED PROJECTS**

**Laguna Niguel General Plan Update, City of San Juan Capistrano, Orange County, CA.** Cogstone reviewed and summarized available information regarding known paleontological, archaeological, and historical resources within the City of Laguna Niguel to support the General Plan Update Project. Cogstone conducted a Sacred Lands File search from the Native American Heritage Commission (NAHC), cultural and paleontological resources records searches, and consultation with local historical societies. A Cultural and Paleontological Resources Assessment report was prepared that outlined culturally sensitive areas within the city and included recommendations for mitigation. The City of San Juan Capistrano was the lead agency under the California Environmental Quality Act (CEQA). Sub to De Novo Planning Group. Project Manager. 2023

**Camino Capistrano Mixed-Use Project, City of San Juan Capistrano, Orange County, CA.** Cogstone conducted a cultural and paleontological resources assessment to determine the potential impacts to cultural and paleontological resources during the project, which consisted of the retention and rehabilitation of two National Register of Historic Places (NRHP)-listed adobe buildings; reconstruction of a contributing barn that was recently dismantled and stored onsite; removal, offsite relocation, and rehabilitation of a second contributing barn that is extant; and the construction of three new buildings. The project area and vicinity are known to be archaeologically sensitive areas. Cogstone’s services included records searches, a Sacred Lands File search from the Native American Heritage Commission (NAHC), a pedestrian survey, and the preparation of a Cultural and Paleontological Resources Assessment Report. Site updates were prepared on California Department of Parks and Recreation (DPR 523) forms for the two previously recorded adobe buildings. The City of San Juan Capistrano was the lead agency under the California Environmental Quality Act (CEQA). Sub to 31871 Camino Capistrano LLC. Principal Archaeologist. 2023-ongoing

**City of San Juan Capistrano, In-N-Out 31791 Del Obispo Street, San Juan Capistrano, CA.** Cogstone conducted a Historic Resources Project Review to determine potential impacts to historical resources resulting from the proposed construction of a 3,897 square foot In-N-Out Restaurant with a drive-through and related site improvements on two adjoining lots totaling 1.77 acres. Cogstone’s services included a cultural resources records search, built environment survey, updates to existing DPR 523 forms, National Register of Historic Places (NRHP) eligibility assessments, and preparation of a Historic Resource Project Review Report. Cogstone also reviewed design plans of the proposed commercial building for compatibility with the NRHP-listed Blas Aguilar Adobe and attended an in-person public hearing with the public and the San Juan Capistrano Cultural Heritage Commission. The assessment was completed in compliance with the requirements of CEQA with the City of San Juan Capistrano as the lead agency under CEQA. Project Manager. 2021

#### **EDUCATION**

2013 M.S., Biology with a paleontology emphasis, California State University, San Bernardino  
2000 B.S., Geology with paleontology emphasis, University of California, Los Angeles

#### **SUMMARY QUALIFICATIONS**

Scott has over 29 years of experience in California as a paleontologist and sedimentary geologist. She has worked extensively in the field surveying, monitoring, and salvaging fossils on hundreds of projects. In addition, she has special skills in jacketing large fossils, fossil preparation (cleaning and stabilization) and in the preparation of stratigraphic sections and other documentation for fossil localities. Ms. Scott frequently authors paleontological assessments, paleontological mitigation plans, and monitoring compliance reports to all agency requirements. She authors and conducts crew sensitivity training, serves as company safety officer, and has authored both the company safety and paleontology manuals. She is a Member of the Society of Vertebrate Paleontology and the Geological Society of America.

#### **SELECTED PROJECTS**

**Valley Boulevard Widening Project, City of Menifee, Riverside County, CA.** The City of Menifee proposed to widen the existing Valley Boulevard roadway and extend the roadway through two existing gaps, providing local residents with one continuous route. The project included raised medians, turn lanes, and seven new traffic signals at major intersections. Additionally, sidewalks and bike lanes would be constructed on both sides of the roadway. Soundwalls would be incorporated along the roadway where applicable. Cogstone conducted a paleontological resources assessment which consisted of records searches, a pedestrian survey, and preparation of a Paleontological Resources Assessment Report. The project area was determined to have a moderate potential for fossils, and Worker Environmental Awareness Program (WEAP) training was recommended for all construction personnel. The City of Menifee was the lead agency under the California Environmental Quality Act (CEQA). Sub to Dokken Engineering. Principal Investigator for Paleontology. 2022

**The Terraces Project, City of Murrieta, Riverside County, CA.** The purpose of this study was to determine the potential effect on paleontological resources by the Terraces Project, which involved construction of 900 apartment units in 12 four-story buildings on a 37.8-acre site. Parking spaces, a leasing center, clubhouse, swimming pool, various walking paths and green space areas, and a dog park or other outdoor open space area would be provided throughout the project site. Planned vertical impacts would be in excess of 10 feet during grading. Cogstone performed records searches, a pedestrian survey, and produced a Paleontological Resources Assessment Report. All work was done in compliance with the mitigation measures for the project. The City of Murrieta was the lead municipal agency under CEQA. Sub to Birdseye Planning Group, LLC. Principal Investigator for Paleontology. 2021-2022

**Purple Line Extension (Westside Subway) Sections 1 and 2 Construction Management, Los Angeles County Metropolitan Transportation Authority, Los Angeles, Los Angeles County, CA.** The project involves construction of seven stations from the existing Purple Line at Wilshire/Western Avenue along Wilshire Boulevard to the Veterans Administration Hospital in Westwood for 8.6 miles. Cogstone manages all paleontological services for Sections 1 and 2 of the subway project including budgets, WEAP training, monitoring, fossil recovery, fossil preparation, identification, cataloguing curation with the Natural History Museum of Los Angeles County, and reporting. Sub to JV West (Stantec/Jacobs JV; Section 1), AECOM (Section 2). Principal Investigator for Paleontology. 2014-*ongoing*

**Cold Canyon Landfill Expansion Module 12, Arroyo Grande, San Luis Obispo County, CA.** Cogstone conducted archaeological and paleontological resources monitoring for the expansion of an existing landfill. In addition, Cogstone provided WEAP training for all construction personnel. Upon completion of monitoring, Cogstone prepared a Cultural and Paleontological Resources Monitoring Compliance Report. Sub to Waste Connections, Inc. Principal Investigator for Paleontology. 2022

## **EDUCATION**

2009 B.A., Archaeology/History, Simon Fraser University, Canada

## **SUMMARY QUALIFICATIONS**

Ms. Hickman is a qualified archaeologist and cross-trained paleontologist with over 11 years of experience in pedestrian survey, monitoring, excavation and burial recovery, as well as the identification of human and faunal skeletal remains. She is proficient in the preparation of cultural resources assessment reports for a variety of federal, state, and local agencies throughout California and the eastern United States. Ms. Hickman is responsible for the organization of field data, supervision, preparing California Department of Parks and Recreation 523 (DPR 523) forms, as well as identifying and cataloging prehistoric and historic artifacts. She also has experience with preparing artifact collections for curation at a variety of different repositories throughout California and the eastern United States.

## **SELECTED PROJECTS**

**Pacific Gas and Electric (PG&E) Master Services Agreement, Statewide, CA.** Cogstone was sub-contracted to provide on-call cultural resources monitoring services for various PG&E projects throughout California. Cogstone has conducted archaeological monitoring for over 30 task orders. In addition, Cogstone assisted in burial recovery and repatriation of human remains in consultation with the Most Likely Descendant (MLD), PG&E, and Cardno on one project. Sub to Cardno (now Stantec). Project Manager/Supervisor. 2019-2022

**Southern California Edison (SCE) Environmental Clearance On-Call Program, Statewide, CA.** Cogstone was subcontracted to provide on-call cultural resources monitoring services for various SCE projects throughout California. Projects have included new pole and tower placements, existing pole and tower replacements, vegetation clearance, underground repairs, and general maintenance. Cogstone has conducted archaeological monitoring and surveys, GIS mapping, and prepared technical reports for over 130 task orders. Sub to Cardno (now Stantec). Project Manager/Supervisor. 2018-2021

**New Cuyama Dump Sites 1, 2, and 3, Bureau of Land Management (BLM) Bakersfield Office, Santa Barbara County, CA.** The Project involved identifying archaeological and historical resources present within three illegal dump sites on BLM land. This study included an assessment of the historic potential of dump refuse and National Register of Historic Places (NRHP) eligibility recommendations for debris demonstrating affirmative evidence for an age of greater than 45 years. A Class III Cultural Resources survey was conducted and included an intensive-level pedestrian survey of the Area of Potential Effect (APE) with no larger than ten-meter-wide transects when used. Smaller transects were used in narrower areas of the APE and during investigations of newly identified archaeological sites and isolates. A total of three historic trash scatters were identified during the survey and a total of four historic isolates were identified. These resources were recorded on Department of Parks and Recreation 523 (DPR 523) forms. No archaeological sites or isolates were identified. No artifacts were collected. Cogstone was able to meet the scheduled deadlines for the Project and completed the work within the budget. The deliverables were accepted by the BLM without revisions. Project Manager and Archaeologist. 2020-2021

**Morro Bay Water Facility, City of Morro Bay, San Luis Obispo County, CA.** The City of Morro Bay has proposed to construct a new water reclamation facility. Federal funding for the project required compliance with Section 106 of the NHPA along with the California Environmental Quality Act (CEQA). The United States Environmental Protection Agency (EPA) acted as federal lead and the City acted as state lead agency, with permitting by the California Coastal Commission (CCC), California Department of Transportation (Caltrans), and the State Water Resources Control Board. Cogstone conducted Workers Environmental Awareness Program (WEAP) trainings for all construction personnel, cultural and paleontological resources monitoring, and prepared a Cultural Resources Monitoring Compliance Report upon completion of construction. Sub to Filanc Black & Veatch Joint Venture. Supervisor. 2020-2021

**EDUCATION**

2018 Geographic Information Systems (GIS) Certificate, California State University, Fullerton  
2003 B.A., Anthropology, University of California, Santa Barbara

**SUMMARY OF QUALIFICATIONS**

Mr. Freeberg has over 20 years of experience in cultural resource management and has extensive experience in field surveying, data recovery, monitoring, and excavation of archaeological and paleontological resources associated with land development projects in the private and public sectors. He has conducted all phases of archaeological work, including fieldwork, laboratory analysis, research, and reporting. Mr. Freeberg also has a strong grounding in conventional field and laboratory methods and is skilled in the use of ArcGIS.

**SELECTED PROJECTS**

**Bell Gardens Water Reservoir Project, City of Bell Gardens, Los Angeles County, CA.** Cogstone conducted a cultural and paleontological resources assessment to determine the potential impacts to cultural and paleontological resources during improvements which included a new two-million-gallon reservoir, booster pump station, well to be drilled, and other components. Services included record searches, Sacred Lands File search from the Native American Heritage Commission, and an intensive pedestrian survey of the 1.7-acre project area. Sub to Infrastructure Engineers. GIS Supervisor. 2019-2020

**Santiago Canyon Estates Fuel Mod Project, unincorporated Orange County, CA.** Cogstone conducted a cultural resources assessment to determine the potential for surface cultural resources for compliance with Orange County Fire Authority's Precise Fuel Modification Plan for zones of the Santiago Canyon Estates Community. Services included a cultural resources records search, Sacred Lands File search from the Native American Heritage Commission, and a reconnaissance survey. Sub to Fire Safe Council East Orange County Canyons. GIS Supervisor. 2020

**State Route 108/Highway 49 and Mackey Ranch Road Intersection Improvements Project, Caltrans District 10, Tuolumne County, CA.** The Chicken Ranch Rancheria of Me-Wuk Indians of California (Tribe), in partnership with the California Department of Transportation (Caltrans), proposed to replace an intersection and convert to a roundabout designed to accommodate forecasted future traffic volumes and provide an alternative access route to the Chicken Ranch Rancheria. Cogstone completed an intensive-level pedestrian survey, CHRIS records search, sacred lands file search from the NAHC, Native American consultation, consulted with local history societies and preservation groups, and produced a Historical Resources Compliance Report (HRCR) and Archaeological Survey Report (ASR). Sub to Foothill Associates. GIS Supervisor. 2019-2020

**Dogwood Road Project, City of El Centro, Imperial County, CA.** Cogstone conducted a cultural resources assessment to determine the potential effects to cultural resources resulting from the construction of United States Department of Agriculture (USDA) Part 70-B RD Funding assisted housing on a 2.2-acre parcel. Cogstone conducted a record search, pedestrian survey, and determined that no further cultural resources work was necessary. The assessment provided environmental documentation as required by Section 106 of the National Historic Preservation Act (NHPA) and the California Environmental Quality Act (CEQA). The City of El Centro acted as the lead agency. Sub to Partner Science & Engineering, Inc. GIS Supervisor. 2019-2020

**Laguna Creek Trail and Bruceville Road Project, Caltrans District 3, City of Elk Grove, Sacramento County, CA.** The City of Elk Grove, in cooperation with Caltrans, proposed multiple trail extensions and gap closures in effort to provide connecting links that would ultimately provide trail users with access to a vast system of trails, with connections to parks, schools, community centers, commercial retail and office areas, and transit facilities. Cogstone conducted pedestrian surveys, records search, and prepared an Archaeological Survey Report (ASR) and a Historic Property Survey Report (HPSR). Sub to Helix Environmental. GIS Supervisor. 2019-2020

## **EDUCATION**

- 2022 Certificate in Historic Preservation, The Boston Architectural College, Boston  
2018 M.A., History (with an emphasis in architecture), California State University, Fullerton  
2012 B.A., History, Minor in Asian-Pacific Studies, California State University, Dominguez Hills

## **SUMMARY QUALIFICATIONS**

Ms. Lopez is a qualified architectural historian with over five years of experience who meets or exceeds the Secretary of the Interior's Standards and Guidelines for Architectural History. Her experience includes architectural history research and surveys with photo documentation and recording of built environment resources for local and federal projects. She has extensive knowledge with Native American consultation, consultation with local and state historical societies, and in the analysis of primary and secondary sources. Ms. Lopez is acknowledged as an approved Architectural Historian by Caltrans and is listed as a Principal Investigator on Cogstone's Bureau of Land Management (BLM) Cultural Resources Use Permit. She is accepted as a Principal Investigator for Architectural History and History by the State Historic Preservation Office (SHPO). Additionally, she is an approved Reader at the Huntington Library by the Los Angeles Office of Historic Resources.

## **RELEVANT EXPERIENCE**

**San Gabriel River Commuter Bikeway and Big Dalton Wash Commuter Bikeway, City of Baldwin Park, Los Angeles County, CA.** Cogstone conducted a cultural and historic built environment resources assessment to determine the potential impacts to cultural and historical resources for the proposed construction of approximately five miles of new bikeway/pedestrian pathway. Services included pedestrian surveys, records searches, a Sacred Lands File search from the Native American Heritage Commission (NAHC), preparation of California Department of Parks and Recreation 523 (DPR 523) forms, National Register of Historic Places (NRHP) eligibility assessments, and reporting. The project required a Section 408 permit from the United States Army Corps of Engineers (USACE) due to the proximity of the federally managed San Gabriel River and tributaries. All work was completed in compliance with Section 106 of the National Historic Preservation Act (NHPA). The City of Baldwin Park acted as lead agency under the California Environmental Quality Act (CEQA). Sub to Infrastructure Engineering Corporation. Architectural Historian. 2020-2021

**Irwindale Concrete Tilt-Up Warehouse Building, City of Irwindale, Los Angeles County, CA.** Cogstone conducted an assessment to determine the potential impacts to cultural, historic built environment, and paleontological resources in compliance with the California Environmental Quality Act (CEQA) for the construction of an approximately 129,830 square foot stand-alone concrete tilt-up warehouse building with an office mezzanine. The project required the demolition of an existing building constructed in 1956. Cogstone's services included cultural and paleontological resources records searches, a Sacred Lands File search from the Native American Heritage Commission (NAHC), Assembly Bill 52 (AB 52) consultation support, and an intensive pedestrian survey. A Pepsi-Cola bottling plant constructed in the late 1950s was identified during the survey and was fully documented on California Department of Parks and Recreation 523 (DPR 523) forms and was evaluated for listing in the California Register of Historical Resources (CRHR). Cogstone prepared a Cultural and Paleontological Resources Assessment Report. The City of Irwindale was the lead agency for the project under CEQA. Sub to PlaceWorks. Architectural Historian. 2021

**City of San Juan Capistrano, In-N-Out 31791 Del Obispo Street, San Juan Capistrano, CA.** Cogstone conducted a Historic Resources Project Review to determine potential impacts to historical resources resulting from the proposed construction of a 3,897 square foot In-N-Out Restaurant with a drive-through and related site improvements on two adjoining lots totaling 1.77 acres. Cogstone's services included a cultural resources records search, built environment survey, updates to existing DPR 523 forms, NRHP eligibility assessments, and preparation of a Historic Resource Project Review Report. The assessment was completed in compliance with the requirements of CEQA with the City of San Juan Capistrano as the lead agency under CEQA. Architectural Historian. 2021

re: Vertebrate Paleontology Records Check for paleontological resources for the proposed City of Irvine General Plan Update, Phase 2, Project, Cogstone Project # 4339, in the City of Irvine, Orange County, project area

Dear Megan:

I have conducted a thorough search of our paleontology collection records for the locality and specimen data for the proposed City of Irvine General Plan Update, Phase 2, Project, Cogstone Project # 4339, in the City of Irvine, Orange County, project area as outlined on the portions of the Orange, Black Star Canyon, Tustin, El Toro, Laguna Beach, and San Juan Capistrano USGS topographic quadrangle maps that you sent to me via e-mail on 18 September 2018. We have at least 23 vertebrate fossil localities that lie directly within the boundaries of the proposed project area, and other localities nearby or at some distance from the same sedimentary deposits that occur in the proposed project area.

In the elevated terrain of the San Joaquin Hills in the southwestern portion of the proposed project area there are some exposures of intrusive igneous rocks that will not contain any recognizable fossils. From oldest to youngest the elevated terrain of the San Joaquin Hills also has exposures of the marine Paleocene Silverado Formation, the early Eocene Santiago Formation, the late Eocene through earliest Miocene Sespe Formation, the marine Eocene through earliest Miocene Vaqueros Formation and the marine middle Miocene Paulerino, Los Trancos, and Bommer Members of the Topanga Formation.

In the elevated terrain of the northern portion of the proposed project area, from the Loma Ridge area southeastward, there are exposures of the marine late Cretaceous Williams Formation, the marine Paleocene Silverado Formation, the early Eocene Santiago Formation, the late Eocene through earliest Miocene Sespe and Vaqueros Formations undifferentiated, the marine middle to late Miocene Monterey Formation, the marine late Miocene Oso, La Vida, and Soquel Members of the Capistrano Formation, and the marine Pliocene Niguel Formation.

In the slightly less elevated terrain in the eastern and southern portions of the proposed project area there are surface deposits of older Quaternary Alluvium, mostly geologically mapped as terrestrial Quaternary terrace deposits but mapped as a mixture of terrestrial and marine Quaternary terrace deposits in the southwestern portion of the proposed project area closer to Upper Newport Back Bay. Most of the proposed project area though, the less elevated terrain in the southeastern portion of the Orange County Coastal Plain, has surface deposits of younger Quaternary Alluvium, derived as alluvial fan deposits from the surrounding hills and mountains.

We do not have any vertebrate fossil localities identified as coming from the Williams Formation. Our vertebrate fossil locality LACM (CIT) 592, though, was originally listed as coming from either the Ladd Formation or Williams Formation in the Santiago Canyon area. Locality LACM (CIT) 592 produced a rare specimen of a fossil dinosaur, Hadrosauridae, from California, published and later figured in the scientific literature by W. J. Morris (1973. *Journal of Paleontology*, 47(3):551-561; 1982. *SEPM Field Trip Volume & Guidebook*, 89-90). Our vertebrate fossil locality LACM 1895, in the Santa Ana Mountains east of Santiago Canyon, produced a fossil specimen of mackerel shark, *Squalicorax falcatus*. This specimen was figured in the scientific literature by S.P. Applegate (1964. *First Record of the Extinct Shark, Squalicorax falcatus*, from California. *Bulletin of the Southern California Academy of Sciences*, 63(1):42-43) and published again by B.J. Welton et.al. (1981. *A Preliminary Note on the Late Cretaceous Sharks of the Chatsworth Formation at Dayton Canyon, Simi Hills, Los Angeles County, California*. *September Guidebook*). Applegate described the specimen as coming from the Pleasants Sandstone Member of the Williams Formation, but more likely it came from the Holz Shale Member of the Ladd Formation.

Our only vertebrate fossil locality indicated as being from the Silverado Formation, LACM 4634, is an older locality only identified as coming from the Irvine Ranch in the Santa Ana Mountains. Locality LACM 4634 produced a specimen of an unidentified fossil tortoise, Testudinidae.

All of our fossil vertebrate localities from the Santiago Formation, LACM 3881, 3883-3884, 3979, 4022, 5346-5347, 6926 and 68102, occur in the northwestern part of San Diego County, clustered around Carlsbad. These localities produced a suite of vertebrate fossils including turtles, crocodiles, birds, rodents, insectivores, brontothere, and amynodont rhinoceroses. David J. Golz (1976. *Eocene Artiodactyla of Southern California*. *Los Angeles County Museum Science Bulletin*, 26:1-85) published on the LACM specimens of the protoceratid artiodactyl *Leptoreodon leptolophus* and the camels *Protylopus petersoni* and *Protylopus stocki* from our Santiago Formation locality LACM 68102.

We have a number of Vaqueros Formation localities that occur within the proposed project area: LACM 7505, 7548-7553, 7675-7678, and 7712, all situated in the southeastern portion of the proposed project area south of the San Diego Freeway (I-405) mostly west of the Laguna Freeway (Highway 133) between about the Laguna Reservoir and the Sand Canyon Reservoir. These localities has so far produced a marine fauna containing fossil specimens of eagle ray, *Myliobatis*, basking shark, *Cetorhinus*, requiem shark, Carcharhinidae, quadrupedal marine mammal, Desmostylia, long snouted dolphin, *Argyrosetus*, shark-toothed dolphin, Squalodontidae, early toothless whale, Eomysticetidae, and primitive baleen whale, Cetotheriidae. We have two more vertebrate fossil localities, LACM 5448, and 6666, that occur within the proposed project area and are designated as being from the Sespe / Vaqueros Formations undifferentiated. Both localities have produced marine fossils though and are likely from the Vaqueros facies of the Sespe / Vaqueros Formations undifferentiated. Locality LACM 5448, jut inside the eastern border of the proposed project area east of the current Orange County Great Park in the hills on the southern side of the Borrego Canyon Wash, produced fossil specimens of undetermined bird, Aves, and whale, Cetacea. Locality LACM 6666, in the eastern portion of the proposed project area near the Lambert Reservoir and Tomato Springs, produced a fossil specimen of the quadrupedal marine mammal *Desmostylus*.

We have one locality, LACM 8016, from the Los Trancos Member of the Topanga Formation, that occurs within the boundaries of the proposed project area on the southern side of the University of California at Irvine campus near Bonita Canyon Drive. Locality LACM 8016 produced a marine fauna contain fossil specimens of requiem shark, *Carcharhinus*, tiger shark, *Galeocerdo*, snaggletooth shark, *Hemipristis*, hammerhead shark, *Sphyrna*, raggedtooth shark, *Odontaspis*, bramble shark, *Echinorhinus*, herring, *Xyngreus*, and mora, Moridae.

We have no Monterey Formation localities that occur within the proposed project area boundaries, but we do have a number of Monterey Formation localities that occur in Lake Forest just outside the boundaries of the southeastern portion of the proposed project area: 3198, 3486, 3209-3210, 3412-3413, and 4103-4114. These localities produced a suite of fossil marine vertebrates including hammerhead shark, *Sphyrna*, giant white shark, *Carcharocles megalodon*, bonito sharks, *Isurus benedeni* and *Isurus oxyrinchus*, bramble shark, *Paraechinorhinus barnesi*, eel, Anguilliformes, jack, Carangidae, bonito, *Sarda*, barracuda, *Sphyrna*, crocodile, *Crocodylus*, bird, Aves, sea lion, Otariidae, dugong, *Dioplotherium allisoni*, baleen whale, Mysticeti, and dolphin, Kentriodontidae. A specimen of the dugongid sirenian *Dioplotherium allisoni* from locality LACM 3210 was figured in the scientific literature by D. P. Domning in 1978 (Sirenian Evolution in the North Pacific Ocean. University of California Publications in Geological Sciences, 118:1-176). Specimens of the fossil crocodile *Crocodylus* from localities LACM 3209 and 3210 were published in the scientific literature by C. A. Brochu in 1999 (Phylogenetics, Taxonomy, and Historical Biogeography of Alligatoroidea. Journal of Vertebrate Paleontology, 19(2):9-100). F. H. Pfeil designated the holotype (name bearing specimen for a species new to science) of the echinorhinid shark *Paraechinorhinus barnesi* from locality LACM 3198 (1983. Zahnmorphologische Untersuchungen an rezenten und fossilen Haien der Ordnungen Chlamydoselachiformes und Echinorhiniformes. Palaeoichthyologica. 1:1-315).

Near the southwestern portion of the proposed project area, on the eastern side of Newport Back Bay in the bluffs along Backbay Drive west of Jamboree Road and south of San Joaquin Hills Road, we have two Monterey Formation localities, LACM 1160 and 7139, that produced undetermined fossils of bony fish, Osteichthyes and baleen whale, Mysticeti.

We do not have any Puente Formation localities that occur within the proposed project area boundaries. Our closest locality, LACM 6287, from the La Vida Member of the Puente Formation, occurs to the northeast of the northeastern portion of the proposed project area along East Santiago Canyon Road in Limestone Canyon near Blue Diamond Haul Road and produced fossil specimens of tonguefish, *Symphurus*.

We have two localities from the Oso Member of the Capistrano Formation that occur within the boundaries of the northeastern portion of the proposed project area: LACM 3866 and 4171. Locality LACM 4171, at Tomato Springs near the mouth of Round Canyon, produced a fossil specimen of undetermined baleen whale, Mysticeti. Locality LACM 3866, on the southwestern side of the Lambert Reservoir just to the southwest, produced fossil specimens of walrus, *Pontolis magnus*, and dugongid sea cow, *Dioplotherium allisoni*. The skeleton of *Pontolis Magnus* from locality LACM 3866 was published by the scientific literature by J. Vélez-Juarbe (2017. *Eotaria citrica*, sp. nov., a new stem otariid from the “Topanga” formation of Southern California. PeerJ, 5(e3022):1-25). In Round Canyon just to the northeast, but outside the proposed project area boundaries, our Capistrano Formation LACM 7539 produced a fossil specimen of undetermined fur seal, Otariidae.

We have two Niguel Formation localities that occur within the southwestern boundaries of the proposed project area: LACM 3977 and 3986, along what is now MacArthur Boulevard near University Drive. Locality LACM 3977 produced fossil specimens undetermined bony fish, Osteichthyes, in addition to brachiopods and mollusks. Locality LACM 3986 produced fossil specimens of chimaera, Chimaeroidei, spiny dogfish, *Squalus acanthias*, Pacific hake, *Merluccius productus*, mora, Moridae, queenfish, *Seriphus*, sculpin, Cottidae, and rockfish, *Sebastes*.

Also within the southwestern boundaries of the proposed project area we have the older Quaternary localities LACM 1068, just east of MacArthur Boulevard and north of what is now Bison Avenue, LACM 3978, adjacent to the southeastern side of the intersection of University Drive and MacArthur Boulevard, and LACM 1069, on the south side of University Drive east of MacArthur Boulevard. Locality LACM 1069 produced fossil specimens of undetermined mammals, Mammalia. Locality LACM 3978 produced fossil specimens of undetermined even-toed ungulate, Artiodactyla and turkey, *Meleagris*. The turkey specimen from locality LACM 3978 was published in the scientific literature by D.W. Steadman (1980. A Review of the Osteology and Paleontology of Turkeys (Aves: Meleagridinae). LACM Contributions in Science, 330:131-207). Locality LACM 1068 produced fossil specimens of ground sloth, *Paramylodon*, rabbit, *Sylvilagus*, tapir, *Tapirus californicus*, horse, *Equus*, camel, *Camelops*, deer, *Odocoileus*, and bison, *Bison*. The tapir from locality LACM 1068 was published in the

scientific literature by G.T. Jefferson (1989. Late Cenozoic Tapirs (Mammalia: Perissodactyla) of Western North America. LACM Contributions in Science, 406:1-21). In the southeastern portion of the proposed project area, on the western side of the Laguna Freeway (Highway 133) at the southern end of the interchange with the San Diego Freeway (I-405), we have another older Quaternary locality, LACM 7713, that produced a fossil specimen of ground sloth, Mylodontidae. In the central eastern portion of the proposed project area, in the Orange County Great Park near the end of 5<sup>th</sup> Street, our older Quaternary locality LACM 7867 produced fossil specimens of pocket gopher, *Thomomys*.

Excavations in the intrusive igneous rocks exposed in the San Joaquin Hills in the southern portion of the proposed project area will not contain recognizable fossils. Shallow excavations in the uppermost few feet of the younger Quaternary alluvial deposits exposed in the lower lying terrain in most of the proposed project area probably will not uncover significant fossil vertebrate remains. Deeper excavations in those portions of proposed project area that extend down into older sedimentary deposits, as well as any excavations in the Williams Formation, the Silverado Formation, the Santiago Formation, the Sespe & Vaqueros Formations, the Topanga Formation, the Monterey Formation, the Puente Formation, the Capistrano Formation, the Niguel Formation, or the older Quaternary deposits, exposed in the more elevated terrain in the proposed project area, however, may well encounter significant vertebrate fossils. Any substantial excavations in the sedimentary deposits in the proposed project area, therefore, should be closely monitored to quickly and professionally collect any specimens without impeding development. Also, sediment samples should be collected and processed to determine the small fossil potential in the proposed project area. Any fossils recovered during mitigation should be deposited in an accredited and permanent scientific institution for the benefit of current and future generations.

This records search covers only the vertebrate paleontology records of the Natural History Museum of Los Angeles County. It is not intended to be a thorough paleontological survey of the proposed project area covering other institutional records, a literature survey, or any potential on-site survey.

Sincerely,

Samuel A. McLeod, Ph.D.  
Vertebrate Paleontology

**APPENDIX C. FOSSIL LIST**

Group	Taxon	Common Name	Formation
Bivalve	<i>Aphrodina</i> sp.	clam	Williams, Pleasants M

## APPENDIX E

### Greenhouse Gas Emissions Forecasts Report for the City of Irvine Draft Climate Action and Adaptation Plan

# Memo

1230 Columbia St, Suite 440  
San Diego, CA 92101  
619.219.8000

**Date:** August 8, 2023

**To:** City of Irvine – CAAP Project Team

**From:** Poonam Boparai, Fred Hochberg, Hannah Kornfeld, and Andrew Martin (Ascent)

**Subject:** Greenhouse Gas Emissions Forecasts Report for the City of Irvine Climate Action and Adaptation Plan

---

## INTRODUCTION

The City of Irvine (City) is developing a Climate Action and Adaptation Plan (CAAP) to reduce greenhouse gas (GHG) emissions and prepare the city for the impacts of climate change. This technical memorandum provides the results of these forecasts, and describes the methods, assumptions, emissions factors, and data sources used to prepare them. The GHG emissions forecasts provide a foundation for the forthcoming steps of the City’s climate action planning process, including establishing City-specific targets for reducing emissions levels, calculating additional reductions in emissions levels needed to meet the City’s targets (also referred to as the emissions “gap”), and formulating and quantifying measures the City can take to meet its targets and close the gap.

## ORGANIZATION OF THIS MEMORANDUM

This memorandum consists of two parts:

- ▶ **Section 1: Summary of Inventory Results** presents an overview of the City’s 2019 GHG emissions inventories for community-wide activities and municipal operations.
- ▶ **Section 2: Greenhouse Gas Emissions Forecasts** summarizes the forecasted GHG emissions under “business-as-usual” (BAU) and legislative-adjusted BAU scenarios for years 2030, 2035, 2040, and 2045. The first scenario, called the BAU scenario, does not account for GHG emissions reductions resulting from laws and regulations adopted by local, regional, State, or federal agencies; it illustrates how much emissions would increase due to population and economic growth if no actions to reduce emissions were taken. The second scenario, a legislative-adjusted BAU scenario, shows emissions reductions from laws and regulations enacted by regional, State, and federal agencies; it does not reflect City actions to reduce GHG emissions. Further reductions in GHG emissions from City actions will be evaluated as a next step in the process of preparing the CAAP.

# 1 SUMMARY OF INVENTORY RESULTS

## 1.1 2019 COMMUNITY-WIDE INVENTORY

According to the *Greenhouse Gas Emissions Inventory Report for the City of Irvine Climate Action and Adaptation Plan* (2019 Inventory Report), the community generated approximately 2,247,593 metric tons of carbon dioxide equivalent (MTCO<sub>2</sub>e) in 2019. Figure 1 and Table 1 present 2019 community-wide emissions by sector.

The largest emissions-generating sectors include on-road transportation and nonresidential and residential building energy. The 2019 emissions level serves as the baseline to forecast emissions and set reduction targets in the CAAP. GHG emissions from stationary sources regulated by State and federal agencies (e.g., sources covered by the Cap-and-Trade program) and outside the City's jurisdiction and influence (e.g., UC Irvine, County-operated landfill) are discussed in the 2019 Inventory Report but not reflected in the community-wide emissions total for 2019.

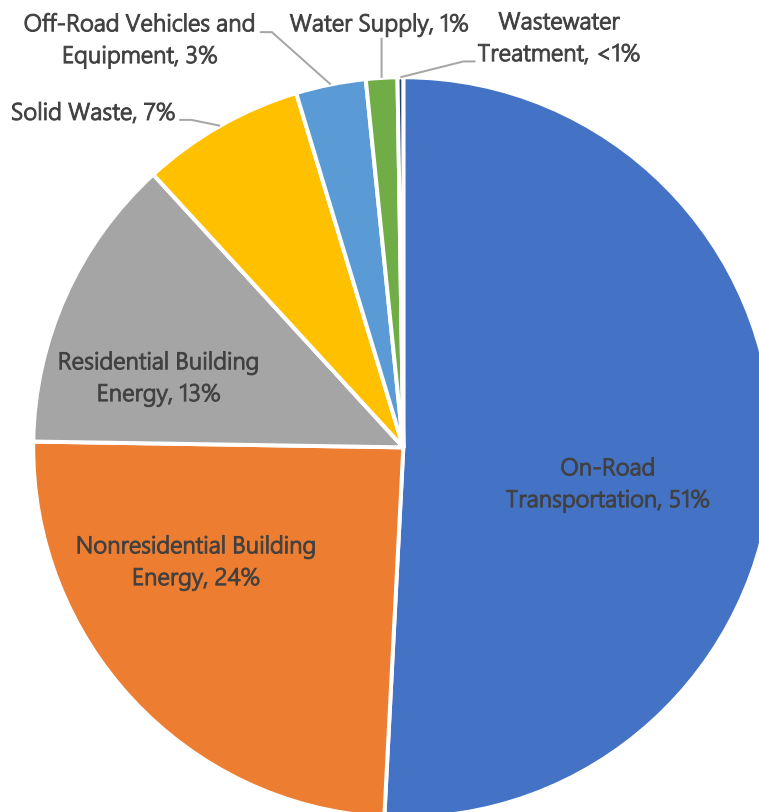

Figure 1. 2019 Community-wide GHG Emissions Inventory in the City of Irvine

Note: Totals are rounded to the nearest percent.

**Table 1. 2019 Community-wide GHG Emissions Inventory in the City of Irvine**

Sector	GHG Emissions (MTCO <sub>2</sub> e)	Percent of Total
On-Road Transportation	1,140,206	51
Nonresidential Building Energy	550,138	24
Residential Building Energy	291,405	13
Solid Waste	160,626	7
Off-Road Vehicles and Equipment	68,756	3
Water Supply	30,798	1
Wastewater Treatment	5,665	<1
<b>Total</b>	<b>2,247,593</b>	<b>100</b>

Notes: Totals may not sum exactly due to independent rounding to the nearest percent. GHG = greenhouse gases; MTCO<sub>2</sub>e = metric tons of carbon dioxide equivalent; NA = not applicable.

Source: Ascent Environmental 2023.

## 1.2 2019 MUNICIPAL OPERATIONS INVENTORY RESULTS

Based on the modeling conducted, the City's municipal operations generated approximately 18,566 MTCO<sub>2</sub>e in 2019. The employee commute and buildings and facilities sectors generated approximately 81 percent of total emissions. The 2019 inventory serves as the municipal operations GHG emissions baseline for the CAAP to forecast emissions and set emissions reductions targets. Table 2 and Figure 2 present the results of the City's 2019 municipal operations GHG emissions inventory by sector, and a description of each emissions sector, including key sources of emissions, is provided in further detail in *Greenhouse Gas Emissions Inventory Report for the City of Irvine Climate Action and Adaptation Plan*.

**Table 2. 2019 City of Irvine Municipal Operations GHG Emissions Inventory**

Sector	GHG Emissions (MTCO <sub>2</sub> e)	Percent of Total
Buildings and Facilities	12,003	65
Employee Commute	3,032	16
Wastewater Treatment	1,144	6
Vehicle Fleet	1,127	6
Streetlights and Traffic Signals	1,097	6
Solid Waste	159	1
Water Supply	4	<1
<b>Total</b>	<b>18,566</b>	<b>100</b>

Notes: Totals may not sum exactly due to independent rounding. GHG = greenhouse gases; MTCO<sub>2</sub>e = metric tons of carbon dioxide equivalent.

Source: Ascent Environmental 2023.

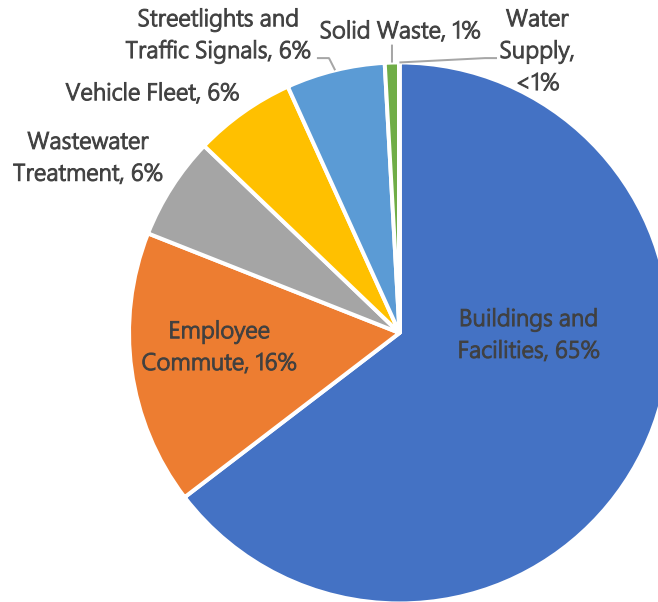

Figure 2. 2019 City of Irvine Municipal Operations GHG Emissions Inventory

## 2 GREENHOUSE GAS EMISSIONS FORECASTS

### 2.1 COMMUNITY FORECAST RESULTS

The BAU GHG emissions forecasts provide an assessment of how emissions generated by community activities will change over time without further local, State, or federal action. In addition to accounting for the city's growth under a BAU scenario, an adjusted BAU forecast was prepared, which includes adopted legislative and regulatory actions at the State and federal levels that would affect emissions without any local action (referred to hereafter as 'legislative-adjusted BAU'). These include regulatory requirements to increase vehicle fuel efficiency and increase renewable energy sources in grid electricity portfolios. It is important to note that the legislative-adjusted BAU emissions forecasts only include emissions reductions associated with implementation of adopted federal and State legislation and regulations and do not include goals established by executive orders or targets established by federal or State agencies. These forecasts provide the City with the information needed to focus efforts on emissions sectors and sources that have the greatest opportunities for GHG emissions reductions.

The GHG emissions forecasts for 2030, 2035, 2040, and 2045 are aligned with the reduction targets for statewide emissions levels established in State law, including the 2030 target set forth in Senate Bill (SB) 32 and the 2045 target set forth in Assembly Bill (AB) 1279:

- ▶ SB 32 (2016)
  - reduce statewide GHG emissions to 40% below 1990 levels by 2030.
- ▶ AB 1279 (2022):
  - achieve net zero GHG emissions statewide as soon as possible, but no later than 2045, and maintain net negative emissions thereafter; and
  - ensure that by 2045, statewide anthropogenic greenhouse gas emissions are reduced to at least 85% below the 1990 levels.

Both the BAU and legislative-adjusted BAU emissions forecasts were based on population and employment from the City's land use database and the California State University, Fullerton, Center for Demographic Research Orange County Projections. Population and employment are expected to increase by 21 and 28 percent, respectively, from 2019 to 2045. These growth factors were used to forecast emissions for most sectors. Additional information regarding the growth factors used for each sector is included in the following sections. Annual vehicle miles traveled (VMT) projections were developed using the origin-destination method using data from the Irvine Transportation Analysis Model (ITAM) Traffic Model 2021. Annual VMT by 2045 is projected to increase by 3.2 percent from 2019. VMT projections were used to scale emissions from the on-road transportation sector. Table 3 shows growth in population, employment, and annual VMT from 2019 to 2045.

**Table 3. City of Irvine Community Demographic and Vehicle Miles Traveled Forecasts**

Forecast Factor	2019	2030	2035	2040	2045
Population	291,124	317,246	329,119	340,993	352,866
Employment	250,954	280,541	293,989	307,438	320,886
Annual VMT	2,910,428,375	2,950,103,309	2,968,137,370	2,986,171,431	3,004,205,493

Notes: VMT = vehicle miles traveled.

Source: City of Irvine 2021; California State University, Fullerton 2018.

Table 4 shows baseline emissions in 2019 and BAU emissions forecasts for 2030, 2035, 2040, and 2045. Results for 2035 and 2040 were derived from the results for 2030 and 2045 using linear interpolation.

**Table 4. City of Irvine Community GHG Emissions Inventory and BAU Forecasts (MTCO<sub>2e</sub>)**

Sector	2019	2030	2035	2040	2045
On-Road Transportation	1,140,206	1,155,749	1,162,814	1,169,879	1,176,944
Nonresidential Building Energy	550,138	549,886	576,246	602,607	628,967

Off-Road Vehicles and Equipment	68,756	76,077	82,144	88,210	94,276
Water Supply	30,798	43,202	44,819	46,435	48,052
Wastewater Treatment	5,665	6,159	6,395	6,631	6,866
<b>Total</b>	<b>2,247,593</b>	<b>2,304,450</b>	<b>2,363,511</b>	<b>2,422,573</b>	<b>2,481,634</b>
Percent Change from 2019 Levels	—	3%	5%	8%	10%

Notes: Total may not sum exactly due to independent rounding. BAU = business-as-usual; GHG = greenhouse gas; MTCO<sub>2e</sub> = metric tons of carbon dioxide equivalent.

Source: Ascent Environmental 2023.

Legislative-adjusted BAU emissions forecasts were prepared using the same demographic and VMT data that were used for the BAU forecasts, while accounting for regional, State, and federal laws and regulations that would affect local emissions. These forecasts provide the City with an understanding of future community emissions to inform the identification of emissions reduction measures developed to meet GHG targets. A summary of the legislative reductions applied is provided in Table 5.

**Table 5. Legislative Reductions Summary**

Source	Legislative Reduction	Description	Sectors Applied
Regional	Orange County Power Authority (OCPA)	In the forecast years (i.e. all future years after 2019), approximately 62 percent of City of Irvine customers will take service on OCPA’s Renewable Choice plan (100 percent renewable), 15 percent on the Smart Choice Plan (69 percent renewable), and 1 percent on the Basic Choice plan (38 percent renewable). In total, this represents 77 percent of City of Irvine customers being served by OCPA, with the remaining 23 percent served by Southern California Edison. (Kramer 2023 and City of Irvine 2023: 2). Totals may not sum exactly due to independent rounding.	Building Energy
State	California’s Building Energy Efficiency Standards (2022 Title 24, Part 6)	Effective January 1, 2023, requires new residential and nonresidential buildings in California to comply with energy efficiency standards established by CEC. The 2022 standards establish energy performance requirements that encourage energy efficient approaches to building decarbonization by emphasizing electric heat pumps for space heating and water heating and extending the benefits of photovoltaic and battery storage systems and other demand flexible technology to work in combinations with heat pumps.	Building Energy
State	IRP (Integrated Resource Planning)	California Public Utilities Commission proceeding requiring California energy utilities to submit resource plans that reduce their carbon emissions below their share of 38 million metric tons (MMT) of total statewide electric sector emissions by 2030 and 30 MMT by 2035 (CPUC 2022: 8). <sup>1</sup>	Building Energy, Transportation
State	SB 100	Requires that all retail electricity sold in California must come from renewable or zero-carbon resources by 2045.	Building Energy, Transportation
State	SB 1020 (Clean Energy, Jobs, and Affordability Act of 2022)	Requires that eligible renewable energy resources and zero-carbon resources supply 90% of all retail sales of electricity to California end-use customers by December 31, 2035, 95% of all retail sales of electricity to California end-use customers by December 31, 2040, 100% of all retail sales of electricity to California end-use customers by December 31, 2045, and 100% of electricity procured to serve all state agencies by December 31, 2035.	Building Energy
State	Advanced Clean Car Standards I and II	Requires all new passenger cars, trucks and SUVs sold in California to meet increasingly stringent requirements regarding zero emissions technologies and emissions standards.	On-Road Vehicles
State	Truck and Bus Regulation	Requires diesel trucks and buses that operate in California to be upgraded to reduce GHG emissions.	On-Road Vehicles
Federal	Fuel Efficiency Standards for Medium- and Heavy-Duty Vehicles	Establishes fuel efficiency standards for medium- and heavy-duty engines and vehicles.	On-Road Vehicles
Federal	EPA Off-Road Compression-Ignition Engine Standards	Establishes standards for phasing of EPA diesel engine tiers for off-road compression-ignition equipment.	Off-Road Vehicles and Equipment

Notes: CAFE = Corporate Average Fuel Economy; CEC = California Energy Commission; EPA = U.S. Environmental Protection Agency; GHG = greenhouse gas; OCPA = Orange County Power Authority; SB = Senate Bill.

Source: Ascent Environmental in 2023.

<sup>1</sup> IRP also requires that utilities submit a second, lower-carbon resource plan to meet statewide carbon goals. This second plan uses targets of 30 and 25 MMT in 2030 and 2035, respectively. However, this analysis uses the 38 MMT in 2030 and 30 MMT in 2035 plan, as stated in Table 5, as a more conservative estimate of possible electric sector emissions reductions.

The city’s legislative-adjusted BAU emissions would decrease by approximately 60 percent between 2019 and 2045, as shown below in Table 6 and Figure 3. Results for 2035 and 2040 were derived from the results for 2030 and 2045 using linear interpolation. Figure 3 also shows the emissions trend that would occur without anticipated legislative reductions, accounting only for population, employment, and VMT changes (i.e., BAU emissions). Without the legislative reductions, emissions would be approximately 178 percent higher in 2045 compared to 2045 emissions levels in the legislative-adjusted BAU forecast. Emissions forecasts for each sector are discussed in detail in the following sections.

**Table 6. City of Irvine Community GHG Emissions Inventory and Legislative-Adjusted BAU Forecasts (MTCO<sub>2</sub>e)**

Sector	2019	2030	2035	2040	2045
On-Road Transportation	1,140,206	793,628	602,306	410,984	219,662
Nonresidential Building Energy	550,138	271,904	243,504	215,105	186,705
Residential Building Energy	291,405	210,707	203,991	197,276	190,561
Solid Waste	160,626	175,038	181,590	188,141	194,692

**Figure 3 City of Irvine Community GHG Emissions Inventory and Forecasts**

## 2.1.1 Building Energy

### BUILDING ENERGY ASSUMPTIONS

Building energy emissions in the city result directly from onsite combustion of natural gas and indirectly from electricity consumption. The combustion of fossil fuels (i.e., diesel, liquid propane gas [LPG], and natural gas) in backup generators also contributes to the city’s building energy emissions. Southern California Edison (SCE) is the electricity provider and Southern California Gas Company (SoCalGas) is the natural gas provider in the city. Orange County Power Authority (OCPA) is a community choice aggregation agency established to source clean and renewable electricity in Orange County including the City of Irvine.

#### Electricity Emissions Factors

Emissions factors for electricity vary depending on the utility (SCE or OCPA), the carbon content of the different portfolios that each utility offers its customers, and year. To calculate City’s overall electric emissions factor for a given year, a weighted average of OCPA emissions and SCE emissions was taken, accounting for participation rates and portfolio offerings across those two utilities shown in Table 5 of this memorandum. This weighted average emissions factor was then applied to all electric usage. Table 7 below shows how this calculation was performed.

**Table 7: Calculation of Weighted Emissions Electric Emissions Factor**

Year	Participation rates by utility and power portfolio					MT CO <sub>2</sub> e / MWh by utility and power portfolio				
	SCE	OCPA Basic	OCPA Smart	OCPA 100%	Total	SCE	OCPA Basic	OCPA Smart	OCPA 100%	Weighted Average
2019	100%	0%	0%	0%	100%	0.208	NA	NA	NA	0.208
2030	23%	1%	15%	62%	100%	0.141	0.244	0.094	0	0.048
2045	23%	1%	15%	62%	100%	0	0	0	0	0

Notes: Total may not sum exactly due to independent rounding. MTCO<sub>2</sub>e = metric tons of carbon dioxide equivalent. MWh = megawatt-hour. NA = Not Applicable.

Source: Ascent Environmental 2023.

SCE’s emissions factor for 2019 was derived from its Power Content Label, which shows 16.1 percent natural gas and 32.6 percent from unspecified sources of power (unspecified power is electricity that has been purchased through open market transactions and is not traceable to a specific generation source: SCE 2019). In total, this implies that SCE’s portfolio is 48.7 percent carbon-emitting power.<sup>2</sup> This 48.7 percent was then multiplied by California Air Resources Board (CARB) emissions factor for Mandatory Reporting of Greenhouse Gases (MRR) of 0.428 MT CO<sub>2</sub>e/MWh, which reflects the emissions from unspecified power, and additionally is similar to the emission factor from an average single-cycle natural gas power plant (CARB 2018: 16).

Emissions factors for 2030 were derived from SCE and OCPA’s IRP electricity resource plans as described in Table 5. In the case of SCE, its 2030 IRP plan shows 67 percent GHG-free power (SCE 2022). This corresponds to 33 percent emitting power from natural gas or unspecified power and thus 0.141 MT CO<sub>2</sub>e/MWh based on the CARB emissions factor of 0.428 MT CO<sub>2</sub>e/MWh shown above.

<sup>2</sup> This memorandum uses “carbon-emitting power” as a shorthand to refer to the sum of power generated by natural gas-fired generators and unspecified power.

In the case of OCPA, a separate emission factor for each portfolio (Basic, Smart, and 100%) was calculated. A percentage of carbon-free power for each portfolio was estimated by taking OCPA’s overall ratio of carbon-free energy to renewable energy in 2030 in its IRP plan (113 percent, per OCPA 2022) and multiplying that ratio by each portfolio’s percentages of renewable content. This percentage of carbon-free power was then subtracted from 100 percent to yield a percentage of carbon-emitting power. Finally, this percent of carbon-emitting power was multiplied by 0.428 MT CO<sub>2</sub>e/MWh to yield an emissions factor. Table 8 below shows the results of this calculation.

**Table 8: Derivation of 2030 OCPA emissions factors**

	Basic	Smart	100% Renewable
Percent Renewable	38%	69%	100%
Percent Carbon-Free	43%	78%	100%
Percent Carbon-Emitting Power	57%	22%	0%
Emissions Factor (MT CO <sub>2</sub> e / MWh)	0.244	0.094	0

Source: Ascent Environmental 2023.

### Natural Gas Emissions Factors

Natural gas emissions are based on emissions factors obtained from The Climate Registry’s (TCR’s) 2020 Default Emission Factors, which are estimated to be 11.7 pounds of carbon dioxide equivalent per therm (lb CO<sub>2</sub>e/therm) for stationary combustion in buildings and 11.6 lb CO<sub>2</sub>e/therm for electricity generation in backup generators (TCR 2020). Emissions factors associated with natural gas combustion are not anticipated to change over time, as there are no legislative actions that would reduce the carbon intensity of natural gas.

### Diesel Emissions Factors

Emissions from diesel fuel used to power backup generators are based on emissions factors from TCR, which are estimated to be 22.6 pounds of carbon dioxide equivalent per gallon (lb CO<sub>2</sub>e/gal). Emissions factors associated with diesel combustion are not anticipated to change over time, as there are no legislative actions that would reduce the carbon intensity of diesel.

### Gasoline Emissions Factors

Emissions from gasoline fuel used to power backup generators are based on emissions factors also from TCR, which are estimated to be 19.3 lb CO<sub>2</sub>e/gal. Emissions factors associated with gasoline combustion are not anticipated to change over time, as there are no legislative actions that would reduce the carbon intensity of gasoline.

### Energy Efficiency and Fuel Source

Future energy use was adjusted to reflect increased emissions-intensity stringency under California’s Building Energy Efficiency Standards (California Code of Regulations Title 24 Part 6, hereafter referred to as “Title 24”). Title 24 standards apply to new residential and nonresidential construction. The 2019 Title 24 standards apply to projects constructed after January 1, 2020, and the 2022 Title 24 standards will apply after January 1, 2023. To estimate adjusted future energy consumption resulting from Title 24 requirements in new construction, electricity- and natural gas-specific adjustment factors were calculated using the difference in the average energy use in residential and nonresidential buildings between those built to 2019 Title 24 standards and those built to 2022 Title 24 standards. Adjustment factors were calculated using data available from the California Energy Commission (CEC) that were developed for the 2022 Title 24 standards. In addition to accounting for Title 24 requirements by land use type (i.e., residential and nonresidential), CEC also developed estimates for energy usage rates by climate zone, and the city’s climate zone (Zone 8) was used for the residential buildings analysis. Climate zone-specific data for nonresidential buildings were unavailable; therefore, nonresidential adjustment factors relied on statewide averages.

The adjustment factors (specific to both building type and energy type) were applied to the BAU growth in energy use to estimate the energy consumption and associated GHG emissions of future development with legislative adjustments. It is important to note that although average electricity use in new residential buildings is anticipated to rise (due to an increase in electrical demand associated with electric appliances installed instead of natural gas appliances), emissions from new residential buildings are expected to be lower than they would be under 2019 Title 24 as a result of overall lower building emissions intensities (due to lower emissions factors associated with electricity compared to natural gas).

## BUILDING ENERGY RESULTS

Emissions from future electricity, natural gas, and backup generator (i.e., diesel, natural gas, and gasoline) use were estimated by multiplying anticipated energy use by forecasted emissions factors. Future energy use was forecasted in two parts. First, energy use was scaled by population and employment growth factors detailed above. Second, energy emissions factors were adjusted as described in the previous section. Natural gas, diesel, and gasoline emissions factors were not adjusted, as the emissions intensity of these energy sources is anticipated to stay constant. The assumptions for future electricity emissions factors are described below. Table 9 summarizes the scaling factors and legislative reductions used to forecast building use by energy type.

**Table 9. Building Energy Emissions Forecast Methods by Energy Type**

Energy Type	Forecast Methods	
	Scale Factor	Applied Legislative Reductions
Electricity	Scaled by population growth for residential building energy; scaled by employment growth for nonresidential building energy.	Emissions factors derived from SCA and OCPA IRP plans. Accounts for Title 24 energy efficiency gains in new construction based on the best available data for average building energy efficiency.
Natural Gas		Accounts for Title 24 energy efficiency gains in new construction based on the best available data for average building energy efficiency.
Backup Generators	Scaled by employment growth.	None.

Notes: OCPA = Orange County Power Authority; RPS = Renewables Portfolio Standard; SCE = Southern California Edison.

Source: Ascent Environmental 2023.

## RESIDENTIAL BUILDING ENERGY

Between 2019 and 2045, emissions from residential building energy would decrease by approximately 35 percent from 291,405 to 190,561 MTCO<sub>2e</sub> with legislative adjustments, despite overall population growth of approximately 25 percent over the same time. Table 10 shows the 2019 inventory and legislative-adjusted BAU forecasted emissions from the residential building energy sector by energy type for 2030, 2035, 2040, and 2045. Results for 2035 and 2040 were derived from the results for 2030 and 2045 using linear interpolation.

**Table 10. Residential Building Energy GHG Emissions Inventory and Legislative-Adjusted BAU Emissions Forecasts (Annual MTCO<sub>2e</sub>)**

Energy Type	2019	2030	2035	2040	2045
Electricity	116,584	29,451	19,634	9,817	0
Natural Gas	174,820	181,255	184,357	187,459	190,561
<b>Total</b>	<b>291,405</b>	<b>210,707</b>	<b>203,991</b>	<b>197,276</b>	<b>190,561</b>

Notes: Totals may not sum exactly due to independent rounding. BAU = business-as-usual; GHG = greenhouse gas; MTCO<sub>2e</sub> = metric tons of carbon dioxide equivalent.

Source: Ascent Environmental 2023.

## NONRESIDENTIAL BUILDING ENERGY

Between 2019 and 2045, emissions from nonresidential building energy would decrease by approximately 66 percent from 550,139 to 187,371 MTCO<sub>2e</sub> with legislative adjustments, despite overall employment growth of approximately 33 percent over the same time. Increased natural gas and backup generator emissions would be offset by reduced emissions from electricity in 2045. Table 11 shows the 2019 inventory and legislative-adjusted BAU forecasted emissions for the nonresidential building energy sector by energy type for 2030, 2035, 2040, and 2045. Results for 2035 and 2040 were derived from the results for 2030 and 2045 using linear interpolation.

**Table 11. Nonresidential Building Energy GHG Emissions Inventory and Legislative-Adjusted BAU Forecasts (Annual MTCO<sub>2e</sub>)**

Energy Type	2019	2030	2035	2040	2045
Electricity	385,130	98,767	65,845	32,922	0
Natural Gas	160,501	170,317	174,705	179,092	183,480
Backup Generators	4,507	3,401	3,564	3,728	3,891
<b>Total</b>	<b>550,139</b>	<b>272,486</b>	<b>244,114</b>	<b>215,743</b>	<b>187,371</b>

Notes: Totals may not sum exactly due to independent rounding. BAU = business-as-usual; GHG = greenhouse gas; MTCO<sub>2e</sub> = metric tons of carbon dioxide equivalent.

Source: Ascent Environmental 2023.

## 2.1.2 Transportation

### ON-ROAD TRANSPORTATION

Between 2019 and 2045, GHG emissions from on-road vehicles would decrease by approximately 81 percent from 1,140,206 to 219,662 MTCO<sub>2e</sub>, accounting for an increase in VMT of approximately 4 percent, and future vehicle emissions factors modeled in California Air Resources Board's (CARB's) Emissions FACTor (EMFAC2021) model. VMT projections were developed using the origin-destination method and data from the ITAM model. With respect to the legislative adjustments included in this forecast, State and federal laws and regulations incorporated in the on-road transportation sector include the Pavley Clean Car Standards Advanced Clean Car I and II (ACC I and II) Standards, and fuel efficiency standards for medium- and heavy-duty vehicles. Pavley Clean Car Standards and fuel efficiency standards are included in EMFAC2021's emissions factor estimates and forecasts. Vehicle fleet assumptions were adjusted to account for the effect of Advanced Clean Car II (ACC II) Standards, including assumed new sales of battery electric vehicles and plug-in hybrids (CARB 2022: 5). The Low Carbon Fuel Standard was excluded in EMFAC2021 forecasts because the emissions benefits originate from upstream fuel production and do not directly reduce vehicle tailpipe emissions that affect the city's GHG emissions forecasts. Table 12 summarizes the scaling factors and legislative reductions used to forecast on-road transportation emissions.

**Table 12. On-Road Transportation Emissions Forecast Methods**

Source	Forecast Methods	
	Scale Factor	Applied Legislative Reductions
On-Road Transportation	Scaled by VMT estimates provided by Iteris.	EMFAC2021 forecasts vehicle fleet distributions by vehicle type and the emissions factors anticipated for each vehicle category based on both vehicle emissions testing and approved legislative reductions. EMFAC2021's forecasts incorporate the effects of federal standards and fuel efficiency standards for medium- and heavy-duty vehicles, as well as truck and bus regulations. Vehicle fleet assumptions were adjusted to account for the effect of Advanced Clean Car II (ACC II) Standards, including assumed new sales of battery electric vehicles and plug-in hybrids

Notes: ACC II= Advanced Clean Cars CAFE = Corporate Average Fuel Economy; EMFAC2021 = California Air Resources Board's Emission Factor 2021 model.

Source: Ascent Environmental 2022.

Table 13 shows the 2019 inventory and legislative-adjusted BAU forecasted emissions from on-road transportation for 2030, 2035, 2040, and 2045.

**Table 13. On-Road Transportation GHG Emissions Inventory and Legislative-Adjusted BAU Forecasts (Annual MTCO<sub>2e</sub>)**

Source	2019	2030	2035	2040	2045

Notes: BAU = business-as-usual; GHG = greenhouse gas; MTCO<sub>2e</sub> = metric tons of carbon dioxide equivalent.

Source: Ascent Environmental 2023.

## OFF-ROAD VEHICLES AND EQUIPMENT

Between 2019 and 2045, emissions associated with off-road vehicles and equipment used in the city would increase by 37 percent from 68,756 to 94,276 MTCO<sub>2e</sub>, with legislative adjustments applied and overall growth in various demographics. Emissions were obtained primarily from CARB's latest off-road emissions model, OFFROAD2021, as well as from CARB's OFFROAD2007 model. With respect to the legislative adjustments in the off-road vehicle sector, OFFROAD2021 was used, which incorporates regulatory actions such as reformulated fuels and more stringent emissions standards. However, some off-road vehicle and equipment sources that are included in the OFFROAD2007 model are excluded from OFFROAD2021. For these sectors, emissions were obtained from OFFROAD2007. In addition, OFFROAD2021 provides CO<sub>2</sub> emissions but does not provide emissions from CH<sub>4</sub> and N<sub>2</sub>O. Ratios of CH<sub>4</sub> and N<sub>2</sub>O to CO<sub>2</sub> reported in OFFROAD2007 were calculated and applied to CO<sub>2</sub> data from OFFROAD2021 to calculate CH<sub>4</sub> and N<sub>2</sub>O emissions, as recommended by CARB.

Orange County-level emissions from off-road vehicles and equipment were scaled using changes in city-specific demographic factors. Table 12 summarizes the scaling factors and legislative reductions used to forecast off-road vehicle and equipment emissions.

**Table 12. Off-Road Vehicles and Equipment Forecast Methods by Source**

Notes: Totals may not sum exactly due to independent rounding. BAU = business-as-usual; GHG = greenhouse gas; MTCO<sub>2e</sub> = metric tons of carbon dioxide equivalent.

Source: Ascent Environmental 2023.

### 2.1.3 Solid Waste

Between 2019 and 2045, solid waste emissions generated from community activities in the city would increase by approximately 21 percent from 160,626 to 194,692 MTCO<sub>2e</sub>, accounting for overall population growth of approximately 25 percent over the same time. Solid waste sector emissions include CH<sub>4</sub> emissions from the decay of waste generated annually, which were scaled by population growth within the city between 2019 and 2045. No additional legislative reductions could be applied to this sector, so legislative-adjusted BAU emissions are equivalent to BAU emissions. Table 14 shows the 2019 inventory and legislative-adjusted BAU forecasted emissions from the solid waste sector for 2030, 2035, 2040, and 2045.

**Table 14. Solid Waste GHG Emissions Inventory and Legislative-Adjusted BAU Forecasts (Annual MTCO<sub>2</sub>e)**

Community-Generated Solid Waste	160,626	175,038	181,590	188,141	194,692

Notes: BAU = business-as-usual; GHG = greenhouse gas; MTCO<sub>2</sub>e = metric tons of carbon dioxide equivalent.

Source: Ascent Environmental 2023.

## 2.1.4 Water Supply

Between 2019 and 2045, water supply emissions generated from community activities in the city would be reduced to zero due to 100 percent RPS by 2045. It was assumed that certain proportions of water used within the city was extracted, conveyed, treated, and distributed within and outside the city boundary. For the water supply from local sources within the city, the electricity usage associated with extracting, conveying, treating, and distributing water is captured in the building energy sector because these activities take place within the city. Therefore, the electricity usage and emissions associated with extracting, conveying, treating, and distributing water from outside the city boundary was applied to the water sector. Electricity usage associated with water consumption is subject to RPS targets, pursuant to SB 100 requirements. Table 15 summarizes the scaling factor and legislative reduction used to forecast water supply emissions.

**Table 15. Water Supply Forecast Methods and Legislative Reductions by Source**

Source	Forecast Methods	
	Scale Factor	Applied Legislative Reductions
Water Consumption	Scaled by population growth.	Assumes electricity use for extraction, conveyance, distribution, and treatment follows the 2045 carbon-free electricity requirements.

Source: Ascent Environmental in 2022.

Table 16 shows the 2019 inventory and legislative-adjusted BAU forecasted emissions from the water supply sector for 2030, 2035, 2040, and 2045. Weighted average electric emissions factors shown in Table 7 were used to derive these figures. Results for 2035 and 2040 were derived from the results for 2030 and 2045 using linear interpolation.

**Table 16. Water Supply GHG Emissions Inventory and Legislative-Adjusted BAU Forecasts (Annual MTCO<sub>2</sub>e)**

Water Supply	30,798	9,973	6,649	3,324	0

Notes: BAU = business-as-usual; MTCO<sub>2</sub>e/year = metric tons of carbon dioxide equivalent per year.

Source: Ascent Environmental in 2023.

## 2.1.5 Wastewater Treatment

Between 2019 and 2045, community wastewater treatment emissions would increase by 21 percent from 5,665 to 6,851 MTCO<sub>2</sub>e. This change reflects an increase in wastewater generation resulting from population growth within the city of approximately 21 percent over the same time. Wastewater treatment-related emissions are generated from centralized wastewater treatment plants (WWTPs) providers for the city. Table 17 shows the 2019 inventory and legislative-adjusted BAU forecasted emissions from wastewater treatment sources for 2030, 2035, 2040, and 2045.

**Table 17. Wastewater Treatment GHG Emissions Inventory and Legislative-Adjusted BAU Forecasts (Annual MTCO<sub>2e</sub>)**

Centralized WWTPs	5,665	6,173	6,399	6,625	6,851

Notes: BAU = business-as-usual; GHG = greenhouse gas; MTCO<sub>2e</sub> = metric tons of carbon dioxide equivalent; WWTP = wastewater treatment plant.

Source: Ascent Environmental 2023.

## 2.2 MUNICIPAL OPERATIONS FORECAST RESULTS

Estimated municipal operations BAU emissions forecasts were based on predicted growth in City employment between 2019 and 2045. Municipal employment is expected to increase by 21 percent between 2019 and 2045. Change in municipal employment was the sole factor used to forecast BAU emissions for 2030, 2035, 2040, and 2045 for all sectors in the municipal operations inventory. Table 18 shows 2019 municipal employment and anticipated change in municipal employment for the forecast years.

**Table 18. City of Irvine Municipal Operations Demographic Forecasts**

Source: Ascent Environmental 2023.

Legislative-adjusted BAU emissions forecasts provide an assessment of how the City's municipal operations emissions would change over time without further action from the City. The legislative-adjusted BAU forecast accounts for laws and regulations at the regional, State, and federal levels that would affect emissions, such as regulatory requirements to increase vehicle fuel efficiency and building energy efficiency. These forecasts provide the City with the information needed to focus efforts on certain municipal operations emissions sectors and sources that have the most GHG reduction opportunities. Annual municipal employment change was the sole scaling factor applied to all sectors. A summary of legislative reductions applied is provided in Table 5. Municipal operations legislative-adjusted BAU emissions would decrease by approximately 76 percent between 2019 and 2045, as shown in Table 20 and Figure 4.

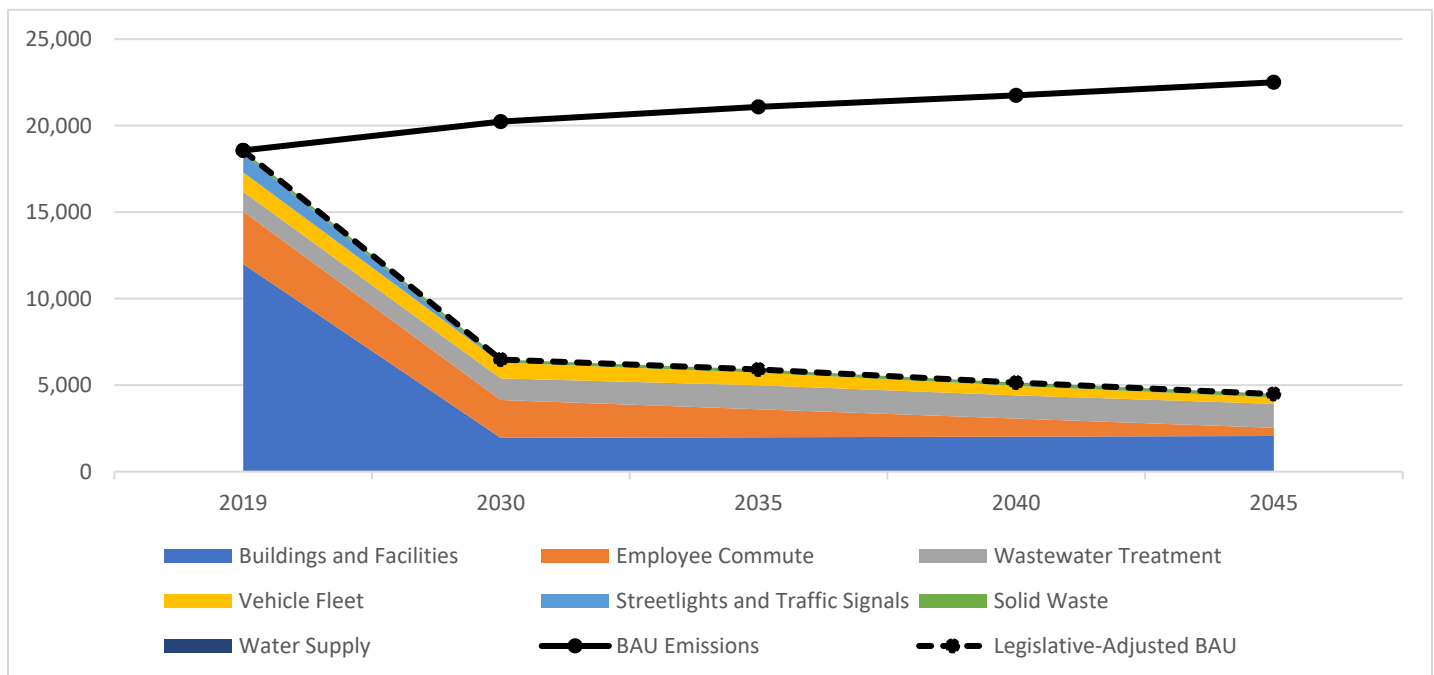

**Table 20. City of Irvine Municipal Operations GHG Emissions Inventory and Legislative-Adjusted BAU Forecasts (Annual MTCO<sub>2e</sub>)**

Sector	2019	2030	2035	2040	2045
Buildings and Facilities	12,003	1,950	1,987	2,023	2,060
Employee Commute	3,032	2,192	1,618	1,045	471

Vehicle Fleet	1,127	912	732	552	372
Streetlights and Traffic Signals	1,097	0	0	0	0
Solid Waste	159	174	180	187	193
Water Supply	4	2	2	1	0
<b>Total</b>	<b>18,566</b>	<b>6,477</b>	<b>5,905</b>	<b>5,147</b>	<b>4,482</b>
<i>Percent Change from 2019 Levels</i>		<b>-65%</b>	<b>-68%</b>	<b>-72%</b>	<b>-76%</b>

Notes: Total may not sum exactly due to independent rounding. BAU = business-as-usual; GHG = greenhouse gas; MTCO<sub>2e</sub> = metric tons of carbon dioxide equivalent.

Source: Ascent Environmental 2023.

Figure 4 also shows the emissions trend that would occur without anticipated legislative reductions, accounting only for changes in municipal employment (i.e., BAU emissions). Without the legislative reductions, emissions would be approximately 237 percent higher in 2045 compared to the legislative-adjusted BAU forecast. Emissions forecasts for each sector are discussed in detail in the following sections.

**Figure 4** City of Irvine Municipal Operations GHG Emissions Inventory and Forecasts

## 2.2.1 Buildings and Facilities Energy

Emissions from future electricity, natural gas, and backup generator use in City buildings and facilities were estimated by multiplying anticipated energy use by forecasted emissions factors. Future energy use was forecasted in two parts, as described in Section 2.1.1. Table 21 summarizes the legislative reductions used to forecast buildings and facilities emissions by energy type.

**Table 21. Buildings and Facilities Energy Emissions Forecast Legislative Reductions by Energy Type**

Energy Type	Applied Legislative Reductions
Electricity	OCPA’s carbon-free option was applied to OCPA’s electricity emissions factors. Accounts for 2022 Building Energy Efficiency Standards Title 24 energy efficiency gains in new construction based on the best available data for average building energy efficiency.
Natural Gas	Accounts for 2022 Building Energy Efficiency Standards Title 24 energy efficiency gains in new construction based on the best available data for average building energy efficiency.
Backup Generators	None.

Notes: OCPA = Orange County Power Authority.

Source: Ascent Environmental 2022.

Between 2019 and 2045, emissions from electricity, natural gas, and backup generators from municipal buildings and facilities would decrease by approximately 83 percent from 12,003 to 2,060 MTCO<sub>2</sub>e, accounting for legislative adjustments and municipal employment changes. This change reflects increases in emissions from natural gas and backup generators combined with the City’s automatic enrollment in OCPA’s carbon-free option. Table 22 shows the 2019 inventory and legislative-adjusted BAU forecasted emissions for the municipal operations buildings and facilities energy sector by energy type for 2030, 2035, 2040, and 2045.

**Table 22. Buildings and Facilities Energy GHG Emissions Inventory and Legislative-Adjusted BAU Forecasts (Annual MTCO<sub>2</sub>e)**

Energy Type	2019	2030	2035	2040	2045
Electricity	10,138	0	0	0	0
Natural Gas	1,862	1,947	1,983	2,020	2,056
Backup Generators	3	3	3	3	4
<b>Total</b>	<b>12,003</b>	<b>1,950</b>	<b>1,987</b>	<b>2,023</b>	<b>2,060</b>

Notes: Totals may not sum exactly due to independent rounding. BAU = business-as-usual; GHG = greenhouse gas; MTCO<sub>2</sub>e = metric tons of carbon dioxide equivalent.

Source: Ascent Environmental 2023.

## ELECTRICITY EMISSIONS FACTORS

As a result of the electricity emissions factors to be decreased to zero by 2030, GHG emissions from electricity consumption in the buildings and facilities sector would also be zero through 2045 without additional City action. Electricity emissions factors and changes through 2045 are described in Section 2.1.1.

## NATURAL GAS EMISSIONS FACTORS

Natural gas emissions are based on data from TCR, as described in Section 2.1.1. Emissions factors associated with natural gas combustion are not anticipated to change over time, as there are no legislative actions that would reduce the energy intensity of natural gas.

## DIESEL EMISSIONS FACTORS

Emissions from diesel fuel used to power backup generators are based on emissions factors from TCR, as described in Section 2.1.1. Emissions factors associated with diesel combustion are not anticipated to change over time, as there are no legislative actions that would reduce the energy intensity of diesel.

### 2.2.2 Streetlights and Traffic Signals

Between 2019 and 2045, emissions from streetlights and traffic signals would be reduced to zero, accounting for legislative adjustments and employment reductions. This reflects lower electricity emissions factors related the City's automatic enrollment of municipal accounts in OCPA's carbon-free option. Table 23 summarizes the legislative reductions used to forecast streetlight and traffic signal emissions.

**Table 23. Streetlights and Facilities Emissions Forecast Legislative Reductions**

Source	Applied Legislative Reductions
Electricity	OCPA's carbon-free option was applied to OCPA's electricity emissions factors.

Notes: OCPA = Orange County Power Authority.

Source: Ascent Environmental 2022.

Table 24 shows the 2019 inventory and legislative-adjusted BAU forecasted emissions for the streetlights and traffic signals sector for 2030, 2035, 2040, and 2045.

**Table 24. Streetlights and Traffic Signals GHG Emissions Inventory and Legislative-Adjusted BAU Forecasts (Annual MTCO<sub>2e</sub>)**

Streetlights and Traffic Signals	1,097	0	0	0	0

Notes: BAU = business-as-usual; GHG = greenhouse gas; MTCO<sub>2e</sub> = metric tons of carbon dioxide equivalent.

Source: Ascent Environmental 2023.

### 2.2.3 Employee Commute

Between 2019 and 2045, GHG emissions from employee commutes would decrease by approximately 85 percent from 3,032 to 471 MTCO<sub>2e</sub>, accounting for future vehicle emissions factors modeled in CARB's EMFAC2021 model and municipal employment change. It was assumed that employees that commute to work all use light-duty vehicles. With respect to the legislative adjustments included in this forecast, State and federal laws and regulations incorporated in the employee commute sector include the Pavley Clean Car Standards and ACC II Standards. Pavley Clean Car Standards are already included in EMFAC2021's emissions factor estimates and forecasts. Additional calculations were performed to incorporate the effects of ACCII.

It should be noted that the Low Carbon Fuel Standard was excluded in EMFAC2021 forecasts because most of the emissions benefits originate from upstream fuel production and do not directly reduce emissions in the City's municipal operations GHG emissions forecasts. Table 25 summarizes the legislative reductions used to forecast employee commute emissions.

**Table 25. Employee Commute Forecast Legislative Reductions**

Source	Applied Legislative Reductions
Employee Commute	EMFAC2021 forecasts vehicle fleet distributions by vehicle type and the emissions factors anticipated for each vehicle category based on both vehicle emissions testing and approved legislative reductions. EMFAC2021's forecasts incorporate the effects of the CAFE standards. Separate calculations were performed to incorporate the effects of ACC II.

Notes: ACC II= Advanced Clelars II; CAFE = Corporate Average Fuel Economy; EMFAC2021 = California Air Resources Board's Emission FACTor 2021 model.

Source: Ascent Environmental 2022.

Table 26 shows the 2019 inventory and legislative-adjusted BAU forecasted emissions from municipal employee commutes for 2030, 2035, 2040, and 2045. Values for 2035 and 2040 were derived using linear interpolation.

**Table 26. Employee Commute GHG Emissions Inventory and Legislative-Adjusted BAU Forecasts (Annual MTCO<sub>2e</sub>)**

Employee Commute	3,032	2,192	1,618	1,045	471

Notes: BAU = business-as-usual; GHG = greenhouse gas; MTCO<sub>2e</sub> = metric tons of carbon dioxide equivalent.

Source: Ascent Environmental 2023.

## 2.2.4 Vehicle Fleet

Between 2019 and 2045, emissions associated with the City's municipal vehicle fleet would decrease by approximately 67 percent from 1,127 to 372 MTCO<sub>2e</sub>, accounting for legislative adjustments and municipal employment change. Vehicle fleet fuel consumption data (i.e., gallons of gasoline and diesel fuel) for 2019 were provided by the City for all City-owned vehicles and equipment. Because additional vehicle fleet data were unavailable, total emissions for gasoline and diesel fuel were estimated using emissions factors obtained from TCR. With respect to the legislative adjustments in the vehicle fleet sector, improvements in fuel efficiency reported by CARB's EMFAC2021 model, as described in Section 2.1.2, were applied to BAU emissions forecasts. Effects of ACCII standards were incorporated using calculations performed separately. Table 27 summarizes the legislative reductions used to forecast vehicle fleet emissions.

**Table 27. Vehicle Fleet Forecast Legislative Reductions**

Source	Applied Legislative Reductions
Vehicle Fleet	EMFAC2021 forecasts vehicle fleet distributions by vehicle type and the emissions factors anticipated for each vehicle category based on both vehicle emissions testing and approved legislative reductions. EMFAC2021's forecasts incorporate the effects of the CAFE standards. Additional calculations were performed to incorporate the effects of ACCII.

Notes: ACC II= Advanced Clean Cars II; CAFE = Corporate Average Fuel Economy; EMFAC2021 = California Air Resources Board's Emission FACTor 2021 model.

Source: Ascent Environmental 2022.

Table 28 shows the 2019 inventory and legislative-adjusted BAU forecasted emissions from the vehicle fleet sector by fuel source for 2030, 2035, 2040, and 2045. Values for 2035 and 2040 were derived using linear interpolation.

**Table 28. Vehicle Fleet GHG Emissions Inventory and Legislative-Adjusted BAU Forecasts (Annual MTCO<sub>2</sub>e)**

Source	2019	2030	2035	2040	2045
Gasoline	954	772	620	467	315
CNG	173	140	112	85	57
<b>Total</b>	<b>1,127</b>	<b>912</b>	<b>732</b>	<b>552</b>	<b>372</b>

Notes: Totals may not sum exactly due to independent rounding. BAU = business-as-usual; CNG = compressed natural gas; GHG = greenhouse gas; MTCO<sub>2</sub>e = metric tons of carbon dioxide equivalent.

Source: Ascent Environmental 2023.

## 2.2.5 Solid Waste

Between 2019 and 2045, municipal operations solid waste emissions would increase by approximately 11 percent from 159 to 193 MTCO<sub>2</sub>e, accounting for municipal employment change. No additional legislative reductions could be applied to this sector, so legislative-adjusted BAU emissions are equivalent to BAU emissions. Table 29 shows the 2019 inventory and legislative-adjusted BAU forecasted emissions from the municipal operations solid waste sector for 2030, 2035, 2040, and 2045.

**Table 29. Solid Waste GHG Emissions Inventory and Legislative-Adjusted BAU Forecasts (Annual MTCO<sub>2</sub>e)**

Source	2019	2030	2035	2040	2045
Solid Waste	159	174	180	187	193

Notes: BAU = business-as-usual; GHG = greenhouse gas; MTCO<sub>2</sub>e = metric tons of carbon dioxide equivalent.

Source: Ascent Environmental 2023.

## 2.2.6 Water Supply

Between 2019 and 2045, emissions from water supplied for municipal operations would be reduced to zero due to 100 percent RPS by 2045. For the water supply from local sources within the city, the electricity usage associated with extracting, conveying, treating, and distributing water is captured in the buildings and facilities energy sector because these activities take place within the city. Therefore, the electricity usage and emissions associated with extracting, conveying, treating, and distributing water from outside the city boundary was applied to the municipal water sector. Table 30 summarizes the legislative reductions used to forecast water supply emissions.

**Table 30. Water Supply Forecast Legislative Reductions**

Source	Applied Legislative Reductions
Water Consumption	RPS achieved to date and scheduled targets (i.e., 33 percent renewable by 2020, 60 percent renewable by 2030, 100 percent renewable by 2045) applied to SCE's, and State electricity emissions factors.

Notes: RPS = Renewables Portfolio Standard; SCE = Southern California Edison.

Source: Ascent Environmental 2022.

Table 31 shows the 2019 inventory and legislative-adjusted BAU forecasted emissions from municipal operations water supply for 2030, 2035, 2040, and 2045.

**Table 31. Water Supply GHG Emissions Inventory and Legislative-Adjusted BAU Forecasts (Annual MTCO<sub>2</sub>e)**

Activity	2019	2030	2035	2040	2045
Water Supply Emissions	4	2	2	1	0

Notes: BAU = business-as-usual; GHG = greenhouse gas; MTCO<sub>2</sub>e = metric tons of carbon dioxide equivalent.

Source: Ascent Environmental 2023.

## 2.2.7 Wastewater Treatment

Between 2019 and 2045, wastewater treatment emissions from municipal operations would increase by approximately 20 percent from 1,144 to 1,386 MTCO<sub>2e</sub>, accounting for legislative reductions and municipal employment change. This reflects both an increase in wastewater generation and lower electricity emissions factors related to the 2030 and 2045 RPS targets for SCE, pursuant to SB 100, due to treatment processes located outside of the OCPA service area. Although electricity intensity factors are reduced through 2045, increases in process and fugitive emissions resulting from wastewater collection and treatment would offset decreased electricity emissions. Table 32 summarizes the legislative reductions used to forecast emissions from municipal operations wastewater treatment.

**Table 32. Wastewater Treatment Forecast Legislative Reductions**

Source	Applied Legislative Reductions
Wastewater Treatment	RPS achieved to date and scheduled targets (i.e., 33 percent renewable by 2020, 60 percent renewable by 2030, 100 percent renewable by 2045) applied to SCE's electricity emissions factors.

Notes: RPS = Renewables Portfolio Standard; SCE = Southern California Edison.

Source: Ascent Environmental 2022.

Table 33 shows the 2019 inventory and legislative-adjusted BAU forecasted emissions from wastewater treatment for 2030, 2035, 2040, and 2045.

**Table 33. Wastewater Treatment GHG Emissions Inventory and Legislative-Adjusted BAU Forecasts (Annual MTCO<sub>2e</sub>)**

Activity	2019	2030	2035	2040	2045
Wastewater Treatment	1,144	1,246	1,386	1,340	1,386

Notes: BAU = business-as-usual; GHG = greenhouse gas; MTCO<sub>2e</sub> = metric tons of carbon dioxide equivalent.

Source: Ascent Environmental 2023.

## 2.3 DISCUSSION

The community and municipal legislative-adjusted BAU emissions would decrease by approximately 38 percent and 64 percent between 2019 and 2045, respectively. This is a result of reductions that would be achieved from several legislative actions including:

- ▶ a greater renewable mix in SCE's and State electricity supply (60 percent by 2030 and 100 percent by 2045);
- ▶ carbon-free electricity supplied by OCPA;
- ▶ improved building energy efficiency through compliance with Title 24 standards;
- ▶ reductions in on-road vehicle emissions factors from State vehicle standards as forecasted in EMFAC2021 and ACC II standards; and
- ▶ reductions in off-road vehicle and equipment emissions factors forecasted in OFFROAD2021.

Going forward, new legislative actions that would affect emissions may be adopted by State and federal agencies; however, because information regarding these regulatory changes is currently unavailable or not final, emissions reductions from future potential legislative actions are not quantified in this memorandum. Where new State regulations or programs are imminent and reasonably foreseeable, they can be incorporated as complementary actions to locally based GHG reduction measures.

Tree Type	Number	Electricity Saved (kWh/year)	Natural Gas Saved (btu/year)
-----------	--------	------------------------------	------------------------------

## 6. Climate Risk Detailed Report

### 6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Hazard	Result for Project Location	Unit
Temperature and Extreme Heat	9.54	annual days of extreme heat
Extreme Precipitation	3.60	annual days with precipitation above 20 mm
Sea Level Rise	—	meters of inundation depth
Wildfire	0.00	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about  $\frac{3}{4}$  an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (Radke et al., 2017, CEC-500-2017-008), and consider inundation location and depth for the San Francisco Bay, the Sacramento-San Joaquin River Delta and California coast resulting different increments of sea level rise coupled with extreme storm events. Users may select from four scenarios to view the range in potential inundation depth for the grid cell. The four scenarios are: No rise, 0.5 meter, 1.0 meter, 1.41 meters

Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

### 6.2. Initial Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	1	0	0	N/A
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	1	0	0	N/A
Wildfire	1	0	0	N/A
Flooding	N/A	N/A	N/A	N/A

Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	0	0	0	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.

The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.

The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

### 6.3. Adjusted Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	1	1	1	2
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	1	1	1	2
Wildfire	1	1	1	2
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	1	1	1	2

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.

The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.

The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores include implementation of climate risk reduction measures.

### 6.4. Climate Risk Reduction Measures

## 7. Health and Equity Details

### 7.1. CalEnviroScreen 4.0 Scores

The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Exposure Indicators	—
AQ-Ozone	59.7
AQ-PM	63.2
AQ-DPM	81.4
Drinking Water	47.3
Lead Risk Housing	18.3
Pesticides	45.9
Toxic Releases	84.3
Traffic	53.5
Effect Indicators	—
CleanUp Sites	17.1
Groundwater	10.6
Haz Waste Facilities/Generators	94.3
Impaired Water Bodies	83.0
Solid Waste	24.8
Sensitive Population	—
Asthma	8.91
Cardio-vascular	23.2
Low Birth Weights	28.8
Socioeconomic Factor Indicators	—
Education	12.0
Housing	51.8
Linguistic	40.4
Poverty	54.1
Unemployment	35.0

## 7.2. Healthy Places Index Scores

The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Economic	—
Above Poverty	59.84858206
Employed	83.80597973
Median HI	61.09328885
Education	—
Bachelor's or higher	89.87552932
High school enrollment	100
Preschool enrollment	95.7141024
Transportation	—
Auto Access	32.25972026
Active commuting	49.49313486
Social	—
2-parent households	54.35647376
Voting	24.03438984
Neighborhood	—
Alcohol availability	37.16155524
Park access	81.35506224
Retail density	86.30822533
Supermarket access	86.78301039
Tree canopy	16.0272039
Housing	—
Homeownership	7.481072758
Housing habitability	58.06493007
Low-inc homeowner severe housing cost burden	85.62812781

Low-inc renter severe housing cost burden	80.00769922
Uncrowded housing	49.60862312
Health Outcomes	—
Insured adults	78.89131272
Arthritis	95.7
Asthma ER Admissions	91.4
High Blood Pressure	94.4
Cancer (excluding skin)	74.5
Asthma	72.9
Coronary Heart Disease	96.0
Chronic Obstructive Pulmonary Disease	93.7
Diagnosed Diabetes	95.3
Life Expectancy at Birth	83.1
Cognitively Disabled	62.4
Physically Disabled	45.1
Heart Attack ER Admissions	80.6
Mental Health Not Good	78.4
Chronic Kidney Disease	95.6
Obesity	95.5
Pedestrian Injuries	53.5
Physical Health Not Good	93.2
Stroke	95.7
Health Risk Behaviors	—
Binge Drinking	29.5
Current Smoker	81.1
No Leisure Time for Physical Activity	80.7
Climate Change Exposures	—

Wildfire Risk	0.0
SLR Inundation Area	0.0
Children	67.0
Elderly	84.2
English Speaking	30.4
Foreign-born	89.5
Outdoor Workers	68.8
Climate Change Adaptive Capacity	—
Impervious Surface Cover	58.1
Traffic Density	22.1
Traffic Access	23.0
Other Indices	—

Other Decision Support	—
2016 Voting	46.9

### 7.3. Overall Health & Equity Scores

Metric	Result for Project Census Tract
CalEnviroScreen 4.0 Score for Project Location (a)	37.0
Healthy Places Index Score for Project Location (b)	75.0
Project Located in a Designated Disadvantaged Community (Senate Bill 535)	No
Project Located in a Low-Income Community (Assembly Bill 1550)	No
Project Located in a Community Air Protection Program Community (Assembly Bill 617)	No

a: The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

b: The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

### 7.4. Health & Equity Measures

No Health & Equity Measures selected.

## 7.5. Evaluation Scorecard

Health & Equity Evaluation Scorecard not completed.

## 7.6. Health & Equity Custom Measures

No Health & Equity Custom Measures created.

## 8. User Changes to Default Data

Screen	Justification
Operations: Hearths	No woodstoves or fireplaces

## APPENDIX F-2

### Greenhouse Gas Emissions for Hypothetical Project #2

# 15937 - Irvine GPU (Operation) Detailed Report

## Table of Contents

## 6. Climate Risk Detailed Report

### 6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Hazard	Result for Project Location	Unit
Temperature and Extreme Heat	9.03	annual days of extreme heat
Extreme Precipitation	3.50	annual days with precipitation above 20 mm
Sea Level Rise	—	meters of inundation depth
Wildfire	1.31	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about  $\frac{3}{4}$  an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (Radke et al., 2017, CEC-500-2017-008), and consider inundation location and depth for the San Francisco Bay, the Sacramento-San Joaquin River Delta and California coast resulting different increments of sea level rise coupled with extreme storm events. Users may select from four scenarios to view the range in potential inundation depth for the grid cell. The four scenarios are: No rise, 0.5 meter, 1.0 meter, 1.41 meters

Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

### 6.2. Initial Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	1	0	0	N/A
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	1	0	0	N/A
Wildfire	1	0	0	N/A
Flooding	N/A	N/A	N/A	N/A

Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	0	0	0	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.

The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.

The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

### 6.3. Adjusted Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	1	1	1	2
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	1	1	1	2
Wildfire	1	1	1	2
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	1	1	1	2

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.

The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.

The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores include implementation of climate risk reduction measures.

### 6.4. Climate Risk Reduction Measures

## 7. Health and Equity Details

### 7.1. CalEnviroScreen 4.0 Scores

The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Exposure Indicators	—
AQ-Ozone	58.2
AQ-PM	68.7
AQ-DPM	84.2
Drinking Water	53.2
Lead Risk Housing	28.7
Pesticides	11.8
Toxic Releases	91.4
Traffic	88.9
Effect Indicators	—
CleanUp Sites	97.3
Groundwater	99.0
Haz Waste Facilities/Generators	98.4
Impaired Water Bodies	83.0
Solid Waste	97.7
Sensitive Population	—
Asthma	17.0
Cardio-vascular	20.8
Low Birth Weights	54.8
Socioeconomic Factor Indicators	—
Education	49.2
Housing	39.2
Linguistic	59.4
Poverty	55.5
Unemployment	5.57

## 7.2. Healthy Places Index Scores

The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Economic	—
Above Poverty	47.45284229
Employed	76.27357885
Median HI	69.01065058
Education	—
Bachelor's or higher	70.42217375
High school enrollment	100
Preschool enrollment	16.21968433
Transportation	—
Auto Access	57.21801617
Active commuting	69.0619787
Social	—
2-parent households	42.17887848
Voting	31.99024766
Neighborhood	—
Alcohol availability	44.80944437
Park access	28.53843193
Retail density	94.63621199
Supermarket access	58.28307455
Tree canopy	29.41100988
Housing	—
Homeownership	19.54317978
Housing habitability	30.20659566
Low-inc homeowner severe housing cost burden	97.88271526

Low-inc renter severe housing cost burden	75.33684075
Uncrowded housing	22.40472219
Health Outcomes	—
Insured adults	50.3143847
Arthritis	98.6
Asthma ER Admissions	82.6
High Blood Pressure	98.8
Cancer (excluding skin)	96.0
Asthma	65.7
Coronary Heart Disease	98.7
Chronic Obstructive Pulmonary Disease	94.6
Diagnosed Diabetes	98.6
Life Expectancy at Birth	99.4
Cognitively Disabled	52.2
Physically Disabled	81.6
Heart Attack ER Admissions	76.4
Mental Health Not Good	58.7
Chronic Kidney Disease	99.0
Obesity	94.5
Pedestrian Injuries	72.5
Physical Health Not Good	93.2
Stroke	98.4
Health Risk Behaviors	—
Binge Drinking	4.3
Current Smoker	42.3
No Leisure Time for Physical Activity	69.0
Climate Change Exposures	—

Wildfire Risk	0.0
SLR Inundation Area	0.0
Children	25.4
Elderly	82.5
English Speaking	49.5
Foreign-born	80.9
Outdoor Workers	61.4
Climate Change Adaptive Capacity	—
Impervious Surface Cover	18.1
Traffic Density	92.8
Traffic Access	65.3
Other Indices	—
Hardship	52.6
Other Decision Support	—
2016 Voting	59.2

### 7.3. Overall Health & Equity Scores

Metric	Result for Project Census Tract
CalEnviroScreen 4.0 Score for Project Location (a)	64.0
Healthy Places Index Score for Project Location (b)	56.0
Project Located in a Designated Disadvantaged Community (Senate Bill 535)	No
Project Located in a Low-Income Community (Assembly Bill 1550)	No
Project Located in a Community Air Protection Program Community (Assembly Bill 617)	No

a: The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.  
 b: The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

### 7.4. Health & Equity Measures

No Health & Equity Measures selected.

## 7.5. Evaluation Scorecard

Health & Equity Evaluation Scorecard not completed.

## 7.6. Health & Equity Custom Measures

No Health & Equity Custom Measures created.

## 8. User Changes to Default Data

Screen	Justification
Land Use	Taken from client data
Construction: Construction Phases	Project start date taken from client data
Construction: Off-Road Equipment	T/L/B replaced with Crawler Tractor to accurately calculate disturbance for Site Preparation and Grading phases. Standard 8 hours work days.
Operations: Hearths	No fireplaces or woodstoves

Table 1

<sup>1</sup> The CNEL is calculated at the boundary of the right-of-way of each roadway and the property line of the nearest receiving land use.  
 "RW" = Location of the respective noise contour falls within the right-of-way of the road.

Table 6

Table 6: Current General Plan Conditions Noise Contours

<sup>1</sup> The CNEL is calculated at the boundary of the right-of-way of each roadway and the property line of the nearest receiving land use.  
 "RW" = Location of the respective noise contour falls within the right-of-way of the road.

Table 7

<sup>1</sup> The CNEL is calculated at the boundary of the right-of-way of each roadway and the property line of the nearest receiving land use.

"RW" = Location of the respective noise contour falls within the right-of-way of the road.

Table 8

Table 8: Conservative Cumulative Plan Conditions Noise Contours

<sup>1</sup> The CNEL is calculated at the boundary of the right-of-way of each roadway and the property line of the nearest receiving land use.  
 "RW" = Location of the respective noise contour falls within the right-of-way of the road.

Table 9

<sup>1</sup> The CNEL is calculated at the boundary of the right-of-way of each roadway and the property line of the nearest receiving land use.  
 "RW" = Location of the respective noise contour falls within the right-of-way of the road.

Table 10

Table 10: Preferred Cumulative Plan Conditions Noise Contours

<sup>1</sup> The CNEL is calculated at the boundary of the right-of-way of each roadway and the property line of the nearest receiving land use.  
 "RW" = Location of the respective noise contour falls within the right-of-way of the road.

Table 11

Table 11: Existing and Current General Plan Traffic Noise Level Increases

ID	Road	Segment	CNEL at Receiving Land Use (dBA) <sup>2</sup>			Incremental Noise Level Increase Threshold <sup>3</sup>

<sup>1</sup> Based on a review of existing aerial imagery. Noise sensitive uses limited to existing residential land uses.

<sup>2</sup> The CNEL is calculated at the boundary of the right-of-way of each roadway and the property line of the receiving land use.

<sup>3</sup> Does the Project create an incremental noise level increase exceeding the significance criteria?

Table 12

Table 12: Existing and Conservative Plan Traffic Noise Level Increases

<sup>1</sup> Based on a review of existing aerial imagery. Noise sensitive uses limited to existing residential land uses.

<sup>2</sup> The CNEL is calculated at the boundary of the right-of-way of each roadway and the property line of the receiving land use.

<sup>3</sup> Does the Project create an incremental noise level increase exceeding the significance criteria?

Table 13

Table 13: Existing and Preferred Plan Traffic Noise Level Increases

<sup>1</sup> Based on a review of existing aerial imagery. Noise sensitive uses limited to existing residential land uses.

<sup>2</sup> The CNEL is calculated at the boundary of the right-of-way of each roadway and the property line of the receiving land use.

<sup>3</sup> Does the Project create an incremental noise level increase exceeding the significance criteria?

Table 14

<sup>1</sup> Based on a review of existing aerial imagery. Noise sensitive uses limited to existing residential land uses. <sup>2</sup> The CNEL is calculated at the boundary of the right-of-way of each roadway and the property line of the receiving land use. <sup>3</sup> Does the Project create an incremental noise level increase exceeding the significance criteria?								

Table 15

<sup>1</sup> Based on a review of existing aerial imagery. Noise sensitive uses limited to existing residential land uses. <sup>2</sup> The CNEL is calculated at the boundary of the right-of-way of each roadway and the property line of the receiving land use. <sup>3</sup> Does the Project create an incremental noise level increase exceeding the significance criteria?								

Table 16

<sup>1</sup> Based on a review of existing aerial imagery. Noise sensitive uses limited to existing residential land uses. <sup>2</sup> The CNEL is calculated at the boundary of the right-of-way of each roadway and the property line of the receiving land use. <sup>3</sup> Does the Project create an incremental noise level increase exceeding the significance criteria?								

Table 17

<sup>1</sup> Based on a review of existing aerial imagery. Noise sensitive uses limited to existing residential land uses. <sup>2</sup> The CNEL is calculated at the boundary of the right-of-way of each roadway and the property line of the receiving land use. <sup>3</sup> Does the Project create an incremental noise level increase exceeding the significance criteria?
